UNGAVA, the northern portion of the Province of Quebec, bounded by Hudson bay on the west; Hudson strait and Ungava bay on the north; and the coast strip of Labrador belonging to Newfoundland on the east The area is estimated at more than 300,000 sq m and includes much of the lower portion of Labrador, with a rim of recent marine deposits along its western coast, but the interior has the usual character of low rocky hills of Archean rocks, especially granite and gneiss, with a long band of little disturbed iron-bearing rocks, resembling the Animikie, or Upper Huronian of the Lake Superior region, near its eastern side Along Hudson bay shore there is a strip of similar rocks, and a long row of small islands of the same age, with great sheets of trap or diabase forming the tops of the hills Ungava, like the rest of Labrador, has risen several hundred feet since the Ice age, marine beaches being found up to 700 ft. on the Hudson bay side; and it is interesting to find seals like those of the adjoining sea-coasts in the Seal lakes 100 m inland and 800 ft above the present sea-level. Owing to its northerly position a large part of Ungava is treeless, and belongs to the barren grounds where caribou roam and feed on the so-called caribou moss, a greyish lichen.

UNGER, FRANZ (1800–1870), Austrian physician and botanist, was born at Amthof in Steiermark on Nov. 30, 1800. He studied medicine in Graz, Vienna and Prague He practiced in Stockerau and Kitzhubel and in 1833 became professor of botany at the University of Graz In 1849 he went to Vienna to occupy the chair of plant physiology. In 1866 he retired to live in the country near Graz where he died on Feb 13, 1870 Unger made many contributions to the understanding of plant anatomy and physiology, and was also much interested in plant palaeontology He contributed numerous articles to such scientific reviews as *Neues Jahrbuch Miner*, *Steiermark Nat*, *Ver Mitth*, etc His more important published works were *Die Exantheme der Pflanzen* (1833); *Ueber den Einfluss des Waldbodens auf die Verteilung der Gewächse* (1836), *Ueber der Bau und das Wachstum des Dikotyledonenstammes* (1840); *Ueber Kristallbildungen in den Pflanzenzellen* (1840), *Anatomie und Physiologie der Pflanzen* (1855); *Synopsis plantarum fossilium* (1845), *Chloris protogaea, Beitrage zur Flora der Vorwelt* (1841–47); *Inconographia plantarum fossilium* (1852); *Sylloge plantarum fossilium* (1860); *Die Urwelt* (1851), *Versuch einer Geschichte der Pflanzenwelt* (1852), *Geologie der Europaischen Waldbaumen* (1870), *Botanische Streifzuge auf den Gebiet der Kulturgeschichte* (1857–67)

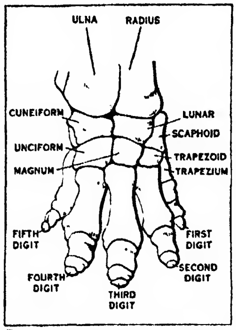
UNGER, RUDOLF (1872–), German writer and literary critic, was born in Hildburghausen in 1872 He studied in the universities of Heidelberg, Munich and Berlin, and in 1911 became professor in literature at Munich Since 1921 he has been professor of German literature at the university of Gottingen He is most noted for his studies in the period of Goethe He edited *Obras de Goethe* (1910) and *Briefe von Dorothea und Friedrich Schlegel* (1913), and wrote *Philosophische Probleme in die neueren Literaturwissenschaft* (1908); *Von Nathan zu Faust* (1916), and *Weltanschauung und Dichtung* (1917); and *Zur Geschichte des Palingenesisgedankens im 18 Jahrhundert* (1924).

UNGULATA, an order or super-order of placental mammals including the hoofed herbivorous quadrupeds Aristotle in his work on *The Parts of Animals,* in describing the extremities of the viviparous quadrupeds, says that " . . some are bifid and have hoofs instead of nails, as the sheep, the goat, the elephant, the hippopotamus, and some have undivided feet, as the solid-hoofed animals, the horse and the ass . ."

After the Renaissance Wotton (1552), following Aristotle, divided the viviparous quadrupeds into the many-toed, double-hoofed and single-hoofed. In 1693 John Ray divided the viviparous quadrupeds into two grand divisions, the Ungulata, or hoofed, and the Unguiculata, or clawed, forms. The former were subdivided into: (*a*) the Monochela, or Solidipeda, with solid hoofs, including the horse, the ass and the zebra, (*b*) the Dichela, or Bisulca, with cloven hoofs, and (*c*) the Tetrachela or Quadrisulca, including the rhinoceros and hippopotamus. The Dichela were again subdivided into the Ruminantia, or ruminants, and the Non-ruminantia, or swine; the Ruminantia were finally divided into

those with permanent horns, namely the cattle, sheep and goats, and those with deciduous horns, of the deer kind. Here then was a usable and nearly correct classification of the ungulates before the beginning of the 18th century.

Subsequent discoveries have added to the Ungulata a great many extinct and some recent groups which were wholly unknown to Ray. Thus in Osborn's *Age of Mammals* (1910) the "Cohort Ungulata" includes no less than 13 "orders" of hoofed mammals. While each of these is a more or less natural group of animals related by descent from a common ancestral stock, the derivation and interrelationships of the orders themselves are still far from clear. It is well established that the typical ungulates, namely the Perissodactyla (horses, tapirs, rhinoceroses, etc.) and the Artiodactyla (ruminants, swine, etc) were wholly distinct from each other in the Lower Eocene, some 50 to 60 million years ago It is indeed not improbable that the ungulate, or hoofed herbivorous type, was evolved several different times from different families of placental mammals of the Cretaceous period, or in other words, that many of the resemblances between ungulate orders are examples of either parallel or convergent evolution.



RIGHT FORE FOOT OF INDIAN ELEPHANT, SHOWING PARTS

Order Condylarthra.—In the Basal Eocene formations of New Mexico and in the Lower Eocene of Wyoming have been found the fragmentary jaws and teeth, and very rarely more or less entire skeletons, of small hoofed mammals which on the whole were *structurally* intermediate between the oldest creodonts or flesh-eaters, and the true ungulates Of these the most primitive was the genus *Mioclaenus,* known chiefly from the conical-cusped upper molars, which recall those of such primitive carnivores (creodonts) as *Tricentes* and *Claenodon* Somewhat higher in the scale was the group of species of the genus *Hyopsodus*; these little animals were about as large as a hedgehog, the skull being of remarkably generalized type The dental formula, (Incisors $\frac{3}{3}$ Canines $\frac{1}{1}$ Premolars $\frac{4}{4}$ Molars $\frac{3}{3}$)$\times 2=44$, was that of other very primitive placental mammals The crown-patterns of the molar teeth were advancing ever further away from the primitive tritubercular type toward the more typical condylarth types presently to be described

By far the most famous condylarth was the Lower Eocene *Phenacodus primaevus,* an animal about as large as a Newfoundland dog, which has figured in many textbooks as the "five-toed ancestor of the horse." But W. D Matthew has advanced decisive evidence against this view. For in *Phenacodus* (*q v.*) each quadrangular upper molar had four conical main cusps and two very small intermediate cusps or conules; whereas in the contemporary ancestors of the horse family the oblique crests of the molars were progressively developed. Even in the Lower Eocene genus *Ectocion,* which was related to *Phenacodus,* the detailed patterns of the upper and lower molars were not quite right to be structurally ancestral to the molars of the primitive horses. Another Eocene condylarth, the genus *Meniscotherium,* had more complex upper molar patterns of the type known as buno-lopho-selenodont (*i.e.,* with cones, ridges and crescents), which in some respects foreshadow the general molar types of such later ungulates as the hyracoids, the chalicotheres and the litopterns

The foot structure of the condylarths was likewise of interest. In the five-toed hind foot the ankle bones were much like those of a contemporary creodont, with a ball-and-socket joint at the lower end, an arrangement to which the name Condylarthra refers. In the fore foot of *Phenacodus* the two rows of carpal bones were placed directly above each other, "like unstruck bricks," whereas in typical ungulates a more displaced, or alternating arrangement, was the rule. E D Cope supposed that *Phenacodus* was in this respect also ancestral to later ungulates but Matthew showed that in both *Phenacodus* and the later ungulates the contrasting arrangements of the carpal elements above mentioned were probably both derived independently from the still older interlocking creodont type.

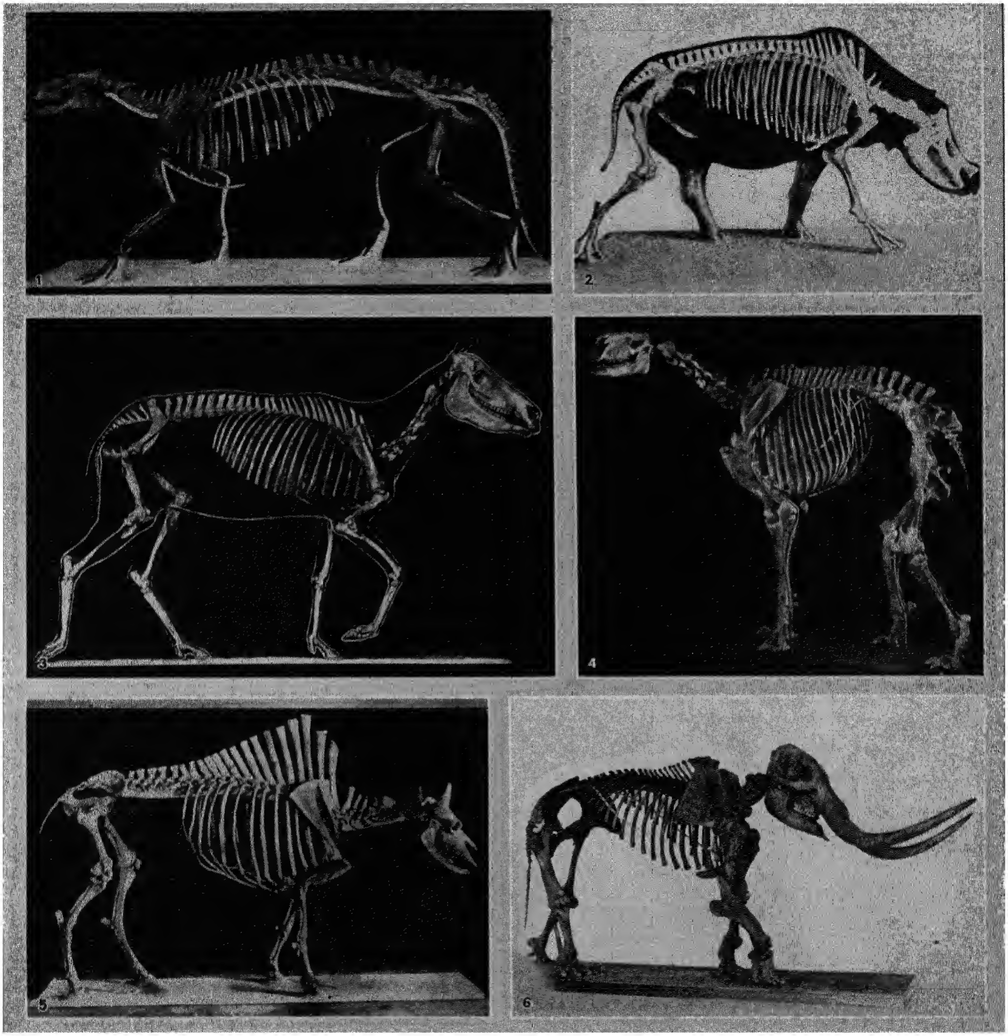
Amblypoda (*q.v.*).—In the basal Eocene of New Mexico occur the fragmentary remains of a diversified series of small hoofed mammals collectively known as Taligrada, or primitive Amblypoda Some of the smaller genera were hardly bigger than insectivores and with teeth suggestive of insectivore-creodont ancestry, while the larger taligrades (*Periptychus, Pantolambda*) were about the size and proportions of stocky badgers. The upper molar teeth in the smaller forms had three main cusps arranged in a triangle with the apex toward the inner side; the small intermediate cusps or conules were more or less circular; the main internal cusp was flanked by small cusps borne by the anterior and posterior ridges or cingula. In *Periptychus* the upper molar cusps were all subcircular and the enamel surface was pleated. The brain-cast indicates a brain of extremely primitive form with large olfactory lobes and a minimum development of the neopallium. In *Pantolambda* the upper molar crowns bore two sharp outer V's and a centrally placed conical internal cusp

In all the taligrades the feet were short, especially so in *Pantolambda* This feature becomes greatly emphasized in the later members of the order, the coryphodons and Dinocerata *Coryphodon* is characteristic of the Lower Eocene of Wyoming and England It was broad-headed and almost hippopotamus-like Related forms have recently been found in the Eocene of Mongolia *Uintatherium, Dinoceras* and their allies were characteristic of the later Eocene. Their bodies were gigantic, larger than modern rhinoceroses, with massive, post-like limbs and extremely short stubby toes They had sabre-like upper tusks, six or more horn-like bony outgrowths on top of the skull and a brain of low type

Notoungulata.—The condylarths and taligrades disappeared from the fossil record of the northern hemisphere in early Eocene, but there is some reason to believe that some of them reached South America and there gave rise to the amazingly varied series of herbivorous mammals which are often referred to collectively as notoungulates These flourished for millions of years in Patagonia and adjacent regions, while the perissodactyls, artiodactyls and other ungulates held sway in the northern world These notoungulates exemplified the law of adaptive radiation on a grand scale. Protected by geographical barriers from the deadly competition of their larger-brained northern analogues, they exploited all the economic possibilities for ungulates available in South America and gave rise to the wide diversity of forms that covered the ancient pampas Some (the protypotheres) were small and swift-running like rabbits, others (the smaller litopterns) were like slender-limbed three-toed horses, some (*Macrauchenia*) paralleled the llamas and camels, others closely paralleled the rhinoceroses, while a few almost rivalled the elephants in bulk (*Pyrotherium*).

Litopterna (*q v*).—Among the most primitive of the entire series of notoungulates is the genus *Didolodus,* a small forerunner of the litopterns known only from the upper cheek-teeth, which in some ways recall those of the smaller taligrades. In the swift-footed proterotheres of the Miocene of Patagonia both cheek-teeth and feet suggest those of the Oligocene three-toed horses of the northern world. But in the upper molars the main inner cusp is central rather than anterior in position and the posterior cross-crests fail to meet the middle point of junction of the two main outer cusps, as they do in the three-toed horses, while the feet, although superficially horse-like, differ profoundly from the horses in the detailed arrangements and contacts of the tarsal elements. The larger litopterns (*Theosodon, Macrauchenia*), while in general appearance paralleling llamas and camels, yet are more nearly related to the horse-like proterotheres in their deeper characters.

Entelonychia, or *Homalodontotheria.*—In the "*Notostylops* beds" of Lower Oligocene or Upper Eocene in Patagonia occur a strange group of ungulates, varying in size from a rabbit to a rhinoceros. Of these the most famous form, *Notostylops,* had a small skull in which the upper grinding teeth have oblique and flattened



BY COURTESY OF THE AMERICAN MUSEUM OF NATURAL HISTORY

EXTINCT MAMMALS OF TERTIARY AND QUATERNARY TIMES

1. Skeleton of Lower Eocene *Phenacodus primaevus*, believed to be a five-toed ancestor of the horse
2. Skeleton of Upper Oligocene *Diceratherium*, an extinct species of Rhinoceros
3. Skeleton of *Neohipparion whitneyi*, a horse of the Upper Miocene plains region of North America. The outline is restored
4. Skeleton of Lower Miocene *Moropus*. It stood about six feet high at the shoulders and resembled a large horse
5. Skeleton of *Bison occidentalis*, extinct North American mammal of the Quaternary period, inhabiting Kansas and Alaska. Closest species to the existing bison
6. Pleistocene North American *Mastodon americanus*, forerunner of the elephant

outer walls remotely suggesting those of recent rhinoceros. The lower molars bore long obliquely-placed blades on the hinder part or talonid. The skull as a whole suggests that of the recent *Hyrax*. In certain early members in which the feet are known there are five digits on the fore and hind feet, the terminal bones are cleft for the attachment of fairly large hoofs, the main ankle bone (astragalus) is more or less flattened. A single very small jaw, the genus *Arctostylops* of Matthew, found in the Lower Eocene of Wyoming, appears to be related to these South American Entelonychia. Another apparently related type is found in the Eocene of Mongolia. These small jaws seem to increase the probability that the South American Entelonychia, like other members of the notoungulate series, had been derived from some basal Eocene or Upper Cretaceous forerunners of the taligrades and condylarths of the northern world. Of the later Entelonychia the best known is the Santa Cruzian (Lower Miocene) genus *Homalodontotherium*, a larger form in which all the teeth had become high-crowned and all the incisors, canines, premolars and molars were pressed together in a continuous series without break or interval.

The *Astrapotheria*, gigantic Santa Cruzian (Lower Miocene) forms with long downwardly growing tusks, may be highly specialized derivatives of some early member of the Entelonychia.

Toxodontia (*q v*).—These were perhaps the most numerous in species of all the notoungulate series. The Santa Cruzian (Lower Miocene) *Nesodon* was about the size of a rhinoceros but with the back curved and the limbs shorter. The front teeth were enlarged and flattened for cropping vegetation, the upper molar teeth had extremely long oblique outer walls and folded wearing surfaces. The three-toed feet, although rhinoceros-like in appearance, agreed with those of the litopterns in their fundamental characters. The Pampaean (Pleistocene) *Toxodon* was still larger, with a gigantic head and a huge curved back. This was one of the famous fossil South American mammals studied by C. Darwin (see *Voyage of the Beagle*)

Typotheria.—The smaller genera of this group, named protypotheres, included some that broadly resembled *Hyrax* and others that were rabbit-like They were very abundant in the Lower Miocene of Patagonia. The extremely high-crowned molar teeth were much curved transversely, as in some rodents, and were adapted for grinding tough vegetation The later form, *Typotherium*, from the Pampaean or Pleistocene of Argentina, had rodent-like incisors. It was about as large as a brown bear. This group is rather closely related to the toxodonts

Pyrotheria.—In these curious animals the molars were bilophodont, that is they bore two cross-crests like those of tapirs and dinotheres The skull in some ways resembled those of the Proboscidea (*q.v*) and the same is true of the tusks, but on the whole it seems more likely that the pyrotheres are simply the South American analogues of the Proboscidea.

Hyracoidea (*q.v.*).—This characteristically African group is represented to-day by the "coneys" or dassies of southern and west Africa, Abyssinia, Arabia and Syria These furry little animals have but slight external resemblance to ungulates but their jaws and teeth abound in resemblances to ungulates of many groups The internal anatomy shows a curious mixture of resemblances to elephants and perissodactyls There is no satisfactory evidence, however, of the relationship of *Hyrax* to any of the groups so far named. The hyracoids as a group must have been in Africa for many millions of years, since various forms of fossil hyracoids have been found in the Lower Oligocene of the Fayûm district in Egypt. In some of these very ancient hyracoids (*Megalohyrax*) the molar teeth recall those of Eocene titanotheres or of *Meniscotherium* among the condylarths. In its skull *Megalohyrax* was more or less swine-like.

Embrithopoda.—While the hyracoids played the part of the small ruminants in the ancient fauna of the Fayûm, the economic rôles of the rhinoceroses and elephants were assumed by gigantic beasts named *Arsinoitherium* (*q.v.*) in honour of an Egyptian queen. In these very strange animals the whole fore-part of the skull was surmounted by an enormous pair of bony horns, which in the front view rose to a great height The folded surfaces of the molar teeth remotely recall those of the American Eocene amblypods, but the premolars rather suggest relationships with the hyracoids. The body was very massive and the skeleton shows a curious mingling of resemblances to elephants and amblypods, doubtless the results of similar adaptations to slow browsing movements and the support of the immense body weight. The existence of these highly specialized animals in Africa at such an early date as the Lower Oligocene and their apparent isolation, in spite of their adaptive resemblances to elephants and amblypods, all indicate a very long line of less and less specialized ancestors, traces of which may some day be discovered when still older fossil-bearing horizons are discovered elsewhere in Africa.

Barypoda.—Still another strange type of extinct ungulate (named *Barytherium grave* by C. W. Andrews) was discovered in the Fayûm district of Egypt along with the fossil hyracoids, arsinoitheres and ancestral elephants. The only parts of the animal found were a large lower jaw, a humerus and a radius, all of which show a curious mixture of resemblances on the one hand to the primitive proboscidean *Moeritherium* and on the other hand to *Dinoceras* of the Amblypoda. In a general way it also resembles the ancient South American *Pyrotherium*.

Proboscidea.—The evolution and structure of the elephants (*q v*) are considered in the article PROBOSCIDEA, and further information can be found in H. F. Osborn's *Monograph* of this group As to the remote origin of the Proboscidea, the fact that *Arsinoitherium*, in spite of its wholly different skull and dentition, shows so many curiously detailed resemblances to the Proboscidea in its limbs and backbone, lends some support to C. W Andrews' view that the group of "Subungulata," consisting of the Proboscidea, Hyracoidea, Embrithopoda, Amblypoda, may after all be a more or less natural assemblage of ungulates. In fact we may even advance the tentative hypothesis that some such small Lower Eocene condylarth as *Hyopsodus walcottianus* (described by Matthew and Granger), with short spreading feet, reduced canines, slightly procumbent incisors and bunodont molars, would have been an ideal starting-point for the entire subungulate series, including also the South American Pyrotheria and perhaps even the Sirenia

Sirenia (*q v*)—If "common sense" and superficial appearances were trustworthy, these surprisingly whale-like mammals would still be classified with the Cetacea (*q v*) as they were by all early naturalists But De Blainville as far back as 1816 classified them as *"ongulogrades anomaux pour nager"*—anomalous ungulates adapted for swimming; in his later classification he brigaded them with the Proboscidea under the term "Gravigrades" Andrews in his description of *Eosiren* (the oldest known sirenian, from the Upper Eocene of the Fayûm, Egypt) pointed out a number of significant features in which the skull of *Eosiren* resembled that of *Moeritherium*, the oldest and most primitive known proboscidean from the same formation. He also cited a number of curious anatomical details in which even the modern Sirenia agree with the elephants in spite of the enormous difference in their external appearance and mode of life On the other hand, R. Lydekker pointed out that the unworn molar teeth of certain extinct sirenians were curiously like those of certain extinct artiodactyls (*Merycopotamus*) and that this fact suggested the derivation of the Sirenia from very early Eocene artiodactyls; but one might equally say that the molar teeth of another extinct sirenian (*Miosiren*) suggest those of the Eocene rodent *Ischyromys* and that the order Sirenia had therefore been derived from primitive rodents. Either of these views would be hard, in the present meagre state of our knowledge of the subject, to disprove; but neither has nearly as much positive evidence in its favour as the view of De Blainville and Andrews that the Sirenia are an aquatic specialization from the Proboscidean stem.

Be that as it may, however, by the time of the Lower Oligocene *Eosiren* was already definitely a sirenian in its dentition, skull and locomotor skeleton. Thereafter during the Oligocene, Miocene, Pliocene and Pleistocene epochs the changes in the skull and skeleton were comparatively slight and unimportant. The middle and late Tertiary sirenians (such as *Halitherium* and *Metaxytherium*) were for the most part considerably larger than the modern manatees and dugongs (*qq.v*) and had a large vertically-

placed pair of upper tusks, which have been retained by the dugongs but lost by the manatees.

The Sirenia are whale-like in their torpedo-like bodies and horizontal tail flukes, in the complete absence of external hind limbs and in their flipper-like forelimbs, which however still retain external nails or vestigial hoofs They differ markedly from typical cetaceans in their relatively small heads, truncate flattened snouts with transversely expanded upper lips covered with very large bristles The molar teeth are two-ridged,—wholly unlike the conical teeth of toothed cetaceans. Their tusks when present are situated at the end of the muzzle and directed downward They differ profoundly from cetaceans in their food and feeding habits, being the herbivores of the coasts and estuaries, whereas at least the typical cetaceans are essentially carnivores of the open seas. In their internal anatomy the sirenians likewise differ widely from cetaceans· the musculature of the forelimbs is less profoundly modified for aquatic life, the brain has a much less complexly convoluted surface and the digestive tract recalls that of the ruminants The skeleton of sirenians is peculiarly massive and dense, the swollen, heavy ribs serving apparently as ballast to keep these voluminous, gas-filled bodies below the surface.

Most of the many known extinct types of sirenians conform in essentials to the dugong type, but one extinct family, the Miocene *Desmostylidae*, is widely different from the rest In these the large upper tusks almost suggest the earliest proboscidean types but the most remarkable peculiarity is found in the molar teeth, each of which consists of a closely packed cluster of cylindrical columns of circular cross-section

Perissodactyla.—For the origin and evolution of this order of ungulates *see* PERISSODACTYLA

Artiodactyla.—This order is chiefly dealt with in the article ARTIODACTYLA Here it may be noted that attempts, as by Cope and others, to brigade the artiodactyls with the perissodactyls under the terms Taxeopoda or Ungulata Vera have in the long run only served to bring out the entirely artificial nature of such an assemblage and to throw into relief the significant differences which widely separated these two orders from each other as far back as Lower Eocene times There is indeed more to be said in favour of the view that the Artiodactyla may be an offshoot of some forerunner of the mesonychid family of the creodonts, while the Perissodactyla may be related remotely to the Cretaceous ancestors of the condylarths Recent studies by Miss H S Pearson on the skull structure of the earliest artiodactyls have revealed that at a very early date the order was already subdivided into two series, one the amastoid series, in which the mastoid region of the periotic bone was completely covered by the squamosal and adjacent elements (as in the suillines and their extinct relatives) and the other, or mastoid series, in which the mastoid was well exposed on the outer side, as in the Eocene Dichobunidae and all the ruminant artiodactyls

In conclusion, much future palaeontologic exploration, in Africa, in Mongolia and many other parts of Asia, will doubtless be necessary before many of the problems touched upon in this article can be pushed forward nearer to solution

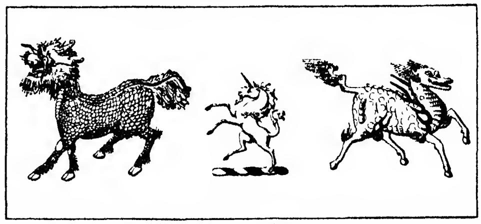
UNICORN, a fabulous beast, usually having the head and body of a horse, the hind legs of an antelope, the tail of a lion (sometimes horse's tail), sometimes the beard of a goat, and as its chief feature a long, sharp, twisted horn, similar to the narwhal's tusk, set in the middle of its forehead (Lat. *Unicornis*, single-horned, Gr. *μονόκερως*). The earliest description is that of Ctesias, who (*Indica opera*, ed. Baehr, p 254) states that there were in



FROM (LEFT AND RIGHT) GOULD, 'MYTHICAL MONSTERS' (ALLEN & CO), (CENTRAL) FAIRBAIRN, 'BOOK OF CRESTS' (T. C. & E. C. JACK)

THE UNICORN OF LEGEND AND HERALDRY

The centre illustration shows the heraldic unicorn, and those on the left and right, the Chinese and Japanese varieties respectively

India white wild asses celebrated for their fleetness of foot, having on the forehead a horn a cubit and a half in length, coloured white, red and black; from the horn were made drinking cups which were a preventive of poisoning. Aristotle mentions (*Hist. anim*, ii 1; *De part anim*, iii. 2) two one-horned animals, the oryx, a kind of antelope, and "the so-called Indian ass" In Roman times Pliny (*N H*, viii 30; xi 106) mentions the oryx, the Indian ass, and an Indian ox as one-horned, Aelian (*De nat anim*, iii 41; iv 52), quoting Ctesias, adds that India produces also a one-horned horse, and says (xvi 20) that the *Monoceros* was sometimes called *Carcazonon*, possibly a form of the Arabic *Carcadân*, rhinoceros

The mediaeval conception of the unicorn as possessing great strength and fierceness is perhaps due to the fact that in certain passages of the Old Testament (*e g*, Num xxiii 22, Deut xxxiii 17, Job xxxix 9–10) the Hebrew word *R'êm*, now translated in the Revised Version "wild ox," was translated in the Septuagint *μονόκερως*, in the Vulgate *unicornis* or *rhinoceros*, and in the Authorised Version "unicorn," though in Deut xxxiii 17 it obviously refers to a two-horned animal Isidore xii 2, 12 tells how the unicorn has been known to worst the elephant in combat

As a decoration on drinking-cups it symbolized the ancient belief in the efficacy of the unicorn's horn against poison, which in England remained, even in the time of Charles II, though Sir E Ray Lankester (*Science from an Easy Chair*, 1910, p 127) mentions that a cup made of rhinoceros horn was then handed over to the Royal Society for experiment, with the result of entirely disproving the superstition In the court ceremonial of France as late as 1789 instruments of "unicorn's" horn were still used for testing the royal food for poison

In heraldry the unicorn was sometimes used as a device (*see* HERALDRY), but oftener as a supporter, and subsists to the present day as the left-hand supporter of the royal arms This position it assumed at the Union, the Scottish royal arms having been supported by two unicorns. When the unicorn became a supporter of the royal arms both of England and Scotland, a royal crown was added on the head of the unicorn, in addition to the crown with chain and ring round its neck (*see* Great Seal of James I and VI in Anderson, Pl. xciii), but this crown was removed after the Hanoverian succession. In England after the Union the unicorn became the left-hand supporter, but in Scotland, as late as 1766, it was still put on the right (Seton, p. 442).

BIBLIOGRAPHY.—*See* Drexler *s.v. Monokeros*, in Roscher's *Lexicon;* and Rev. W. Haughton in *Annals and Magazine of Natural History* for 1862, p. 363, "On the Unicorn of the Ancients"

UNICORN-PLANT (*Martynia prosboscidea*), a North American plant of the family Martyniaceae, called also proboscis-flower and devil's-claw, native from Indiana to New Mexico and southward to Mexico, cultivated for its abundant foliage, peculiarly shaped flowers and oddly formed fruiting pods. It is a

coarse, sticky-hairy, half-prostrate annual, with thick, roundish leaves; larger violet or purple flowers, 1¾ in. long; and hanging, horn-like, woody pods, with a thick body, 3 in to 4 in long, ending in a curved beak of equal or greater length When dry, the beak splits into two opposed hook-like or claw-like appendages.

UNIDIRECTIONAL RADIO DIRECTION FINDER, a radio device which permits determination of the direction (without 180 deg. ambiguity) of waves as received from a transmitting station.

UNIFIED FIELD THEORY, a term widely applied, early in 1929, to represent the new theory which was then advanced by Dr. Albert Einstein, according to which there is but a single background to all material activity—one unified field A material object is commonly conceived of as existing in *space* and *time.* The scientist often adds that the object is in a *gravitational field* and in an *electro-magnetic field* These four terms seem to attribute four different backgrounds to the object But the special theory of relativity (*q v.*) has amalgamated space and time into space-time and the general theory of relativity, with its Riemannian geometry, has absorbed the gravitational field into space-time. Thus three of the four terms were already reduced to one. The unified field theory goes a step further by including the electro-magnetic field A survey of Dr Einstein's announced solution of the problem of unification has been written by Professor A S. Eddington, and will be found immediately after Dr. Einstein's own article on SPACE-TIME in vol. xxi, page 108.

UNIFORMS. The word "uniform" (Lat *unus*, one, and *forma*, form), meaning adjectively homogeneous, is specifically used as a substantive for the distinctive naval, military and air service dress, which serves, in its various styles, to give homogeneity to the several services, regiments and ranks. Although in ancient history we occasionally meet with uniformed soldiers, such as those of Rome and the white and crimson Spanish regiments of Hannibal, it was not until the establishment of standing armies that uniforms were introduced in modern times The absence of uniforms accounts very largely for the significance attached to the colours and standards, which alone formed rallying points. The beginnings of uniforms are therefore to be found in truly national armies, in the *Indelta* of Gustavus, and the English armies of the Great Rebellion In the earlier years of the latter, though the richer colonels uniformed their men (as, for instance, the marquess of Newcastle's "Whitecoats" and the king's own "Bluecoats"), the rustics and the citizens turned out for war in their ordinary rough clothes, donning armour and sword-belt But in 1645 the parliament raised an army "all its own" for permanent service, and the colonels became officials rather than proprietors. The "new model" was clothed in the civilian costume of the date —ample coat, waistcoat, breeches, stockings and shoes (in the case of cavalry, boots)—but with the distinctive colour throughout the army of red and with regimental facings of various colours. The regiments were known as the Blue, Orange, Yellow, etc. Regiments—according to the colour of these facings The breeches were grey. Soon afterwards the helmet disappeared, and its place was taken by a grey broad-brimmed hat From the coat was evolved the tunic of to-day, and the hat became the cocked hat of a later generation, which has never altogether disappeared, and has reverted to its original form in the familiar "slouch-hat."

For service in Ireland the red coat was exchanged for one of russet colour. The cavalry, however, wore buff leather coats and armour long after the infantry had abandoned them; the Austrians on account of their Turkish wars, retained them longer than any.

Thus the principle ever since followed—uniform coat and variegated facings—was established In France, as in England and Austria, the cavalry, as yet rather led by the wealthy classes than officered by the professional, was not uniformed upon an army system until after the infantry. But in 1688 six-sevenths of the French cavalry was uniformed in light grey with red facings; and about half the dragoon regiments had red uniforms and blue facings. Louvois, in creating a standing army, had introduced an infantry uniform as a necessary consequence. The native French regiments had light grey coats, the Swiss red, the German black and the Italian blue, with various facings.

The hat and the long coat and breeches remained the uniform of line infantry almost everywhere up to the advent of the shako and the coatee about 1790–1820 The gradual evolution of these two garments, from the comfortable civilian clothes of 1690 to the stiff, precise military garments of 1790, can be traced in a few words The brim of the felt hat was first looped up on one side for convenience, then, for appearance' sake, on the other, and so became the three-cornered cocked hat, fringed with feathers, lace or braid, of Marlborough's wars Then came the fashion of looping up before and behind, which produced the hat called the "Khevenhuller," or the broadside-on cocked hat Lastly, came the purely decorative, lace-looped "fore-and-aft" pattern Though the long skirts that rendered great coats unnecessary were looped back, and the ample cuffs of Marlborough's time were becoming narrower until they were at last sewn down to the sleeve, yet the military costume was in all essentials the civil costume of the time —long coat, hat, sleeved waistcoat, breeches and gaiters.

The introduction into armies of Slavonic irregulars, tended to restrict line infantry and cavalry to parade drill and to pitched battles in parade order This stiffened their costume until it became "soldierly" The flapped cuffs have become plain round cuffs, above which are embroidery stripes and buttons which at one time laced the flaps of the cuff together and now survive as the "guard-stripe." This may be called the first instance of the dummy adornments, which are so marked in modern full-dress uniforms Similarly the former cloth turnback on the front of the coat has even in 1756 been cut off, the buttons and embroidered loops that retained it being kept as decorations

Many of these specially military adornments were borrowed from the national costumes of the irregulars themselves Their head-gear in particular drove out the cocked hat. The grenadier cap, now a towering bearskin, was its first successful rival, the shako the next The grenadier cap was, in the first instance, a limp conical cap (identical with the hussar cap), edged with fur and having a tassel at the end Soon the fur became more prominent in the front, and the tail disappeared. Then the cloth mitre-cap appeared This was originally a field-service cap with ear-flaps and sunshade. From the narrow and forward-pointing bearskin of Peninsular days, it evolved into the great fur cap of grenadiers and fusiliers of the present time As early as 1755, a conical leather cap with a large brass plate in front had come into existence This held its ground for some time, and the grenadier cap of the modern Russian and German armies was a metal copy of the mitre field-service cap itself

The Hungarian hussars introduced the jacket and the busby The latter was originally a conical cap with fur edge, but the fur became higher until there was nothing left of the cap but the ornamental "busby-bag" of to-day The lancer cap, which, originally the Polish czapka, was a cylindrical cap with a square top, the upper part of which could be pushed up or down after the fashion of a bellows or accordion. The line infantry and cavalry coat, full-skirted in the first instance, retained its original length until about 1780, but from that time onwards it becomes, little by little, shorter and scantier until at last it is a "coatee," not as long as the present-day tunic or a swallow-tailed coat This did away with the protection afforded by the full skirt, and necessitated the introduction of the great coat The white breeches and gaiters, retained to the last, gradually gave way to trousers and ankle boots in 1800–1820

Meanwhile another form of head-dress came into vogue This was the helmet, which had disappeared from the infantry about 1650–1670, and the cavalry thirty years afterwards It took two forms, a small helmet with sausage-shaped ornament from front to back, worn chiefly by British light dragoons and artillery, and the towering crested helmet worn by the French, British and Austrians The French cuirassiers and dragoons had long horse-hair tails dependent from the crest

At the beginning of the 19th century gaitered breeches were replaced by trousers and cavalry uniforms were increasing in brilliance. After Waterloo, indeed, all traces of the old-fashioned coat disappeared, and, the soldier was more showy and worse off in comfort and convenience than previously The hussar furred pelisse, originally worn over a jacket had become a magnificently

embroidered and laced garment, always slung and never worn, and the old plain under-jacket had been loaded with buttons and lace, and differed from the pelisse only in the absence of fur The dress regulations of 1855 introduced the low "Albert" shako and the tunic, and abolished the epaulette

The tunic, accompanied by a spiked helmet of burgonet shape, had been introduced in Prussia and Russia about 1835 The French adopted the tunic in 1853, the Austrians in 1856, and in both countries the shako became smaller and lighter. From about 1880, when the spiked helmet replaced the low shako in England, no radical changes were made in full dress uniforms, except that the Russian army, abandoning the German pattern uniforms formerly in vogue, adopted a national uniform In 1906–1909, however, this attempt to combine handsomeness and comfort was given up, full dresses being made more decorative, and light green-grey service dresses being introduced Lastly, subsequent to the South African War and its revelation of the development of infantry fire, the attempt to wear full dress uniform on active service was practically given up Great Britain first of all adopted the Indian khaki, and then a drab mixture for "service dress" Germany, Italy, the United States and other countries followed suit, though each has chosen its own shade, and the shades vary from light grey blue in Italy to deep olive drab in the United States The details of the present-day uniforms in the principal states are given below (X)

GREAT BRITAIN

The uniforms of the British Army fall into two main categories (a) full-dress and (b) service dress From 1881 to 1914 full-dress had not undergone any radical change, although minor alterations had been sanctioned in a few cases to express some regimental tradition or national sentiment On the outbreak of the World War full-dress ceased to be worn and up-to-date (1928) it has only been re-introduced for the Household Cavalry, Brigade of Guards and regimental bands

(a) **Full Dress.**—Within each arm of the service the regiments or corps composing it possess special distinctions. For details reference should be made to the British Army Dress and Clothing Regulations.

(i) *Cavalry*—There are two main divisions of Cavalry, viz. "Household Cavalry" and "Cavalry of the Line." The Household Cavalry consists of the The Life Guards and Royal Horse Guards The distinctive features of these regiments are their steel cuirasses, white leather breeches and high jack boots reaching above the knee They both wear single-breasted tunics, that of the Life Guards being scarlet and that of the Royal Horse Guards blue, and metal helmets with horsehair plumes Both regiments mount guard at "The Horse Guards" Whitehall, where their brilliant uniforms have attracted the attention of many generations of London sightseers

The Cavalry of the Line consists of Dragoon Guards, Dragoons, Hussars and Lancers All wear blue pantaloons (with broad distinctive stripes on the outside) and jack boots Dragoon Guards and Dragoons wear a single breasted tunic and metal helmet with horsehair plume (except The Royal Scots Greys [2nd Dragoons] who wear a bearskin cap) Lancers wear a double breasted tunic (the front or "plastron" reaching from the shoulders to the waistline) and lancer caps (the Polish Czapka) with drooping plumes Hussars wear a single breasted ribbed jacket and fur busby

(ii) *Infantry*—Foot Guards all wear tall bearskin caps, red single-breasted tunics with blue facings, blue trousers with a red stripe The regimental distinctions consist in the spacing of the buttons on the tunic, colour of the plume of bearskin, colour of cap-band and badges and titles on the tunic. Infantry of the Line wear a cloth helmet (dark blue, black or green) which is to be replaced by a shako scarlet tunic, blue cloth trousers with a red stripe, with the following exceptions; Rifle Regiment astrakhan cap, dark green tunics and trousers; Fusiliers wear a bearskin with hackle plume instead of a helmet. Scottish Regiments, both Highland and Lowland, wear a "doublet" with gauntlet cuffs, Highland regiments wear a tartan kilt and plaid and sporran, diced hose-tops and white spats. Lowland regiments wear tartan "trews." Highland regiments wear a "feather bonnet," Lowland the Kilmarnock bonnet. The Cameronians (Scottish Rifles) wear a shako

(iii) *Royal Artillery.*—All wear blue riding-breeches (with broad red stripes) and jack boots, cloth helmet and blue single-breasted tunic, except Royal Horse Artillery who wear a cylindrical fur busby and short ribbed jacket. The cylindrical fur busby, however, is to become universal throughout all branches of the Royal Artillery

(iv.) *Royal Engineers*—Scarlet tunic, blue trousers and cloth helmet (to be replaced by cylindrical fur busby)

(b) **Service Dress.**—As a result of experience gained during the Boer War (1899–1902) service dress of khaki serge was introduced in 1903 and is still in use At the same time a khaki great coat was introduced, and a peaked cap and puttees. During the World War the cap was made of "soft" flexible material. The Royal Tank Corps wear a bonnet of the "beret" pattern

(c) **Mess Dress.**—Officers mess dress consists of a jacket of Eton cut with roll collar, waistcoat, overalls and Wellington boots

The use of gas and the enormous increase in the use of shrapnel have led to an addition to the field uniform of the British soldier —viz, the gas respirator and the steel helmet With a view to accustoming the men to their weight and employment, they are now worn during all field exercises

THE UNITED STATES OF AMERICA

As with the British service, the full dress uniforms worn before the World War have not yet been authorised However, full dress was practically of one universal pattern and had few of the distinctions which is a characteristic of the British full dress. The olive drab service dress is now the prescribed uniform for ordinary wear. In the tropics or in hot weather white uniforms may be worn by officers and warrant officers when not on duty with troops under arms. When off duty and away from their station the wearing of civilian dress by officers is optional except in the Philippine, Hawaiian and Panama Canal Departments and in Porto Rico For wear in Alaska, special clothing is provided. heavy all wool underwear, double cloth-lined pea jackets, duck and fur parkas, buffalo overcoats, water and winter mucklucks, shoe pacs, goose-down filled bed comforts, fur caps and gauntlets

(a) **Full Dress.**—The Infantry pattern dress is the basis of all arms It consists of a dark blue, double-breasted tunic with thick gold shoulder cord, light blue gold laced collar, light blue trousers with white stripe, peaked cap of stiff blue cloth, light blue band with eagle badge The Cavalry pattern is the same as the infantry but with yellow collar, cap band and trousers stripes Artillery, the same as infantry but with red collar, cap band and trousers stripes Engineers, the same as infantry, but with red ground with white edges on collar and cap band. Ordnance Corps, the same as infantry but with dark blue red-edged trousers stripes

(b) **Undress.**—Universal dark blue single-breasted frock, black-braided and hooked, trousers as in full-dress; cap same shape as full-dress but with plain black braid band

(c) **Mess Dress.**—Blue with shoulder cords, and blue trousers

(d) **Service Dress.**—This is the ordinary uniform now worn at the present time by all ranks It is olive drab made of either wool or cotton according to the climate or weather The coat is single-breasted with shoulder loops of the same material and a notched lapel collar, and fastened with four equally-spaced regulation buttons. For enlisted men the skirt is slit at the back from the lower edge and $\frac{3}{4}$ of the distance to the waistline; for officers from the lower edge of the waistline. The breeches are made of material to match the coat. The overcoat is a double-breasted ulster of woollen material with pleated back, with a double row of buttons made of horn, four on each side The cap is of woollen material similar in the shape to the British pattern, but with a leather covered peak and a mohair braid band, with a chin strap of brown leather. There is also a hat of olive drab, wideawake type, Montana peak; the cord is of colours varying according to the rank and branch of the service.

The Army Nurse Corps.—For indoor wear all members wear a one-piece white uniform; outdoor they wear an olive drab skirt, coat and overcoat or cape with an olive drab cap. Student members of the Army Nursing School wear a one-piece blue gingham

uniform indoors and a navy blue shirt, blouse, overcoat and hat out of doors.

Field Service.—As in the British Service the World War has caused the gas mask and steel helmet to become permanent articles of equipment of the U S.A The Service Gas Mask now in use is the 1919 model and combines the portability of the British pattern and the comfort of the French Tissot type. A russet boot, with bellows tongue and laced to the top, is provided for wear by cavalry and field artillery.

FRANCE

1 The French Army The Metropolitan Army is clothed in "horizon" blue, the Colonial Army being clothed in khaki of a nature similar to the British All arms are dressed alike except for the different coloured patches on the collars of the uniform, and in some cases pipings on the trousers or breeches. Exceptions to this rule occur in the case of the Chasseurs à Pied who are clothed in dark blue, yellow piping on the breeches and yellow patches on the collars and who wear a beret except in war time Other exceptions are special corps like the Chasseurs d'Afrique and various regiments of Spahis all of whom wear a special dress with a very large coloured burnous outside it, and a fez or turban in the case of the native ranks

2 A steel helmet of a pattern introduced in the late war is universally worn on active service In peace time the army either wear a peaked forage cap, a "bonnet de police" or a beret.

3 Simplicity is the keynote of the French uniform, the full dress for officers merely consisting in adding epaulettes and full dress belt to the "horizon" blue uniform A survival of old times remains in the French foot soldiers' overcoat, which is normally worn in marching order and is of the old French pattern with a skirt which can be looped back for marching He wears breeches, puttees and ankle boots; in the case of mounted troops leather gaiters with side buckles over the infantry ankle boot.

Regiments specially distinguished in the war of 1914–1918 wear a fourragère or aiguillette of the colours of the "Legion of Honour," the "Medaille Militaire" or the "Croix de Guerre" on the left shoulder

GERMANY

Service Uniform.—The present uniform of the German army is derived from the field service uniform of 1914 and has been modified in accordance with the experience of the World War It is claimed to be durable, comfortable and inconspicuous The shade of "Feldgrau" (field grey) which is the prevalent colour employed is of practical protective value in most northern latitudes The regulations provide for five orders of dress, viz. (a) Marching order (Feldanzug), (b) Drill order (Dienstanzug), (c) Fatigue dress (Arbeitsanzug), (d) Sports kit (Sportanzug), (e) Normal walking-out dress (Strassenanzug)

Peace and field service uniforms are identical The jacket is made of field grey cloth and has cloth shoulder-straps edged with coloured piping indicating the branch of the service to which the wearer belongs The steel helmet is of the pattern introduced in 1916 and is now the only helmet in use in the German army It is roughly bell-shaped, is made of hard magnetic nickel steel and weighs about 2½ pounds On either side a large lug projects from the body of the helmet These lugs serve a double purpose. (a) A heavy bullet-proof protective face shield can be attached to them for use by snipers and observers (b) When not in use for this purpose, the lugs, which are hollow, serve to ventilate the helmet. On the left side of the helmet, which is painted field grey, a small badge is painted in the colours of the State of origin to which the wearer belongs

Two patterns of caps are used: the field service cap (Feldmutze) made of soft cloth with a cloth cockade of the State colours worn on the cap band; in cold weather this cap may be worn under the steel helmet: the service dress cap (Dienstmutze) is a peaked cap made of ordinary field-grey cloth, the cap-band is grey-green made of the special cloth for badges and piping in the colour of the arm of the service

Trousers and pantaloons of grey cloth without raised seams are issued to all arms. Trousers are worn by dismounted units when "half-jack" boots are worn and alternatively with overalls by all arms when walking out, pantaloons are worn by mounted men in field service marching order and by dismounted men when laced boots and puttees are ordered. The greatcoat worn by "other ranks" is of universal pattern and is made of field-grey cloth. The lower corners may be hooked up to facilitate marching in difficult country Gloves of grey cotton are issued to all ranks, though woollen ones are sometimes worn

POLAND

The Polish army is equipped with a universal pattern uniform of khaki The same uniform is in use for home service and in the field The tunic is of khaki serge, with upright collar On each side of the collar opening is a patch of coloured cloth, about 4″ long, with rear edging of different colours, varying with the arm, except in the cavalry and horse artillery, who wear in the same place a miniature pennon of identical colours with those of the lance pennon Trousers or breeches are of plain khaki serge or cord. General officers wear a double dark-blue stripe down both breeches and trousers

A modified form of the national headdress or czapka, has been adopted and made into the headgear for all ranks of the Polish army A band of coloured cloth, varying with the regiment, is worn round the cap in the cavalry On the front of the cap is worn the badge of rank A steel helmet of French pattern is worn by troops on manoeuvres and in war A silver eagle is attached to the front The soldier's greatcoat is of khaki cloth, single breasted, with broad collar, belt and shoulder straps The officer's is similar but the new pattern is similar to the double-breasted British During winter fur coats of no standard pattern, with fur collars, are allowed Khaki mackintoshes are also worn A gas mask is carried

BELGIUM

The Belgian Army is universally clothed in khaki, of a pattern very similar to the British The peace and war uniforms are identical Officers also invariably wear khaki uniform, the classes of dress for special occasions being varied by the addition of epaulettes, medals, and overalls for full dress or ceremonial purposes The uniform of all ranks is serviceable and solid No pre-war uniform is worn, except by the gendarmerie, who have retained their black and silver kit for general wear Wound and service stripes are universally worn by those entitled to them

THE NETHERLANDS

Review order has now been abolished entirely and field service uniform of a grey-green type is universal It consists of a kepi, tunic, knickerbockers, puttees (riding breeches and black leather leggings for mounted troops), black boots and overcoat Each soldier on joining the colours receives two tunics, one new and one part-worn The tunic is of grey-green cloth with one row of bronze buttons The collar is upright with coloured piping for all arms except cavalry and horse artillery The steel helmet is similar to the French pattern and weighs 2 2 lb

SWITZERLAND

In 1915, a grey-green field uniform was adopted. The universal pattern tunic is of grey-green cloth, with an upright collar (except for cyclists), breast and side pockets The different arms are distinguished by coloured collar patches, cuff tabs, pipings, etc. The trousers are of grey-green cloth with piping down the outer seams of the same colour as the facings Officers wear riding breeches. General Staff Officers wear a black stripe down the seam. The officer's cap is grey-green with a black leather peak and chin strap. It is of a peculiar shape, being high and full at the back of the head; piping the same colour as facings; gold and silver stripes varying in number and width according to rank Army Unit Commanders and General Staff officers wear a black cap band. The kepi is of felt, with peak before and behind. The kepi is now used for all training purposes, replacing it by a steel helmet of a distinctive pattern being high-crowned and coming low down over the ears and brow The gas mask is a combination of the French and German models. A new mask of American manufacture is being tested

THE NEW EUROPEAN STATES

Baltic States.—On the formation of their armies these states at first adopted provisional uniforms; these have now been replaced by some of an entirely new pattern, which approximate to the British in general cut and colour. For winter there are special caps, furred and with earflaps, short sheepskin overcoats for general purposes, and extra heavy greatcoats for guard purposes. For summer a light cotton tunic or blouse of Russian pattern is worn.

Yugoslavia.—(a) All ranks of the *Guards* are supplied with an elaborate full dress The service dress is of olive yellow cloth and consists of a soft service cap, a loose jacket with shoulder straps, on which are the number of the regiment and the badges of rank, loose breeches, tight from the calf to the ankle, puttees and black boots Mounted men wear riding breeches of the same colour, with black boots and leggings. Each army has a clothing department organized as a battalion of 2 companies. The steel helmet in appearance is much like a dragoon helmet

Czechoslovakia.—The Army is clothed in a light olive drab cloth, or cotton drills The gendarmerie, who are clothed in all respects as the army, use a field grey cloth For officers and permanent staff warrant officers and N C Os there are two orders of dress (a) *service dress* and (b) *walking-out-dress*, which is service dress with certain modifications. The various arms and services are distinguished by their facings, units are indicated by numerals or collar badges The same pattern cap badges and buttons, in various metals, are used by all.

Officers and Warrant Officers wear olive drab Trousers and pantaloons as for walking-out dress. Cap, soft forage cap without peak, with bronze badge This can be worn inside the steel helmet, and can be pulled down to cover the ears in cold weather. Other ranks wear a jacket of olive drab woollen material, four patch pockets Pantaloons, cavalry scarlet-cloth; other arms drab cloth Trousers, all arms drab cloth Cap, all arms, soft service dress cap as for officers N C Os are provided with, and privates may purchase for themselves, stiff forage caps, to be worn when walking out. Greatcoats, double-breasted with strap across back Cavalry have a short warm coat All ranks are provided with a cotton jacket of the same pattern as the service dress jacket for wear during summer training. Gas masks form a part of the equipment, as also do steel helmets of the German pattern

JAPAN

Officers and Warrant Officers have a full dress which they wear on ceremonial occasions when not on parade with troops Khaki is the normal uniform for all ranks, that for officers and warrant officers is similar in shade to that worn in the British Army, while that of the non-commissioned officers and men is of a more yellow shade The various arms of the army are distinguished by the colour of the collar patches. Units are distinguished by numerals on the collar patches. The cap and buttons are the same for all arms From June to September inclusive, non-commissioned officers and men wear uniform similar to Indian drill. In winter, for service in Korea and Manchuria, special articles of uniform are issued

Full dress consists of a blue kepi, of French pattern, the guards and military police wear a red kepi: a blue frock-coat, with gold collar, around which runs a coloured band, denoting the arm; gold aiguillettes from the right shoulder are worn by Generals and General Staff Officers; blue trousers, with a broad stripe down the outside of each leg of a colour to denote the arm of the service; military police wear red trousers Cavalry officers wear a blue tunic, blue breeches and black butcher boots Cavalry of the Guard wear red breeches

Khaki.—Dismounted officers wear a green shade; the winter uniform is made of thick nap cloth of rather hard texture, the summer cloth is a light but rather coarse gabardine. The cap and jacket are of German pattern, the breeches button below the knee. Puttees also are worn Mounted officers wear uniform as for dismounted officers except that long "pull-on" black boots are worn instead of puttees and ankle boots. Non-commissioned officers and men wear khaki serge, the jacket, trousers and puttees similar to the British pattern. Officers wear an armless cloak of khaki serge reaching to the knee. A hood is attached to go over the cap when required Officers' greatcoats are similar to the British pattern in 1914, but slightly shorter. They are double-breasted. The steel helmet is similar to the British pattern but heavier. It is dome-shaped with no back shield, giving a cap-like appearance. It is painted a sandy brown colour. It is not issued in peace. The gas mask is a British small box respirator with modifications suitable to the build of the Japanese soldier and his volume of respiration; is not issued in peace-time

SPAIN

(a) **Full Dress.**—This approximates the French in general style and hue The tunic and greatcoat (long cape in the cavalry) is blue throughout the army General officers and officers of the infantry wear red trousers The kepi is practically universal, corps being distinguished by its colouring.

(b) **Service Dress.**—Owing to the unsuitability for active service of the former pattern it was decided in 1927 to change it completely The new pattern consists of a cap, tunic, breeches and puttees all made of material of a greenish tint

ITALY

The wearing of uniform is obligatory at all times except for General officers The regulation full-dress and undress for all ranks, arms and services is of a grey-green cloth but, during the summer months, washable grey cotton drill is worn as undress by N C Os and men

Full Dress.—(a) A cap is the normal head-dress for officers but when under arms officers wear a steel helmet with the badge of the corps or a special head-dress appertaining to cavalry, bersaglieri, etc When actually in command of troops higher commanders wear an aigrette Braid shoulder straps, plaited in the form of the knot of Savoy are worn, the width being in accordance with the rank of the wearer, that of generals being ornate silver or gold A blue sash is also worn Officers of all dismounted arms, when on duty, normally wear a large cape (*mantellina*) extending to the knees, those of mounted arms wear a double-breasted greatcoat (*pastrano*) (b) Other ranks wear a cap similar to that of the officers, except that it is made of coarser material, and steel helmets or special head-dresses are worn when under arms The tunic is single-breasted, with plain pointed cuffs, and stand-up collar The regimental badge in metal is on the shoulder-strap Dismounted men wear pantaloons and mounted men breeches Mounted men wear grey-green greatcoats and dismounted *mantellina*

Undress.—(a) Officers on ordinary duty wear a cylindrical cloth cap but on special duty, *i e*, active service, ceremonial parades, etc, the steel helmet is worn Collars of stand-up pattern are universal except for bersaglieri cyclist officers who may wear turn-down collars. The shoulder-straps are detachable and are edged with piping the colour according to the different corps. The buttons are hidden by a flap down the front of the tunic The trousers and breeches have a wide dark grey silk braid stripe down the centre of which runs a narrow stripe of a distinctive colour according to the corps. (b) Other ranks wear the same head-dress as for full-dress except that the bersaglieri cyclists wear a red fez with a blue tassel The remainder of the undress is much the same as for full-dress

AIR FORCES

Great Britain.—(a) At the present moment full-dress has only been authorized for officers, and the provision of it is optional It is made of blue material and consists of a single-breasted tunic with plain cuffs, collar trimmed with ½ in gold lace in front and along the top and an oak-leaf device in gold embroidery on each side of the front of the collar. The trousers are without "turn-ups" with foot straps. The head-dress is of black chrome leather, trimmed with seal dyed nutria, with a gold and blue plaited cord across the front, ostrich feather plume dyed a distinctive blue (b) Service dress for officers is made of blue Barathea cloth. It is a single-breasted tunic cut loose above the waist with four pockets. The breeches are made of cavalry twill

and the cap has a peak of Barathea cloth. The rank of the officer is indicated by bands of black and blue braid worn round cuffs. The puttees are of the spiral pattern. Other ranks wear a similar uniform of a different material of the same colour. For foreign service all ranks wear a khaki drill uniform in which a Wolseley helmet is included on which is worn a "flash" bearing in silk the R A F colours. (c) Officers' Mess Dress is similar to the army pattern but is made of the distinctive R A.F. blue material. In hot climates abroad a white drill uniform is worn consisting of jacket, waistcoat, trousers, with which shoes are worn. The uniform for Flying Cadets consists of a coat similar in design to that of the Air Corps officers.

United States.—The Army air service being an integral part of the army, the members wear the uniform laid down for the army with particular distinctions, viz, aviators and observers wear a pair of wings and a vertical propeller in silver on the left breast; enlisted men wear the same on the sleeve; flying instructors a pair of wings only.

France.—The air service is an integral part of the army and its members' uniform is the same as the infantry except that the collar patches are dark blue instead of horizon blue and the piping on the uniform, orange for balloons, light blue for observation, green for fighting, red for bombing, grey for non-flying personnel.

Japan.—As part of the army the air service wears the universal khaki uniform with distinctive badges, viz., aviation pilots wear, on the right breast, an oval device of wings, propeller and sun's rays; members of aviation battalions wear a propeller across a steering wheel in the form of a gilt badge on the right collar patch, the number of the battalion being on the left patch.

Switzerland.—The flying corps wears the universal grey-green uniform with two wings and a propeller in light-brown thread as a distinguishing badge.

Czechoslovakia.—The air arm wears the army universal light olive drab cloth with distinctive sky-blue facings

Poland.—As part of the army the members of the aviation arm wear the universal khaki uniform with yellow collar patches

Yugoslavia.—As part of the army the air service wears the universal olive-yellow service dress with horizon blue collar patches

Baltic States.—The Estonian air service wears the universal greenish hairy khaki uniform with the following distinctions: a badge of wings and propeller in the form of a shield, silver braid for officers and white metal for other ranks, worn on the arm. The Latvian air force wears a black uniform with red cap, collar patch and piping, and the Lithuanian a greenish khaki uniform with black velvet collar patch and cap and dark red piping.

(T. J. E.)

NAVAL

Great Britain.—The dress of seafarers in the British Isles had attained a certain uniformity, principally brought about by the conditions and hazards of their calling, long before any regulations were made on the subject. Chaucer's description of the attire of the Shipman depicts a figure he had doubtless seen many times at Dartmouth, or in the streets of London in the neighbourhood of Bankside and the Pool A sea gown of "falding," reaching to the knee, a homely garment of rusty blue or brown, intended to stand hard usage, was long worn by seamen. In a book on costume by Caesare Vecellio, published in Venice in 1598, a full-length figure of an English mariner is shown, and the legend states that they wore short coats, sky blue, white, or some other colour, wide baggy breeches with many folds, and ruffs round their necks. Their caps were hairy, like those that pilgrims wore. Such expressions as a "sea gown," a "pitch'd jacket," and a "canvas shrowd," as synonyms for sailors' wear, are common in Tudor and Stuart literature

An important step leading to uniformity in the dress of the seaman was taken in 1628, when an order for the provision of ready-made clothing was given. Certain articles of attire were placed on board his Majesty's ships and hired vessels for issue to the officers and men, the cost to be charged against their wages. In 1638, an order for the prevention of over-charging was hung up in the steerage of every ship, and a list of the articles to be sold, with their prices. In 1663, the slop clothing included canvas suits, red caps, blue shirts, red or striped breeches, and blue neck-cloths, among the articles for sale. From 1706 until about 1750, the slop clothing consisted of grey kersey jackets, waistcoats of striped ticking or Welsh red, breeches of red kersey or striped shag, blue and white check shirts, grey stockings, shoes, and leather caps, faced with red cotton, or flat-topped three-cornered hats.

From the middle of the eighteenth century, when blue and white became the colours of the officers' uniform, the dress of the seamen gradually conformed to the same combination It comprised usually a blue jacket, a scarlet or buff waistcoat, a check or striped shirt, white or striped trousers "long in the legs and taut at the hips and ankles," a kerchief, black or brightly coloured, tied loosely round the neck with two corners hanging down outside the jacket behind to protect it from the chafe of the pigtail, the vogue of which was only from about 1780 to 1830. The round hat was made of straw, leather, or tarred canvas, turned up at the sides with a coloured lining, and a ribbon with the name of the ship painted on it. The strips of canvas sometimes sewn on the seams of the jacket were only to repair and strengthen old and used garments, as Jonas Hanway wrote in 1759, and not as ornamentation. After the first quarter of the nineteenth century, nearly all colours except blue had disappeared for all articles but waistcoats and kerchiefs

In 1787, a uniform for all officers was established, and remained in force until 1795, when, to commemorate Lord Howe's victory of June 1, 1794, gold epaulettes hanging down like tassels, with marks on them to indicate rank, were introduced At the same time, the white facings were abolished, with one exception, the patch on the midshipman's collar Nearly all the later portraits of Nelson and those of his band of brothers are in the full or undress of these regulations. In 1812, white facings were re-introduced, and this dress was worn during the War with the United States. New regulations were issued on January 1, 1825, with plans, which may be seen in the Admiralty Library. Since this date, regulations have been published in the Navy List, where the changes to the present time may be traced. The most important was made by William IV, who in 1832 altered the facings from white to red, and so they remained until June 30, 1843 Queen Victoria then restored white, and so it has remained ever since. Illustrated manuals of current naval uniforms were published by the Admiralty on May 7, 1879, and October 10, 1891. (X)

United States.—The uniform, with its various insignia and devices, is designed primarily to indicate on sight those men belonging to the naval service; to show at a glance their rank, corps, or rating, and is required to be worn at all times by officers and enlisted men while on duty.

The United States naval officers' uniform in general corresponds to those worn by officers of the various navies of the world, and officers of different ranks are most readily distinguished by the sleeve markings, or sleeve stripes of gold lace which completely encircle the sleeve. In addition to this insignia of rank, officers of the several corps and warrants are indicated by individual corps devices embroidered above the sleeve stripes. Sleeve markings (stripes) for the various ranks follow:

Admiral	One 2-inch stripe with three ½-inch stripes above it.
Vice-Admiral	One 2-inch stripe with two ½-inch stripes above it.
Rear-Admiral	One 2-inch stripe with one ½-inch stripe above it.
Commodore	One 2-inch stripe.
Captain	Four ½-inch stripes.

Commander	Three ½-inch stripes
Lt.-Comdr.	Two ½-inch stripes with one ¼-inch stripe between the other two.
Lieutenant	Two ½-inch stripes
Lieut (jr grade)	One ½-inch stripe with one ¼-inch stripe above it.
Ensign	One ½-inch stripe
Chief warrant officer	One ½-inch stripe, the gold lace to be woven at intervals of 2 inches with dark-blue silk thread in widths of ½-inch.
Warrant officer	One ¼-inch stripe, the gold lace to be woven at intervals of 2 inches with dark-blue silk thread in widths of ½-inch.

Sleeve markings (corps devices) of the commissioned grades and line warrants are listed as follows:

Line officers	Five-pointed gold star.
Medical officers	A spread oak leaf, embroidered in gold, surcharged with acorn, embroidered in silver.
Supply officers	A sprig of three oak leaves and three acorns.
Chaplains	A Latin cross.
Naval constructors	A sprig of two live-oak leaves, spreading with an acorn on the stem between the leaves.
Civil engineers	Two sprigs of two live-oak leaves embroidered in gold and an acorn embroidered in silver in each sprig
Chief boatswain and boatswain	Two crossed foul anchors.
Chief gunner and gunner	Flaming spherical gold shell.
Chief machinist and machinist	A three-bladed gold propeller.

Uniforms worn by enlisted men of the United States navy consist in general of the conventional seaman's overshirt or jumper, with trousers that flare slightly at the bottom. The various enlisted ratings are indicated by rating badges worn on the sleeve midway between shoulder and elbow, consisting of an eagle, chevrons, and specialty marks. The chevrons indicate the rank or class of the petty or non-commissioned officer, while the specialty marks indicate, as the name implies, the branch in which the individual has been rated Enlisted men, other than petty officers, wear what is known as a branch mark, consisting of a stripe of braid, white for the seaman branch and red for the engineer branch, extending entirely around the shoulder seam of the jumper

Detailed description, accompanied by photographic plates of the various naval uniforms of the United States, together with regulations defining the occasions upon which worn may be found in a publication known as the *Uniform Regulations, United States Navy*, issued to members of the naval service and purchasable at the Government Printing Office, Washington, D C.

UNION, a town of South Carolina, U.S A , the county-seat of Union county; 65 m N W of Columbia, on Federal highway 176, and served by the Buffalo, Union-Carolina and the Southern railways Pop 6,141 in 1920, 30% negroes It is in the beautiful Piedmont region, near the foot of the Blue Ridge, and is one of the important textile-manufacturing centres of the State, with cotton-mills operating over 200,000 spindles and 4,700 looms in 1928.

UNION CARBIDE AND CARBON CORPORATION was organized in the State of New York on Nov 1, 1917, with an authorized capital stock of 3,000,000 shares, without par value, of which 2,742,072 were outstanding on Jan 1, 1929. It is a holding company owning all the common stock of over 35 subsidiary operating companies. The subsidiaries have been pioneers in the important industries in which they are engaged. Their raw materials are basic, including limestone, silica, coal, iron, oxygen, ores of metals, graphite, rare earths, air, rare gases, natural gas and petroleum From these have been developed a highly inter-related list of products essential in peace and war They maintain large laboratories for fundamental scientific research and the development of new products and processes. They manufacture and sell carbide and acetylene, and apparatus for their utilization They have perfected the separation of oxygen, in vast quantities from the air

Subsidiaries in the United States, Canada and Norway are the largest manufacturers of ferro-alloys These alloys, as ferro-silicon, ferro-chromium, ferro-manganese, silico-manganese, ferro-tungsten, ferro-vanadium, and zirconium alloys, impart greatly improved properties to steels. Practically all steels are treated with one or more of such alloys as a purifier or for producing the superior quality steels extensively used in modern manufacture. Another series of alloys are manufactured under the trade name Stellite. Such alloys are of extreme hardness and have the unusual quality of being tougher at red heat than when cold; they neither rust nor stain and are highly resistant to chemical corrosion. Stellite tools have remarkable cutting qualities. Subsidiaries also produce metals, such as silicon, chromium and manganese for the aluminum and other non-ferrous industries; as well as a wide variety of carbon products, including carbon electrodes for electric furnaces, and as a source of light for motion picture photography, streets and factories and for therapeutic purposes; brushes for dynamos, motors, generators and other electrical apparatus, dry cells for domestic and ignition purposes, flashlights and flashlight batteries; carbon specialties for many uses; and dry batteries for radio receiving sets They also produce many chemicals, the principal of which are ethylene dichloride, ethylene glycol, diethylene glycol, acetone and cellosolve used as solvents or intermediates in the rubber, explosive, artificial silk, lacquer and varnish industries. Ethylene glycol is also sold as an anti-freeze compound Hydrocarbon gases, such as pyrogen, used in the metal cutting process, and pyrofax, a portable fuel for industrial and domestic use, are also produced.

Early in 1929 subsidiaries had in continuous operation 145 plants. They had over 100 sales offices and 343 warehouses, and owned mines, quarries and other sources of raw materials.

UNION-CASTLE MAIL STEAMSHIP CO. LTD, a British joint-stock company combining long established steamship lines and in 1928 owning 41 vessels aggregating 340,090 gross tons The present company was formed in 1900. Of the two chief firms which it incorporated, the Union Steam Collier Co. dated back to 1853, while the Castle Line, its other component, was founded by Sir Donald Currie, G C M G , in 1862

In 1900, the Castle Line and the Union Line were amalgamated under the management of Donald Currie and company Sir Donald Currie died in 1909 and in 1912 Donald Currie and company retired from the management of the line, the Royal Mail and allied companies purchasing it, Sir Owen Philipps (now Lord Kylsant) becoming chairman Sir Owen at once proceeded to the Cape, where he arranged a new mail contract.

The authorized capital of the company is £8,240,000, consisting of 24,000 £10 4½% preference shares issued and paid, 5,000,000 £1 preference shares (of which 1,000,000 6% "A" shares and 1,500,000 6½% shares are issued and paid), and £3,000,000 ordinary shares or stock, £2,740,000 stock being issued and paid There is also £2,000,000 6% debenture stock, repayable in 1934.

(L. C. M.)

UNION CITY, a city of Hudson county, New Jersey, U S.A , ¼ m. W of the Hudson river, opposite New York city, on high ground above Weehawken, between Hoboken and West New York. Railroad facilities are provided through Hoboken, Weehawken and Jersey City. Pop. (1920) 60,725 (33% foreign-born white); 1928 local estimate 76,000. It is an important silk-manufacturing centre. The assessed valuation of property for 1928 was $72,100,462 Union City was formed in 1925 by the consolidation of Town of Union (incorporated 1864) and West Hoboken (incorporated as a town in 1884), which in 1920 had populations of 20,651 and 40,074 respectively

UNIONIST PARTY: *see* CONSERVATIVE PARTY.

UNION LEAGUE OF AMERICA, THE, sometimes called the Loyal League, was an organization for political purposes of Northern whites, later of Southern blacks, which originated in Ohio in 1862 when the Confederate military successes and political disaffection in the Northern States made the outlook for the North seem doubtful Within one year it had spread over 18 Northern States and among the Unionists of the South. The order raised troops, paid their expenses, sent supplies to the field and distributed political literature. At the close of the war it worked for radical reconstruction of the Southern States, punishment of the Southern leaders, confisca-

tion of property and negro suffrage. The Southern Unionists hoped to make it the nucleus of a new political party, but this was frustrated by the admission of the blacks for political purposes, after which the Southern whites generally deserted the league. After the Freedmen's Bureau agents and other Northern whites obtained command of the league in the South it became simply a machine to control the negro vote The league died out about 1870, but not before it had succeeded, with the Freedmen's Bureau and other forces, in permanently arraying the blacks and whites into opposing political parties.

UNION OF SOCIALIST SOVIET REPUBLICS, THE (U.S.S.R.), the official title of the State comprising most of the territories of the old Russian empire The constitution of the U.S.S.R., a change of the Soviet constitution adopted on July 10, 1918, was settled at a conference in Moscow on Dec 30, 1922, between delegates of the Russian, Ukrainian, White Russian and Transcaucasian Soviet Republics To these were added in 1924 the Uzbek and Turcoman Soviet Republics The Union also contains 18 "autonomous regions" and the following autonomous republics: Moldavia, Bashkir, Tartar, Kirghiz, Dagestan, Crimea, Yakutsk, Karelian, German Volga Settlements, Buriat (Caucasus) Mountains; Georgia, Azerbaijan and Armenia are constituent republics of the Transcaucasian Federal Republic

All of these republics are controlled by the Communist Party, and have a Soviet constitution. Employers and priests are excluded from voting and the government is officially declared to be the dictatorship of the proletariat The population in 1926 was 132,000,000 and the area 7,041,120 sq m The government is nominally vested in a Soviet Congress representing all States of the Union But the effective representative organ is the "Union Central Executive Committee" elected by this Congress. The executive body of the Committee is the Union Council of People's Commissaries (*See* RUSSIA, SOVIETISM)

UNION PACIFIC RAILROAD SYSTEM extends from the Missouri river at Council Bluffs, Omaha, and Kansas City, via Denver, Cheyenne, Ogden and Salt Lake City, to Los Angeles and the Pacific ocean in the south-west, to Portland, Ore., and to Olympia, Tacoma and Seattle on Puget sound in the north-west (and in connection with the Central Pacific, to San Francisco and central and northern California) The system embraces a total of 9,677 m of railroad in 13 States, owned and operated by the Union Pacific Railroad Company, a Utah corporation, and subsidiaries controlled through stock ownership The main line between Council Bluffs, Ia., and Ogden and Salt Lake City, Utah, 1,027 m., is double tracked, besides approximately 500 m in other sections The system owned as on Dec 31, 1927, 1,785 locomotives, 1,392 passenger cars, 57,877 freight cars and a one-half interest in Pacific Fruit Express Company, which owned 35,841 refrigerator cars.

The original company was incorporated in 1862 under an act of Congress, approved by President Lincoln, providing for the construction of railroads from the Missouri river to the Pacific as a war measure and for the preservation of the Union Constructed westwardly from Council Bluffs, and from Kansas City via Denver, the connection of the line with that of the Central Pacific, constructed eastwardly from San Francisco bay, at a point 53 m W of Ogden, May 10, 1869, completed the first transcontinental railroad

Settlement of the territories traversed was slow, construction of other railroads throughout the west rapid, and the growth of unrestricted and destructive competition disastrous; in the business depression of 1893 the company went into receivership and the Government and other mortgages were foreclosed The properties were reorganized by E H. Harriman and associates, the present company incorporated July 1, 1897, assumed operation Feb. 1, 1898. (C R. G.)

UNIONTOWN, a city of south-western Pennsylvania, U.S.A., 50 m. S. by E of Pittsburgh, the county seat of Fayette county; on Federal highways 40 and 119, at an altitude of 1,020 feet It is served by the Baltimore and Ohio and the Pennsylvania railways. Pop. (1920) 15,692 (82% native white); 1928 local estimate 21,000. A government airport and a commercial landing field are near by A village was laid out here in 1776 on land belonging to Henry Beeson. It was incorporated as a borough in 1796, as a city in 1916 and has a commission form of government. On the Old National road, 8 m E. of Uniontown, a monument marks the spot where Gen. Braddock met defeat and received his mortal wound. Two miles farther east is the site of Ft. Necessity, built by Washington in 1754.

UNITARIANISM, a system of Christian thought and religious observance, deriving its name from its doctrine of the single personality of God the Father, in contrast with the Trinitarian conception of His threefold being as Father, Son and Holy Spirit But the significance of the movement is imperfectly indicated by its name Its real importance lies in its teachings concerning mankind and the nature and work of Jesus Christ.

Free Study of the Bible.—The movement cannot be traced to any single teacher or any specific date; it had its sources in the thoughts of many minds in many lands.

During the 17th century separate religious communities arose in Poland (now extinct) and in Hungary (Transylvania, now part of Rumania), standing for Unitarian Christianity, though not under that name; and afterwards in England and in America, when the name came into general use These societies took seriously the rule of "the Bible and the Bible only." And at the end of the following century we find the English Unitarians, in the petition presented to parliament in 1792, explaining their position by saying that they conceived it to be "their duty to examine into and interpret the Holy Scriptures for themselves, and their right publicly to declare the result of their enquiries"

A Two-fold Tradition.—In the history of the movement two factors stand out as equally characteristic, distinctive and essential the demand for personal religious freedom, and the demand for clear, distinct and coherent religious thought and teaching

(1) The demand for personal religious freedom, so far as England is concerned, can be traced directly to the Act of Uniformity (1662), under which 2,000 clergymen were deprived of their livings Richard Baxter (*q v*) represents the spirit of the ejected ministers at its best He had no idea of complete toleration; but he stood for the endeavour to find a basis of agreement by reducing the number of the essentials and fundamentals The influence of this endeavour, with its implied comprehensiveness and recognition of degrees of certainty, went on working after his death, and led to results undreamt of in his day This history of a large number of Churches in England, whose members now profess Unitarianism, begins with the ejection of 1662

(2) Some of the ejected clergy, in the exercise of their freedom, arrived at the conviction that "the Trinitarian scheme" (by which they meant the whole scheme of salvation, with its doctrines of inherited guilt, eternal punishment, and vicarious atonement) was no part of essential Christianity. The advocacy of Joseph Priestley (*q.v.*), and the withdrawal of Theophilus Lindsey (1723–1808) from the Church of England to establish a Unitarian church in London (Essex street, Strand, 1774) aroused the liberal dissenters to consider their position, and to a large extent they found that they had grown into Unitarian Christianity.

There were also various interests which they had in common, in which they were threatened with serious injury The penal laws against deniers of the Trinity were not repealed until 1813, and the Corporation and Test Acts (against all dissenters from the National Church) not until 1828 The general desire for more united and effective action led to the formation of the British and Foreign Unitarian Association in 1825, by the amalgamation of three older societies for literature (1791), mission work (1806), and civil rights (1818).

Changing Bases of Belief.—At the beginning of the 19th century Unitarian Christianity was, broadly speaking, a biblical religion, accepting miracles, and rejecting creeds, not as incredible but as non-biblical, resting its hopes on an external revelation, and attaching little importance to what it regarded as the uncertain influences and promises of "natural religion." Then this system in its turn gave way to a revised theology which was part of the changed outlook on the world and human history, due to the development of scientific and historical knowledge during

the 19th century. A steady movement of doctrine can be traced among English Unitarian ministers and laymen, influenced by the personality and teaching of William Ellery Channing (1780–1842) and Theodore Parker (1810–60) from New England, and J. J. Tayler (1797–1869), J Hamilton Thom (1808–94), and above all, James Martineau (1805–1900), in England. The result of that movement has been that Unitarians no longer find the seat of authority only within the pages even of the best and broadest of books, but in religious history and experience, interpreted by the reason and conscience of mankind

The past history of the Unitarian movement has stamped certain characteristics on its life Many of its founders were forced into exile by exclusion from the larger historic Churches of Christendom; and this, together with its subsequent denominational history, has infused a certain habit of mind—of independent judgment, of bringing opinions to the bar of strong commonsense, of proving all things and holding fast that which is good. But the need of more effective corporate union is being deeply felt, and has led to the recent union of the principal denominational organizations in a new and representative body, the "General Assembly of Unitarian and Free Christian Churches" (1928)

UNITED STATES

Unitarianism in the United States followed essentially the same development as in England, and passed through the stages of Arminianism, Arianism, anti-tritheism, to rationalism and a modernism based on a large-minded acceptance of the results of the scientific and comparative study of all religions As early as the middle of the 18th century Harvard college represented the most advanced thought of the time, and a score or more of clergymen in New England were preaching what was essentially Unitarianism. The most prominent of these men was Jonathan Mayhew (1720–66), pastor of the West church in Boston from 1747 to 1766

The first official acceptance of the Unitarian faith on the part of a congregation was by King's chapel in Boston, which settled James Freeman (1759–1853) in 1782, and revised the Book of Common Prayer into a mild Unitarian liturgy in 1785 Unitarian congregations were organized at Portland and Saco in 1792 by Thomas Oxnard. in 1800 the First church in Plymouth accepted the more liberal faith. Joseph Priestley came to the United States in 1794. and organized a Unitarian church at Northumberland, Pa, in the same year, and one at Philadelphia in 1796. His writings had a considerable influence Thus from 1725 to 1825 a more tolerant belief was developing in New England, and to some extent elsewhere.

William Ellery Channing was settled over the Federal Street Congregational church, Boston, 1803; and in a few years he became the leader of the Unitarian movement. At first mystical rather than rationalistic in his theology, he took part with the 'Catholic Christians," as they called themselves, who aimed at bringing Christianity into harmony with the progressive spirit of the time His essays, *The System of Exclusion and Denunciation in Religion* (1815) and *Objections to Unitarian Christianity Considered* (1819), make him a defender of Unitarianism The Unitarian movement has grown slowly; and its influence has been chiefly exercised through general culture and the better literature of the country. Many of its clergymen have been trained in other denominations; but the Harvard divinity school was distinctly Unitarian from its formation in 1816, to 1870, when it became an unsectarian department of the university. The Meadville theological school was founded in Meadville, Pa., in 1844, and in 1926 was removed to Chicago. The Pacific Unitarian school for the ministry at Berkeley, Calif, was established in 1904. The Tuckerman school in Boston gives training for parish assistants and directors of religious education

Periods of Unitarian Thought.—Unitarian thought in the United States has passed through three periods. The first, from 1800 to 1835, was formative, mainly influenced by English philosophy, semi-supernatural, imperfectly rationalistic, devoted to philanthropy and practical Christianity. Dr. Channing was its distinguished exponent The second, from 1835 to 1885, profoundly influenced by German idealism, was increasingly rationalistic, though its theology was largely flavoured by mysticism The leaders of this second period were Emerson and Theodore Parker

The third period, beginning about 1885, has been one of rationalism, recognition of universal religion, large acceptance of the scientific method and ideas and an ethical attempt to realize the higher affirmations of Christianity. It has been marked by harmony and unity to a degree found in perhaps no other religious body, by steady growth in the number of churches and by a widening fellowship with all other progressive phases of modern religion. This last phase has been shown in the organization of the International Council of Unitarian and other Liberal Religious Thinkers and Workers at Boston on May 25, 1900, "to open communication with those in all lands who are striving to unite pure religion and perfect liberty, and to increase fellowship and co-operation among them." This council has held sessions in London (1901), Amsterdam (1903), Geneva (1905), Boston (1910), Paris (1913), Boston (1920), Leyden (1922) and Prague (1927). Since 1910 its title is International Congress of Free Christians and other Religious Liberals During this period the influence of Emerson has become predominant

Beyond its own borders the body has obtained recognition through the public work of such men as Henry Whitney Bellows and Edward Everett Hale, the remarkable influence of James Freeman Clarke and the popular power of Robert Collyer In 1927 the number of Unitarian churches in the United States and Canada (whose churches are affiliated with the American associations) was 422, with 491 ministers Adherents in the United States in 1927 numbered 131,912 The periodicals are *The Christian Register*, weekly, Boston; *Unity*, weekly, Chicago; *Pacific Unitarian*, San Francisco.

(J. H. L)

UNITED BRETHREN IN CHRIST, an American religious sect which originated in the last part of the 18th century under the leadership of Philip William Otterbein (1726–1813), pastor of the Second Reformed church in Baltimore, and Martin Boehm (1725–1812), a Pennsylvanian Mennonite of Swiss descent. Otterbein and Boehm licensed some of their followers to preach and did a great work, especially through class-meetings of a Wesleyan type; in 1789 they held a formal conference at Baltimore, and in 1800, at a conference near Frederick City, Md., the Church was organized under its present name, and Otterbein and Boehm were chosen its first bishops or superintendents.

The liberal branch had 3,135 organizations in 1927 with a total membership of 401,553. This body carries on missions in West Africa (since 1855), Japan, China, the Philippines and Porto Rico. It has a publishing house (1834) and Bonebrake theological seminary (1871) at Dayton, O., and supports Otterbein university (1847) at Westerville, O.; York college (1890) at York, Neb.; Philomath college (1867) at Philomath, Ore.; Lebanon Valley college (1867) at Annville, Pa.; Central university (1907) at Indianapolis, Ind., and Kansas City university (1924) at Kansas City, Kan. The "Old Constitution" body had 572 organizations

in 1906 with a total membership of 21,401. It has a publishing house at Huntington, Ind.

UNITED FREE CHURCH OF SCOTLAND, a religious organization, representing the union made in 1900 between the Free Church of Scotland (except a dissentient section who separated off and retained the name of Free Church) and the United Presbyterian Church (*See* FREE CHURCH OF SCOTLAND and UNITED PRESBYTERIAN CHURCH.)

The first moderator was Dr Robert Rainy (*q.v*). The Free Church brought into the union 1,077 congregations, the United Presbyterians 599; the revenue of the former amounted to £706,546, of the latter to £361,743 The United Church has three divinity halls, at Glasgow, Edinburgh and Aberdeen, served by seventeen professors and five lecturers

The minority of the Free Church who had refused to join the union lost no time in testing the legality of the act of the majority in entering it. Their summons, dated the 14th of December 1900, claimed that in uniting with the United Presbyterian Church, which did not hold the principles of the Free Church, the majority had forfeited the right to the property of the Free Church, which must be judged to belong to the minority who remained faithful to the principles of the Free Church and were that Church. In the Scottish courts the case was decided in favour of the union on the 9th of August 1901, and on the 4th of July 1902; but, on appeal, the House of Lords, on the 1st of August 1904, by a majority of five to two, reversed these decisions, and found the minority entitled to the funds and property of the Free Church

Few legal decisions have occasioned so great consternation or such serious practical difficulties At first sight it deprived the majority of the Free Church section of the United Church of all its material goods—churches, manses, colleges and missions, even of the provision for the old age of the clergy, and handed them over to a body which could have little prospect of making effective use of them Nothing remained but to invoke the intervention of parliament to put an end to an impossible situation. In December a commission was appointed, consisting of Lord Elgin, Lord Kinnear and Sir Ralph Anstruther, to inquire into matters connected with the two churches, while the question of interim possession was referred to Sir John Cheyne, as commissioner, for inquiry and action. The commission sat in public, and after hearing evidence on both sides, issued their report in April 1905. They reported that the state of feeling on one side and on the other had made their work difficult They had concluded however that the Free Church was unable in many respects to carry out the purposes of the trusts, which, under the verdict of the House of Lords, was a condition of their holding the property, and that there was a case for parliamentary interference They recommended that an executive commission should be set up by act of parliament, in which the whole property of the Free Church, as at the date of the union, should be vested, and which should allocate it to the United Free Church, where the Free Church was unable to carry out the trust purposes. The Churches (Scotland) Act, which gave effect to these recommendations, was passed on the 11th of August 1905 The allocation of churches and manses was a slow business, and involved litigation; but at length was carried through (*See* FREE CHURCH OF SCOTLAND.)

The United Free Church, after rearrangement of the Synods and Presbyteries, has 12 Synods and 63 Presbyteries, and 2 Continental Presbyteries. The Supreme Court is the General Assembly, which meets the third week of May every year at the same time as that of the Established Church and of the remanent Free Church of Scotland. In the year ending Dec. 31, 1926, there were 1,449 congregations and 46 preaching stations. The total membership was 536,409, and there were 2,034 Sunday Schools, with 187,545 scholars and 24,784 teachers In 15 Foreign Mission Fields there are 430 European Mission Agents and 5,773 native pastors, evangelists, and teachers, including in both cases those of the Women's Foreign Mission. The amount raised on the field in 1925 was £303,361. The income of the Church at the close of financial year 1926 amounted to £1,543,648. (*See* also SCOTLAND, CHURCH OF)

UNITED FRUIT COMPANY was incorporated in New Jersey, on March 30, 1899 It is engaged in the production and transportation of tropical products, principally bananas, sugar, cacao and coco-nuts Its fruit is carried to U S ports by a fleet of 62 vessels and is sold there and in Canada by its subsidiary, Fruit Dispatch Company; in Great Britain and the Continent its fruit is transported and sold by Elders and Fyffes Ltd., its English subsidiary, which operates a fleet of 34 ships Sugar from its Cuban plantations is refined and distributed by its subsidiary, Revere Sugar Refinery at Boston, Mass.

The company operates 1,600 m of railways, 671 m. of tramways, 3,000 of telephone and telegraph lines; owns 1,900,000 ac. of land, 437,000 of which are cultivated, and leases 152,000 ac of which 32,000 are cultivated It maintains a weekly passenger freight and mail service between the ports of the United States, Europe, Cuba, Jamaica, Guatemala, Panama, Colombia, Costa Rica, Honduras and British Honduras, and a highly developed radio service

In 1927 the company paid in wages to the nationals of the countries in which it operates, $24,000,000 An equal amount was spent in the purchase of fruit from private growers

The United Fruit Company had in 1928 26,000 stockholders and 70,000 employees, a great many of whom own, or are subscribers to, the company's stock The stock and surplus on Dec 31, 1927 represented by 2,500,000 shares outstanding (no par value) was $181,028,729 It has had no bonded debt for many years. (V. M. Cu.)

UNITED KINGDOM OF GREAT BRITAIN AND IRELAND, the title of the former political unity composed of England, Wales, Scotland and Ireland, officially adopted on Jan 1, 1801, when the Act of Union between Great Britain and Ireland came into force The name Great Britain has been used since the union of the kingdoms of England and Scotland in 1707 as the official designation of the united countries

When, in 1922, 26 Irish counties were severed from the United Kingdom and erected into a dominion of the British empire under the name of the Irish Free State, no provision was made in the act for any change in the royal style or in the title of the imperial parliament It even seems to have been assumed that the Free State was to remain technically part of the United Kingdom, for in sec 2 (1) of the Free State Constitution Act we read that "Goods transported during the current year from or to the Irish Free State or from *any other part of the United Kingdom* or the Isle of Man shall not . ." From 1922 onward, however, the title of the United Kingdom of Great Britain and Northern Ireland was frequently used in official documents to designate those parts of the British Isles represented in the imperial parliament, meeting at Westminster.

In the report of the inter-imperial relations committee of the Imperial Conference of 1926 it was suggested that, in view of new constitutional developments, the words "United Kingdom" should be omitted from the royal style, which should run. "George V, by the Grace of God, of Great Britain, Ireland, and the British Dominions beyond the Seas King, Defender of the Faith, Emperor of India" By the Royal and Parliamentary Titles Act, 1927 (17 Geo. 5 ch 4), accordingly, the king was authorized to change the style and titles of the Crown by royal proclamation This was done, on May 13, 1927, by a proclamation adopting the recommendation of "the representatives of our Governments in Conference," and declaring that in the Latin style "Magnae Britanniae, Hiberniae" should henceforth be used, and in the English style "Great Britain, Ireland and . . ." instead of "the United Kingdom of Great Britain and Ireland"

By the same act of parliament (2, 1) it was enacted that "Parliament shall hereafter be known as and styled the parliament of the United Kingdom of Great Britain and Northern Ireland" (*See* also, GREAT BRITAIN; ENGLAND; IRELAND; IRELAND, NORTHERN; IRISH FREE STATE; SCOTLAND; WALES)

UNITED METHODIST CHURCH, or UNITED METHODISTS, an English Nonconformist community formed in 1907 by the union of the Methodist New Connection (1797), the Bible Christians (1815), and the United Methodist Free Churches (1857) The act of parliament which enabled this amalgamation received the royal assent on the 26th of July 1907. The union was completed on the 16th of September 1907 in Wesley's Chapel, City Road, London (For recent statistics concerning this religious body, *see* METHODISM)

UNITED METHODIST FREE CHURCHES, an English Nonconformist community merged since 1907 in the United Methodist Church (*q v*)

UNITED PRESBYTERIAN CHURCH (of Scotland). This Presbyterian organization, merged since 1900 in the United Free Church of Scotland (*see* above), was formed in 1847 by the union of the United Secession and Relief Churches

The general causes which led to the first great secession from the Church of Scotland, as by law established in 1688, are indicated in the article SCOTLAND, CHURCH OF Its immediate occasion rose out of an act of assembly of 1732, which abolished the last remnant of popular election by enacting that, in cases where patrons might neglect or decline to exercise their right of presentation the minister was to be chosen, not by the congregation, but only by the elders and Protestant heritors The act itself had been passed by the assembly, although the presbyteries to which it had been previously submitted as an overture had disapproved of it by a large majority; and in accordance with a previous act (1730), which had taken away even the right of complaint, the protests of the dissentient majority were rejected The protests however were vigorously renewed by Ebenezer Erskine minister of Stirling He was soon joined by other ministers, who in December 1733 constituted themselves into a presbytery, disowning the authority of the general assembly The members of the "Associate Presbytery" and its adherents steadily increased, until in 1745 there were forty-five congregations under its jurisdiction, and it was reconstituted into an "Associate Synod" A violent controversy respecting the religious clause of the oath taken by burgesses in Edinburgh, Glasgow and Perth ("I profess and allow with my heart the true religion presently professed within this realm and authorized by the laws thereof"), resulted in April of 1747 in a "breach," when two bodies were formed, each claiming to be the "Associate Synod", those who condemned the swearing of the burgess oath as sinful came to be popularly known as "Anti-burghers," while the other party, who contended that abstinence from it should not be made a term of communion, were designated "Burghers." The Associate (Antiburgher) Synod held its first meeting in Edinburgh on the 10th of April 1747 It grew with considerable rapidity, and for purposes of organization was formed into four provincial synods, and took the name of "The General Associate Synod" The Associate (Burgher) Synod held its first meeting at Stirling on the 16th of June 1747. The number of congregations under its charge also increased, and in 1820 the General Associate or Anti-burgher Synod (to the number of 129 congregations) united with the 154 congregations of the Associate or Burgher Synod The body thus constituted, "The United Secession Church," had increased by 1847 to 400 congregations.

In 1847 a union was formed between all the congregations of the United Secession Church and 118 out of 136 of the Relief Churches, in what now became the United Presbyterian Church. Doctrinally there was little difference between the United Presbyterian Church and the Free Church of Scotland, and between 1863 and 1873 negotiations were carried on for a union, which however were fruitless But in 1896 the United Presbyterian Church again made advances which were promptly met, and on the 31st of October 1900 the United Free Church of Scotland came into existence

UNITED PRESS ASSOCIATIONS, founded in 1907 on the principle of non-exclusive collection and distribution of the spot news of the world, has developed an organization which covers the United States and Canada with a network of 105,000 m. of leased telegraph lines The service also extends to 39 foreign countries. The management claims that the full leased wire service is used (1929) by 507 daily and Sunday newspapers, with limited service going to 339 additional clients. The founder was the late E W. Scripps, pioneer American newspaper publisher, whose group of papers, numbering 25 in as many cities of the United States, is now known as Scripps-Howard newspapers United Press was created from the merger of the Scripps-McRae Press Association and the Publishers' Press Association. Scripps opposed the principle of exclusive news franchises, granting none and seeking none United Press serves evening and morning and Sunday newspapers with news of every description In some 50 bureaux or branch offices staff employees collect and distribute the news of various prescribed territories and feed trunk-line wires which carry the reports to the general clientele Bureaux are maintained in every important capital of the world The principal foreign bureau is in London News is distributed in Great Britain by the British United Press, organized in 1922. The London bureau also serves clients in Spain, Italy, France and the Orient The Berlin bureau serves newspapers in Central Europe. Modern means of communication are employed and the management claims an annual expenditure of $4,500,000 for the collection and distribution of news. The general headquarters are in New York

(M. E P)

UNITED PROVINCES OF AGRA AND OUDH. One of the nine major provinces of British India, and second only to Bengal in population (45,375,787 in 1921) Marching with Tibet and Nepal along its north and north-east borders, it covers a compact area of 106,295 sq m , and imbedded in it are the three Indian States of Rampur, Tehri-Garhwal and Benares Including them, the province comprises the whole of the upper part of the Gangetic basin, from the Himalayas and the Punjab border to the Vindhyan plateau and the rice lands of Bihar, an area roughly corresponding to the Hindostan of the old Muslim chroniclers To this it adds the great semi-circular tract, watered by the Gogra and the Gumti, which was formerly the kingdom of Oudh

Physical Aspects.—At one end the province rises into the Himalayas and includes, at one extreme, some of the grandest of the peaks which look out upon upper Asia At the other extreme, where it borders on Central India, it has a fringe of rough, broken and picturesque country Apart from these, however, it is a level and somewhat monotonous expanse, well-drained, closely cultivated and studded with villages, the number of which (nearly 105,000) far exceeds that in any other province, many of them, standing high on the débris of older sites, have the air of fortified places, and the fine mango groves which often adjoin them redeem the bareness of the surrounding plain

The flora of the forests is rich and varied The *sal* tree yields the most important timber, the hard wood of the *shisham* is also valuable; and several other timber-trees afford materials for furniture or roofing shingle Among the scattered jungles in various parts of the province, the *mahua* tree is prized alike for its edible flowers, its fruits and its timber The fauna comprises most of the animals and birds common to the Gangetic plain; but the wild elephant is now practically unknown, except when a stray specimen loses its way at the foot of the hills Tigers are now found in any numbers in the *tarai* only Leopards still haunt the cane-brakes and thickets along the banks of the rivers; and *nilgai* and antelopes abound. Game birds consist of teal and wild duck, snipe, jungle fowl and peacock.

The Ganges and its great affluents, the Jumna, the Ramganga and the Gogra, rise in the Himalayas, and meet within the province. In addition there are the following secondary streams. the Kalinadi and the Hindan flow through the Doab; the Chambal intersects the trans-Jumna tract; in Bundelkhand the principal streams are the Betwa and the Ken; the Ramganga, rising in Garhwal, pursues a tortuous course through Rohilkhand; the Gumti flows past Lucknow and Jaunpur to join the Ganges; the trans-Gogra region is divided into two nearly equal parts by the Rapti. These rivers are constantly modifying the adjacent lands.

Climate.—The climate as a whole is hot and dry. The Himalayan districts of course are cool, and have a much greater rainfall than the plains They are succeeded by a broad submontane

belt, the *tarai,* which bears the reputation of being the most unhealthy in all India, and in many parts only the acclimatized aborigines can withstand its deadly malaria. The plain country is generally warm and dry, the heat becoming more oppressive as the general level of the country sinks towards Allahabad and Benares, or among the hills of Bundelkhand. The rainfall varies from 30 to 44 in in the plains, increasing gradually towards the Himalaya. The temperature in the hot season ranges from 86° to 115° F, and even higher, in the shade

Minerals and Agriculture.—Owing to the loamy nature of the soil, few minerals of any kind are found, and the chief underground product is the abundant nodular limestone (*kankar*) which is used for road-making Iron and coal exist in the southern hills, but not in paying quantities, and there are traces of old iron-workings in the lower Himalaya The course of tillage comprises two principal harvests, the *kharif*, or autumn crops, sown in July and reaped in October or November, and the *rabi*, or spring crops, sown in October or November and reaped in March or April. The great agricultural staple is wheat, but millets, rice, barley and pulses are also largely cultivated Speaking broadly, rice and oilseeds predominate in the eastern and sub-Himalayan districts, millets and cotton in Bundelkhand and wheat in the greater part of the Gangetic plain Sugar-cane, condiments and tobacco are locally important, and a little tea is grown in the submontane districts of Almora Garhwal and Dehra Dun.

Land Tenure.—Owing to historical reasons, the system of land tenure is not uniform In the Benares division, the land revenue was permanently fixed in 1795, on the same principles that had been previously adopted in Bengal, and there a special class of tenants, as well as the landlords, enjoy a privileged status. Throughout the rest of the province of Agra, temporary settlements are in force, usually for a term of thirty years, the revenue being assessed at one-half of the "assets" or estimated rental value The settlement is made with the landholders or *zamindars,* who are frequently a group of persons holding distinct shares in the land, and may be themselves petty cultivators. The privileged tenants are those possessing "occupancy" rights, defined by statute. All other tenants are merely tenants-at-will In Oudh, after the convulsion of the Mutiny, all rights in land were confiscated at a stroke, and the new system adopted was in the nature of grants to the *talukdars,* or great landlords, who were thus given a status that has no analogy in the rest of India By *sanad* (or patent) and by legislation the *talukdars* were declared to possess permanent, heritable and transferable rights, with the special privilege of alienation, either in lifetime or by will, notwithstanding the limits imposed by Hindu or Mohammedan law. In addition most of them follow the rule of primogeniture, while a power of entail has recently been granted The estates of *talukdars* extend over more than half the total area of Oudh. No "occupancy" rights based on continuous cultivation are recognized in Oudh, but any person admitted to the cultivation of land is entitled to hold it for seven years at the same rent, which may not be advanced by more than 6¼% at the end of the term.

Manufactures.—The principal manufactures are those of sugar, metal and coarse cotton cloth Ornamental metal-work is made at Benares. Among the factories on the English model are the Elgin and Muir cotton mills at Cawnpore, the Cawnpore wool-mill, tanneries and leather factories, the Shahjahanpur rum distillery, and breweries at Mussoorie and Naini Tal. There are also iron and brass foundries, lac factories and oil mills.

The export trade is chiefly confined to agricultural produce. The principal staples include wheat, oilseeds, raw cotton, sugar, molasses, timber and forest produce, dry-stuffs, ghee and tobacco. The imports consist mainly of English piece-goods, metal-work, manufactured wares, salt and European goods. The chief centres of trade are Cawnpore, Allahabad, Agra, Mirzapur, Benares, Meerut and Moradabad.

Irrigation.—The Doab is intersected by canals drawn from the great rivers The major productive works are the upper and lower Ganges, the eastern Jumna, and the Agra canals The greatest work in the province, and one of the greatest irrigation works in the world, is the upper Ganges canal, which is taken from the river where it leaves the hills, some 2 m. above Hardwar In the first 20 m. of its course this gigantic canal crosses four great torrents, which bring down immense volumes of water in the rainy season. The total length of the main canal is 213 m., navigable throughout, and designed to irrigate 1,500,000 acres. The lower Ganges canal is taken from the river at Narora, 149 m. below Hardwar After crossing four great drainage lines, it cuts into the Cawnpore, and 7 m. lower down into the Etawah, branches of the upper Ganges canal. These branches are now below the point of intersection, part of the lower Ganges canal system. The irrigating capacity of this canal is 1,250,000 acres A magnificent new canal has just been opened, to carry the waters of the Sarda over Oudh

Railways.—The province is well supplied with railways. The main line of the East Indian traverses it from end to end, on both banks of the Ganges, connecting with Bengal on the one side and the Punjab on the other, and linking up with the G I P. line at Allahabad, Agra and Cawnpore Besides this broad-gauge system, there is also a metre-gauge nexus (the Bengal and North-Western, with its associate, the Rohilkhand & Kumaun), which serves the whole of the submontane tract and projects into Bengal, while it also joins with the B B &C I at Muttra The trade of the province thus has access to the sea at Bombay, Calcutta and Karachi.

Administration.—The province is under the direction of a Governor, with an Executive Council and Ministers. There are seven secretarial departments, besides a board of revenue, which is the highest tribunal in rent and land revenue matters The legislative council is 118 strong. For ordinary business, the province is divided into 48 districts, each under a collector and magistrate, called also the deputy commissioner in Oudh and Kumaun; while the districts are grouped into nine divisions under commissioners The supreme judicial tribunals are the chartered high court at Allahabad with jurisdiction over the old Agra part of the province, and a chief court at Lucknow with jurisdiction over Oudh.

Population.—Out of the total census of 1921, no fewer than 38,405,624 are Hindus, and only 6,481,132 are Mohammedans, or 84·6% and 14·3% respectively Hindostani (or Urdu) and Hindi (Eastern and Western) are the chief languages

History.—If the present limits be slightly extended in either direction so as to include Delhi and Patna, the United Provinces would contain the area on which almost the whole drama of Indian history has been played Here lay the scene, known as *Madhya Desa* or "middle country," of the second period of Aryan colonization, when the two great epics, the *Mahabharata* and *Ramayana,* were probably composed, and when the religion of Brahmanism took form. Here Buddha was born, preached and died Here arose the successive dynasties of Asoka, of the Guptas, and of Harshavardhana, which for a thousand years exercised imperial sway over the greater part of India. Here ruled the Mogul for his most brilliant period at Agra and at Fatehpur Sikri Here finally, at the crisis of the Mutiny, British dominion was permanently established in India

The political vicissitudes through which this tract of country passed in earlier times are described under India *History.* It will be sufficient here to trace the steps by which it passed under British rule. In 1765, after the battle of Buxar, when the nawab of Oudh had been decisively defeated and Shah Alam, the Mogul emperor, was a suppliant in the British camp, Lord Clive was content to claim no acquisition of territory. The whole of Oudh was restored to the Nawab, and Shah Alam received as an imperial apanage the province of Allahabad and Kora in the lower Doab, with a British garrison in the fort of Allahabad. Warren Hastings augmented the territory of Oudh by lending the nawab a British army to conquer Rohilkhand, and by making over to him Allahabad and Kora on the ground that Shah Alam had placed himself in the power of the Mahrattas At the same time he received from Oudh the sovereignty over the province of Benares Lord Wellesley in 1801 obtained from the nawab of Oudh the cession of Rohilkhand, the lower Doab, and the Gorakhpur division, thus enclosing Oudh on all sides except the north. In 1804, as the result of Lord Lake's victories in the Mahratta War, the rest of the Doab and part of Bundelkhand, together with Agra, were secured from

Sindia. In 1815 the Kumaon division was acquired after the Gurkha War, and a further portion of Bundelkhand from the peshwa in 1817. These new acquisitions, known as the ceded and conquered provinces, continued to be administered by the governor-general as part of Bengal. In 1835 an act of parliament authorized the appointment of a lieutenant-governor for the North-Western Provinces, as they were then styled They included the Delhi territory, transferred after the Mutiny to the Punjab; and also (after 1853) the Saugor and Nerbudda territories, which in 1861 became part of the Central Provinces Meanwhile Oudh remained under its nawab, who was permitted to assume the title of king in 1819, until it was annexed in 1856 and constituted a separate chief commissionership Then followed the Mutiny, when all signs of British rule were for a time swept away throughout the greater part of the two provinces. The lieutenant-governor died when shut up in the fort at Agra, and Oudh was only reconquered after several campaigns lasting for eighteen months

In 1877 the offices of lieutenant-governor of the North-Western Provinces and chief commissioner of Oudh were combined in the same person; and in 1902, when the new name of United Provinces was introduced, the title of chief commissioner was dropped, though Oudh still retains some marks of its former independence. In 1920 the tract was created a governor's province under the new constitution.

UNITED STATES (OF AMERICA), THE, the foremost nation of the western hemisphere in the number and wealth of its people, and the second largest in area. It is situated advantageously in the temperate zone of the North American continent (25° 35′ to 49° N. lat.), and extends in a broad belt from the Atlantic ocean on the east to the Pacific ocean on the west (66° 55′ to 124° 45′ W. long). On the north it is bordered by the Dominion of Canada, the boundary in the west being an arbitrary line at the 49th parallel and in the east largely a natural one formed by the Great Lakes. The eastern half of the southern boundary is naturally defined by the Gulf of Mexico, but in the west the nation is separated from the Republic of Mexico by an oblique line following first the Rio Grande river and continuing afterwards generally west-north-west across the highlands to the Pacific ocean. The eastern coast is separated from Europe by approximately 3,000 miles of the Atlantic ocean which acts as a carrier for an enormous commerce between the two continents, but which, at the same time, gives the United States a degree of isolation from European affairs which has been welcomed and which has contributed greatly to its independent growth and progress. The Pacific ocean which separates the United States from the Oriental nations of the Far East is wider, varying from 5,000 to 6,000 miles, but in the Hawaiian Islands (*q v*) the United States has acquired possession of an important midway stepping stone.

The United States consists of 48 separate and theoretically sovereign States which are joined together by a Federal Government to which the original 13 States delegated certain powers as outlined in the Federal Constitution adopted in 1787 and put in force in 1789 The official name "The United States of America" is in general usage shortened to "United States," the term being used in the singular instead of a plural sense The total area of the nation is 3,026,789 sq m Its population in 1920 was 105,710,620, or 35·5 per sq m Of this number 89·7% was white and chiefly of European origin The official population estimate for 1928 was 120,013,000. In addition there are outlying possessions with a total area of 711,604 sq m. and a population in 1920 of 12,112,545 (For these possessions *see* ALASKA, HAWAIIAN ISLANDS, PHILIPPINE ISLANDS, PORTO RICO, GUAM, VIRGIN ISLANDS, etc)

III. Climate.
IV. Fauna and Flora
V. Population and Social Conditions.
VI. National Finance
VII. Industry and Commerce.
VIII. Defence.
IX Constitution and Government
X History.

The reader is also referred to the articles on the separate States.

I. PHYSICAL GEOGRAPHY

Plan of Relief.—The primary features of the United States are: (*a*) a vast western highland covering a full third of the country, dominated by mountains of which the general trend is a little west of north, (*b*) a smaller and lower eastern highland south of the St. Lawrence river, trending north-east–south-west, roughly parallel to the Atlantic coast, (*c*) a broad interior plain sloping southward and interrupted by the smaller interior highland, and (*d*) a lowland belt bordering the Atlantic and the Gulf of Mexico

Major Physiographic Divisions.—The eight major divisions are as follows, the order being determined by the numbering of the physiographic provinces on the map (p. 720) and in table pages 721 and 722: *A*,—the Laurentian Upland covers most of eastern Canada and only a small part of the United States south of Lake Superior; *B*,—the Atlantic Plain embraces the Atlantic and Gulf coastal plains; *C*,—the Appalachian Highlands extend from the St. Lawrence south-west to the Gulf coastal plain with an average width of 300 miles *D*,—the Interior Plains are bordered on the east and west by great highlands of the continent and partly enclosed on the north by the Laurentian highland, but west of that they extend north to the Arctic ocean On the south these Interior plains give way to the Gulf coastal plain but not without a distinct descent *E*,—the Interior Highlands are surrounded by plains, the Interior plain on the west and north, and the Gulf coastal plain on the east and south *F*,—the Rocky Mountain System enters the United States from Canada and extends south to latitude 36° This system carries the main continental divide and, while not bearing the highest peaks, affords the greatest mass of land at high levels on the continent *G*,—the Intermontane Plateaux west and south of the Rocky mountain system, occupy approximately half a million square miles, most of it at high altitudes and half of it ribbed by mountains. *H*,—the Pacific Mountain System occupies a strip about 200 m. wide along the Pacific coast, embracing several distinct ranges and important valleys

Rivers and Harbours.—In a very general way the major divides follow the great highlands, hence the rivers entering the Atlantic between the St Lawrence and the Gulf of Mexico are of moderate size and of little direct value to navigation Their indirect value is great, however, because all their valleys were carved when the continent stood at a higher level Subsidence of the land drowned the lower courses of streams, making estuaries and harbours as at New York, Baltimore and all the other Atlantic seaports The Hudson was drowned to Albany and the Delaware to Trenton, permitting ocean vessels to reach Philadelphia. Chesapeake bay is the largest indentation thus made One of its branches, the Potomac, is at sea-level as far up as Washington.

The St Lawrence system embraces the five Great Lakes on the Canadian border. The divide limiting the drainage basin of these lakes on the west and south is not far from their shores, hence all tributary streams are short. But the mouths of these streams have likewise been drowned by the tilting of the basin in such a manner that the south-western shores of these lakes are being progressively submerged while the north-eastern shores are rising Milwaukee, Chicago, Toledo and some other ports owed their original harbours to this cause The extraordinary harbour of Duluth lies behind a sand bar which has cut off the western end of Lake Superior

Five-twelfths of the United States (1¼ million sq.m), mainly in the Interior plains, drain to the Mississippi and its branches These afford thousands of miles of navigable water, chiefly on the main stream and its tributaries from the humid east. The Ohio is the most navigated stream in America. New Orleans is a river city 100 m from the Gulf; it is a seaport only in the sense that sea-going vessels can reach it. Mobile and some other Gulf ports are on drowned valleys altered and supplemented by artificial works. A small estuary at Galveston is fronted by a broad sand reef on which the city stands.

The Mississippi river has received much attention on account of navigation and flood prevention. More than three-fourths of its water comes from three main streams, the Missouri, the Upper Mississippi (above the mouth of the Missouri) and the Ohio. Their several contributions are approximately as follows:

	Drainage area (square miles)	Average discharge in second-feet	Percentage of total discharge
Upper Mississippi	171,500	127,000	18·27
Ohio	202,000	300,000	43·17
Missouri	527,000	100,000	15·83
Mississippi at mouth .	1,238,000	695,000	

The Missouri drains the largest basin but has the least rainfall, hence its volume is least. Each year the Mississippi carries to the sea 340,500,000 tons of solid matter in suspension and 136,400,000 tons in solution Erosion would thus reduce the level of the entire drainage basin by one foot in 6,000 years.

West of the continental divide on the Rocky mountains are two long rivers, the Snake-Columbia in the north and the Colorado in the south, which traverse the full width of the Intermontane plateaux Other streams are short and the total amount of water reaching the Pacific is small in proportion to the great area drained. In this part of the United States, chiefly in the States of California, Nevada, Utah and Arizona, and in the adjacent part of Mexico is a vast area too arid to drain to the sea, comprising 3·2% of the area of the continent or nearly a quarter of a million square miles The Pacific shore, like the Atlantic, has suffered submergence, drowning the lower courses of most streams Thus was made the harbour of Portland, Oreg., on Columbia river, 100 m from the sea The local subsidence that made San Francisco bay came at a point where the chief rivers of California break through the Coast ranges to the Pacific Puget sound, with Seattle, Tacoma and other harbours, is similar to San Francisco bay San Diego, near the Mexican border, owes its harbour to the protection of a magnificent sand reef

Atlantic and Gulf Coastal Plain.—South of New York, the continent slopes almost imperceptibly to the shore, beyond which the sea bottom continues the very gentle slope many miles, and then descends less gradually to the oceanic abyss The line where this relatively rapid descent begins is the real edge of the continent and this margin of shallow sea bottom is the continental shelf. Within this margin is deposited most of the sand and mud carried down from the land A large part of the ocean's life is concentrated on this shallow bottom where the water is relatively warm and food is abundant.

Repeatedly in late geologic time this border of the continent has stood lower, and also higher, than at present, thus broadening and narrowing the continental shelf alternately The part of the shelf above water at any one time is coastal plain All that is shown on the map (p. 720) as coastal plain has been continental shelf at a time so recent that its structure remains unchanged. The materials of its underlying strata are the same as those now accumulating beneath the adjacent shallow sea. Some of the sand, clay and ooze has been poorly consolidated into sandstone, shale or limestone. All beds dip faintly seaward, the older and lower ones passing seaward beneath the younger beds, so that the several formations appear at the surface in strips parallel to the coast, the lower beds outcropping farthest inland. As the beds offer unequal resistance to erosion and are unlike in their soil-making properties, the striped pattern of the geologic map is apt to be reproduced in the topography of the coastal plain.

Topography.—As the surface of the continental shelf is extremely flat, so also is the land nearest the coast, which has but recently emerged and lies too near sea-level to permit the cutting of valleys. The landward edge of the coastal plain was necessarily first to emerge from the sea. It is also the highest. For both of these reasons it is more deeply eroded and more completely dissected by small streams than is the seaward edge. In the southern States this inner edge is at places more than 700 ft. above the sea and has a relief of 300 to 400 feet. At places erosion has even made new lowlands or peneplains. Other things equal, the number and depth of valleys increase inland.

Where the underlying strata resist erosion unequally, a strong stratum may give rise to a cuesta, a ridge with a very gentle slope down dip towards the sea and a steeper slope cutting across the strong stratum and leading down to an "inner lowland" on the underlying weak stratum. The effect on topography is to make the *belted coastal plain* wherein the stronger beds (usually sandy) make higher, rougher and less fertile belts and the weaker beds (usually clay, marl or "chalk") make belts of smooth, fertile lowland. Thus central Alabama has its well known "Black Belt" on the outcrop of the Selma chalk (Cretaceous) which erosion has reduced to a lowland with a rich black soil, famous for its cotton Dipping seaward, the chalk passes under stronger sandy beds which are poor soil makers, hence the rich lowland is paralleled by a broad, now much dissected cuesta of poor upland. Another lowland and another upland follow but are less well known Northern Texas has a similar belt, the "Black Prairie," along the western boundary of the coastal plain. It is likewise on a chalk outcrop and has on its seaward side an infertile cuesta. New Jersey has a similar lowland on the weak Raritan clays which outcrop along the landward edge of the coastal plain From Trenton south-westward this low strip is followed by Delaware river. North-east from Trenton it is followed by the great railroads running from New York to Philadelphia.

Islands—It will be observed that the coastal plain is broadest at the south and narrows toward the north The opposite is true of the continental shelf, indicating that the continent is now relatively depressed at the north and elevated at the south. One effect of this is seen in the islands from New York to Cape Cod. These islands, Staten, Long, Block, Martha's Vineyard and Nantucket, are disconnected fragments of the coastal plain, parts of one or more cuestas whose corresponding inner lowlands are submerged. The low strip described across New Jersey is continuous with Long Island sound The same weak clays underlie both

Coastline—Throughout the Atlantic and Gulf coast recent (not necessarily current) sinking is in evidence From New England to Texas the smaller streams have estuaries, as the larger ones had also until filled by sediments. North of southern Virginia all the major streams crossing the coastal plain are drowned across its entire width The numerous large estuaries from New York to North Carolina make that part of the coast extremely ragged or crenulated Sand reefs or barrier beaches form a nearly straight "outer coast" and these continue most of the way from Long Island to Mexico They are especially long and continuous along the coast of Texas where tides are weak

The peninsula of Florida is due to an uplift of the sea bottom on an axis almost at right angles to the outline of the continent Its southern third is so little above sea-level that valley cutting is all but impossible. Here are the vast Everglades (*q v*), swamps whose water surface is less than 20 ft. above the sea. Its most valuable part is a low limestone ridge on the Atlantic side, bearing Miami and other winter resorts On this ridge and a line of coral reef wrapping around the southern end of the peninsula the Florida East Coast railroad passes to Key West The northern part of the peninsula has suffered some erosion Its underlying limestone suffers solution, giving rise to many sinkholes, some of them clogged and making lakes of considerable size. Here are the largest deposits of phosphate rock in eastern United States

Mississippi Embayment.—In the vicinity of the Mississippi river the coastal plain is greatly widened, extending north in a pronounced embayment to southern Illinois The greater part of this area is occupied by the alluvial plains, 40 to 80 m wide, of the Mississippi and its tributaries. At the south this plain merges with and includes the great protruding delta, the entire alluvial plain covering an area of nearly 30,000 square miles A large part of it is subject to flooding, or would be if not protected by artificial levees. The breaking of the levees in 1927 allowed most of the area to be inundated, the river at Arkansas City, Ark, rising at one time to 60·5 feet. The natural levees are at places 15 to 20 ft. above the back swamps Slopes of 5 ft. per mile from the

river are common Slopes of 10 and even of 12 ft. are known.

Piedmont and Blue Ridge Provinces.—Inland from the Atlantic coastal plain is a belt underlain mainly by very old rocks, much deformed, generally metamorphosed and resistant This belt extends from central Alabama north-eastward into Canada, but the part to be described here terminates at Hudson river. Its greatest width in the south is nearly 200 m, but north of Potomac river it averages barely 60 miles This relic of the early Paleozoic continent is marked now by a mountain range on its north-western side. From southern Pennsylvania, where it is called South Mountain, to southern Virginia, where it is called Blue Ridge, it is rarely more than 10 or 15 m wide and from 1,500 to 3,000 ft high. In North Carolina and adjacent States it broadens to 70 m and culminates in Mt Mitchell (6,711 ft), the highest point in eastern United States The range is interrupted by a short gap in southern Pennsylvania. North-eastward from this gap it is known as the Highlands of New Jersey and New York This part, being detached from the main range (Blue Ridge Province) and contiguous with the New England province, which is largely of the same character, is considered a part of the latter From New England to southern Virginia the crest as viewed from a distance is gently undulating and is considered to be the remains of an uplifted peneplain preserved by the strength of the rocks, while weaker rocks on both sides have been reduced to a new and lower peneplain In western North Carolina the ancient mountains were never worn down to the peneplain indicated by the crest farther north Partly for this reason and partly because of greater recent uplift these mountains are several thousand feet higher

Between the mountains and the coastal plain is the Piedmont province, most of it a low plateau sloping seaward, consisting in the main of the same rocks found in the mountains Where the rocks of the piedmont and mountain belts are similar the existence of a newer and lower peneplain in the former and not in the latter is explained by the fact that the new peneplain developed first along the lower courses of streams flowing from the mountains to the sea It spread westward, its limit of advancement being the eastward slope of the Blue Ridge This newer peneplain is itself uplifted and dissected by revived streams Much of the northern end of the Piedmont province in Pennsylvania and adjacent States is exceptional, consisting of softer Triassic rocks As these were more readily worn down and, as already pointed out, the continent in this latitude has been less uplifted, this part of the Piedmont province is lowland rather than plateau, though still distinctly higher than the coastal plain Taken as a whole the rocks of this province are not very good soil makers, but the position, especially of its northern part, favours intensive cultivation Parts of the upland farther south are adapted to fruit trees and an important cotton district in South Carolina is in this province

New England Province.—The New England province is a broadened north-eastward extension of the belts already described. It has the same rocks along with some younger Paleozoics, generally deformed, metamorphosed and peneplaned Residual mountains rising above the general level to an altitude of 4,000 to 6,000 ft are found in the Green mountain section of Vermont and Massachusetts and the White mountain section of New Hampshire and Maine Between and around these mountains the upland level is generally a little above 1,000 ft, studded here and there with isolated residual mountains or "monadnocks," the original Mount Monadnock being in south-western New Hampshire This upland is an uplifted peneplain, itself dissected by sharp valleys since uplift. The surface declines seaward to the "Seaboard Lowland" and it is probable that newer and lower peneplains are here represented. The coastal margin below a level of 500 ft. has a rolling surface with wide open valleys in contrast with the narrow and steeper valleys that incise the plateau. The land below 500 ft also includes the broad valley of Connecticut river carved from Triassic rocks and analogous in every way to the low northern end of the Piedmont province With this valley included, the relatively narrow seaboard lowland contains the greater part of New England's population and industry

Elevation was followed by depression and the valleys are drowned This is typically shown on the coast of Maine where the style of depressed coastline is quite different from that of the coastal plain because of difference in topography previous to drowning. Outlying islands, formerly hills or mountains of hard rock, are abundant here Harbours are numerous and fishing is favoured by this as well as by the broad continental shelf.

Unlike the Piedmont and Blue Ridge provinces, New England was severely glaciated, its mountains overridden and scraped by the continental ice sheet, and its surface generally covered by ice-laid drift abounding in boulders Some of its valleys are partly filled with sandy outwash Both topography and the stony soil are unfavourable to agriculture. The northern part of the province was long the great lumbering district of eastern United States. One of the chief effects of glaciation was the dislocation of streams. Drainage in beginning anew was obliged to fill many basins and cross many rocky ledges Lakes and rapids, therefore, abound, the latter being a great source of power New England, with its poor soil, abundant water power and excellent harbours early developed manufacturing and commerce

The Adirondacks.—In its physical geography the Adirondack area in northern New York is much like northern New England, a combination of subdued mountains and hilly plateaux, all severely glaciated and abounding in lakes Like the White Mountains and New England coast it is much used as a summer resort The State of New York has reserved large areas of forest

Appalachian Valley-and-Ridge Province.—West of the Piedmont, Blue Ridge and New England provinces is a narrow belt of folded sedimentary rocks stretching from the St Lawrence valley to the Gulf coastal plain. The length is 1,000 m and the width rarely 75 m, more often half that amount. Between New England and the Adirondacks it is very narrow In its present state this belt consists of alternating ridges and valleys, the former being parallel, even-topped and rarely 3,000 ft high For the most part they are nearly straight and in line with the major belt but a zigzag pattern appears in Pennsylvania The valleys occupy more than half the space Throughout its length the Paleozoic sandstones, shales and limestones are folded and often faulted by great lateral compression which made mountains of great height The ridges now seen are not those made by the folding Those lay far above the level of the present mountain tops Even the synclinal trough bottoms were above the present crests All were eroded away to a peneplain covering this and adjacent provinces At the time of its making it could not have been, at highest, more than a very few hundred feet above the sea The tilted strata came to the surface of this plain in parallel strips. Later came a general rise of the whole Appalachian region and the limestones and shales were worn down to a new and lower level (generally a peneplain) while the sandstones, being stronger, along with the hard rocks of the Blue Ridge province and the sandstone-capped plateau on the west, retained almost their former level. The tops of the present even-crested ridges indicate approximately the level of the old peneplain

The greatest breadth of this Valley-and-Ridge province is in Pennsylvania where it is almost 90 miles From here to southern Virginia the eastern third or fourth is almost without ridges. Its several parts from the Lebanon valley in Pennsylvania to the Shenandoah valley in Virginia are well known for their agricultural wealth. In this central portion the master streams cross the belt transversely, their longitudinal tributaries being developed on the softer outcrops In the northern section of the province; Hudson-Champlain valley, and again in the southern section, Valley of East Tennessee and neighbouring States, the main streams are longitudinal. In the latter case this came about by the headward elongation of Tennessee river capturing the former streams which flowed from the Blue Ridge to the Ohio river.

Appalachian Plateaux.—West of the Valley-and-Ridge province is a plateau of almost equal length with a minimum width of 35 miles at the south but more than 200 miles wide farther north. On the side toward the Valley-and-Ridge province, it is at least as high as the ridges already described, 2,000 to 3,000 ft., but it declines north-westward and is barely 1,000 ft. high where its edge approaches Lake Erie. Its rocks are almost horizontal, generally outcropping on the south-east in an escarp-

ment overlooking the adjoining valley of the folded province. Except at the north end the rocks at the surface are Carboniferous and Permian. Thick beds of strong sandstone are common and generally cap the hills. Soils, therefore, are generally not good. They are least fertile at the south end where the sandstones are most dominant, and best at the north end where Devonian rocks form the plateaux and glaciation has left its heterogeneous drift.

The larger part of the province is almost or quite completely dissected by stream valleys. These may approximate 1,000 ft. in depth on the higher south-east side, but the relief diminishes toward the north and west. Nevertheless the hilltops are about at the same altitude and the horizon is nearly level. The Cumberland plateau at the southern end, mainly in Tennessee, is exceptional in preserving large patches of undissected upland on beds of strong sandstone. In parts of the eastern margin the beds are mildly folded though not enough to develop the topography of the next province to the east. The surface is less plateau-like than elsewhere in this province and the horizon less level. As these are also places of greater height these districts are known as mountains, the Allegheny mountains in Pennsylvania, and the Cumberland mountains in Kentucky and Virginia, but these names are applied somewhat broadly, and without exact boundaries, to the deeply dissected eastern margin The Catskill mountains in south-eastern New York are like the adjacent plateau but covered by an additional thick plate of strong conglomerate now deeply and maturely dissected The plateau in New York, and to some extent in Pennsylvania and Ohio, was glaciated, leaving the hills and valleys less angular; leaving also many lakes and displaced streams, some of which in carving new valleys have made picturesque falls and gorges The main plateau ends at the north in an escarpment not far south of the 43rd parallel and 600 to 1,000 ft high West of Rome, N Y, this escarpment overlooks the lacustrine plain along Lake Ontario, a part of the central lowland East of Schenectady the descent from the plateau is to the valley of Hudson river (Valley-and-Ridge province). Between these two cities, the descent is only to a lower bench of the plateau province. In this bench Mohawk river has cut its valley connecting the two lowlands named. As all strata here dip slightly southward, the valley of the Mohawk is a strike valley It is the greatest avenue of travel and commerce between the Atlantic coast and the central lowland

The glaciated northern portion of the Appalachian plateau is favoured agriculturally and is one of the leading dairy districts of the United States. The remainder of the province is almost co-extensive with the great Appalachian coal fields, 75,000 sq m in extent As this area was never folded the coal remains bituminous. In the province to the east the folds were so high that the carboniferous beds, being uppermost, were almost wholly eroded away. Only in a few small spots were the synclines so deep as to leave the coal below the base level of erosion Here the coal was metamorphosed to anthracite The total original area of the anthracite fields was 484 square miles In the central part of the plateau province are also the great Appalachian oil and gas fields

Interior Low Plateaux.—West of the southern part of the Appalachian plateaux is a lower plateau province, mainly in the States of Kentucky and Tennessee At its eastern edge it abuts against the western escarpment of the Cumberland plateau. Here the lower plateau is 1,000 to 1,500 ft high and scored by valleys between which the surface is little eroded The ragged escarpment of the Cumberland plateau rises 800 ft higher Everywhere the level of the Interior Low Plateau declines toward Ohio river, near which in western Kentucky the uplands are little more than 500 ft. high. Dissection by streams increases toward the west end where it is complete. The most important parts of this province are two basins. The Nashville basin in central Tennessee is entirely surrounded by an inward facing escarpment 500 ft. high. The Lexington basin in Kentucky is overlooked by escarpments on the east, south and west but merges with the Till Plains at the same level on the north. These basins contain the most fertile lands and the greatest wealth of the province. The term "Blue Grass Region" is sometimes applied to both basins but more commonly to the central and most fertile part of the Lexington basin. Both basins originated as mild structural domes These being eroded down to a common base level exposed the underlying Ordovician (Lower Silurian) limestone and shale surrounded by the Mississippian (Lower Carboniferous) cherty limestones. The latter resisted erosion, making a poor soil while non-resistant Ordovician rocks produced soils that are famed for their fertility Western Kentucky receives the south end of a great coal field with its centre in Illinois. Here is a broad, faint syncline in which the upper Carboniferous rocks were sufficiently depressed to escape the erosion that stripped them away from neighbouring areas Here again, in western Kentucky, the soil is better and produces the famous Burley tobacco.

Central Lowland and Superior Upland.—The term lowland is not capable of exact definition. As applied to north central United States it signifies that most of the area is not obviously much above the level to which streams can cut down.

Within this great province, roughly one-fourth of the United States, the chief contrasts in topography are determined by glaciation The entire province may be divided into six sections. Two of them were never covered by the ice; two of them were left after glaciation as relatively smooth till plains without lakes; two others were left with abundant moraines and undrained basins. Referring to the accompanying map and table, the Eastern Lake section (*12a*) has a topography controlled in detail by its thick glacial deposits, though its large features betray the relief of the underlying rock as carved by pre-glacial drainage Terminal and recessional moraines and outwash deposits, with morainic lakes and swamps, cover perhaps half of the area; the other half is till plains (ground moraine) and lacustrine plains The beds of all the Great Lakes, except Superior, follow belts of weak strata which were presumably lowlands in pre-glacial time and were deepened by glacial erosion As the ice front retreated northward from the Mississippi-St Lawrence divide, lakes formed between the divide and the ice. With further retreat of the ice these lakes expanded and merged, changing from time to time in shape, altitude and outlet but generally discharging into the Mississippi system When the vanishing ice covered only the St Lawrence the lakes discharged for a time through Mohawk valley to the Hudson As each newly discovered outlet lowered the lake levels the water was progressively withdrawn from the farther ends of the basins and the old lake bottoms at the heads of the lakes (south or west ends) were laid bare An important though minor part of this Eastern Lake section consists of these perfectly flat former lake bottoms The glaciation of this section was in the last, or Wisconsin, ice epoch and the surface has been little altered by erosion Lakes and swamps are beginning to disappear but stream systems are poorly developed West of Lake Michigan, in this section, is the leading dairy district of the United States

The Western Lake section in Minnesota, northern Iowa and the Dakotas is similar but with a smaller proportion of morainic topography. It has also a smaller rainfall, so that forests are limited to northern Minnesota. An important feature of this section is the great lacustrine plain of former Lake Agassiz in the valley of Red river. This valley was flooded when the retreating ice cap obstructed the drainage to Hudson bay The lacustrine plain (most of it in Canada) is now the greatest area of spring wheat production in America

The two sections already described are separated by the Superior Upland and the Wisconsin Driftless Area The former, as compared with the lake sections, is higher, is less deeply covered with drift, has a larger number of lakes and vastly more swamp Its rocks are mainly igneous and metamorphic pre-Cambrian Topographically it is a peneplain, upraised, somewhat eroded, then glaciated This is an important part of the great area of northern pine forest Much is now cut-over land, only a minor part being valuable for agriculture. It contains the chief copper mines of eastern United States and the greatest iron mines of the world

South-western Wisconsin and small parts of adjacent States were missed by the several ice invasions though surrounded by a glaciated surface that extends 250 m. farther south Probably at no one time did the ice close around it. The margin of the ice sheet

was divided into lobes following the great valleys. In the different ice epochs they came from different directions, at one time from the north-west, at another from the north-east, the areas covered by these different advances overlapping south of this Driftless Area. The southern and western parts of this area are limestone uplands rather deeply and at places sharply carved by erosion. The northern part is mainly a lowland underlain by friable Cambrian sandstone covered by glacial outwash. With due allowance for the effects of different kinds of rocks on topography, this driftless area may be regarded as a sample of the topography that was elsewhere overridden by the ice It is not very different from that which is seen beyond the limit of glaciation in eastern Ohio or western Kentucky or central Missouri.

Most of Illinois, Indiana and western Ohio have a drift cover remarkable for its small relief and distinguished by a total absence of lakes. The flatness is not absolute, for the retreating ice front halted at various stages, building recessional moraines, a few of which have the distinctive topography of moraines, while others are barely visible, being made apparent only by their effect on drainage. The major streams have cut down moderately into this surface and tributaries are developing, but not much headway has been made except near the Ohio and the Mississippi. A margin near these streams belongs to an older drift sheet (Illinoian) while most of the section was again covered by ice in the last (Wisconsin) glacial epoch. West of this section in Iowa and northern Missouri and parts of eastern Nebraska and Kansas, are the Dissected Till Plains, distinguished from the Till Plains east of the Mississippi by greater erosion This difference results from the fact that the glacial mantle west of the Mississippi was spread in the Kansan glacial epoch and is the oldest glacial drift exposed in the central lowland Complete drainage is re-established; valleys now occupy fully four-fifths of the area In the type of agriculture that distinguishes the central lowland (grains and domestic animals) the Till Plains and Dissected Till Plains are pre-eminent.

South of the latitude of Kansas City (39°) the central lowland (Osage section) was not glaciated It extends almost to central Texas in a belt nearly 200 m. wide The underlying rocks dip gently west beneath the Great Plains syncline and away from the Interior Highland As the surface slopes in the opposite direction the formations outcrop in parallel strips trending nearly north and south. The stronger beds form cuestas with east-facing escarpments, some of them so eroded as to make hilly belts a few miles wide.

Interior Highland.—Surrounded by the lowlands of south-central United States is the Interior Highland. Its northern and larger part consists of the Ozark plateaux on nearly horizontal though slightly domed rocks. The rocks of its southern third are folded along east-west axes. Altitudes in the Ozark plateaux are generally less than 1,600 ft., being highest near the centre, but in northern Arkansas on the southern slope of the dome the strong sandstone beds of the upper Carboniferous are preserved in a plateau that is locally more than 2,000 ft. high and ruggedly eroded, making the Boston mountains. In south-eastern Missouri in the midst of the plateau stand the St. Francois mountains, composed of granite, rising no higher than the surrounding horizontal sediments which once covered all. These ancient granite mountains were buried by marine sediments and are now being exhumed. They are among the best examples of their class. The Ozark province is one of the leading sources of lead and zinc.

The belt of folded structure in Arkansas and Oklahoma, the Ouachita mountains (15*b*) is essentially like the Appalachian Valley-and-Ridge province, the product of two cycles of erosion, with ridges on the stronger outcrops and intervening lowlands on the weaker rocks. The rocks of the Arkansas Valley (15*a*) are but mildly folded and although the stronger sandstones make either flat or sloping uplands the whole strip is less uplifted than its neighbours. This province has large supplies of coal. The Ouachita mountains have the famous Hot Springs of Arkansas and produce the novaculite (natural honestone) of the United States. In and near it also are important bauxite deposits.

Great Plains Province.—The vast area known as Great Plains is a north-south belt averaging about 400 m. in width between the mountains of western United States and the lowlands of its centre. Its height at the base of the mountains is 5,000 to 6,000 ft. and at its eastern edge 1,500 to 2,000 feet. An eastward slope of 10 ft. to the mile is common. A part of this great area is literally plain, most of the northern third is peneplain and considerable areas on the borders, both in the east and west, are dissected into hills. All of it is semi-arid and the only trees are in river bottoms or on certain isolated mountains like the Black Hills. Most of it has good soil without the necessary water to take full advantage of the fertility. Perhaps a tenth part may be irrigated.

The flat portions of the province are best illustrated in the Llano Estacado (Staked Plains) of Texas and eastern New Mexico (13*d* on the accompanying map and table). Interrupted by the valleys of transverse streams these flats extend north to southern Nebraska and, in modified form, to the South Dakota boundary forming a belt known as the High Plains. These are remnants of a vast alluvial slope made by coalescing alluvial fans from the mountains. When the streams ceased their depositing habit and began again to erode, the eastern edge of the fluviatile deposit was first to suffer. In Texas the edge is retreating westward as a well defined escarpment, there being but a few miles between the flat upland and the lowland on the east. In Kansas and adjacent States the wasting edge of the former upland plain is represented by a broad belt of hills (13*e*). In Nebraska, a thick mantle of loess obscures the transition from high plains to central lowland. Between the belt of preserved high plains and the mountains, erosion was also more favoured, partly by original slopes, partly by the nature of the vegetation. Here (13*f*-*g*-*h*) the fluviatile mantle, where formed, was destroyed and the present landscape is one of varied relief The South Platte, Arkansas and Pecos have broad terraced and well-farmed valleys, but north-eastern New Mexico and the adjacent part of Colorado is a region of plateaux, trenched by angular valleys and surmounted by various features of volcanic origin The Edwards plateau at the southern extremity of the province (13*i*) is a limestone tableland almost as flat as the Llano Estacado but without the fluviatile mantle. It is cut off on the south and east sides by the great Balcones fault which for 300 m. forms the inner boundary of the coastal plain. Streams are dissecting the plateau at the edges and have in part removed the same limestone from a large area just north of the Edwards plateau. This hilly section in central Texas (13*k*) is in a stage of the erosion cycle intermediate between the youth of the well preserved plateaux and the old age of the lowlands on the north.

North of latitude 43° the Great Plains province is in large part upraised peneplain, though perhaps not all of the same cycle Second in areal importance are the extensive gravel plains, some of them perhaps being remnants of a sheet similar in origin to that which covers the high plains Others are simple stream terraces of Pleistocene age. Some of the streams, especially near the mountains, have valleys hundreds of feet deep and their tributaries have deeply dissected the upland. Isolated mountains are dome-like uplifts, the largest of which is the Black Hills, almost 100 m. long and 50 m. wide, crossing the Dakota-Wyoming border. The structural uplift approximates 10,000 ft. but erosion has truncated the dome leaving the actual height less than 4,000 ft. above the plain on the east. The core of granite has thus been exposed at the top, while the strata outcrop in concentric ellipses, the stronger ones making ridges.

The northern part of the Great Plains province and a margin on the east (13*a*) was covered by the Pleistocene ice-cap, leaving a strongly morainic topography in the Dakotas. The present course of Missouri river results from the obstruction of former drainage north-eastward to Hudson bay. The ponded waters overflowing from basin to basin found the present south-eastward course. Its relative youth is shown by the small width of its valley (1 to 3 m. between bluffs) as compared with that of the Yellowstone and other tributaries.

Rocky Mountains.—As shown on the map (p. 720) the Rocky Mountain system is divided into four parts. The Southern Rocky Mountain province is a group of linear uplifts initiated

FLORA OF THE UNITED STATES

1. Monterey Cypress. This true cypress, native to a small area along the shore of Carmel bay, California, is widely planted for ornament. The crowns of the native trees are often flattened and broken by the ocean gales
2. Red fir and western red cedar along a roadside in the State of Washington. Both are characteristic forest trees of the Pacific coast region
3. Redwood (*Sequoia sempervirens*), a valuable lumber tree confined to the fog belt of the California coast. This immense conifer is sometimes taller than, though never so massive as, the giant sequoia or big tree of the Sierra Nevada mountains
4. Live oak. A lane near St. Augustine, Florida, over-arched with spreading live oak branches, which are festooned with Spanish moss
5. Pine forest in central Louisiana, composed chiefly of yellow (long-leaf) and loblolly pines, both valuable lumber trees
6. Mixed forest in the Mississippi valley, composed of various hardwood (deciduous) trees, with heavy undergrowth
7. Tree yucca (*Yucca mohavensis*) in Arizona. The arborescent yuccas, some of which attain a height of 60 ft., are a characteristic feature of the deserts in the south-western States
8. Cholla (*Opuntia Bigelovii*), an exceedingly spiny cactus abundant in the Colorado desert of south-eastern California and in the Gila basin of Arizona

by east-west compression. The original folds were in large part levelled by erosion which thereby exposed the underlying granite, now revealed in north-south belts with a maximum width of 40 miles. Later uplift raised the general level to mountain heights but without sharp deformation. The old erosion surface was warped rather than folded, producing intermont basins. This later uplift enabled erosion to carve valleys in the granite and reduce the weaker rocks to lowlands. Commonly the granite belts are bordered by upturned sedimentary rocks, the several formations being of unlike strength, thus developing monoclinal foothills and valleys. Some large areas of granite 8,000 to 10,000 ft. high are plateau-like with a relief of only several hundred feet. These plainly represent a former lowland made by approximately peneplaning the first mountains. The largest of these tracts is South Park, 9,000 to 10,000 ft. high, west of Pikes peak. The same surface farther east and at many other places is carved into mountains whose summits approximate the same level. Looking across these crests, or over the undissected upland, Pikes peak is seen to rise as an isolated eminence 5,000 ft above the level. It was a monadnock on the South Park peneplain. North of the Park and extending almost to Wyoming is the main crest of the Front range with many peaks 12,000 to 14,000 ft. high. Along this entire line residual mountains rise clearly above a dissected plateau Only a minor part of what is called "mountains" in the southern Rockies consists of these residual eminences. The greater part are carved from the uplifted peneplain In the entire system, both north and south, most of the residual mountains have "alpine" features due to former glaciers These are cirques and U-shaped troughs, often separated by steep and narrow crags The San Juan mountains in south-western Colorado consist largely of volcanic rocks which once covered the area in sheets of relatively small relief. Later they were carved by water and ice into their present forms.

The Middle Rocky mountains, between the Wyoming basin and Yellowstone National park, consist of definite ranges in which structures and trends are clearly related. The axes radiate from Yellowstone park to the south, south-east and east. A long sickle-shaped arm whose eastern side is the Bighorn range almost surrounds the Bighorn basin. Of the group of ranges trending south, the Wasatch in northern Utah is outlined on the west by a great fault, the range on the upthrown side overlooking Great Salt lake on the downthrow. Meeting this range at right angles is the Uinta range which extends eastward forming the southern rim of the Wyoming basin.

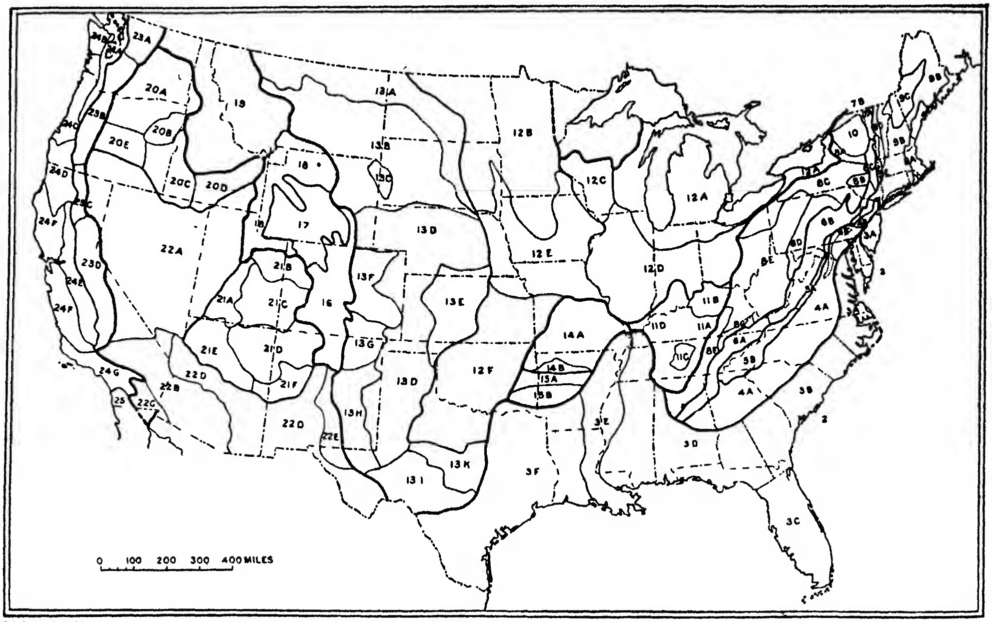
Yellowstone park is a plateau of rhyolitic lava with an average height of about 8,000 ft, enclosed by mountains on three sides but open to the west where a rapid descent leads down to the Snake river (basalt) plateau. A single narrow belt of mountains north and east of the plateau connects those to the north and those to the south. The lava fills a basin probably 2,000 ft. deep and appears to have conserved the heat revealed by geysers and hot springs. The hot springs are among the most extensive in the world and the geysers have no rival.

North and west of Yellowstone park the mountains (with few exceptions) are not in "ranges" in the usual sense of that word. Linear arrangement in agreement with structure is found to a limited extent, *e g.*, in the Lewis range of Glacier National park, but in general the present relief does not suggest corrugation. Much the larger part of the area is a vast mountain upland divided only by stream valleys or by "Tertiary basins" in which the mountain surface has sagged. Generally the dominant ridges within a single view are of sub-equal height so that the horizon is not far from level. Altitudes between 6,000 and 9,000 ft. are prevalent. The Bitterroot mountains on the Montana-Idaho boundary are the upturned edge of a fault block tilted westward. Except for this deformation the surface is as described above. The history of the Northern Rocky mountains is much like that of those farther south. At similar altitudes glacial features are more pronounced. They are specially marked and picturesque in Glacier National park in the Front range near the Canadian boundary. The Selkirk and Bitterroot ranges are likewise noteworthy in this respect.

Wyoming Basin.—North of the southern Rocky mountain province is the Wyoming basin whose floor, almost 40,000 sq m. in extent, is a plateau 6,500 to 7,500 ft. high and largely free from mountains. Beneath its horizontal Tertiary rocks, and rising through them here and there, are the older folded sedimentaries and granite, showing that the Rocky mountain system is structurally continuous. Within and around this plateau the drainage is strikingly out of harmony with structure and topography Green, Yampa, Bighorn, North Platte and Laramie rivers all leave the basin by canyons 1,000 to 3,000 ft. deep which might be avoided by going around the mountains. Green river, especially, was once a favourite illustration of antecedent river. This assumes that the river was in its place before the mountains rose across its course. It is now known that these streams are superposed, *i e.*, they chose their courses when the mountains were buried by weak Tertiary rocks lying on top of those that now make the basin floor.

Colorado Plateau.—South and west of the Rocky mountains is a region of 125,000 sq m. whose underlying rocks are in the main horizontal and whose surface is tabular. In part it consists of wide-spreading plains at high altitude; elsewhere the plateau consists of tabular remnants between deep and branching canyons In general the plateau abuts against the mountains on the north and east and ends in an escarpment overlooking lowlands on the west and south. The best known part of the province is the south-western section (21*e*) traversed by the Grand Canyon of the Colorado This has a maximum depth of 6,000 ft and a minimum width of less than 5 m. from rim to rim. The conditions favouring canyons are all present in this province. Great altitude above base level, strong through-flowing streams and geologically recent uplift favour downcutting, while strong rocks and arid climate favour preservation of steepness In this section the surface is on Permian limestone not deeply eroded. These rocks dip north under younger strata At the same time the surface rises terrace-like over system after system until Eocene (Tertiary) beds and lava flows are found capping the high plateaux of Utah (21*a*) 9,000 to 11,000 ft. high, bounded, both east and west, by escarpments. Most of the strata underlying the high plateaux formerly extended southward over the plateau in which the Grand Canyon is cut A mass of rock equal in thickness to the entire depth of the canyon was stripped from this plateau leaving a relatively low surface which was later uplifted. In other words, if the present canyon broadens and similar canyons develop and broaden until the entire plateau has been carried away to the depth of the present canyon bottom, then the streams of the present, newly inaugurated erosion cycle will have accomplished what was done once before. The same Eocene beds which appear in the high plateaux form a wide band on the northern margin, dipping northward until they turn up in the foothills of the Uinta range, and ending at the south in an escarpment. The general surface slopes agree with the structure. This is the Uinta basin (21*b*). South of it, and east of the high plateaux is the area of arid Canyon Lands (21*c*) deeply trenched by Colorado river and its tributaries, though its eastern margin in Colorado contains some broad fertile valleys. Farther south is the Navajo section (21*d*), like the Canyon lands but more arid and less canyoned because there are no mountains on the border to supply through-flowing streams. The Datil section (21*f*) on the south-east is largely lava-covered as is a very considerable area farther west (San Francisco mountain and vicinity) in the Grand Canyon section. Here also is the Zuni uplift, a dome like the Black hills.

Basin-and-range Province.—West and south of the Colorado plateau is a region marked by numerous small, roughly parallel mountain ranges separated by nearly flat detrital plains generally 4,000 to 5,000 ft. above the sea, but declining in altitude toward the Gulf of California. The northern half has long been known as the Great Basin and is the largest area of internal drainage in North America. The 100 or more mountain ranges divide it into an almost equal number of undrained basins. The hydrographic centres of some of these are marked by salt lakes; some others have playas, mud flats covered occasionally by a few inches of



BY COURTESY OF THE GEOLOGICAL SURVEY, U.S. DEPT OF INTERIOR

MAP SHOWING PHYSIOGRAPHIC DIVISIONS OF THE UNITED STATES (SEE TABLE P 721)

water All are filled or veneered by detritus eroded from the mountains and deposited as alluvial fans. Such surfaces are nearly level and tend to rise until the basin is full. A few basins along the course of Humboldt river have been so aggraded with detritus as to establish through drainage which may reach Carson Sink or stop at Humboldt lake, according to season and weather. Many of the mountain ranges are 50 to 75 m. long and 3,000 to 5,000 ft. above the basins and trend approximately north–south. Trees appear only in exceptional spots Some of the ranges are known to be upraised or up-tilted fault blocks. As there is a strong family resemblance among ranges, it is considered probable that faulting is at least the master process in the making of these ranges. The internal structures are complex showing that the rocks were strongly folded and (in the best known cases) peneplaned and lava-covered before faulting made the present mountains In northern Nevada and southern Oregon the mountains were uplifted so recently that their origin by faulting is beyond doubt Farther south some ranges are so old and eroded that their origin is not obvious. Some of the ranges bear evidence that the master faults were made before the peneplain, the present mountains consisting of the more resistant fault-blocks exhumed by selective erosion The extent to which this explanation is applicable to the mountains of this province is not yet definitely known

South of latitude 35° 30′, and extending from California to New Mexico, many of the intermontane basins are connected by through drainage or at least by continuous slopes on which water might flow to the sea if the rainfall were sufficient

Columbia Plateau.—The surface of the Columbia plateau between the Northern Rocky mountains and the Cascades is made by flows of dark lava. These flows submerged an uneven surface of erosion, locally almost mountainous as may be seen in vertical section in the mile-deep canyon of Snake river between Idaho and Oregon. The Snake river basin east of the 115th meridian represents the simplest and most youthful phase of lava plains Here the flat surface, 4,000 to 5,000 ft. high, remains as it was when the lava cooled, without erosion and only beginning to weather and to form soil It is trenched only by the canyon of Snake river whose depth increases westward to 700 feet. Farther west, in south-western Idaho and south-eastern Oregon, there is more erosion Near the State boundary the terraced valleys afford valuable irrigable land. The plateau in eastern Washington declines from nearly 3,000 ft. on the east to less than 500 ft where Columbia river breaks through the Cascades. This northern section (20*a*) consists of older lavas, subjected to long erosion and having a rolling surface covered (at least in the east) with wind-blown soil. Here are the famous wheat fields of eastern Washington and western Idaho, cultivated by methods of "dry farming" by which a crop is raised in alternate years In eastern Oregon near the middle of the province a group of mountains stood as an island in the floods of lava. Around these a later bulging raised the plateau surface to 7,000 ft, exposing it to greater erosion. This is the Blue Mountain section (20*b*). The rise lay across the course of Snake river which succeeded in cutting down as fast as the land rose, making a canyon 5,000 ft. deep

Sierra-Cascade Mountains.—From Canada to southern California a continuous barrier of mountains separates the Pacific border from the Intermontane plateaux. The Sierra Nevada south of the 40th parallel presents to the Great Basin one of the highest and steepest mountain fronts on the continent. It is the escarpment of a great fault, or compound fault, west of which an old mountain range, worn down almost to a lowland, rose again with a westward tilt Streams descending its long western slope have greatly increased its ruggedness by cutting gorges. These were later occupied by glaciers which deepened the valleys and steepened their sides. Yosemite valley is only an extra fine example of the typical glacial trough with its uneven floor whose basins retained lakes until filled by gravel, and its over-steepened walls notched at the top by tributary valleys, the "hanging valleys" which end in falls. These mountains are mainly of granite but in the northern half is a belt of folded and metamorphosed sedimentaries making the "Gold Belt" which has yielded a large part of California's output of gold.

Table Showing the Physiographic Divisions of the United States

Divisions	Characteristics
Laurentian Upland	
1. Superior Upland	1. Submaturely dissected, recently glaciated peneplain on crystalline rocks of complex structure.
Atlantic Plain	
2. Continental Shelf	2. Sloping submarine plain of sedimentation.
3. Coastal Plain	
a. Embayed section	3a. Submaturely dissected and partially submerged, terraced coastal plain.
b. Sea Island section	3b. Young to mature terraced coastal plain with submerged border
c. Floridian section	3c. Young marine plain sandhills, swamps, sinks and lakes.
d. East Gulf Coastal Plain	3d. Young to mature belted coastal plain
e. Mississippi Alluvial Plain	3e. Flood plain and delta.
f. West Gulf Coastal Plain	3f. Young, grading inland to mature coastal plain.
Appalachian Highlands	
4. Piedmont Province	
a. Piedmont Upland	4a. Submaturely dissected peneplain on disordered resistant rocks, moderate relief.
b. Piedmont Lowlands	4b. Less uplifted peneplain on weak strata; residual ridges on strong rocks.
5. Blue Ridge Province	
a. Northern section	5a. Maturely dissected mountains of crystalline rocks, accordant altitudes
b. Southern section	5b. Mature to subdued mountains of disordered crystalline rocks
6. Valley-and-Ridge Province	
a. Tennessee section	6a. Second-cycle mountains of folded strong and weak strata, valley belts predominating over even-crested ridges.
b. Middle section	6b. The same, but even-crested ridges predominate over valleys except on east side
c. Hudson Valley	6c. Glaciated peneplain on weak folded strata.
7. St. Lawrence Valley	
a. Champlain section	7a. Rolling lowland, glaciated, in part covered by young marine plain.
b. Northern section	7b. Young marine plain with local rock hills.
8. Appalachian Plateaux	
a. Mohawk section	8a. Maturely dissected, glaciated plateau, varied relief.
b. Catskill section	8b Maturely dissected plateau of mountainous relief and coarse texture (glaciated).
c. Southern New York section	8c Mature glaciated plateau of moderate relief.
d. Alleghany Mountain section	8d. Mature plateau of strong relief, some mountains due to erosion of open folds.
e. Kanawha section	8e Mature plateau of fine texture, moderate to strong relief
f. Cumberland plateau section	8f. Submaturely dissected plateau of moderate to strong relief
g. Cumberland Mountain section	8g. Higher mature plateaux and mountain ridges on eroded open folds.
9. New England Province	
a. Seaboard Lowland	9a. Peneplains below 500 feet, past-maturely eroded and glaciated, few monadnocks.
b. New England Upland	9b. Dissected and glaciated peneplains on complex structures; monadnocks
c. White Mountain section	9c. Subdued and glaciated mountain masses of crystalline rock.
d. Green Mountain section	9d Linear ranges of subdued and glaciated mountains and residual plateaux
e. Taconic section	9e. Maturely dissected and glaciated mountains and peneplain on resistant folded strata.
10. Adirondack Province	10 Subdued mountains and dissected peneplain glaciated
Interior Plains	
11. Interior Low Plateaux	
a. Highland Rim section	11a Young to mature plateau of moderate relief
b. Lexington Plain	11b Peneplain on weak rocks; trenched by main rivers and locally dissected.
c. Nashville Basin	11c Peneplain on weak rocks, slightly uplifted, moderately dissected.
d. Possible Western section (not delimited)	11d Low, maturely dissected plateau with silt-filled valleys.
12. Central Lowland	
a. Eastern lake section	12a Maturely dissected and glaciated cuestas and lowlands; moraines, lakes, and lacustrine plains.
b. Western lake section	12b. Young glaciated plain, moraines, lakes, and lacustrine plains
c. Wisconsin Driftless section	12c. Maturely dissected plateau and lowland invaded by glacial outwash (Margin of old eroded drift included)
d. Till Plains	12d. Young till plains, morainic topography rare, no lakes
e. Dissected Till Plains	12e. Submaturely to maturely eroded till plains
f. Osage Plains	12f. Old scarped plains beveling faintly inclined strata; main streams entrenched.
13. Great Plains Province	
a. Missouri Plateau, glaciated	13a. Glaciated old plateaus, isolated mountains.
b. Missouri Plateau, unglaciated	13b Old plateau, terrace lands, local badlands, isolated mountains
c. Black Hills	13c. Maturely dissected domed mountains.
d. High Plains	13d. Broad inter-valley remnants of smooth fluviatile plains
e. Plains Border	13e. Submaturely to maturely dissected plateau.
f. Colorado Piedmont	13f. Late mature to old elevated plain.
g. Raton section	13g. Trenched peneplain surmounted by dissected, lava-capped plateaux and buttes.
h. Pecos Valley	13h. Late mature to old plain.
i. Edwards Plateau	13i. Young plateau with mature margin of moderate to strong relief.
k. Central Texas section	13k. Plateau in maturity and later stages of erosion.

Table Showing the Physiographic Divisions of the United States—continued

Divisions	Characteristics
Interior Highlands	
14 Ozark Plateaux	
a Springfield-Salem plateaux	14a. Submature to mature plâteaux.
b. Boston "Mountains"	14b. Submature to mature plateau of strong relief.
15 Ouachita Province	
a. Arkansas Valley	15a. Gently folded strong and weak strata; peneplain with residual ridges
b. Ouachita Mountains	15b. Second-cycle mountains of folded strong and weak strata
Rocky Mountain System	
16. Southern Rocky Mountains	16. Complex mountains of various types, intermont basins
17 Wyoming Basin	17. Elevated plains in various stages of erosion, isolated low mountains.
18 Middle Rocky Mountains	18. Complex mountains, mainly anticlinal ranges; intermont basins.
19. Northern Rocky Mountains	19. Deeply dissected mountain uplands, not anticlinal ranges, intermont basins.
Intermontane Plateaus	
20. Columbia Plateaux	
a. Walla Walla Plateau	20a Rolling plateau with young incised valleys.
b. Blue Mountain section	20b. Complex mountains and dissected volcanic plateaux.
c. Payette section	20c. Young plateaus of prevailingly weak rocks; broad alluvial terraces (Applies to northern part only)
d. Snake River Plain	20d. Young lava plateau.
e. Harney section	20e. Young lava plateau, features of recent vulcanism, internal drainage.
21. Colorado Plateaux	
a High Plateaus of Utah	21a High block plateaux, in part lava-capped, include terraced plateaux on south side
b. Uinta Basin	21b Dissected plateau, strong relief
c Canyon Lands	21c. Young to mature canyoned plateaux, high relief
d. Navajo section	21d Young plateaux; smaller relief than 21c. into which it grades.
e Grand Canyon section	21e High block plateaux, trenched by Grand Canyon
f. Datil section	21f. Lava flows entire or in remnants, volcanic necks.
22. Basin-and-Range Province	
a Great Basin	22a Isolated ranges (largely dissected block mountains) separated by aggraded desert plains
b. Sonoran Desert	22b Widely separated short ranges in desert plains
c. Salton Trough	22c Desert alluvial slopes and delta plain, Gulf of California
d. Mexican Highland	22d Isolated ranges (largely dissected block mountain) separated by aggraded desert plains
e. Sacramento section	22e. Mature block mountains of gentle dip, block plateaux, bolsons
Pacific Mountain System	
23 Sierra-Cascade Mountains	
a Northern Cascade Mountains	23a. Sharp alpine summits of accordant height, higher volcanic cones
b Middle Cascade Mountains	23b. Generally accordant summits; higher volcanic cones
c Southern Cascade Mountains	23c. Volcanic mountains variously eroded, no very distinct range.
d. Sierra Nevada	23d Block mountain range tilted westward, accordant crests, alpine peaks near east side.
24. Pacific Border Province	
a. Puget Trough	24a. Lowlands of diverse character, in part submerged
b. Olympic Mountains	24b. Generally accordant crests, local alpine peaks
c. Oregon Coast Range	24c. Uplifted peneplain on weak rocks, dissected, monadnocks of igneous rock.
d. Klamath Mountains	24d. Uplifted and dissected peneplain on strong rocks, extensive monadnock ranges
e California Trough	24e. Low fluviatile plains.
f California Coast Ranges	24f Parallel ranges and valleys; on folded, faulted and metamorphosed strata, rounded crests of subequal height
g Los Angeles Ranges	24g. Uplifted fault blocks, alluviated lowlands
25 Lower Californian Province	25 Dissected west-sloping granite upland (in northern part)

North of Feather river the range changes completely. There is no evidence of uplift, only a piling up of volcanic materials from hundreds of vents Lava flows, ash beds and cinder cones are of all ages from those that are fresh and shapely to others almost eroded away Mt Shasta with its beautiful cone (14,380 ft), and Lassen's peak, the only volcano in the country witnessed in action, belong to this southern section of the Cascades (*23c*) A little north of the Oregon boundary there is evidence that crustal uplift is added to volcanic accumulation Farther north the range owes its height more and more to uplift and less and less to the piling up of ejecta The volcanic cover gives out entirely in central Washington, north of which the Northern Cascade mountains (*23a*) consist of metamorphosed Paleozoic rocks and granite, intricately dissected into sharp peaks and ridges most of which, in a single view, rise to an almost uniform height. The level thus determined varies from 6,000 to 8,500 ft, being gently arched. Above this nearly level horizon in both Oregon and Washington rise the isolated cones of extinct volcanoes 3,000 to 7,000 ft higher. The best known are Mt Rainier (14,526 ft.) in Washington and Mt. Hood (11,225 ft) in Oregon. Crater lake in southern Oregon is the finest example of its class in America. It originated by the engulfment of the upper part of a volcano thus truncating the cone and leaving a pit 5 to 6 m in diameter at the water-level, which is here 6,117 ft. high Above it the walls of the caldera rise 500 to 2,200 ft. and below it the basin is 2,000 ft. deep.

Pacific Border.—The Pacific Border embraces a chain of coast ranges with long and important valleys between these and the Sierra-Cascade mountains The most northerly range is the Olympic mountains (*24b*), not unlike the Northern Cascades but lower. The Oregon Coast range (*24c*) is a gentle anticline of Tertiary beds, relatively recent in origin It is succeeded on the south by the Klamath mountains, (*24d*), a range of long standing, consisting largely of metamorphosed Palaeozoic rocks, once eroded down to a peneplain but uplifted again, locally as high as 7,000 ft., then deeply and ruggedly eroded. Most of the California coast is occupied by the California coast ranges (*24f*). These are relatively low mountains (generally between 2,000 and 4,000 ft.)

ranged in parallel ridges due largely to faulting of an earlier, much deformed and much worn down mountain belt. Some broad valleys south of San Francisco are filled with late Tertiary sediments because of depression at that time. Still later the coast seems to have been depressed some 1,500 ft. below its present level. Shore-lines etched against the mountain side are preserved here and there at various levels between the sea and the 1,500 ft contour. As shown by these old shorelines, the depression that caused San Francisco bay is relatively recent.

Puget sound is the submerged northern end of a trough (24*a*) 350 m. long between the Cascades and the Coast range. Its southern end is the valley of the Willamette, a southern tributary of the Columbia Some of the valleys in this long trough are agriculturally rich. Commercially the region of the sound is favoured by its fine harbours and the four or more transcontinental railroads which these harbours have attracted. The Great Valley of California (24*e*) between the Coast range and the Sierra Nevada is 400 m long and 50 m. wide. In the upwarp of the adjacent mountain belts, this belt was bent down As a consequence it was covered with the silt, sand and gravel washed from the mountain slopes That deposition is still going on in the valley is evident from the habits of the two master streams, the Sacramento from the north and the San Joaquin from the south These have small gradients and run between high natural levees; sandbars are abundant; at the head of San Francisco bay the two streams unite to build an extensive delta The filling of the valley is mainly from the higher mountains on the east Deposition is in the form of alluvial fans which in the southern part have crowded the San Joaquin westward to the foot of the Coast range, the great alluvial fan of Kings river, extending across the valley, has cut off its southern third forming Tulare basin, partly occupied at times by a playa lake. Here the climate is so arid that all inflow is evaporated and there is no drainage to the San Joaquin Irrigation is highly developed, especially in the more arid southern half on the great alluvial fans. Fruits, nuts and raisins are the chief products

The Sierra Nevada and the Great Valley extend south to latitude 35° beyond which there are ranges trending nearly east-west from the Mohave desert to the Pacific These and smaller ranges to the south partly enclose the famous fruit-growing lowlands of southern California The sea on the south-west forms the remaining boundary Roughly half of this lowland is underlain by marine sediments The other half consists of small basins filled with detritus from the mountains and overflowing to the sea. Considerable areas both in the basins and on the coastal plain yield artesian water. In the mountains and lowlands of southern California are the great oil fields of the Pacific coast (N M. F)

II. GEOLOGY

All the great general systems of rock formations recognized in Europe are represented in the United States, but close correlation across the Atlantic is not possible in all the systems. The generalized geologic chronology for the United States, including part of the Pre-Cambrian from Canada, is shown in the next column.

Archaeozoic Group.—The rocks representing the Archaeozoic era, the oldest group, outcrop in many parts of the United States, as in the cores of some of the western mountains and in some of the deep western canyons, in the worn down bases of the old mountain complexes of Wisconsin, Minnesota, New England and the eastern piedmont plateau of the Appalachians, and other regions of geologically ancient terrain. They have been revealed in deep borings in many other places and are believed to underlie the younger formations everywhere. They have been described as a "complex of basic and acidic surface and deep-seated igneous rocks, of schists and gneisses in part derived from them and in part of unknown origin, and of shreds and small masses of metamorphosed sediments, all unconformably below and older" than the Proterozoic sedimentary rocks.

No incontrovertible *direct* evidence has been uncovered of Archaeozoic life, though globular masses of metamorphosed limestone of distinctive structure described from Canada and elsewhere, designated ***Eozoon canadense***, are widely believed to be calcareous depositions made by marine algae. The indirect evidences of life are the presence of sedimentary carbon in the form of graphite, and possibly of bacteria-precipitated limestone and bacteria-oxidized iron oxides, in the rocks of the Archaeozoic era. Locally the Archaean rocks are rich in iron ores, chiefly oxides, as in northern Minnesota, and in graphite, as in the Adirondacks.

Eras of Time *Groups of Systems*	*Periods of Time* *Systems of Rocks*	
Psychozoic	Recent Post-glacial	
Cenozoic	Pleistocene (*Quaternary*)	
	Pliocene	(*Tertiary*)
	Miocene	
	Oligocene	
	Eocene	
	Transition—(Arapahoe and Denver Formations)	
Mesozoic	Cretaceous	
	Wide-spread unconformity	
	Comanchian	
	Jurassic	
	Triassic	
Palaeozoic	Permian	(*Carboniferous*)
	Pennsylvanian (*Coal Measures*)	
	Wide-spread unconformity	
	Mississippian	
	Devonian	
	Silurian	
	Wide-spread unconformity	
	Ordovician	
	Cambrian	
Proterozoic	*Great unconformity*	(*Algonkian*)
	Keweenawan	
	Wide-spread unconformity	
	Animikian	
	Wide-spread unconformity	
	Huronian	
	Great and wide-spread unconformity	
	Sudburian (Sudbury, Temiscaming, Doré and Seine Series)	(*Neo-Laurentian*)
Archaeozoic	*Great and wide-spread unconformity*	(*Palaeo-Laurentian*)
	Keewatin (*Grenville*)	
	Coutchiching	

Proterozoic Systems.—The rocks of the Proterozoic systems are widely spread in the United States adjacent to the outcrops of the Archaean rocks, from which they are not always easily distinguished or separated, and in a few other places, but the areal extent of their outcrops is relatively limited. The Sudburian has been but little studied by the geologists of the United States, whereas in Canada, like the other formations of the Proterozoic, it is extensively represented and has been allotted a great deal of attention due to its relation to the great metalliferous ore-bodies which have there been discovered and exploited The Huronian has been much more thoroughly studied by United States geologists, particularly in the Lake Superior region where it is well exposed in the great iron-producing districts The basal members of the Huronian contain tillites (consolidated deposits of glacial till or boulder clay) indicating a glacial climate in this early period of the geologic history of America. Upon this tillite lies a series of heavy quartzites and above this a marine limestone in which are found an abundance of the oldest undoubted fossils *Atokania lawsoni*, an algal growth of considerable size, and definite structure The Animikian is found in the United States only in northern Michigan and Minnesota where it has been exhaustively studied in connection with the rich deposits of hematite and other iron oxides for which the region has become famous and which have their origin principally in the Animikian In nearly all the Animikian areas small or large bodies of hematite are concentrated as a secondary enrichment from extensive deposits of cherty ferruginous carbonate or oolitic greenalite or jasper, and from the productive fields, Mesabi, Penokee-Gogebic, Menominee, and Marquette.

The Keweenawan, the uppermost of the Proterozoic systems, is not extensively represented in the United States, but in Canada it is wide-spread about the Laurentian Shield and of exceeding

economic importance because of its heavy mineralization—"copper, nickel, and silver in large amounts; cobalt, gold, platinum, and palladium in much smaller amounts, and if the iron mines are left out of account, almost all the metalliferous deposits of the southern margin of the Canadian Shield have resulted from the coming of its (Keweenawan) dikes, or sheets, or lava streams." The Keweenawan differs from the earlier Proterozoic systems in enormously thick lava beds which apparently welled up through great fissures to form a thickness of almost or quite 6 m of igneous material, indicating a period of local volcanism unsurpassed in geologic history

The Proterozoic formations of the western cordillera in Montana, Idaho and British Columbia attain a thickness of over 37,000 ft., and in the Grand Canyon region over 12,000 ft. remain after an unknown amount of erosion The Proterozoic formations elsewhere in the continent cannot with even approximate certainty be correlated with the Lake Superior members, because the fossils are too few and indistinct to permit a correlation upon the life of the period, and the lithologic character and sequence of the series are not at all similar.

Palaeozoic Groups.—At the opening of the Palaeozoic era most of the United States, as it now is, was submerged beneath the sea. Over its northern border in north-eastern Minnesota and northern Michigan projected the southernmost extension of that ancient nuclear shield of the North American continent, *Laurentia* Along its eastern seaboard from Maine to northern Florida lay the mountainous western edge of old *Appalachia*, the eastern shore of which has disappeared in the abysmal depths of the Atlantic The south-eastern tip of Florida was included within the northernmost tip of *Antillia*, a land which extended eastward from Central America to the most easterly of the Lesser Antilles Most of Texas and small parts of Louisiana and New Mexico formed the north-eastward point of ancient *Columbia*, and on its north-western border from west-central Nevada to Puget sound the south-westerly shore of *Cascadia* constituted a fifth land mass which, like the other four, has been largely submerged or eroded These five great land masses bounded the great interior sea, within which a complete and fairly continuous series of Palaeozoic series of sediments derived from the erosion of these bordering lands was laid down to record the geologic history in the rich development of life upon the surface of the earth during that early time

Nowhere else in the world is the Palaeozoic record so complete or so full as in North America, and chiefly in the United States. Almost everywhere southward from the Great Lakes and the St Lawrence the strata of the Palaeozoic outcrop, occupies practically all of the Ohio basin, most of the Upper Mississippi and the eastern third of the Missouri Nearly everywhere these strata are relatively horizontal and undisturbed except in the Appalachians where they are much broken and folded, in the Cincinnati uplift where they are gently arched and in the Ozark uplift, an extensive dome where they are more steeply inclined The Palaeozoic strata are also exposed locally in folded narrow bands from north-western Mexico to the Arctic and from the Pacific States as far east as Denver

The Cambrian, the oldest system in the Palaeozoic, is not exposed at the surface over large areas, but is widely distributed across the United States from California to the Appalachians, and from the St Lawrence to Alabama, outcropping generally along the borders of the Pre-Cambrian rocks of old *Laurentia, Appalachia* and *Cascadia* The earliest Waucobian, the first period of the Cambrian found in the United States, has been discovered only in southern California, though the latest Waucobian extends from there to the eastward across the Sierras and northward approximately through Nevada, Utah, Idaho and parts of Wyoming, Montana, Oregon and Washington, and thence to the Arctic ocean, and along the Appalachians from the Gulf of Mexico to the St Lawrence. The outcrops of the Acadian, the middle period of the Cambrian, and of the Croixian, the upper period, are more widely distributed The Ozarkian, which has been only recently definitely established and not yet exactly delimited in vertical extent and which comprises members formerly referred to the Upper Cambrian and Lower Ordovician, is best developed in the southern Appalachians, but is rather widely distributed in the Mississippi valley region and along the borders of old *Appalachia* as well. These four periods, of which the first three are indisputably Cambrian, and the last possibly part of the same system, are characterized by the development of a rich marine fauna in their relatively shallow seas—trilobites, brachiopods and gastropods.

The rocks, dominantly limestone, of the Ordovician system outcrop widely in the United States, but, like the Cambrian, not over very large areas, though in some regions, like the Lexington basin in Kentucky and the Nashville basin in Tennessee, they are extensively exposed. Like the Cambrian, too, the Ordovician exposures are generally distributed about the peripheries of the old Pre-Cambrian land masses, but naturally farther out from their shores. The Canadian, the earliest period of the Ordovician (if the Ozarkian be included within the Cambrian), has not been even roughly delimited, but the submergence during which the Canadian deposits were laid down was restricted to the eastern United States and the Great Basin of Nevada and Utah, and the Acadian section of Canada. The Champlainian period, following the Canadian, was characterized by a submergence of the North American continent to an extent not since approached, with consequent deposit of Champlainian sediments rich in marine fossils—bryozoans, brachiopods, gastropods, cephalopods, crinoids locally, silicious sponges, hydroids, ostracods and early corals—over wide areas. The Cincinnatian, the closing period of the Ordovician, was also a period of extensive submergence during parts of its continuance, but the epicontinental seas varied greatly in extent and position as a whole. The Cincinnatian closed with such a wide-spread withdrawal of these seas that the configuration of the American continent at the close of the Ordovician approached its present outline in its major characteristics

Little indication of volcanic activity during the Ordovician is found in North America, but the period was distinguished by important tectonic movements which resulted in the Taconic deformation in the eastern United States, whereby the sedimentary deposits which had been laid down in a trough between the Appalachians and a land mass lying eastward in New England, from the St Lawrence to Long Island, were folded sharply and metamorphosed profoundly, to constitute the Taconic complex; and the Cincinnati arch and other central interior anticlines were initiated in the middle of the period and at its close were elevated and greatly enlarged.

In the Ordovician, not only of America, but elsewhere, the adaptation of life to environment seems almost as well established as now. The muddy bottoms of the seas into which rivers of medium grade emptied, were characterized by certain forms that were quite distinct from those that developed in seas with sandy and gravelly bottoms, and the clear water areas developed still other groups The differentiating effect of isolation is clearly brought out in the fossils of the Ordovician wherever a portion of the epicontinental sea was cut off by such a barrier as an anticline, or wherever ocean currents of different temperature or salinity prevented intermingling of the faunas. Thus the life of the Ordovician was fuller, richer and higher in the evolutionary stage than that of the Cambrian. Trilobites, cephalopods, gastropods, pelecypods, cystoids, graptolites and corals of advanced and varied types predominated, and bryozoans, crinoids and fishes appeared for the first time.

The Ordovician formations have yielded much, if not most, of the natural gas and petroleum of Ohio and Indiana and a great deal in other eastern States; lead and zinc have been produced from the sulphide and carbonate ores from the Galena formation of eastern Iowa, south-western Wisconsin and north-western Illinois which is a Middle Ordovician member; calcium phosphate, a valuable fertilizer is obtained from the Ordovician of central Tennessee; and limestone, marble and cement are widely quarried from the members of the Ordovician from Vermont to Tennessee.

The Silurian of North America is nearly everywhere rather readily cut off from the Ordovician by a relatively distinct, angular unconformity in the east and by an equally distinct disconformity in fossil content in the interior. The Oswegan, the lowest of the

three distinct major divisions of the Silurian, initiates the period with the epicontinental seas apparently confined to three major extensions upon the area of the present continent: one stretching up the Mississippi valley to northern Illinois; a second extending across Newfoundland and northern New Brunswick, and a third occupying the Appalachian trough, and stretching east and west over central New York and Ontario. Following the Oswegan, the Niagaran continues the period with an expansion of the Silurian seas over the United States east of the Mississippi river and over a large part of Canada to the Arctic ocean, and an extension of two seas on the west, one from California through Idaho to Canada, and another from Mexico into Arizona and New Mexico. The Cayugan closes the period with a withdrawal of the Silurian seas until they covered only the region from Wisconsin and Illinois through New York and over the Appalachian trough.

During the Silurian the Cincinnati uplift or anticline continued a prominent physiographic feature separating distinct marine basins and faunal provinces. The Ozark uplift likewise constituted a conspicuous feature of the continental landscape; and more land emerged in western United States than ever before.

The Silurian fauna is characterized by a wealth of types with radial symmetry, as was the Ordovician; the brachiopods became larger and sturdier, the eurypterids or "sea-scorpions" were common and corals widely scattered. It was in the Niagaran when the seas were most widely extended that the life was richest and most cosmopolitan The first recognized land plants—of low form—are from the Cayugan. Fishes probably occupied the fresh waters of the whole Silurian period, but their fossils appear only in the closing part.

The Salina group, one of the upper members of the Cayugan, yields the salt obtained from wells in New York, Ohio and Ontario; and the Clinton formation, the basal member of the Niagaran, yields hematite, or red iron ore, from New York to Alabama, now worked extensively only in the Birmingham region, and considerable oil and gas in central Ohio and eastern Kentucky.

The Devonian system is widely distributed in North America, but the lower groups are confined to the margins of the continent, whereas the middle groups also occupy a considerable portion of the interior of the continent, where the disconformity in faunal succession makes it easy to separate the Devonian from the underlying Silurian The Catskills constitute one of the most impressive sections of the Devonian in the United States, and the Eureka district of Nevada another. Excellent type sections also outcrop along the shore of Lake Erie for about 25 m west of Buffalo, and about Cumberland, Md Cleveland, Ohio, is situated on Upper Devonian; Sandusky and Columbus, in the same State; Milwaukee, Wisconsin, Davenport, Iowa and Alpena, Michigan, are situated upon Middle Devonian.

When the Devonian period opened practically all of North America had emerged from the ocean, only narrow seas occupying the Appalachian, Acadian and Cordilleran troughs, and an embayment extending northward from the Gulf to the base of the Cincinnati uplift and the Ozark dome The continent began submerging early, however, and by the Middle Devonian the Gulf embayment with its warm waters had spread northward to Hudson bay, and the Cordilleran trough was occupied by a widened sea that extended northward to the Arctic During the Upper Devonian the seas gradually withdrew again until the interior and the Cordilleran area were no longer inundated Only small crustal movements, except the notable Shickshockian disturbance which affected eastern Canada and north-eastern United States, and little volcanic activity distinguish the Devonian of North America

The life of the Devonian in America may be arranged in three provinces: the Atlantic, especially in the Lower Devonian, with its life forms related to those of the Rhine district of Europe; the Central Interior, or Gulf, its life related to that of South America; and the Cordilleran, its life derived from the Pacific and the Arctic. In general, the life resembled that of the Silurian, except that fishes had become exceedingly abundant, and amphibia had begun to appear, indicative of the evolutionary trend toward vertebrate dominance, and the further rapid development of air-breathing animals to occupy the land and the air.

> There is no more significant or picturesque period in the history of the earth than the Devonian. This is the time when the former nakedness of the lands becomes clothed with a deeper verdure and the first forests appear, providing the needed homes and food for the invasion of the continents by the ever-hungry descendants of the denizens of the sea. The conquest is first attained by the invertebrates —the scorpions, shell-fish, worms and insects Of greater significance, however, is the adaptation of other marine animals to the land, which eventually leads to the origin of the fishes, the advance guard of the vertebrate hosts, through the development of lungs and the increase in mentality
>
> The invasion of the land is fairly under way in the Devonian, chiefly in the rivers and lakes, but due to the prevailingly arid climates a fierce struggle is instituted among the inhabitants of the then temporary waters, resulting in the dominancy of the better equipped air-breathing fishes, an issue prophetic of vertebrate ascendancy, hereafter never to be questioned in its onward sweep to its culmination in man (Pirsson and Schuchert, *Text-book of Geology*, p. 714)

Petroleum and natural gas in large quantity have been derived from the Devonian formations of Pennsylvania, West Virginia, Ohio and New York

The Carboniferous periods, including the Mississippian (Lower Carboniferous), the Pennsylvanian (Upper Carboniferous) and the Permian, are best considered together, because while there is general unconformity between the Mississippian and the Pennsylvanian, the only areas of continuous sedimentation persisting in Utah and Arizona, the transition from Pennsylvanian to Permian is so gradual as to make definite separation impracticable, and the evolution of life forms is continuous and interrelated through the whole period

When the Devonian period closed the seas had retreated from most of North America, but in Waverlian time (early Mississippian) the Gulf States and the western side of the Cincinnati uplift were inundated over small areas which later gradually expanded to large size, and the Cordilleran sea submerged extensive areas in the Rocky Mountain region, connecting with the embayment in the Central Interior The northern Appalachian basin during Waverlian time extended over Ohio, Michigan and Pennsylvania, the Central Interior sea from central Iowa southward and south-eastward to the Gulf, and south-westward to Texas; and the Acadian seas flooded a connected series of narrow troughs between mountain ranges At the close of Waverlian time the seas had apparently withdrawn from the whole Cordilleran basin, and from practically the whole of the continent, so that the sedimentary record to the Tennesseean is broken Tennesseean time is characterized by general emergence with limited areas of sea in the Central Interior embayment and the southern Appalachian and Cordilleran troughs.

The marine life of the Waverlian was distinguished by a great abundance and rich variety of crinoids, and the *Productus* type of brachiopods flourished Reef-building corals were rare but bryozoans and cup corals were numerous Sharks dominated the seas Trilobites were almost gone On land no record has been found of animals but low forms of plants were wide-spread The marine life of the Tennesseean closely resembled that of the Waverlian, while the land record is better in that it reveals tracks of many amphibians. Petroleum and natural gas have been obtained from the Mississippian of Ohio, Pennsylvania, West Virginia and Kentucky

The Pennsylvanian is distinguished by the greatest known accumulations of coal, not only in America but in Eurasia as well, that have been laid down in all geologic history, though some of the later formations, especially those of the Cretaceous, also bear coal in much smaller extent and quantity. In the United States the Pennsylvanian formations of the Rocky Mountains bear no significant coal beds such as are found in the central and eastern parts of the country

The Pennsylvanian-Permian was a period of quiet inundation, the seas transgressing the land from the south-west and spreading northward and eastward. Only local warping or uplift occurred in this period in most of America, except in the Pacific area from northern California to Alaska, though in Eurasia it was a period of extensive tectonic disturbance. In the Appalachian basin east of the Cincinnati uplift, and in the Interior Sea west of this axis into Nebraska, Kansas, Oklahoma and Texas the sea-level was

oscillatory and deep-sea conditions alternated with littoral and marsh conditions, the coal being formed when the latter conditions prevailed. The Pennsylvanian-Permian seas receded from the North to the south-westward and finally vanished in Permian time, when the Appalachian revolution raised mountains probably 3 m. high in the eastern part of the United States, and the whole continent emerged to the same extent, approximately, as now.

The life, both plant and animal, of the Pennsylvanian-Permian was characterized by its relatively cosmopolitan character and distinguished by the change of dominance in biologic interest from the sea to the land. The vegetation, particularly of the humid, tepid marshes of the Pennsylvanian, was extremely luxuriant The numbers, sizes and varieties of ferns and fernlike plants, horsetails, clubmosses, sigillarias or seal-trees, and lepidodendrons or scale-trees has apparently never been surpassed in geologic history, and though many other low forms were abundant, it was these that gave the flora of the period its unique quality and furnished the parent material for the great coal beds. Through these bizarre forests a host of insects, some of them of great size and including some 500 species of cockroaches, swarmed, and grotesque amphibians and reptiles crawled from pool to pool and among the giant boles. The freshwater and marine life was likewise rich and varied with an abundance of sand-loving or mud-loving forms frequenting the shallow pools, lagoons and seashores With the desiccation and glaciation attendant upon Permian time both plant and animal life declined in vigour and variety, but made great advances in evolution toward adaptation to modern conditions.

The most important product, by far, of the Pennsylvanian formations, is coal. The important coal beds of Nova Scotia and New Brunswick, the great Appalachian coal-field including the anthracite beds of north-eastern Pennsylvania; the Michigan coal-field; the great Indiana-Illinois-Kentucky coal-field; the Iowa-Missouri-Texas field; all these are of Pennsylvanian origin. Beds of iron ore in a few places, particularly Ohio and Pennsylvania, are associated with the coal, and fire-clay is often taken from the mines and pits where coal is extracted. Petroleum and natural gas have been found in some of the Pennsylvanian sandstones in Illinois, Kansas and Oklahoma.

Mesozoic Groups.—The Mesozoic formations are, in general, more important in the western part of the United States than in the eastern, for while the present configuration and character of the eastern part of the North American continent were practically completed as they now are by the Appalachian revolution which concluded the Palaeozoic era, the western part was essentially modified and determined in the Mesozoic

In the Triassic, the earliest period of the Mesozoic, the eastern part of the United States was almost entirely land, with wind, water and other agents of erosion wearing down the eminent ridges and peaks formed by the Appalachian revolution at the close of the Permian, with deposition of sediments in intermontane seas and marshes such as the trough in which the Connecticut valley now lies, and with considerable volcanic activity locally; the Rocky Mountain region was covered over in part with some marine sediments from seas intruding from the west, but in much greater part with freshwater mud and sand, or wind-blown sand and loess; and the Pacific coast belt was submerged beneath a sea in which normal marine deposits were laid down The Triassic formations of the eastern part of the United States—in the Connecticut valley, across northern New Jersey, south-eastern Pennsylvania, Maryland, and into Virginia and North Carolina, are prevailingly red in colour, coarse, and indicate by the character of their sediments and fossils that they were worn down from a high land of crystalline rocks, and deposited, in a semi-arid climate with hot summers and possibly cold winters, upon the surface of such troughs as that of the Connecticut valley. The Triassic formations of the Rocky Mountain cordillera comprise a series of red or variegated sandy shales and cross-bedded sandstones, with thick beds of gypsum The Triassic formations of the Pacific border are dominantly calcareous and rich in corals and other marine fossils; submarine or littoral volcanoes poured out thick beds of igneous material, particularly from the middle Jurassic to its close. The Jurassic closed with a significant uplift of great block mountains in the eastern part of the country, known as the Palisade disturbance.

The life of the Triassic, strikingly new and different from the Permian, has not been adequately recorded in the rocks and only fragmentary knowledge has been discovered. The floras were small; the insect life was negligible; fish were rather abundant in the freshwater lakes and lagoons and in the salt seas; land vertebrates were varied, particularly such reptiles as the great dinosaurs; primitive reptilian mammals had evolved; and the seas swarmed with ammonids, squids and siphonate gastropods, and reef-building corals formed reefs hundreds of feet thick. Coal beds of limited extent were laid down in the Triassic depressions in Virginia and North Carolina, and at the close of the Triassic some copper ore was deposited in New Jersey with the copious basaltic intrusions

The Jurassic in the eastern United States opened with a period of active erosion as a result of the great uplift of the Palisade disturbance, which continued throughout the period and reduced the high Appalachian and massive Palisade mountains to a peneplain. Along the Pacific coast the sea, after its withdrawal from the continent at the close of Triassic time, again began in the Jurassic to transgress upon the coast and into the Californian sea of Oregon, California and Nevada, where great thicknesses of sandstones and shales and some limestone were deposited From Alaska and British Columbia a middle Jurassic sea, Logan sea, invaded Montana, Idaho, Wyoming, Colorado and Utah, where widely and locally variable deposits of sandy clays, shaly marls, impure limestones, crossbedded sandstones and universally present oyster shells indicate only shallow water conditions. Great tectonic activity characterized the close of the Jurassic in the western part of North America; the Sierra Nevadas, the Coast range of California, the Humboldt range of Nevada, the Cascades and the Klamath mountains were elevated A great geosyncline, called the Coloradoan, east of the Sierra Nevadan uplift, and the Great valley of California were formed near the close of the Jurassic Considerable volcanic activity continued throughout the period, increasing in intensity and extent toward its close.

The life of the Jurassic includes a cosmopolitan land flora revealing a rich, varied growth of Cycads and the beginning of modern types; a great number of insects; diversified and advanced reptiles, both terrestrial and marine, the earliest birds; and a wealth of marine invertebrate and vertebrate forms including sharks of modern types and the first flat fishes.

The Jurassic Mariposa and Auriferous slates (Gold Belt series) of the Sierra Nevadas contain the gold-bearing veins of quartz in which lie the "mother" lode from which the rich placer deposits of California have been derived.

The Comanchean, by which American geologists distinguish the Lower Cretaceous, which corresponds approximately to the lower series of six or perhaps seven stages generally included within the Lower Cretaceous of Europe, appears in the United States as a continental phase in limited areas along the Atlantic coast and in extensive regions in the Rocky Mountains; and as two distinct marine faunal provinces: the Shastan, a Pacific coastal overlap, and the extensive Comanchean of the Gulf of Mexico over Arizona, New Mexico, Texas, Oklahoma, Kansas, Arkansas and Colorado from which the group derives its name. The Comanchean extension proper was limited in extent in the United States during Middle Comanchean time, but became more widespread in Late Comanchean The waters of this sea apparently were shallow, muddy and brackish from the fresh water poured in by the rivers debouching upon it The Shastan overlap at first filled chiefly the Great valley of California and the Willamette-Puget sound basins but later spread widely to become a shelf sea into which rivers from the highlands to the eastward poured a great thickness of generally coarse-grained sediments. The continental deposits of the Great Plains country from Montana southward into New Mexico were apparently laid down over a relatively low, flat plain occupied by small shallow lakes and lagoons, rimmed by broad marshes in which many great dinosaurs lived. Some of these same dinosaurs lived also in the Triassic

swamps of the Atlantic coast, where the deposits indicate fresh-water deposits laid down in river valleys in the earlier part of the period, and estuarine beds along the seaboard in the later part.

Toward the close of the Comanchean, crustal movement is evident along the Pacific coast throughout the coast ranges and the Cordilleran Intermontane disturbance initiated the process by which the high plateaux of the western part of the United States and northward and southward were elevated. Along the Atlantic coast the Piedmont and Appalachian regions were elevated somewhat, thus rejuvenating the streams flowing from them.

The record of the life of the Comanchean indicates the wane of the cycads and the rapid rise, probably in the eastern United States, of the angiosperms, the ancestors of the dominant forms of modern floras, and the growth of the first "hardwood" forests —oaks, elms, poplars, maples and magnolias, for instance; the maximum development, both in size and variety, of the dinosaurs, and the decline of the ammonites in the seas.

The last system of the Mesozoic, the Cretaceous, records the last wide-spread transgression of the sea over the United States The extensive peneplanation of the preceding periods had reduced much of the land to river or coastal plains or low rolling hill lands, and when the Cretaceous submergence began it progressed fast over these. The whole Pacific coast was submerged, practically the whole interior west of the Mississippi, the Gulf States as far north as Illinois, and the Atlantic coast as far north as New Jersey The broad Coloradoan interior sea extended from the Gulf of Mexico to the Arctic ocean Always a shallow sea, the sediments rapidly accumulating after the Laramide revolution in late Cretaceous time soon filled it, but while it persisted deltas, bars and low islands were formed in its shallow, muddy, marshy waters The Laramide revolution was a profound orogenic change by which the mountains of western North America and South America were raised to a grandeur that they have never lost.

The life of the Cretaceous embraces the end of the dinosaurs and their contemporaries The close of the period marked the culmination of the "mediaeval" period in the evolution of animal life, a period long passed by the evolution of the flora; for the flora of the Cretaceous was distinctly modern, including birch, beech, maple, oak, walnut, sycamore, tulip, laurel, holly, ivy, sweet gum, breadfruit and hazelnut The first sedges and grasses appeared Large reptilian carnivorous birds appeared, and many mammals The Cretaceous was a time of extinction for many marine forms, of toothed birds and dinosaurs, and the destruction of reptilian supremacy

The chief economic product of the Cretaceous is the coal which was laid down in many places in the western part of the United States, and ranging in grade from lignite to anthracite.

Cenozoic Groups.—The lower four groups of the Cenozoic—the Eocene, Oligocene, Miocene and Pliocene—record no great epeiric seas in the United States, but merely epicontinental or marginal overlaps which oscillated back and forth over the relatively narrow areas of submergence Along the North Atlantic coast Eocene deposits are not found north of New Jersey, though beds occur in Maryland, Delaware and Virginia; Miocene sands, clays and marls are found all the way from Massachusetts to Alabama; marine Pliocene deposits are few and scattered, the Oligocene is not represented In the eastern Gulf section from Cape Hatteras southward and westward to the Mississippi river, Eocene and Oligocene deposits are well distributed with an excellent sequence of Oligocene and Miocene in Florida. In the western Gulf section from the Mississippi river to Mexico stages of the Eocene are found in rather extensive deposits; the Oligocene is well developed in Louisiana; the Miocene is known only in deep wells; and the Pliocene is missing.

California, Oregon and Washington reveal marine Cenozoic sediments: Eocene to a depth of 8,000 to 12,000 ft.; late Miocene in California, 8,000 ft ; and Pliocene and Pleistocene south of San Francisco to a depth of 13,000 feet Continental Cenozoic deposits are wide-spread in the foot-hills and high plains east of the Rocky Mountains. Great tectonic and volcanic activity characterized the Cenozoic in the United States, and the great Cascadian revolution was initiated, and continued, the great uplift responsible for the Colorado plateaux and the cutting of the Grand Canyon, and the grand volcanoes—Rainier, Shasta and Lassen—which remained active throughout the Pleistocene The close of the Pliocene was a time of great deformation, a critical period of geologic history in the United States, when the final aspect of the surface as we know it was largely determined.

The Pleistocene or Quaternary, the final division of geologic chronology, was marked by the culmination of the Cascadian revolution, and the extensive glaciation that followed, when more than the northern half of North America and Europe was buried beneath great strata of ice Three great ice caps formed in America: the Labrador, east of Hudson bay; the Keewatin, west of Labrador; and the Cordilleran, over the Canadian Rockies Many smaller outlying caps or shields were formed about the margins of these caps. The glaciation was not continuous, but five stages of ice formation and extension with four interglacial stages have been generally recognized in the United States

Divisions of Pleistocene Time in North America[1]

Post-glacial or present time	Vanishing of ice-sheets Champlain marine invasion Lowering of water-level of Great Lakes Gradual amelioration of climate. Gradual extinction of elephants, mastodons, *Megalonyx*, musk-oxen, etc
Fifth or Wisconsin glacial stage Wurm stage in Europe	Spread of ice-sheets and drift Fauna and flora driven south.
Fourth or Peorian inter-glacial stage	Record not well determined Formation of peat beds and soils Wide distribution of loess.
Fourth or Iowan glacial stage	Spread of ice-sheets and drift. Record not well determined.
Third or Sangamon inter-glacial stage	Accumulation of peats, soils and loess Horses, elephants, mastodons, bison, peccaries and tapirs probably present.
Third or Illinoian glacial stage Riss stage in Europe	Spread of ice-sheets and drift. Deposition of loess Apparently 60% of present land fauna then living Mastodons, mammoths, horses, tapirs, bison, deer and sabre-tooth tigers.
Second or Yarmouth inter-glacial stage	Formation of peats, soils and bluish loess Animals about as in Illinoian stage
Second or Kansan glacial stage Mindel stage in Europe	Spread of ice-sheets and drift. Extinction of certain camels and horses
First or Aftonian inter-glacial stage	Great abundance of mylodons, megatheres, *Megalonyx*, mastodons, elephants (3 species), horses (6 species), camels (4 species), sabre-tooth tigers, bears, etc. A warm temperate fauna
First or Sub-Aftonian glacial stage	Spread of ice-sheets and drift Includes Pre-Kansan, Nebraskan and Albertan drifts.
Pliocene	

During the Pleistocene glaciation the surface of the areas covered by the ice as well as those contiguous to its borders was profoundly modified by the ice itself or by the waters resulting from its meeting About the centres of origin of the several ice caps the terrain was scoured, sculptured, deeply grooved by the moving ice; about the peripheries this erosive action was minimized and depositional changes were most pronounced As the ice receded the whole character of the Great Lakes was changed, the drainage systems of the whole area disturbed, and the aspect of the entire area was significantly changed

The extensive lands of Cenozoic time were dominated by mammals, and even the seas contained representatives of this great group. The life that characterized the Mesozoic was practically extinct before the close of the Eocene and by the time the Oligocene had dawned the mammal life had assumed a distinctly modern aspect, though still rather primitive With increasing des-

[1]Pirsson and Schuchert, *Text-book of Geology*, p 949.

iccation and cold in the Miocene, and consequent extension of grasslands, ruminants and rodents increased in number and variety. Prominent among the forms of this time were horses, camels, rhinoceroses, deer, sabre-tooth tigers and many others. The Pliocene is equally interesting for its life, but because the land stood high and little deposition was taking place on land, few fossils formed The evolution of the horses, the camels and the elephants has been most fascinatingly worked out The first primates, from which man is considered to have descended, appear as lemurs or lemuroids in the American Eocene; the oldest ape appears in the Egyptian Oligocene; the oldest ape man in the Javan Pleistocene; and the first dawn-man with the characteristic qualities of the modern *Homo sapiens* is thought to have originated on the steppe plateaux of Central Asia when first appeared conditions necessitating his leaving the trees and walking upright on the grasslands The evolution of man, *Homo sapiens,* is a Pleistocene record, of which little that can be authentically substantiated has been written in the United States, though skeletal remains and cultural artifacts found in Florida, Oklahoma, Texas and Colorado may in time prove valuable pages in the history.

The Psychozoic age is the present and has little geologic significance. As Charles Schuchert, the doyen of American palaeontologists and stratigraphers, states. "We are now living in a time of rugged lands, obliteration of old peneplains, cold polar climates, and marked temperature belts . . . Human mentality now dominates the organic world, and to it all creation will soon be more or less subservient"

Bibliography.—The publications of the U S. Geological Survey and all articles on American geology have been thoroughly indexed on every phase and branch of American geology Modern general treatises include Pirsson and Schuchert's *Text-book of Geology;* Chamberlin and Salisbury's *Geology*, Grabau's *Text-book of Geology*, Scott's *Introduction to Geology*, Cleland's *Geology, Physical and Historical;* and a number of others The *Journal of Geology, Economic Geology* and the *Bulletins* of the American Association of Petroleum Geologists are the chief serial publications on the subject of U S geology The publications of the U S Geological Survey and of the several State Geological Surveys are particularly important (W. E E)

III. CLIMATE

The climates which are found within the boundaries of the continental United States are extremely diverse, yet it is possible to deduce certain facts of broad application concerning them The country lies wholly in the temperate zone Hence its mean annual temperatures are intermediate between those of the Arctic regions on the one hand and those of the torrid zone on the other, a fact not inconsistent with the occurrence, in some parts of the country, of summer maximum temperatures surpassing any found within the tropics, and in other parts of winter minimum temperatures rivalling those of the Arctic The country also lies, for the most part, within a so-called "belt of prevailing westerly winds" This expression implies a general drift of the atmosphere from west to east within the region concerned, but it does not imply anything like constant wind directions in particular localities. The winds of this belt are much modified locally by topography, they are subject to certain seasonal variations, and they vary markedly, especially in the northern part of the country, with the constant passage of the disturbances known as cyclones and anticyclones These disturbances, which, with some exceptions, cross the country in a general west-to-east direction at speeds averaging from 500 to 600 m a day, bring with them frequent weather changes—ups and downs of temperature, alternations of clouds and sunshine—which are a striking feature of the climate in most parts of the United States

The eastward atmospheric drift from the Pacific ocean gives the western coast of the United States a marine climate; which means essentially a small range of temperature, annual and diurnal. This is, however, confined to the immediate border of the Pacific, on account of the mountain barriers that prevent the influence of the ocean from extending far inland Even the relatively low coast range gives the valleys east of it a quasi-continental climate, and "continentality" becomes pronounced east of the lofty Sierra Nevada-Cascade system Wide ranges of temperature are found thence eastward all the way to the Atlantic coast, except in the far south, where trade winds, blowing from easterly quadrants, bring the land under the climatic control of the Atlantic ocean and the Gulf of Mexico. The mountain barriers above mentioned, besides their striking effects on temperatures to the eastward, precipitate most of the moisture brought by winds from the Pacific on their windward slopes, and are thus responsible for the great region of arid and semi-arid climates, embracing about one-third of the country, which extends roughly from the 120th to the 100th meridian. Farther east a moderate to ample rainfall is supplied mainly by intermittent cyclonic air currents, which import moisture from the Atlantic and the Gulf. One more factor of major importance controlling climates east of the Rockies is the absence of mountain ranges trending east and west. A broad open lowland stretches from the Arctic ocean to the Gulf of Mexico. Thus winds of cyclonic origin have a clear sweep between the northern and southern borders of the country and are enabled to exercise profound effects upon the distribution of both temperature and moisture. In winter a flood of cold air from the interior of Canada sometimes causes freezing weather along the Gulf coast; in summer, warm, muggy air from southern waters often affects the comfort of people living inland

For purposes of climatographic description the country has been variously divided into larger or smaller units. The United States weather bureau has published elaborate climatic data for 106 "sections" of the country, the boundaries of which are mainly political or arbitrary In this sketch of regional climates we adhere to the simple system of "climatic provinces" proposed by Prof. Robert De Courcy Ward of Harvard in the year 1915

Eastern Province.—Because of the predominant westerly winds, the Atlantic ocean, though it frequently influences temperatures far inland, does not prevent the occurrence over the whole of this province and even for some distance off shore of the wide temperature ranges characterizing a continental climate "Spells" of extremely cold weather occur in winter, and of intensely hot weather in summer. The latter are frequently attended by high humidity, and are the cause of much distress and discomfort In summer the difference in temperature between the northern and southern parts of this province is relatively small, but in winter it is very marked. In January the mean monthly temperature decreases northward at the rate of 2 7° F for each degree of latitude, both on the Atlantic coast and in the Mississippi valley. The normal rainfall is adequate for crops throughout the province The snowfall is generally heavy in the northern States, where the expense of keeping streets and rural highways open to traffic amounts to many millions of dollars every winter. Frequent weather changes due to cyclonic disturbances are characteristic of the eastern province, especially in the north-eastern part.

Gulf Province.—This region has a semi-marine and semi-tropical climate, less subject to cyclonic control and much more affected by oceanic influences than the climate of the eastern province The summers are long and hot and the winters are prevailingly mild, though occasional severe frosts and freezes cause enormous losses in the rural industries The rainfall is normally copious over most of the region, but severe droughts are known.

Plains Province.—The outstanding climatic feature of this region is the light rainfall—mostly less than 20 in. in the average year. Agriculture is practised with the aid of irrigation, or by dry-farming methods, but over a great part of the province gives place to grazing. The cyclonic control of the weather is less pronounced over the plains than in the eastern States; the diurnal ranges of temperature are greater; the air is drier, there is more sunshine and more wind. Parching "hot winds" sometimes blow in summer, causing much local damage to crops. The "chinooks" that blow down the eastern slopes of the Rocky mountains are *Föhn* winds, the heat and dryness of which are responsible for especially striking effects in winter. The blizzard is a dreaded episode of winter over the northern plains.

Plateau Province.—This region, lying between the Rocky mountain divide on the east and the Sierra Nevada-Cascade divide on the west, has a very light rainfall, except where increased locally by altitude, and includes the most pronounced desert regions of the United States, in south-eastern California, south-

western Arizona and western Nevada Dry, stimulating air, abundant sunshine and a wide diurnal range of temperature are dominant features of the climate. The south-western deserts are notorious for the heat and aridity of their summers Death Valley, Calif., has the smallest mean annual rainfall—1·65 in at Greenland Ranch—recorded anywhere in the country Greenland Ranch likewise registers the highest shade temperatures in the United States, with an absolute extreme of 134° F.

Pacific Province—Marine influences combined with rugged topography give to this region a remarkable diversity of climates. The whole coast has mild winters and cool or moderately warm summers The interior valleys have hot summers In the great central valley of California temperatures of 110° to 120° are sometimes registered on summer days In the northern part of the province, near the coast, the rainfall is the heaviest in the United States (over 100 in), while the southern part of the province is semi-arid The upper slopes of the Sierra Nevada and Cascade ranges have the heaviest snowfall found in North America Precipitation is much heavier in winter than in summer in both the north and the south, and in California the summers are almost rainless. Fog is very prevalent along the coast.

About 100 tornadoes are recorded in the United States annually, and some of them are terribly destructive within small areas They occur mainly in the warmer months and are rare west of the 100th meridian Cyclones of tropical origin ("West Indian hurricanes") cause serious damage on the south Atlantic and Gulf coasts at intervals of a few years Ice storms—cold weather rainstorms coating terrestrial objects with ice—sometimes cause very extensive breakage of trees, wires, etc., especially in the north-eastern quarter of the country

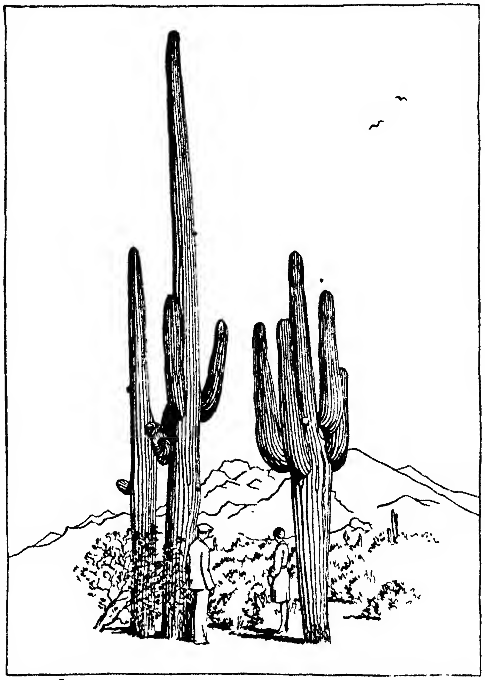
BIBLIOGRAPHY—The latest and most useful descriptive work applying to climates throughout the country is R. De C. Ward's *Climates of the United States* (Boston, 1925) A. J Henry's *Climatology of the United States* (United States weather bureau *Bulletin* [Washington, 1906], contains much more copious numerical data and larger charts) The chief statistical work is the United States weather bureau *Bulletin W*, "Summaries of Climatological Data by Sections," 2nd ed (Washington, 1926) The parts relating to each of the 106 "sections" of the country may be obtained separately. Splendid detailed climatic charts are a feature of the *Atlas of American Agriculture*, which the United States Department of Agriculture has been publishing in instalments for some years. The first section on climate—*Frost and the Growing Season*—appeared in 1918 Statistics and extensive discussions of individual elements of the climate (temperature, rainfall, etc) have been published in bulletins of the weather bureau and elsewhere Abundant climatographic literature will be found in the monthly *Weather Review* (Washington) Among the more remarkable of the numerous works on the climates of particular areas are O. L. Fassig, *Report on the Climate and Weather of Baltimore and Vicinity* (Baltimore, 1907), H J Cox and J H Armington, *Weather and Climate of Chicago* (Chicago, 1914); W H Alexander, *Climatological History of Ohio* (Columbus, 1923) (C. F. T.)

IV. FAUNA AND FLORA

Fauna.—Differences of temperature have produced in North America seven transcontinental life-zones or areas characterized by relative uniformity of both fauna and flora; they are the Arctic, Hudsonian and Canadian, which are divisions of the Boreal Region; the Transition, Upper Austral and Lower Austral, which are divisions of the Austral Region, and the Tropical.

The Arctic, Hudsonian and Canadian enter the United States from the north and the Tropical from the south; but the greater part of the United States is occupied by the Transition, Upper Austral and Lower Austral, and each of these is divided into eastern and western subzones by differences in the amount of moisture. The Arctic or Arctic-Alpine zone covers in the United States only the tops of a few mountains which extend above the limit of trees, such as Mt. Washington in the White Mountains of New Hampshire, and the loftier peaks of the Rocky, Cascade and Sierra Nevada mountains. The larger animals are rare on these mountain-tops The Hudsonian zone covers the upper slopes of the higher mountains of New England, New York and North Carolina and larger areas on the elevated slopes of the Rocky and Cascade Mountains; and on the western mountains it is the home of the mountain goat and mountain sheep.

The Canadian zone crosses from Canada into the northern parts of Maine, New Hampshire, Michigan, Minnesota and North Dakota; it covers the Green Mountains, most of the Adirondacks and Catskills, the higher slopes of the mountains from Pennsylvania to North Carolina and Tennessee, the lower slopes of the northern Rocky and Cascade Mountains, the upper slopes of the southern Rocky and Sierra Nevada Mountains and a strip along the Pacific coast as far south as Cape Mendocino. Among its characteristic mammals and birds are the lynx, porcupine, northern red squirrel, varying and snowshoe rabbits, white-throated sparrow, spruce grouse, and Canada jay, within this zone in the North-eastern states are a few moose and caribou

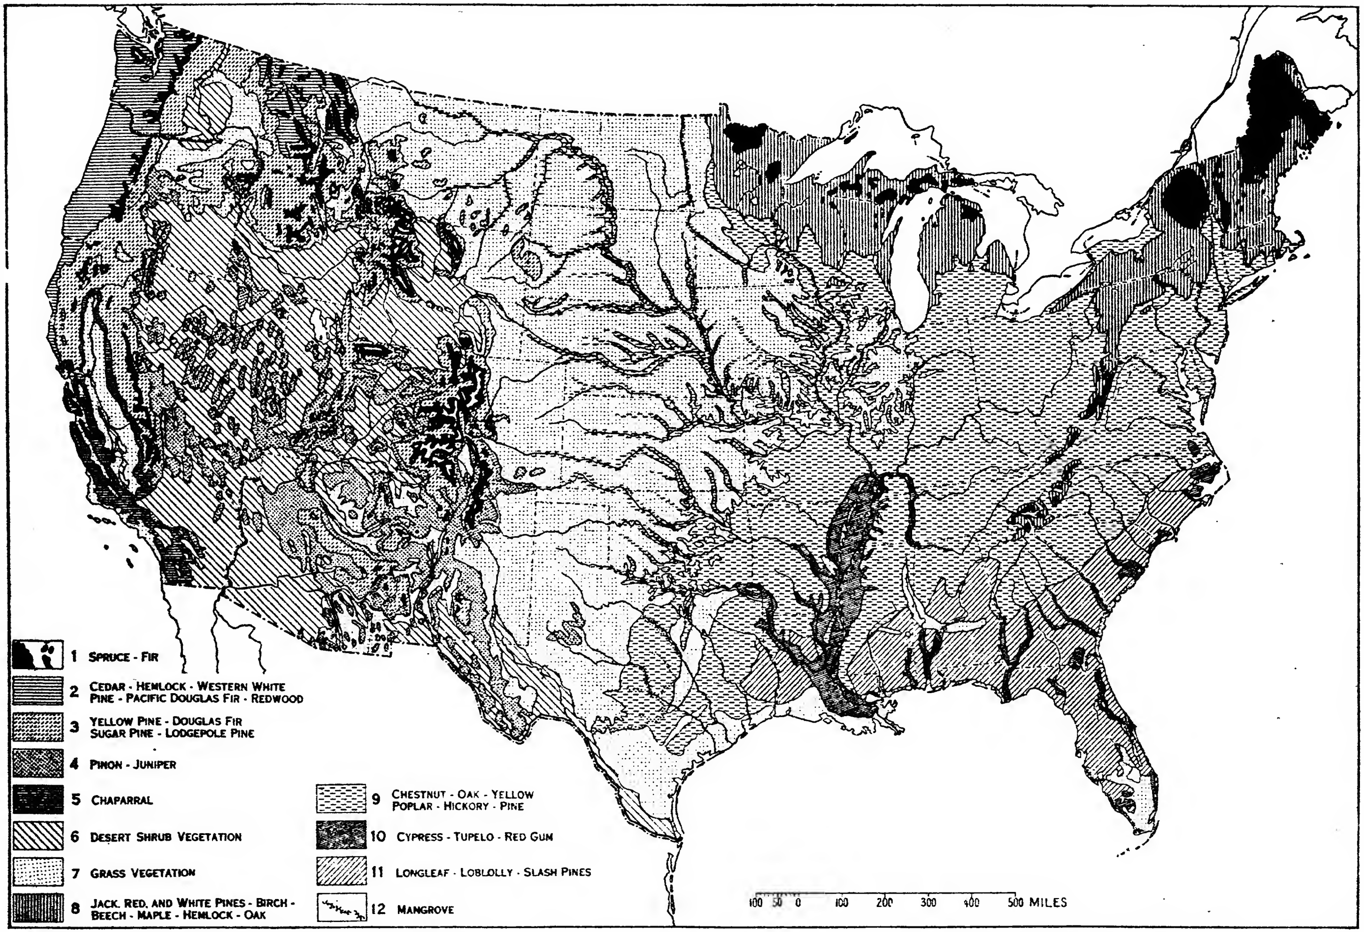


SAGUARO OR MONUMENT CACTUS (CEREUS GIGANTEUS)

This giant cactus, a characteristic feature of the hot deserts of S. Arizona and S.E. California, sometimes attains a height of 60 feet and a trunk diameter of 2 feet The spiny, deeply ribbed, erect stem, often unbranched but usually with several trunk-like ascending or erect branches, bears a profusion of large, showy, white flowers, and red, juicy, edible fruit

The Transition zone, in which the extreme southern limit of several boreal species overlaps the extreme northern limit of numerous austral species, is divided into an eastern humid or Alleghanian area, a western arid area, and a Pacific coast humid area The Alleghanian area comprises most of the lowlands of New England. New York and Pennsylvania, the north-east corner of Ohio, most of the lower peninsula of Michigan, nearly all of Wisconsin, more than half of Minnesota, eastern North Dakota, north-eastern South Dakota, and the greater part of the Appalachian Mountains from Pennsylvania to Georgia It has few distinctive species, but within its borders the southern mole and cotton-tail rabbit of the South meet the star-nosed mole and the varying hare of the North, and the southern bobwhite, bluebird, catbird, chewink, thrasher and wood thrush are neighbours of the bobolink and the hermit and Wilson's thrushes.

The Arid Transition life-zone comprises the western part of the Dakotas, north-eastern Montana, and irregular areas in Washington, Oregon, Idaho, Wyoming, California, Nevada, Utah, Colorado, Arizona, New Mexico and western Texas, covering for the



DISTRIBUTION OF THE MAIN TYPES OF NATURAL VEGETATION IN THE UNITED STATES. THE THREE MAJOR NATURAL DIVISIONS OF VEGETATION ARE FOREST, GRASSLAND AND DESERT SHRUB. THE FOREST FALLS INTO TWO CLEARLY MARKED REGIONS, WESTERN AND EASTERN. THE WESTERN REGION COMPRISES SEVEN LARGE FOREST SUBDIVISIONS AND TWO SUBDIVISIONS OF WOODLAND. THE EASTERN REGION COMPRISES NINE FOREST SUBDIVISIONS. FOUR-FIFTHS OF THE FOREST WAS ORIGINALLY IN THE EAST. OF THIS ORIGINAL FOREST THERE REMAINS NOW ONLY ABOUT 10 PER CENT IN VIRGIN CONDITION, 50 PER CENT HAVING BEEN CLEARED FOR FARMLAND, 30 PER CENT CUT OVER AND NOW GROWN UP TO TREES OF SUFFICIENT SIZE FOR SAW LOGS OR CORDWOOD, AND ABOUT 10 PER CENT CUT OVER OR DEVASTATED BY FIRE AND REDUCED TO BRUSHLAND

most part the eastern base of the Cascade and Sierra Nevada Mountains and the higher parts of the Great Basin and the plateaus. Its most characteristic animals and birds include the white-tailed jack-rabbit, sage-hen and sharp-tailed grouse. The Pacific Coast Transition life-zone comprises the region between the Cascade and Coast ranges in Washington and Oregon, parts of northern California, and most of the California coast region from Cape Mendocino to Santa Barbara. It is the home of the Columbia black-tail deer, western raccoon, Douglas red squirrel, tailless sewellel, Oregon ruffed grouse, and Pacific winter wren

The Upper Austral zone is divided into an eastern humid (or Carolinian) area and a western arid (or Upper Sonoran) area The Carolinian area extends from southern Michigan to northern Georgia and from the Atlantic coast to western Kansas, comprising practically all of this region except the highlands and mountains. It is the northernmost home of the opossum, grey fox, fox squirrel, cardinal bird, summer tanager and yellow-breasted chat. The Upper Sonoran life-zone comprises south-eastern Montana and eastern Wyoming; portions of western South Dakota, Nebraska, Kansas and Oklahoma; north-western Texas, eastern Colorado and south-eastern New Mexico; the lower plains of Utah, Idaho, Washington and Oregon, and narrow belts in California, Nevada and Arizona Among its characteristic mammals and birds are the black-tailed jack-rabbit, sage chipmunk, prairie-dog, burrowing owl and sage thrasher

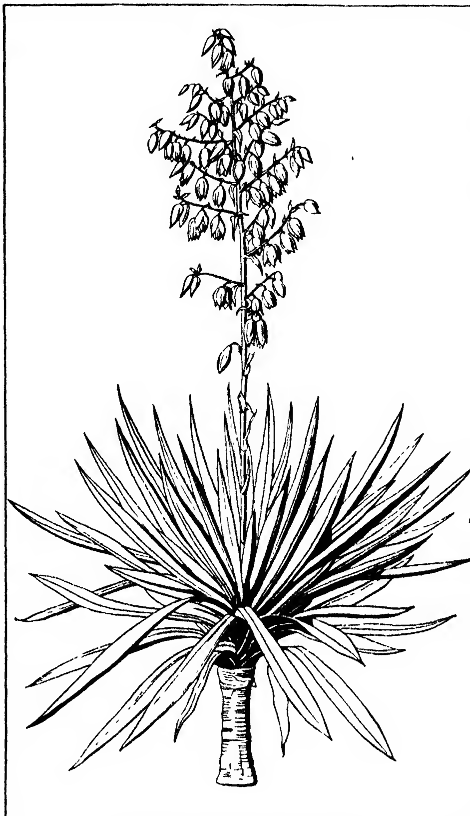
The Lower Austral zone occupies the greater part of the Southern states, and is divided near the 98th meridian into an eastern humid or Austroriparian area and a western arid or Lower Sonoran area. The Austroriparian zone comprises the Atlantic coastal plain from Virginia to Georgia and nearly all the Gulf States as far west as the mouth of the Rio Grande; it also extends up the lowlands of the Mississippi valley to southern Illinois. It is the home of the southern fox-squirrel, cotton rat, wood rat, mocking bird, painted bunting, red-cockaded woodpecker, chuckwill's-widow, and the swallow-tailed kite. A southern portion of this zone, comprising a narrow strip along the coast from South Carolina to Florida and Texas, is semi-tropical, and is the northernmost habitation of several small mammals, the alligator, the ground dove, and the Florida screech owl

The Lower Sonoran zone comprises the most arid parts of the United States south-western Texas, south-western Arizona and a portion of northern Arizona, southern Nevada and a large part of southern California Among its characteristic mammals and birds are the desert fox, kangaroo rats, road runner, cactus wren, hooded oriole and Gambel's quail It is the northernmost home of the armadillo, ocelot and jaguar There is some resemblance to the Tropical life-zone at the south-eastern extremity of Texas, but this zone in the United States is properly restricted to southern Florida and the lower valley of the Colorado river. The area in Florida is small, but it has the true crocodile and is the home of a few tropical birds.

Most of the larger American mammals are not restricted to any one faunal zone The bison, now nearly extinct, formerly roamed over nearly the entire region between the Appalachian and the Rocky Mountains The black bear and beaver were also widely distributed The Virginia deer still ranges from Maine to the Gulf states and from the Atlantic coast to the Rocky Mountains The grizzly bear, cougar, coyote, prairie dog and antelope are still found in several of the Western states, and the grey wolf persists from northern Michigan westward.

Flora.—The Alpine flora, found in the United States only above the limit of trees, consists principally of small plants which bloom brilliantly for a short season. The flora of the Hudsonian and the Canadian zone consists largely of white and black spruce, tamarack, canoe-birch, balsam-poplar, balsam-fir, aspen and grey pine. In the Alleghanian Transition zone the chestnut, walnut, oaks and hickories of the South are interspersed among the beech, birch, hemlock and sugar maple of the North. In the Western Arid Transition zone the flora consists largely of the true sage brush (*q v.*), but some tracts are covered with forests of yellow or bull pine. The Pacific coast Transition zone is noted for its forests of giant conifers, principally Douglas fir, Sitka spruce, Pacific cedar and western hemlock Here, too, mosses and ferns grow in profusion, and the salal, thimble berry, salmon berry and devil's club (*Fatsia horrida*) are characteristic shrubs

In the Carolinian zone the tulip tree, sycamore, sweet gum, rose magnolia, short-leaf pine and sassafras find their northernmost limit. Sage brush is common to both the western arid Transition zone and the Upper Sonoran zone, but in suitable soils of the lat-



SPANISH DAGGER (YUCCA GLORIOSA)

This handsome species of yucca, with a woody trunk sometimes 8 feet high and 6 inches in diameter, is native to sand dunes and sea beaches from North Carolina to Florida and bears in October immense clusters of large creamy-white flowers. Many varieties are widely cultivated in mild climates as garden ornamentals

ter several greasewoods are characteristic species, and on the mountain slopes are some nut pines and junipers The Austroriparian zone has the long-leaf and loblolly pines, magnolia and live oak on the uplands, and the bald cypress, tupelo and cane in the swamps The Lower Sonoran zone is noted for its numerous cactuses, some of which grow to the height of trees, the mesquite, creosote bush, acacias, yuccas and agaves are also common. The Tropical belt of southern Florida has the royal palm, coco-nut palm, banana, manchineel and mangrove, the Tropical belt in the lower valley of the Colorado has giant cactuses, desert acacias, palo-verdes and the Washington or fan-leaf palms

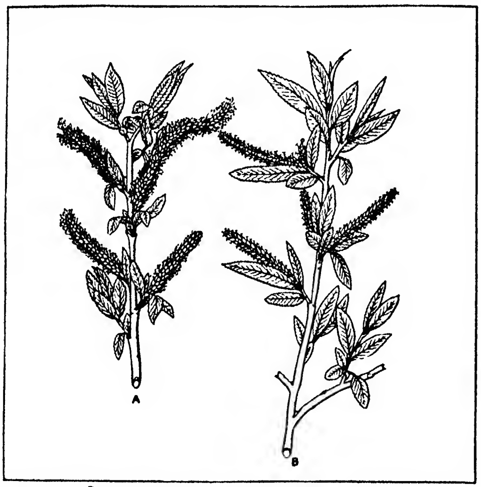
Almost all of the United States east of the 98th meridian is naturally a forest region, and forests cover the greater part of the Rocky Mountains, the Cascades, the Sierra Nevada and the Coast Range, but throughout the belt of plains, basins and deserts west of the Rocky Mountains and on the Great Plains east of the

Rocky Mountains the prevailing type of vegetation ranges from bunch grass to sage brush and cactuses.

The eastern forest region differs from the densely forested region of the Pacific Coast Transition zone in that it is essentially a region of deciduous or hardwood forests, while the latter is essentially one of coniferous trees, it differs also from the forested region of the Rocky Mountains in that the latter is essentially a region of coniferous trees which occupy only a part of its area

The United States is rich in the variety of its native forest trees, some of which, as the species of sequoia (*q v*), are the most massive known C. S Sargent (*Manual of North American Trees*, 2nd ed, 1922) describes 717 species, together with numerous varieties; G. B. Sudworth (1927, see *Bibliography* below) gives the names and geographical distribution of 1,177 species and varieties. Of these, 182 are of economic value, either because of the timber and other useful products which they yield or by reason of their importance in forestry. This forest flora not only includes numerous coniferous soft woods and deciduous hard woods but it also embraces various subtropical trees

Besides the native flowering plants, estimated to comprise from 12,000 to 15,000 species, many hundred species, introduced from other regions—chiefly Europe, Asia and tropical America—have become naturalized A large proportion of these are common annual weeds of fields, pastures and roadsides In some districts these naturalized "aliens" comprise 50% or more of the total plant population W L Jepson in his *Manual of the Flowering Plants of California* (1925) enumerates 4,019 species, of which 3,727 are native to the State (1,416 species endemic) and 292 (7%) are naturalized from other regions In the north-eastern United States from Minnesota to Kansas and eastward the proportion of introduced species is much greater, *Gray's New Manual of Botany* (1908) giving 4,885 species and varieties of which 4,179 are native and 706 (14%) introduced



CRACK OR BRITTLE WILLOW (SALIX FRAGILIS)
Branches with narrow clusters (catkins) of (A) male and (B) female flowers. This hardy tree, a native of Europe and Asia, is representative of a numerous group of Old World trees that have become widely naturalized in the United States, largely as a result of ornamental planting

V. POPULATION AND SOCIAL CONDITIONS

Geographical Growth of the Nation.—The achievement of independence found the people of the United States owning the entire country from the Gulf of Mexico to the Great Lakes, excepting Florida, as far west as the Mississippi river, but the actual settlements were, with a few minor exceptions confined to a strip of territory along the Atlantic shore. The depth of settlement, from the coast inland, varied greatly, ranging from what would be involved in the mere occupation of the shore for fishing purposes to a body of agricultural occupation extending back to the base of the great Atlantic chain, and averaging some 250 miles. Westward, beyond the general line of continuous settlement were four extensions of population through as many gaps in the Appalachian barrier, constituting the four main paths along which migration westward first took place: the Mohawk valley in New York; the upper Potomac—upper Ohio river connections, the Appalachian valley through south-western Virginia into Tennessee; and, around the southern base of the Appalachian system Four outlying groups beyond the mountains—one about Pittsburg, one on the Great Kanawha river in West Virginia, one in northern Kentucky and the last along the Cumberland river in Tennessee—constituted perhaps a twentieth part of the total population of the nation. Finally, there were in 1790 about a score of small trading and military posts, mainly of French origin, scattered over the then almost unbroken wilderness of the upper Mississippi valley and region of the Great Lakes.

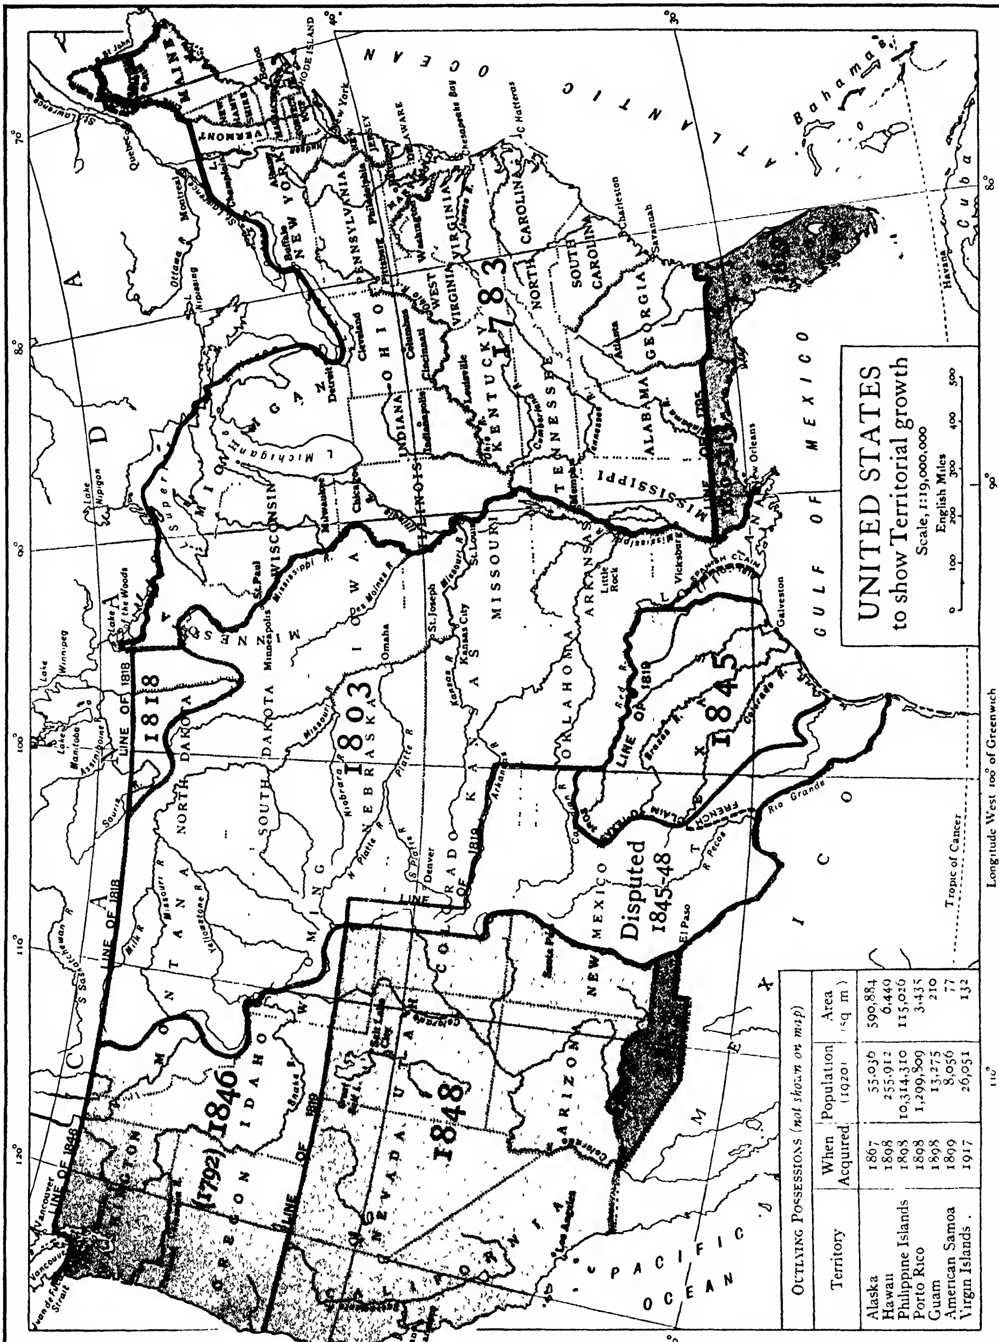
Thirteen decennial censuses taken since that time (1800–1920) reveal the extraordinary spread of population over the expanding area of the United States[1].—

Continental United States, exclusive of Alaska

Census years	Land area in square miles	Population	Decennial increase per cent	Per cent of increase from 1790	Population per square mile	Number of foreign immigrants entering in preceding decade
1790	867,980	3,929,881			4·5	
1800	867,980	5,308,483	35·1	35·1	6·1	
1810	1,685,865	7,239,881	36·4	84·3	4·3	
1820	1,753,588	9,638,453	33·1	145·3	5·5	250,000[2]
1830	1,753,588	12,866,020	33·5	227·4	7·3	128,502
1840	1,753,588	17,069,453	32·7	334·4	9·7	538,381
1850	2,944,337	23,191,876	35·9	490·2	7·9	1,427,337
1860	2,973,965	31,443,321	35·6	700·2	10·6	2,747,897
1870	2,973,965	38,558,371	22·6	881·3	13·0	2,123,219
1880	2,973,965	50,155,783	30·1	1,176·5	16·9	2,742,137
1890	2,973,965	62,947,714	24·9	1,502·0	21·2	5,248,568
1900	2,974,159	75,994,575	20·7	1,834·1	25·6	3,694,294
1910	2,973,890	91,972,266	21·0	2,240·7	30·9	8,202,388
1920	2,973,776	105,710,620	14·9	2,590·4	35·5	6,347,380

[1] In the *Statistical Atlas* of the 1910 census (Washington, 1914) there is for 1790, and for each decennial census thereafter, a map showing the distribution of population, with indication of the density of settlement, and an elaborate explanatory text. The atlas for the 1920 census contains similar maps for 1910 and 1920 only.

[2] Estimates of total up to 1820.



OUTLYING POSSESSIONS (*not shown on map*)

Territory	When Acquired	Population (1920)	Area (sq m)
Alaska	1867	55,036	590,884
Hawaii	1898	255,912	6,449
Philippine Islands	1898	10,314,310	115,026
Porto Rico	1898	1,299,809	3,435
Guam	1898	13,275	210
American Samoa	1899	8,056	77
Virgin Islands	1917	26,051	132

Except for the isolated military or trading posts, which always preceded the settlement frontier, the latter advanced across the prairie region of the Mid-West with a practically solid front until halted for a time at the eastern edge of the Great Plains. The North and the South sections of the country started out with population growths in the decade 1790–1800 very nearly equal (36·5 and 33·7%); but in every succeeding decade before the Civil War the rate of growth of the North was greater, and that of the South less, than its increment in the initial decade In 1790 the two sections were almost of equal population; by 1890, the population of the North was practically double that of the South. In the decade 1890–1900 the increase of the South exceeded slightly that of the North owing to the rapid development of the Southern States west of the Mississippi, but in general the increase of the two sections since has been nearly equal.

The temporary halt in the western advance at the edge of the Great Plains was due to the comparative aridity of this region and the discovery of more desirable agricultural valleys and mineral wealth in the mountainous sections and Pacific coast States of the farther west Population, therefore, leaped over these more barren regions and formed in isolated islands beyond The first of these overland migrations, which were to become a feature of American life in that generation, was the migration over the Oregon trail to the Oregon country (beginning 1842), the Mormon emigration to Utah (beginning 1847) and the gold rush to California, by sea and the Overland trail (beginning 1848) By the treaty of 1848, ending the war with Mexico, a number of old Spanish settlements in the south-west were added to the population Discoveries of mineral wealth between 1858 and 1880 in Colorado, Nevada, Idaho, Montana and Wyoming created other isolated areas of settlement in these States which spread gradually into the more attractive agricultural valleys of the mountains Between 1880 and 1890 a large part of the Great Plains was taken up But a small portion of this region was used for farming purposes until after 1900 when the system of dry land farming became generally known Settlement was then rapid up to the entrance of the United States into the World War, more land being settled than could be held during the period of agricultural depression which followed Similarly the population of the mountain States has to a large degree followed the rise or fall of prosperity in the mining industries, but the growth of agriculture in these States is proving a stabilizing factor.

In 1920 the centre of population was located 1 8 m. W. of Whitehall in Owen county, Indiana In 130 years the centre moved 567 m westward almost exactly along the 39th parallel of latitude, the extreme north and south variation amounting to only 21·4 miles Between 1910 and 1920 the westward movement of the centre, amounting to but 9·8 m, was less than in any previous decade See diagram page 737.

Growth of the Nation in Population.—From 1790 to 1920 the population increased in numbers from 3,929,881 to 105,710,620. The official estimate of the Census Bureau for July 1, 1928 was 120,013,000 In 1800 every important European country, even including Spain and Turkey, exceeded the United States in numbers; in 1925 only the Union of Soviet Republics had a larger population (135,755,000 by 1925 official census) From 1800 to 1900 the increase in the United States was 1,331·6% as compared with 204·3% in Belgium, then the fastest growing of European countries, and 155 9% in the United Kingdom. Natural or genetic growth, which in Europe is the only important source of population increase, is but one of several factors in the United States. There must also be considered the extraordinary additions to the population through immigration, and the less important additions through the annexation of territory.

In 1790 there were about 600,000 white families in the United States. Speaking broadly there were few very rich and few very poor. Food was abundant. Both social traditions and the religious beliefs of the people encouraged fecundity. The land was but partially settled. Mechanical labour was scarce, and even upon the farm it was difficult to command hired service. Yet only an increased supply of labour made more land or more capital of any practical value, and consequently large families possessed a direct economic advantage It is estimated that the total immigration from 1790 to 1830 amounted to but 378,000 persons, but in the same period the native white population increased 237%—a doubling every 22 or 23 years—a rate of genetic increase almost unprecedented in the history of civilized man

From 1830 to the Civil War the rate of increase in the total population of the country continued at the same rate as in the preceding 40 years, the decennial increase for the entire 70 years averaging 34·6% and in no case falling below 32·7%. But after 1830 an increasing proportion of this increase was due to immigration, the accessions, especially in the decade 1840–50 from Ireland and Germany, being enormous, and the total immigration in that decade rising to 1,427,337 as compared with 538,381 during the preceding decade This showed that the natural increase of the native population was slowing up, though the heavy immigration concealed this from view at the time In the decade 1850–60 almost one-seventh of the population consisted of persons born abroad.

The ten years from 1860 to 1870 witnessed the operation of the first great factor which reduced the rate of national increase, namely the Civil War The superintendent of the ninth census, 1870, computed the effects of this cause—first, through direct losses, by wounds or disease, either in actual service of the army or navy, or in a brief term following discharge; secondly, through the retardation of the rate of increase in the coloured element due to the privations, exposures and excesses attendant upon emancipation, thirdly, through the check given to immigration by the existence of the war; and finally, through the temporary reduction of the birth-rate, due to the withdrawal of perhaps one-fourth of the national militia during four years—to be a loss to the population of 1870 of approximately 2,515,000.

The rate of population increase declined steadily from 30·1% in the decade 1870–80 to 20 7% in the last decade of the century. From 1900 to 1910 there was a slight rise to 21%, due chiefly to a tremendous immigration of 8,202,388 in that decade, but in 1910–20 occurred an abrupt drop to 14 9%, the lowest rate of increase in the nation's history This decline in rate of increase in the face of heavy immigration is explained chiefly by a decline in the rate of natural increase of native-born, a decline so great that immigration could not wholly substitute for it This decline was continuous and uniform from 31·8% for the decade 1820–30 to 10 9% for the decade ending in 1920, the latter rate being approximately the rate of European increase.

The causes of the decline in rate of natural increase have been the subject of much speculation by sociologists It was not to be expected that the rate established from 1790 to 1830 by a virile and fertile race in a virgin land would continue Gen Francis A. Walker, superintendent of the 1870 and 1880 censuses, upon noticing, that in spite of increased immigration, the population in 1860 was but 10,000 more than if the rate of natural increase of 1830 had been maintained, ventured that the decline was due to the "competitive shock" of immigration, and that therefore immigration actually contributed little to the final total of population but instead merely substituted foreign for native stock It was no mere coincidence in his opinion that the birth-rate began to decline just as immigration began to increase, and that the decline was greatest in those regions, States "and in the very counties" where immigration was heaviest Walker's explanation, with modifications, has been adopted by most subsequent publicists who have written on immigration, notably Hall, Commons, Ross and Fairchild In 1920 the conditions upon which his conclusions were based were still in evidence The comparative natural increase of native whites was far below that of foreign-born whites, the ratio of infants to females among the latter being 78% greater than among the former. Furthermore the ratio ranged from only 14% greater in the East South-Central section where there are few foreign-born to over 120% in the New England and Middle Atlantic sections where the foreign-born are most numerous. All of which strongly suggests that the presence of the foreign-born acts as a deterrent.

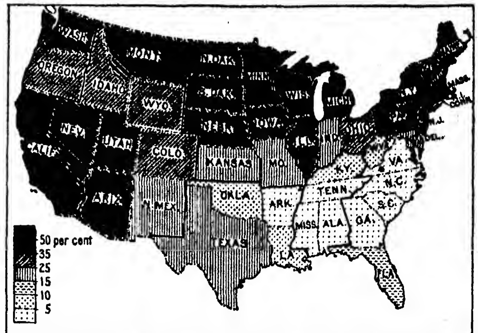
This explanation, however, has not gone unchallenged Goldenweiser and Billings have maintained that the decrease is due to

industrial development and urbanization and the complex forces attendant upon these two. The fact that immigration increased at the same time, is explained by representing this increase and the decline in rate of natural increase as two effects of the same cause. Rural life is still to some extent favourable to the development of large families but city life is not. Cities brought an increased cost of living and at the same time increased standards of living. They made possible increased opportunities for personal gratification along other lines and introduced other interests to compete with home and family. After 1900 the spread of contraceptive knowledge doubtless had an increasing effect. Another factor is the increasing late marriage among the more ambitious and intellectual classes. Finally to be considered is the growing independence of women, the widening of their interests and their entrance into business pursuits. Since the World War the latter considerations have operated to a much greater extent than formerly and their effect was by no means fully registered in the 1920 Census.

Despite the notable decrease in rate of growth, 1910–20, the actual numerical increase of 13,738,354 was greater than in any decade except 1900–10. Population increases showed a less definite geographical trend than ever before, the western movement having slackened decidedly, and seemed dependent instead upon industrial development. Immigration distribution, for instance, has become more and more a matter of labour opportunities. The mountain and Pacific sections continued to have the highest rate of growth, but the percentages, when compared with those of the preceding decade, showed a sharp reduction. The only section showing a higher rate of increase than during the previous decade was the East North-Central division, comprising the states of Ohio, Indiana, Illinois, Michigan and Wisconsin, a section where also occurred the most noticeable industrial expansion. The lowest rate of increase was reported in the East South-Central section. The South suffered from a considerable northward migration of negroes during the World War. Of the States east of the Mississippi, Michigan was the only one to report an increase over 30%, as against five States west of the Mississippi, namely Arizona, California, Idaho, Montana and Wyoming. Connecticut, New Jersey, Ohio, Florida and Oklahoma reported increases over 20%. A percentage basis gives little intimation of the actual numerical increase however. In this respect New York, Pennsylvania and California were the leading States, each with an increase of more than 1,000,000. Ohio, Michigan, Illinois, Texas and New Jersey reported between 500,000 and 1,000,000. Three States only, Nevada, Vermont and Mississippi, declined in numbers.

Racial Composition.—Under the classification "foreign stock" the Census Bureau includes both foreign-born inhabitants and native inhabitants who have one or both parents foreign-born. This classification in 1920 included slightly more than one-third the entire population, the number having increased from 32,243,382 in 1910 to 36,398,958. The rate of increase for the decade was 12·9%—slightly less than the rate for the population as a whole. The rate of increase for the foreign-born only was but 2·8%, so that most of the gain was contributed by the children of foreign-born. In 1920 the total foreign stock consisted of 13,712,754 foreign-born, 15,694,539 native-born with both parents foreign-born, and 6,991,665 with one parent foreign-born.

There have been many attempts to estimate the contribution of immigrants since 1790 to the present population as compared with the contribution of the original stock of 1790. The difficulty is that no record of immigrant stock beyond the second generation is kept. However, a number of estimates by the Census Bureau, arrived at by entirely different methods, closely agree in results. The average of these results places the numerical equivalent of the native white stock descended from the population of 1790 at 37,290,000 in 1900 and 47,330,000 in 1920. These figures do not represent so many persons of pure native blood, but the approximate sum of all fractional proportions of native blood in all individuals. Only in the Southern States is there a large percentage of comparatively pure-blooded descendants of the original inhabitants. Of the 10,040,000 increase between 1900 and 1920 in the calculated descendants of the 1790 population 3,360,694 or 35% was in nine Southern States. There has long been an impression that the original element of the population was slackening in growth to the point where it was doubtful if any increase was occurring, but these estimations indicate that it is increasing 11 or 20% per decade, a rate which closely approximates the average increase shown by European countries.



MAP SHOWING PERCENTAGE OF FOREIGN-BORN WHITE AND NATIVE WHITE OF FOREIGN OR MIXED PARENTAGE COMBINED IN TOTAL POPULATION BY STATES IN 1920

The increase was greatest in the south, and practically stationary, or even on the decline, in New England.

In 1920 the foreign-born represented 14·5% of the total population. This element becomes more significant, however, when it is considered that of the male population over 21 years of age it formed in 1910 24·6% and in 1920 22·1%. In certain sections of the country this percentage rises very high, as in the New England section where it amounts to 38·2% and in New York, Pennsylvania and New Jersey (considered as a unit) where it was 35·4%. In Boston it amounted in 1920 to 46·3%; in New York city to 53·4%.

In the decade 1910–20 the West North-Central section showed an important decline in its proportion of foreign-born, due largely to the mortality among its older pioneer immigrants, and to its inability to compete with the industrial areas for the new immigrants. The main increases in the percentage of foreign-born occurred in the industrial areas along the Atlantic coast and Great Lakes, in Montana and Washington in the far North-west, and in the States along the Mexican border. The percentage of city-dwellers among the foreign-born increased from 61·8% in 1890 to 75·5% in 1920. In the decade 1910–20 the number of foreign-born whites in rural districts decreased 12%. It is not believed that this decrease so much represented an actual migration to the cities, as a replacement of the earlier agricultural immigrants, whose mortality rate is now high, by later races which prefer the cities. In 1910, for example, it was shown that the urban proportion of Scandinavians was 53%, of Germans 67%, Austrians and Hungarians 74%, Italians 78% and Russian Jews 87%.

The shares of different nationalities in the aggregate mass of foreigners have varied greatly. The family names on the registers of the first census show that more than 90% of the white population was then of British stock, and more than 80% was English. The Germans were already near 6%. The entry of the Irish began on so great a scale in 1840 that by 1850 they formed nearly half the foreign-born. In that year 85·6% of the total foreign-born was made up by natives of Great Britain and Germany. The latter element took first place in 1880. In 1900 these two countries represented only 52·7% of the total; add the Dutch, Danes, Swedes, Norwegians and Swiss and the share was 65·1%. A majority of all these elements, except the British, settled in states added to the original Union, many of them being original homesteaders on the frontier. Since 1880 Italians, Russians, Poles, Austrians, Bohemians and Hungarians have enormously increased

FAUNA OF THE UNITED STATES

1. A moose, a large mammal of the deer family, found in forests along the northern border from Maine to the Rocky Mountains
2. Black bears in Yellowstone Park, Wyoming, eating their evening meal. Black bears are widely distributed throughout the wooded parts of the United States
3. A buffalo bull, near Mammoth Hot Springs, Yellowstone Park. This animal, more properly called the American bison, formerly immensely abundant from the Rocky Mountains eastward to Pennsylvania, now survives only in protected reserves
4. The American grey wolf or timber wolf (*Canis nubilis*), found in the Great Lakes region and westward to Wyoming
5. Alligator farm on Anastasia Island, Florida, where more than 6,000 alligators are kept. The North American alligator is native to a narrow strip along the Atlantic coast from North Carolina southward and the Gulf coast from Florida to Texas
6. Grey fox (*Urocyon cinereoargenteus*). This fox, which is widely distributed in North America, prefers wooded country and usually lives in hollow logs, rarely in burrows
7. The common seal (*Phoca vitulina*), found on both the Atlantic and the Pacific shores, is abundant along the New England coast, often ascending rivers
8. Northern banded rattlesnake (*Crotalus horridus*), found from Maine and Northern Florida westward to the Rocky Mountains
9. Porcupine. This woodland animal is native to most forest areas in the United States north of lat. 40° and southward in Rocky Mountains to New Mexico and Arizona
10. Prairie dog, a gregarious rodent found in the more arid districts of the Great Plains region
11. Prairie hen (pinnated grouse). This game bird was formerly abundant in the prairies of the Mississippi valley

the immigrant population. In 1920 Germany, Russia (including Lithuania and Finland), Italy, Austria and Hungary, Poland, Canada and Ireland, in order of importance, were the chief countries of origin, each being represented by between one and two million foreign-born. Between 1910 and 1920 the following European nationalities decreased in number in the United States: English, Scotch, Welsh, Irish, Norwegians, Swedes, Swiss and Germans; the following were represented by an increase: Danes, Dutch and Belgians, French, Austrians, Hungarians, Poles, Russians, Finns, Rumanians, Bulgarians, Greeks, Italians, Spanish, Portuguese and some smaller nationalities. Canadians decreased by 78,192, Mexicans increased by 258,581 and Asiatics increased by 46,136.

With the disappearance of the frontier of free land, agitation for a restriction of immigration began to appear. The newer immigrants crowded in the cities, creating vast problems of assimilation and housing, and their competition with the native labourer was more keenly felt, now that the latter had no frontier to which to escape. The problem was brought to a crisis after the World War, when the United States, faced with the reabsorption into an ebbing industrial life of its own war veterans, realized that unless some barrier were erected it would be swamped by immigrants fleeing from the burdens of war-torn Europe. Immigration increased from 141,132 in 1919 to 805,228 in 1921. For restriction since 1921 *see* MIGRATION.

Immigration decreased under the Immigration Act of 1924, from 706,896 to 294,314 in 1925, 304,488 in 1926 and 335,175 in 1927. In 1927 Canada with 81,506 and Mexico with 67,721 supplied together nearly 45% of the total number of immigrants. Europe sent 168,368 immigrants, Germany with 48,513 leading, followed by the Irish Free State with 28,054, Great Britain 23,669, Italy 17,297 and the Scandinavian countries 16,860. All other European countries combined sent 33,975. Though the State of New York continues to lead all others as the settling ground of immigrants there has been, since the new law, a marked drift to the Central West and to the States beyond. Departures of emigrant aliens have decreased greatly since 1920, the proportion in 1927 being but 33 for every 100 arrivals. For Finland, Greece, Hungary, Italy, Portugal, Spain and Yugoslavia, considered as a separate group, however, the departures were greater by 5,879 than the immigration from these countries. It seems certain that the Immigration Law of 1924 is an epochal event in American history, marking a turning point as full of economic and social significance as was the disappearance of the frontier about 1890.

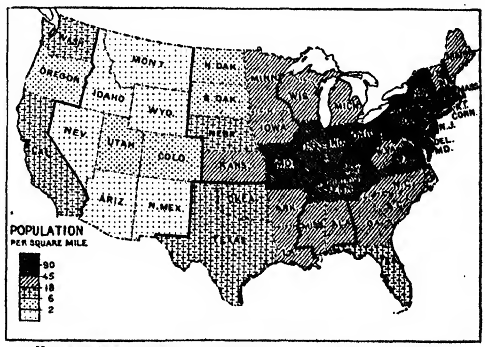
Numerically the Chinese and Japanese are not an important element of the population, but because of their concentration in the States of the Pacific slope, chiefly California, they have presented a problem to those particular States, and consequently to the National Government, far out of proportion to their numbers. The Chinese problem came first when between 1860 and 1880 they were imported at the rate of nearly 20,000 per year chiefly for labour purposes. Because of their serious competition with American labour, and because they were socially unassimilable, opposition to them reached a riot stage in many places, and in 1882 Congress, in contravention of existing treaties with China, passed an exclusion act, which with small changes has remained in force since. Since then the number of Chinese has steadily fallen and between 1910 and 1920 the decrease was from 71,531 to 61,638. Each year between 1920 and 1927 the departures were greater in number than the Chinese admitted. Furthermore the proportion of Chinese women in the United States is so low that the natural increase is slight.

Japanese immigration was not an important problem until after the Chinese Exclusion Act was passed. The cessation of Chinese immigration created a demand for cheap labour, and it was generally felt that the Japanese were cleaner and more attractive than the lower classes of Chinese which formerly arrived. But they were also more ambitious and aggressive economically and the Californians grew increasingly critical. Between 1900 and 1920 they came in greatly augmented numbers, averaging more than 10,000 annually. In 1920 there were 111,010 Japanese in the United States compared with 72,157 in 1910. Of the 1920 total 71,952 were located in California and 17,387 in Washington. As a result of the Immigration Act of 1924 Japanese admissions declined from 8,481 in 1924 to 682 in 1925 and 598 in 1926.

Of the entire population in 1920, 10,463,131, or 9·9% were negroes. This represented an increase of 635,000, or 6·5%, over 1910, the lowest increase of negroes in any decade. The proportion to whites in 1920 was about half of that in 1790 when they represented 19·3% of the population. This decline in proportion is due chiefly to the fact that, unlike the white, the negro race has not been augmented by immigration. Numerically their increase has been steady, ranging from 765,000 to double that number each decade from 1850 to 1910. Their increases were greater for the two decades before emancipation than for any decade since. As compared with 92·2% in 1860 there were resident in the Southern States 89·0% in 1910 and 85·2% in 1920 of the negro population. As compared with their 6·5% increase for the entire United States their increase in the Southern section was but 1·9%, and in the East South-Central section there was an actual decrease. (For more details *see* NEGROES.)

The American Indian numbered 244,437 in 1920 as against 265,683 in 1910 and 237,196 in 1900. The Census Bureau reports that the decrease between 1910 and 1920 may be more apparent than real, because of many with but a slight percentage of Indian blood being counted as whites. In the South-west, and especially in Oklahoma, intermarriage between the Indian and negro has been frequent, increasing the difficulty of enumeration. The number of Indians of pure blood has undoubtedly seen a material decrease. On the other hand the extinction of the Indian has probably been averted by increasing intermarriage so that a considerable strain of Indian blood will remain.

Urban and Rural Population.—In 1790 the population of the United States was almost entirely rural and supported directly from the soil. There were no large cities and no industry of importance other than agriculture. There were but six cities with more than 8,000 inhabitants. By 1920 cities having a population of 8,000, or more, had increased in number to 924, and more than one-half the total population lived in cities numbering over 2,500 inhabitants. The proportion of the population living in cities seems to have been practically constant throughout the 18th century and up to 1820. The great growth of urban centres has been a result of industrial expansion since that time, these centres gathering momentum from decade to decade, drawing man power



MAP SHOWING DENSITY OF POPULATION IN THE UNITED STATES

both from the rural areas and from the great numbers of immigrants. On an average throughout the 130 years the population in cities of 8,000 considerably more than doubled every twenty years. With a much slower rate of increase the rural areas, aided by the constant development of agricultural machinery, have maintained a food supply adequate for the increasing urban inhabitants. In 1880 only 28·6% of the nation's population was urban; in 1910, 45·8% and in 1920, 51·4% was urban.

Of the 13,738,354 inhabitants who represented the national

population increase for 1910–20, 12,138,483 were added to the urban and but 1,599,871 to the rural population Though there was a decline in the percentage of increase for both classes during the decade (which is natural in view of the decline in the rate of national growth from 21% to 14·9%) that for the urban dweller fell from 38 8% to 28·8% Of the urban increase of 28·8% during the decade it is estimated that about 10% was due to the natural increase from excess of births over deaths and the remainder about equally due to immigration of foreign-born and to domestic migration from rural to urban communities Negroes formed about one-fifth of the domestic migrants during the period

Of the migrants from the country to the city four-fifths were between the ages of 10 and 30 The movement from rural to urban continued to be greatest in the areas in which it began—the industrial North-eastern and North-Central States In this region from 1900 to 1910 the rural population was stationary and from 1910 to 1920 it showed a slight decrease. The movement was also very great in the West North-Central States, usually considered the agricultural stronghold of the nation. Here the additions to the rural population were but slight, and almost all the increase was confined to the cities In the Southern States where the proportion of rural population is highest, the rural increase for the decade 1910–20 was but 1,400,000, approximately, and the urban increase 2,300,000. In the Pacific States, where the urban element predominated in 1910, the urban growth continued to be at a much higher rate than rural increase. Only in the Rocky Mountain States was the exception found, the rural element showing a decidedly greater increase from 1910 to 1920 than the urban.

Rhode Island and Massachusetts possess the highest proportion of city dwellers, 97·5% and 94 8%, respectively, living in cities of over 2,500 inhabitants Except for Maine all other Atlantic States south to Virginia have a predominating urban element and similarly all Northern States east of the Mississippi river, except Wisconsin The only other States in which the urban element is highest are California and Washington on the Pacific coast The lowest proportions of city dwellers are found in Mississippi (13·4%) and North Dakota (13 6%), with South Dakota, Arkansas, South Carolina and New Mexico not far behind In 1920 cities with a population over 250,000 numbered 25, over 100,000, 68, and over 25,000, 287 Cities with a population of 100,000, or more on July 1, 1928, as estimated by the Census Bureau, follow:—

Cities with 100,000 Inhabitants or More

Rank in 1920		1920	1910	Per-cent-age in-crease	1928 estimate
1	New York, N.Y.	5,620,048	4,766,883	17 9	6,017,500

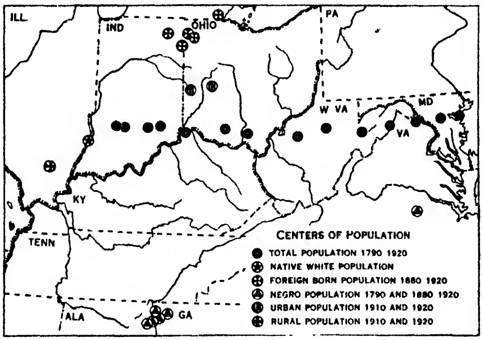
*No estimate made by Census Bureau. Figures are local estimates.

Interstate Migration is an interesting element in American national life. In 1920 19·2% of the native-born population, as compared with 18·4% in 1910, were living in States other than those in which they were born. Formerly the migration of the native element was chiefly westward, but the increased migration from 1910 to 1920 in the face of a slackened westward movement of the centre of the population indicates the increasing movement in other directions. There was an increased movement of whites from the North to the Southern States of Florida, Texas and California, for instance, but the north to south movement was

balanced to a large extent by the northward negro migration. The most stationary population is in the south, the South Atlantic and East South-Central States showing over 90% of their population born in the State of residence. In Oklahoma, Wyoming, Colorado, Idaho and Montana, on the other hand, more than 50% of the population was born outside the State, and the proportion is about 40% for the entire mountain and Pacific divisions.

Sexes.—The percentages of males and females of all ages in the aggregate population of 1920 were 51·0 and 49·0 respectively



BY COURTESY OF BUREAU OF CENSUS

The corresponding figures for the main elements of the population were as follows for native whites, 50·4 and 49·6; foreign-born whites, 54·9 and 45·1; negroes 49·8 and 50·2. In the proportions of the sexes in the aggregate population there has been almost no change since 1820 In the immigration since the restrictions of 1924 there has been an increasing proportion of women which presumably indicates a more stable class of immigrants. In densely settled regions females are proportionally more numerous as a general rule In Massachusetts, Rhode Island, New York and the Southern States of North Carolina, South Carolina, Georgia and Alabama there are more females than males In the more thinly settled western States males predominate, there being in the mountain States 115·7 males, in the Pacific States 113·9 males for every hundred females In 1920 there were in every 1,000 urban inhabitants 38 (in 1900 only 23) more females than in 1,000 rural inhabitants In no State did the females exceed the males in rural districts.

Vital Statistics.—The median age of the aggregate population —that is, the age which divides the population into two equal groups, one younger and the other older—has shown an increase each decade from 1800, when it was 15·97 years, to 1920 when it was 25·2 years, the median ages for 1900 and 1910 being 22·9 and 24 years, respectively The increase has been due chiefly to two causes: first, an increase in the average length of life; second, a reduction in the birth rate, which results in a decrease of the proportion of young persons in the population. Also an increase in immigration tended to raise the median age since most immigrants come as mature persons. The median age of the foreign-born in 1920 was 40. The median age of whites alone was 25·6; of negroes 22·3, of American Indians 19·7 The United States has a larger proportion (60·7% in 1920) within the "productive" age limits of 15 and 60 years than most European countries, due to the immigration of foreign adults.

Statistics of births and deaths in the United States are collected from a registration area which consists of all States wherein at least 90% of the births or deaths are correctly reported In 1920 this area for deaths consisted of 34 States comprising 82·8% of the population; in 1927 it had increased to 42 States with 91% of the population. For births the area increased from 26 States with 65·1% of the population in 1920 to 37 States with 81% of the population in 1927.

The death-rate of the registration area per 1,000 living was 17·6 in 1900, 15 in 1910, 13·6 in 1915, 13·1 in 1920 and 11·8 in 1925. There was considerable variation between 1915 and 1920, the death-rate rising as high as 18·3 per 1,000 in 1918 due to war casualties and to the even more disastrous epidemic of influenza that swept the country in that year. In 1925 the mortality among whites was 11·2 while that among negroes was 18·2 per 1,000 Mortality in the rural districts (10·7 per 1,000) was less than in cities (13 per 1,000) In 1900 the deaths under 1 year of age formed 20·7%, and those under 5 years 30·4%, of the total deaths of all ages, but in 1924 the corresponding percentages were 13·7 and 18·7. In 1924 the death-rate in the United States was lower than in any other important nation except Australia and New Zealand, though the rates for England and Wales, Germany and Sweden were but slightly higher The leading causes of deaths in 1924 were as follows. diseases of the heart, 15%; cancer and other malignant tumours, 7·8%; cerebral hemorrhage and softening, 7·8%; acute and chronic nephritis, 7·6%; violent deaths (except suicide), 7·2%; tuberculosis of respiratory system, 6·7%; congenital debility and malformations, 6·2%; pneumonia, 4·8%

The birth-rate appears to have been declining gradually for a considerable period, but the reductions in infant mortality have, to some degree, offset the effect Only since 1915 has the Census Bureau collected birth statistics systematically For the years 1917–25 the results follow —

Year	Births per 1,000 population*	Deaths per 1,000 population*	Excess of births over deaths	Deaths under 1 yr of age per 1,000 births*
1917	24·7	14·3	10·4	94
1918	24·6	18·1	6·5	101
1919	22·3	12·9	9·4	87
1920	23·7	13·1	10·6	86
1921	24·3	11·9	12·6	76
1922	22·5	11·9	10·6	76
1923	22·4	12·4	10·0	77
1924	22·6	11·8	10·8	71
1925	21·4	11·8	9·6	72

*Stillbirths not counted.

For every 1,000 births in 1917 there were but 868 in 1925, a decrease of 132 The decline in infant mortality, though marked, amounted to but 22 per 1,000 and so fell short 110 per 1,000 in affecting the decline in birth-rate In 1925 the birth-rate of the white population was 21·1 per 1,000 white, that among the coloured population was 26·7 per 1,000 The excess of births over deaths was 9·8 for whites and 8·1 for negroes In every State of the union the birth-rate exceeded the death-rate for whites, but in many Northern States the death-rate was higher than the birth-rate for negroes The birth-rate in the urban area was 21·9% in contrast to 20·9% in rural districts.

Of females above 15 years of age in 1920 35·1% were single, 59·2% married, 4·8% widowed, 0·5% divorced, 0·4% unknown In 1900 the figures were respectively 31·2%, 56·9%, 11·2%, 0·5%, 0·2% Among males above 15 years of age in 1920 27·3% were single, 60·6% married, 11·1% widowed, and 0·8% divorced The corresponding figures for 1900 were 40·2%, 54·5%, 4·6% and 0·3% In 1926 the number of marriages per 1,000 population varied from 7·66 in New England to 12·90 in the East South-Central section The number was high in the remainder of the South and in the Pacific States; the rest of the country was about midway between The number of divorces has shown an increase each year since 1887 when statistics were first taken In proportion to every 100 marriages performed divorces numbered 7·9 in 1900, 8·8 in 1910, 13·4 in 1920 and 15 in 1926. The number of divorces per 1,000 population for the years 1922–26 was lowest in the Middle Atlantic and next lowest in the South Atlantic divisions; it was highest in the Pacific and next highest in the mountain States Of those in 1926 57·3% reported no children In 1850 there were 5·6 persons (excluding the slave population) in an average American family; 50 years later there were only 4·7. The rate of decline has since continued, the average family numbering 4·5 in 1910 and but 4·3 in 1920. The largest families are in the Southern and the smallest in the Western States

Education.—In the article EDUCATION: *United States*, and in the articles on the several States, details are given generally of

the conditions of American education Here the statistics of literacy need only be considered. In 1920 illiterates (that is persons unable to write, the majority of these being also unable to read) constituted 6% of the population at least ten years of age; but the greatest part of this illiteracy was due to the negroes and the foreign immigrants. Since 1880 the percentage has steadily declined for all classes save the foreign-born, for which it increased between 1880 and 1890 and again between 1910 and 1920, due, probably, to the large scale immigration from southern Europe where the percentage of illiteracy is high Illiteracy also is less among young persons of all classes than in the older age-groups, in which the foreign-born largely fall. Between 1900 and 1920 the reduction of illiterates was from 10·7% to 6%. In 1920 classification by races shows that the percentage of illiteracy among negroes was 22 9 (in 1900, 44 5%), foreign-born whites, 13·1 (in 1900, 13%), native whites of native parentage, 2 5% (in 1900, 5·7%), and native whites of foreign or mixed parentage, 0·8% (in 1900, 1 6%) In all classes but the foreign-born, therefore, the figures show a reduction of about half in the two decades Illiteracy is greatest in the East South-Central (12·7%), South Atlantic (11·5%) and West South-Central (10%) sections, and least in the West North-Central (2%), Pacific (2·7%) and East North-Central (2 9%) sections. All differences between sections are lessened if the comparison is limited to children, and still farther lessened if also limited to cities. Increasing literacy in the lower age-groups directly reflects the extension of educational facilities from decade to decade.

Similarly the decrease in illiteracy among women over 10 years of age from 20·3% in 1890 to 5 9% in 1920 reflects the increasing educational opportunities that have been opened to them In the decade 1910–20 for the first time their percentage of illiteracy (5·9%) was less than that for men (6%) In the total population of voting age women were still behind men in illiteracy, the percentages being 7 3 to 7; but within the age group 10 to 24 years the reverse was true. For the ages 25 to 34 years, inclusive, the sexes are even, with an illiteracy of 5 6% each. In 1920 64·3% of the total population 5 to 20 years of age was in attendance at some school, compared to 61·6 in 1910. In 1910 the percentage of males in attendance (62%) slightly exceeded that of females (61·3), but in 1920 the proportions were reversed (male 64·1%, female 64·5%).

Religious Bodies.—According to the census of religious bodies taken by the Federal Census Bureau in 1926 there were in the United States 213 religious denominations, represented by 231,983 organizations with 54,624,976 members. Compared with the religious census of 1916 this represents an increase of 13 denominations, 5,265 organizations and 12,698,122 members. Whereas in 1910 about 46% of the total population was identified with some religious body, by 1920 that proportion had increased to 51%.

While statistics of membership may be used in a very general way for comparison of denominational strength, it must be remembered that membership is counted very differently in different denominations, the membership of children especially differing between Roman Catholic and most Protestant bodies. Though Protestants as a group outnumbered Roman Catholics almost 2 to 1, the Roman Catholic church was far ahead of any other single denomination For membership of each denomination *see* separate articles on the various denominations. The trend toward fewer organizations in spite of increased membership is noticed in the Disciples of Christ, Methodist, Presbyterian and in many lesser Protestant denominations Nineteen of the denominations reported in 1916 were not included in the 1926 census, having either dropped out of existence or joined other organizations. Thirty-two new denominations were reported for the first time in 1926, some being created by divisions within the old churches, others being original organizations. The immigration from south-eastern Europe gave great strength to some sects which had no existence in the religious census of 1890, notably those of the Eastern Orthodox churches (Russian, Serbian, Syrian and Greek)

The Roman Catholic was the leading denomination in membership in every one of the northern and western States, except in Idaho and Utah where the Latter Day Saints (Mormons) predominated by a large margin In the Southern States the leading denominations were either Baptist or Methodist. The Lutherans are relatively strongest in the North-Central division of the country, their members consisting chiefly of Germans and Scandinavians. The other important Protestant bodies are widely and fairly evenly distributed over the country

At the census of 1926 the total annual expenditure of religious bodies was $814,371,529 as compared with $328,809,999 in 1916. The value of church property was $3,842,577,133 as against $1,676,600,582 in 1916.

Occupations.—Of persons 10 years or more of age 41,614,248 —nearly two-fifths (39 2%) of the country's total population—were gainfully employed in 1920 In 1900 the percentage was 38 3 In 1910 and 1920 ten main occupational groups were listed by the Census Bureau, in which the number of wage-earners, male and female, were as follows —

Class of occupation	Both sexes		Males		Females	
	1910	1920	1910	1920	1910	1920
All occupations	38,167,336	41,614,248	30,091,564	33,064,737	8,075,772	8,549,511
Manufacturing and mechanical industries	10,628,731	12,818,524	8,808,161	10,888,183	1,820,570	1,930,341
Agriculture, forestry, and animal husbandry	12,659,082	10,953,158	10,851,581	9,869,030	1,807,501	1,084,128
Trade	3,614,670	4,242,979	3,146,582	3,575,187	468,088	667,792
Domestic and personal service	3,772,559	3,404,892	1,241,338	1,217,968	2,531,221	2,186,924
Clerical occupations	1,737,053	3,126,541	1,143,829	1,700,425	593,224	1,426,116
Transportation	2,637,420	3,063,582	2,530,795	2,850,528	106,625	213,054
Professional service	1,693,361	2,143,889	959,470	1,127,391	733,891	1,016,498
Extraction of minerals	965,169	1,090,223	964,075	1,087,359	1,094	2,864
Public service (not elsewhere classified)	459,291	770,460	445,733	748,666	13,558	21,794

Perhaps the most interesting change occurring during the decade 1910–20 was the advance to first place of manufacturing and mechanical industries over agriculture, forestry and animal husbandry in the number of workers employed. Agriculture, forestry and animal husbandry had previously held the lead ever since 1790. Another exchange which registered the changing social and economic life of the nation was the decrease of workers in domestic and personal service, and the increase in clerical occupations.

The total number of gainfully employed in 1920 included 78·2% of the males and 21·4% of the females over 10 years of age resident in the country. In 1900 the corresponding percentages were 80·8 and 18·8; in 1880 they were 78·7 and 14·7. The proportion of women workers is greatest in New England, New York and New Jersey, where they are engaged in manufacturing, and in the Southern States where the negro women are engaged in agricultural operations. The decreased number of agricultural workers among women in 1920 was due chiefly to a change in census instructions which resulted in a lower number being reported. The most important increase of women in any field was in that of clerical occupations. In the manufacturing industries women are employed chiefly in the dress and millinery trades and

in the cotton factories. Of the women in professional service nearly two-thirds were school teachers, and close to half the remainder were registered nurses. The number of women in trade increased 42·7% from 1910 to 1920, and in many occupations, mainly those of a proprietary nature, enormous increases are shown. Of the total in trade 82·4% were saleswomen and store clerks In 1920 23% of the women in industry were married.

From 1910 to 1920, despite their increase in total numbers, children from 10 to 15 years of age in industry, decreased from 1,990,225 to 1,060,858 The proportion which children of this age engaged in gainful occupations bore to the whole number of such children was in 1900, 26·1% for males and 10 2% for females, in 1910, 24 7% for males and 11 8% for females, in 1920, 11·3% for males and 05·5% for females Over one-half the employment of children was in agricultural pursuits, which are exempt from the restrictions of child labour regulation. About one-sixth of the boys and one-fifth of the girls employed were in manufacturing and mechanical industries, which are usually the first to be brought under legal control Geographically the proportion of children employed ranged from 3% in the Pacific coast States to 17% in the East South-Central States, comprising Kentucky, Tennessee, Alabama and Mississippi When all occupations are taken into account the proportion was much larger in the South than in any other section, but when non-agricultural occupations alone are considered, the proportion was considerably larger in New England and the Middle Atlantic States and slightly larger in the East North-Central States.

National Wealth.—Mulhall has estimated the aggregate wealth of the United States in 1790 at $620,000,000, assigning of this value $479,000,000 to lands and $141,000,000 to buildings and improvements It is probable that this estimate is generous according to the values of that time But even supposing $1,000,000,000 a juster estimate, the increase in wealth from 1790 to 1920 was more than three-hundredfold, or three times as great as the growth in population The estimate of the national wealth of 1850 was $7,135,780,228, since which the increase has been more than fortyfold The Census Bureau estimated the national wealth in 1900 at $88,517,000,000, in 1912 at $186 300,000,000, and in 1922 at $320,804,000,000 The estimated per caput wealth has increased from an average of $308 in 1850 to $1,165 in 1900 and $2,918 in 1922

BIBLIOGRAPHY—The first four volumes of the Fourteenth Census reports (1920) deal with population (1) *Population, Number and Distribution of Inhabitants;* (2) *Population, General Report and Analytical Tables*, (3) *Population, Composition and Characteristics by States*, (4) *Population, Occupations* The data for the census of 1920 are graphically represented in the *Statistical Atlas of the United States.* The 1926 census of religions will be found in *Religious Bodies* (1928). Also published by the Census Bureau are *A Century of Population Growth, 1790–1900* (1909), *Indian Population in the United States and Alaska, 1910* (1915), *Negro Population, 1790–1915* (1918); W. S. Rossiter, *Increase of Population in the United States, 1910–20* (1922), F A. Ross, *School Attendance in the United States, 1920* (1924); L. E Truesdell, *Farm Population of the United States* (1926); N Carpenter, *Immigrants and their Children, 1920* (1927). The Census Bureau also publishes annual compilations on mortality statistics (begun in 1909), birth statistics (begun in 1915) and marriages and divorces (begun in 1922) Non-official works of importance are L. I Dublin, ed, *Population Problems in the United States* (1926); J M. Gillette, "Immigration and the Increase of Population in the United States" in *Social Forces* (Sept, 1926); G M Stephenson, *History of American Immigration* (1926); J W. Jenks and W. J. Lanck, *The Immigration Problem* (1922), E M Phelps, *Selected Articles on Immigration* (1921) is a valuable bibliography

VI. NATIONAL FINANCE

Establishing the Financial System.—The complete financial collapse of the Confederation government in 1786 was the primary motivating factor in the establishment of a new Government. The country itself was economically sound and its resources were inexhaustible, yet attempts to collect sufficient revenue from the States had failed as also had attempts to levy national taxes. The interest on the public debt had gone unpaid and was increasing at a rapid rate. With no income all other governmental functions were faced with extinction. It was this situation which led statesmen to meet to remodel the government in the direction of giving increased power to the central administration. The Constitution which resulted gave the national Congress the power to levy and collect taxes, duties, imports and excises, to coin money and to regulate its value, to pay debts, to borrow money upon the credit of the United States and to provide for the common defense and general welfare of the country. Taxes, duties, imposts and excises were to be uniform throughout the land and could not be levied on commerce between the States. The individual States were forbidden to levy duties or imposts on imports and exports but retained the power of taxation They were also forbidden to coin money, emit bills of credit, or make anything but gold and silver legal-tender in payment of debts Money was to be drawn from the public treasury only according to appropriations voted in Congress Thus the Constitution laid down the broad principles upon which the income and expenditures of the nation are based Of the amendments since added only one, the 16th, ratified in 1913 and allowing a graduated income tax to be levied, relates to finances.

The new Congress met a month before Washington's inauguration to provide revenue by a Tariff Act levying customs duties on imported goods. Differences of opinion over details of the schedule developed and the debate lasted seven weeks Opposition also developed between those who wanted a tariff for revenue only and those who hoped that the duties might be made high enough to protect manufactures also This conflict was also destined to be permanent in American financial history With the Revenue Bill passed the House began to consider the establishment of a Treasury Department, the chief matter of discussion being whether it should be under a commission or a single head The latter was decided upon and Washington appointed Alexander Hamilton (*q.v.*) to the post Hamilton immediately tackled the third problem, the funding of the public debt Obligations to foreign countries, to individuals at home, and the debts of the various States were fixed and funded through loans Hamilton was also convinced that a Government bank would be an important aid in the handling of public credit and Congress by a sectional vote chartered such an institution for 20 years He also recommended that the monetary unit be a coin corresponding as closely as possible to the Spanish dollar and that it be expressed in both gold and silver in the proportion of 1 to 15. In the Coinage Act of 1792 provision for the coinage of this dollar and other coins was made and a mint was established at Philadelphia Thus with the power to tax in its hands, with its financial machinery established, and with rich resources in wealth behind it, the new Government became at once stable and effective

Historical Survey.—The growth of the Government's financial operations falls quite definitely into four periods. Before the War of 1812 Treasury receipts and expenditures were with few exceptions less than $10,000,000 annually Between the War of 1812 and the Civil War they could be expressed in tens of millions, from the Civil War to the World War in hundreds of millions and after the World War only in thousands of millions. For revenue reliance down to the Civil War was chiefly on customs duties. The first internal revenue tax was an excise tax on whiskey levied in Washington's administration, but it proved so unpopular that an armed insurrection broke out, and though defiance quieted down the tax never yielded well The Jeffersonian Democrats abolished internal revenue taxes on principle and, except during the War of 1812, they were not re-established until the financial strain of the Civil War made them necessary They were afterwards continued and became increasingly important until after 1900 they rivalled the customs in amount After the passing of the income tax in 1913 they began to surpass the customs. At the time of the founding of the Government it was hoped that income from the sales of public lands would pay off the national debt but this hope was never realized, and it was finally abandoned.

The government has been in an extremely critical situation, financially, only twice, during the War of 1812 and during the Civil War. The Mexican War and the Spanish-American War were financed without interrupting the nation's stride The War of 1812 was mishandled financially nor did it command the support of the middle and New England States, where the money

power was concentrated The Civil War, disrupting as it did the nation itself, created an even more precarious situation and the years 1862–63 were, doubtless, the darkest in the nation's history. The years 1865–80 were devoted to paying off the war debts or refunding them by long-term loans and to resuming specie payments. New complications, lasting until 1900, came into existence due to the declining price of silver bullion, which disturbed the 1 to 16 silver-gold ratio established in 1835 Owing to the political power of the debtor West the Treasury was obliged to maintain the coinage of this inferior bullion on a parity with gold. The years from 1900 to 1913 were occupied chiefly by attempts to increase the effectiveness of the national banks in meeting the rapidly growing business demands of the country. The solution finally arrived at was the establishment in 1913 of the Federal Reserve System (*q v.*). (X)

PUBLIC FINANCES SINCE 1913

The dominating feature in Federal public finance since 1913 has been the financing of American participation in the World War with the subsequent readjustments necessary for returning to peace conditions Although several significant alterations and innovations in the fiscal system had their origin in the pre-War period, 1910–6, it was the necessity for war expansion and for post-War contraction that made most of these changes important. For example, income taxation had its beginnings in the tariff Acts of 1909 and 1913, but it was due primarily to war experience that it rose to its present pre-eminent position in the revenue system Similarly, the Federal Reserve System had begun operation in 1914, but the use of the Federal reserve banks as fiscal agents of the Government was a war development And it was the need for retrenchment after the War that brought about the adoption of the executive budget, a measure which had been steadily advocated by successive administrations since about 1910.

Public Debt—Although taxation was used to an unprecedented extent in financing the participation of the United States in the World War, it was necessary to borrow the greater portion of the required revenues Four classes of interest-bearing obligations were authorised and issued. (1) Treasury certificates of indebtedness, with maturities not exceeding one year, (2) Treasury notes, with maturities from one to five years; (3) bonds, with maturities exceeding five years; and (4) war savings certificates, with maturities not exceeding five years. All were issued at not less than par except war savings certificates, on which interest was discounted in advance.

The Treasury was placed in funds through the issue of short term Treasury certificates of indebtedness, and from time to time outstanding certificates were funded into loans, discharged from tax receipts or replaced by new issues. Five war loans were issued during the War and post-Armistice periods The War Loan Organisation, directed from the Treasury and centred at the Federal Reserve Banks, with associated Liberty Loan Committees formed in every part of the country, conducted the selling campaigns. The results are shown in the table below.

Issue	Amount subscribed	Amount allotted and issued	Number of subscribers (estimated)
First Liberty Loan, 3½ per cent, June 15, 1917	$3,035,226,850	$1,989,455,550	4,000,000
Second Liberty Loan, 4 per cent, November 15, 1917	4,617,532,300	3,807,865,000	9,400,000
Third Liberty Loan, 4¼ per cent, May 9, 1918	4,176,516,850	4,175,650,050	18,308,325
Fourth Liberty Loan, 4¼ per cent, October 24, 1918	6,992,927,100	6,964,581,100	22,777,680
Victory Liberty Loan, 3¾–4¾ per cent, May 20, 1919	5,249,908,300	4,495,373,000	11,803,895
Total	$24,072,111,400	$21,432,924,700	

The peak of the War debt was reached on Aug 31, 1919, when the gross amount outstanding stood at $26,594,267,878. Congress, in the Victory Liberty Loan Act (March 3, 1919), provided for definite and systematic discharge of the permanent debt through provision for the cumulative sinking fund, effective on July 1, 1920, and through reaffirmation of directions to apply to domestic debt reduction any repayments of loans to foreign governments. The Federal budget is balanced annually on such basis. There remained the problem of the temporary or short-dated debt. Many of the maturities came at inconvenient times and in inconvenient amounts. In order to render this short-dated debt more manageable and to arrange maturities on dates and in amounts that could be discharged without undue strain the Treasury entered on a refunding programme. It resorted to issues of Treasury notes in moderate amounts from time to time, with maturities not exceeding five years The first issue was made on June 15, 1921. Other issues followed. On Oct. 16, 1922, the programme was varied and a series of Treasury bonds was issued with further issues of bonds on Dec. 15, 1924, March 15, 1926, and June 15, 1927. Each year since the War the volume of maturities has been considerably larger than the amount that could be retired, so that refunding operations have been continuously necessary The maturities of all refunding issues are arranged for tax payment dates, and with respect to the bonds provision was made for call before maturity. Sixteen refunding issues aggregating $9,635,899,850 have been made to June 30, 1928.

Included in the short-dated debt to be discharged or refunded were the outstanding Victory notes maturing in 1922 and 1923. Approximately $1,200,000,000 were retired through purchase for the sinking fund and other accounts, approximately $1,500,000,000 were exchanged for other issues, and approximately $1,800,000,000 were paid on call date or at maturity The second liberty loan 4 per cent bonds and converted 4¼ per cent bonds, redeemable on or after Nov. 15, 1927, and payable June 15, 1947, were called on Nov 15, 1927 Approximately $1,300,000,000 were retired through purchase for the sinking fund and other accounts, approximately $2,000,000,000 were exchanged for other issues and about $500,000,000 were paid on the call date Of the third Liberty 4¼ per cent bonds payable on Sept 15, 1928, approximately $2,600,000,000 were retired through purchase for the sinking fund and other accounts, approximately $900,000,000 were exchanged for other issues, and approximately $600,000,000 were paid at maturity.

On June 30, 1928 the outstanding debt was as follows.—

Interest-bearing debt—	
Bonds:	
Pre-War issues	$ 768,132,510 00
Liberty Loans	9,462,046,350 00
Post-War issues	2,790,638,650 00
Treasury notes	2,900,000,500 00
Certificates of indebtedness	1,252,408,000 00
Treasury Savings certificates	144,469,036 45
Total interest-bearing debt outstanding	$17,317,695,096 45
Matured debt on which interest has ceased	45,331,660 26
Outstanding debt bearing no interest	241,263,806 22
Total gross debt	$17,604,290,562 93
Net debt, after adjustments for matured interest obligations, balance held by Treasurer of the United States, etc.	$17,467,605,507 06

Taxation—There were three notable features in the history of Federal taxation in the period 1910–28 The first was the adoption of an income tax with progressive rates and its rapid growth to a position of pre-eminence in the revenue system. The second was the unprecedented expansion of taxation during the War, which made it possible to pay nearly one-third of the War costs, including loans to the Allies, from current revenues The third feature was the post-War reduction in taxation, made possible by an aggressive campaign for economy in public expenditures and by the adoption of an executive budget.

Until 1913 practically all the Federal revenue had been de-

rived from customs and internal excise duties on alcoholic beverages and tobacco In 1910, customs duties were furnishing 50% of the total ordinary receipts of the Federal Govt., while 40% came from internal taxes on tobacco and alcoholic beverages. The ratification of the 16th Amendment in 1913 permitted the Federal Govt. to "lay and collect taxes on incomes from whatever source derived," a privilege that was immediately made use of by a provision in the Tariff Act of Oct. 3, 1913 With the War came an expansion in all taxes, but the new income and excess profits taxes supplied the major portion of the increased revenues By 1928, after three reductions had taken place in the maximum rates, income and profits taxes yielded more than all of the other sources of ordinary revenue combined, while customs duties provided only about one-seventh, and tobacco taxes about one-tenth of the total ordinary receipts. The following table shows the growth in importance of the income tax from 1910 to 1928

Relative Importance of Principal Federal Taxes 1910–28

Fiscal year ending June 30	Income and profits*	Customs*	Tobacco†	Spirits and liquors†	Total ordinary receipts
(In millions of dollars)

†On basis of reports of collections Includes special taxes relating to manufacture and sale
‡From a 1% "excise tax" on corporation incomes Adopted 1909.
Source: Annual Report of the Secretary of the Treasury, 1928.

Under the stimulation of War necessity, not only were former taxes increased to maximum rates, but a multitude of new and temporary taxes came into being In each successive Revenue Act from 1914 to 1918, both of these tendencies were illustrated The climax came in the Revenue Act of 1918, approved Feb 24, 1919, which constituted the high water mark for tax levies in American history Under this law, rates on individual incomes for 1918 began with 6% on the smallest incomes and rose to 77% (65% surtax) on net incomes of over $1,000,000 For years subsequent to 1918, a small reduction in the normal tax was provided, which reduced the rate applicable to the highest incomes to 73%. Corporations were taxed 12% on their net incomes, 1% on their capital stock, and, under a combined War-profits and excess-profits tax, an additional amount up to 80% of the profits in excess of certain credits for the taxable year 1918, and 10% on their net incomes, 1% on their capital stock, and, under an excess-profits tax, an additional amount up to 40% of the profits in excess of certain credits (including 8% of invested capital) for the taxable years 1919, 1920 and 1921. Estates of decedents were made taxable at rates reaching a maximum of 25%. Excise and occupation taxes were increased from the already high rates of 1917, and many new levies were made on transactions and articles of consumption

The new Republican administration upon coming into office in 1921 began an aggressive campaign to decrease expenditures and effect a cut in the high taxes. The success of this economy programme was greatly enhanced by the establishment in 1921 of an executive budget system, which permitted, for the first time, the formulation of a comprehensive fiscal programme by the administration. In spite of the increased cost of government and continued war liabilities for the public debt, disabled veterans and unliquidated War-time agencies, it was found possible to reduce taxes to some extent immediately. Accordingly, the Revenue Act of 1921 repealed the excess-profits tax on corporations (although the corporation income tax was increased as a partial offset), and the maximum rate on individual incomes was reduced from 73% (65% surtax) to 58% (50% surtax). Several of the more unpopular excise taxes were also repealed, such as duties on transportation, toilet and medicinal preparations and clothing

By 1924 the reduction in expenditures had made considerable progress, resulting in a surplus of about $500,000,000 in ordinary receipts over expenditures chargeable against ordinary receipts Congress found it possible, therefore, to make more extensive tax reductions in the Revenue Act of 1924 The maximum rate on individual incomes was reduced from 58% to 46% (40% surtax), while the smallest taxable incomes paid only 2% Numerous excise duties, including taxes on telegraph and telephone messages, manufacturers' sales, drafts and checks, and admissions, were repealed in whole or in part

Two further tax revisions in 1926 and in 1928 were undertaken in an attempt to devise a more scientific system It was felt that some of the taxes, especially the excessive surtaxes on individual incomes and the corporation taxes, had a depressing effect on industry, and, furthermore, were fiscally unnecessary Accordingly, in 1926, the maximum rate on individual incomes was fixed at 25% (20% surtax), while corresponding reductions were made in the lower brackets The corporation capital stock tax was repealed in 1926 and the rate on corporation incomes was fixed at 12% in 1928 (after having been increased to 13½% in 1926) Several taxes including the gift tax and the automobile taxes were repealed and reductions made in many other taxes

Tariff—Two thorough revisions of the tariff have taken place since 1910 In 1913, the new Democratic administration supplanted the "cost of production" duties of the 1909 law with schedules designed to secure "effective competition" between American and foreign producers There was a reduction in rates on many manufactured products, notably textiles, and the free list was extended to include some important raw materials and foodstuffs, as well as a few manufactures A Tariff Commission was created to make researches into comparative costs of production, upon which future tariff rates could be based

With the return of the Republican party to power in 1921, an emergency Act was immediately provided to be effective until a comprehensive tariff revision could be undertaken There was a general increase in rates, and duties were imposed on many articles which had been on the free list The new Tariff Act of 1922, as finally framed, reinforced and extended this upward revision of rates A "flexible" provision was included which gave the President power to increase or decrease rates by not more than 50% of the statutory amount, as occasion demanded, but this privilege has been rarely used

Loans to Foreign Governments—The total principal amount of obligations of foreign governments originally held by the Treasury was $10,338,058,352 20 Such obligations were acquired by the United States (1) under the authority of the Liberty bond acts which authorised the Secretary of the Treasury, with the approval of the President, to establish credits in favour of foreign governments engaged in war with enemies of the United States against which cash advances were made for the general purpose of enabling those governments to meet commitments made in the United States in connection with the prosecution of the War; (2) under the authority of the Act of July 9, 1918, which authorized the President, through the head of any executive department, to sell any surplus war supplies on such terms as the head of such department deemed expedient, (3) under the authority of the Act of Feb 25, 1919, appropriating $100 000,000 as a revolving fund for the participation by the United States, in the discretion of the President, in the furnishing of foodstuffs and other urgent supplies to certain populations in Europe and countries contiguous thereto; and (4) under the authority of the Act of March 30, 1920, which authorized the U.S Grain Corporation, with the approval of the Secretary of the Treasury, to sell or dispose of the flour in its possession, not to exceed 5,000,000 bbl at such prices and on such terms or conditions as might be necessary to relieve populations in the countries of Europe or countries contiguous thereto, suffering for the want of food.

Principal Amounts of Obligations of Other Countries to the United States and Payments Received Thereon, to June 30, 1928

*Credit of $1,932,923 45 allowed for loss of cargo on ship sunk by mine deducted. †Agreement with France not yet (June, 1929) ratified by the United States or France.

The tables above show by countries the total principal amount of such obligations received by the United States and payments on account of principal thereof.

The Budget.—The Budget and Accounting Act of June 10, 1921, directed the President to submit annually to Congress a budget prepared by a Bureau of the Budget in the Treasury Department, whose duties were to be performed directly under the President. By this means it is possible for the President to exercise an effective control over the estimates of appropriations submitted by the executive departments and officers. The first budget was submitted in 1921, for the fiscal year ending June 30, 1923. By that same law, the General Accounting Office was established under the Comptroller-General of the United States and independent of the executive departments

The Federal Reserve Banks as Fiscal Agents.—The organisation of the Federal Reserve System has made a fundamental change with respect to the conduct of the fiscal business of the Government. The Secretary of the Treasury may require the Federal Reserve banks to act as fiscal agents of the United States and as depositaries of public moneys. They have been utilised in both capacities, and since the discontinuance of the independent Treasury system on July 1, 1921 they have been the principal agents for the administration of receipts and expenditures, the depositary system, the public debt and paper currency changes

Other Agencies.—During the War period and subsequently the operations of many governmental agencies created by Congress had more or less connection with and influence on national finance. Mention may be made of the Federal control of railways and the post-War assistance given the carriers under the Transportation Act of Feb. 28, 1920 and of the several War emergency corporations, the capital stocks of which were subscribed for by the Treasury and served as revolving funds, such as the Emergency Fleet Corp., the U.S. Housing Corp., the U.S. Sugar Equalisation Board, the U.S. Spruce Products Corp., the War Finance Corp., and the U.S. Grain Corporation. The United States subscribed to the capital stock of the Federal Land Banks, now repaid for the most part, furnished the capital for the Intermediate Credit Banks, and purchased Federal farm loan bonds when their public sale at par was impossible at statutory coupon rates. In 1910 a Postal Savings System was established that has received deposits aggregating $1,586,498,397, while withdrawals have amounted to $1,434,355,048. Deposits bear interest at 2%.

TABLE I. *Receipts and Expenditures of the United States Government by Fiscal Years from 1911 to 1928*
(On basis of warrants issued)

Fiscal year	Ordinary receipts: Customs	Internal revenue: Income and profits tax	Internal revenue: Miscellaneous	Sales of public lands	Surplus postal receipts covered into the Treasury	Miscellaneous receipts	Total ordinary receipts	Postal revenues[1] exclusive of surplus postal receipts covered into the Treasury	Total ordinary receipts and postal revenues	Surplus (+) or deficit (−) ordinary receipts covered into the Treasury compared with expenditures chargeable against ordinary receipts(2)

1. Postal revenues and expenditures, except surplus postal receipts covered into the Treasury and postal deficiencies paid out of the general fund of the Treasury, are based upon reports of the Post Office Department. Postal expenditures include adjusted losses, etc —postal funds—and expenditures from postal balances but are exclusive of departmental expenditures in Washington, D C , to the close of fiscal year 1922, and amounts transferred to the civil service retirement and disability fund, fiscal years 1921 to 1926, inclusive For the years 1927 and 1928 the 3½ per cent salary deductions are included in "Postal expenditures," the said deductions having been paid to and deposited by the disbursing clerk of the Pension Bureau for credit of the retirement fund.

2. Beginning with 1921, the surplus or deficit takes into account public-debt expenditures chargeable against ordinary receipts.

3 Includes civil expenditures under War and Navy Departments in Washington, to and including fiscal year 1920, and unavailable funds charged off under act of June 3, 1922. (42 Stat. 1502.)

4. Exclusive of civil expenditures under War Department and Navy Department in Washington to and including fiscal year 1920

5. Includes only Army and Navy pensions for service prior to World War, and fees of examining surgeons in Pension Bureau, and is exclusive of payments made by the War Risk Insurance Bureau and Veterans' Bureau to veterans of the World War, and salaries under Bureau of Pensions, which are included in civil and miscellaneous expenditures

6 Exclusive of amounts transferred to the civil service retirement and disability fund (Interior Department) under act of May 22, 1920 (41 Stat. 614), on account of salary deductions of 2½ per cent, as follows: 1921, $6,519,683 50, 1922, $7,899,006 28, 1923, $8,284,081; 1924, $8,679,658.60; 1925, $10,266,977.47, and 1926, $10,472,-289.59 *See* Note 1

7 At par

8. Exclusive of estimated increased postage under act of Oct. 3, 1917 (40 Stat 327), which is included in "Surplus postal receipts," as follows 1918, $39,073,000, 1919, $71,906,000; 1920, $4,013,000

9 Exclusive of additional compensation, Postal Service, under joint resolution of Nov. 8, 1919 (41 Stat. 350), which is included in "Postal deficiencies," as follows, 1920, $35,698,400, 1921, $1,374,014 56, 1922, $22,397 37.

10 Exclusive of $11,268,183 62 transferred on July 1, 1927, from the checking account of the U S Shipping Board on the books of the Treasurer of the United States to the warrant account on the books of the Secretary of the Treasury, and covered into the Treasury by miscellaneous receipt covering warrant under the title, "Funds deposited for construction loan under section 11, merchant marine act, 1920, special fund" This transfer of funds checking account to warrant account is merely an adjustment between accounts in this fiscal year of cash transactions occurring in prior fiscal years Accordingly, the item has not been included in either the receipts or expenditures of this report, inasmuch as it did not affect the cash in the Treasury during the current fiscal year

Adherence to the gold standard has been one of the important factors contributing to the stability of the American financial structure During the War actual payments in gold, though discouraged, were never suspended, and in 1922 the unrestricted payment of gold in the ordinary course of business was reinaugurated.

Table I sets forth the receipts and expenditures of the U S Govt on a warrant basis during the period July 1, 1910 to June 30, 1928 by fiscal years, classified as to ordinary receipts and expenditures, postal revenues and expenditures, and public debt receipts and expenditures. The surplus or deficit of ordinary receipts and of total receipts is also shown for each year. Table II. summarizes the history of the public debt since 1917 Table III. is a statement of ordinary receipts, and expenditures against such receipts, together with the surplus or deficit, stated on a current cash basis, by fiscal years from 1917 to 1926.

BIBLIOGRAPHY.—Annual Reports of the Secretary of the Treasury on the State of the Finances; Message of the President of the United

TABLL II *Transactions in the Public Debt of the United States Government from July 1, 1916, to June 30, 1928*

VII. INDUSTRY AND COMMERCE

MANUFACTURES

During the colonial period there was very little manufacturing in the American Colonies, for the population was occupied largely in the raising of foods and other agricultural products Then, also, there was the competition of the English manufacturers, with their relatively cheap labour, larger capital, and more skill, fostered by the British Government, who regarded the American Colonies first as sources of raw materials, and secondly as markets for their manufactured goods What manufacturing was carried on, was devoted mostly to such products as crude textiles, shipbuilding, naval stores, candles and brick

There was a period of transition from colonial to national economy beginning about 1790 and continuing down to about 1820 or 1825 Manufacturing during this time, while hampered occasionally, made progress.

It represented, however, such a small portion of the endeavours of the population that no attempt was made at the first decennial census of 1790 or that of 1800 to collect statistics regarding it. Congress did provide for such enumerations beginning in 1810 but the results of the 1810 census were so unsatisfactory they were not published, nor were the results of the 1820 census of much value. Practically all manufacturing was done either in local shops or in the home.

Unification.—Beginning about 1820 and continuing down to 1860 might be termed a period of unification Wealth increased, markets widened, inventions of apparatus greatly increased, the manufacturing processes gradually became more complex, and more capital eventually found its way to manufacturing industries, which made for the production of a larger variety of goods The cotton gin patented in 1794, the introduction of the use of power in 1832 and the invention of the ring spinner a little later were destined to transform the textile industry from one of the home to one of the factory. The substitution in 1840 of anthracite coal for charcoal in the smelting of pig iron revolutionized the iron trade and made it possible for American iron manufacturers to compete successfully with the English who had begun the use of bituminous coal for this purpose a few years before. The invention in 1846 of the sewing machine revolutionized the shoe industry and also gave great impetus to the manufacture of ready-made clothing. Other factors which aided in the development during the period of 1825–60 were the growth of population, the extension of railways, the development of natural resources and the taking up of western lands. The north and east were the principal manufacturing sections, while the south and west were largely agricultural.

Rise of Modern Era.—From 1860–99 was a period of industrial revolution. The opening of the west, the increasing means of transportation, growth of inventions, and imposition of heavy tariffs on all imported manufactured goods had an immediate effect upon production. According to an official report in 1869 more cotton spindles were put into operation, more iron furnaces erected, more iron smelted, more steel made, more lumber sawed and more manufactories of different kinds started in 1864–68 than in any previous equal period in the history of the country. Between 1870 and 1899 the production of manufactured goods continued to expand The manufacture of iron and steel, railway equipment, agricultural implements and other machinery, boots and shoes, textiles, paper and printing, and food products grew rapidly Much of the expansion in the production of manufactured goods was due to the continued increase in national income, the growth in population, the consequent widening of home markets, and the continued development of natural resources.

Not only did the volume and value of manufactured products grow rapidly during the period of 1860 to 1899 but at the same time there took place an increase in the size of manufacturing establishments This was particularly pronounced in the manufacture of iron and steel and their products, of cottons and of leather goods, and only less so in all industries except those essentially of a local nature During this period the system of interchangeable machine parts was introduced into manufacturing industries Toward the close of the nineteenth century there was some tendency toward standardization, but there was no great progress at that time The use of mechanical power was increasing rapidly, and though still small compared with the present, its progress between 1870 and 1899 made the United States the leading manufacturing nation of the world.

Before the World War.—Inventions, the growth of population, the development of natural resources and the increasing wealth of the latter part of the nineteenth century set the stage for rapid industrial progress between 1899 and 1914. Value added to cost of raw materials by process of manufacture which in 1899 amounted to $4,800,000,000 had more than doubled by 1914, amounting to $9,900,000,000. In this great growth the production of automobiles began to play an important part The further perfection of motor vehicles was destined to transform many industries, and to affect greatly the whole system of distribution and, indeed of the social fabric of the nation It had a direct beneficial effect on the iron and steel and rubber industries, and many vocations not usually classed as manufacturing.

Apart from the increased demand for steel brought about by the development of the automobile, the resultant increased use of all kinds of machinery—notably agricultural implements, electrical equipment and machine tools—had an important bearing on the rapid growth of the iron and steel industry Indeed there is scarcely an industry of any kind whose development does not affect that of iron and steel, whose output (less the cost of its raw materials) rose in value from $302,000,000 in 1899 to $822,000,000 in 1914, an increase of 172 per cent During the same time a corresponding increase was naturally recorded in the case of rubber tires, the output of which (less raw materials) increased in value from 40 million dollars in 1899 to 138 million dollars in 1914, or 245 per cent. There was also a large growth in the manufacture of textiles, food and kindred products, and in paper and printing, the latter of which was directly due to a large extent to the marked increase in education, and to the rising standards of living

TABLE I. *Value (in Dollars) Added to Cost of Raw Materials by Process of Manufacture*
(000,000's omitted)

Industry group	1914	1919	1925	Per cent change 1914 to 1919	Per cent change 1919 to 1925
Food and kindred products	1,036	2,435	2,670	135	10

Railroad repair shops	291	807	769	177	5
Miscellaneous industries	315	822	982	161	19
Total United States	9,823	24,844	26,778	153	8

The increase in output per worker of about 10% between 1899 and 1910 was due in part to improvement in methods, better management, larger use of capital, more automatic machinery and much freer use of mechanical power No small part of this increase in output per worker, however, was due to changes in the worker himself His alertness, increasing intelligence, and adaptability, aided by improvements in education, made him quick to pick up new ideas and eager to apply them

The installed horsepower in manufacturing establishments multiplied 2·23 times between 1899 and 1914, increasing from 10,100,000 to 22,500,000 between these dates This increase in the use of mechanical power was more rapid in some sections of the country than in others The use of mechanical power in manufacturing establishments increased 304% in the Pacific States, 276% in the Mountain States, 157% in the South Atlantic States, 154% in the West Central States, and about 127% in the East South Central and East North Central States, while the growth in all other sections was less than the average for the whole country The New England States, whose industries were already largely developed naturally showed the smallest relative growth. The use of mechanical power increased, however, much more rapidly in all groups of States than did the number of factory wage earners. New York, Pennsylvania, Illinois, Ohio and Massachusetts with about one-third of the population produced in 1914 about one-half of the value of all manufactures and employed about one-half of the wage earners in manufacturing industries.

The War Period.—Manufacturing activity increased rapidly between 1914 and 1919 The World War caused an overwhelming demand for all kinds of manufactured goods, especially those of a basic nature—food products, chemicals, iron and steel, textiles, and transportation equipment. The value of manufactured products increased from $24,100,000,000 in 1914 to $61,900,000,000 in 1919, and the value added to the cost of raw materials by the process of manufacture increased from $9,800,000,000 to $24,800,000,000, or 153%, the greatest percentage of increase being in transportation equipment, rubber products and machinery (Table I.)

The first effect on American manufacturing of the outbreak of the war in 1914 was one of mild depression caused by the sale of foreign-held United States securities. Then came a period of revival, followed by great activity A loan of $500,000,000 made by American bankers to Great Britain and France, followed by subsequent advances, all of which was to be spent in America, inaugurated several years of tremendous activity in American manufacturing, including steel products, explosives, lubricants, woollen goods, boots and shoes, meat products, automobiles, lumber, agricultural machinery and ships. With the entry of the United States into the World War in the spring of 1917 the demands upon industries were of formidable proportions and required widespread co-ordination. The War Industries Board was therefore created, with which most manufacturers co-operated Certain non-essential industries were cut down considerably, while those required for the successful prosecution of the war were run at top speed.

The expansion of manufacturing plants from 1914 to 1919 caused a large increase in the number of factory workers, wages and the use of mechanical power The number of workers increased from 6,900,000 to 9,000,000, 30%; wages from $4,100,000,000 to $10,500,000,000, 156%; and the use of mechanical power from 22·3 million horsepower to 29 3 million, 31 per cent

Recent Years.—Barring the readjustment of industries to a peace time basis and the depression of 1921, from about 1919 down to about 1929 there has been a marked development in the industries of the country It has been characterized by (1) elimination of waste, (2) standardization of many products, (3) mass (repetitive) production, (4) increasing size of industrial units, (5) larger use of capital, (6) increasing use of mechanical power, (7) more automatic machinery, (8) increased research into methods and processes, (9) increasing output per worker, and (10) steadier employment

Much of the progress of industry, especially since 1921, has been owing to the fact that problems of production and distribution have been systematically studied The result has been to render discovery, invention, economy of material and labour, and improvement of methods in general largely an organized and continuous process rather than a haphazard one This movement has come to be commonly designated as "elimination of waste" or "simplified practice." These systematic movements are conducted by individual corporations, by associations of producers, dealers and consumers, by special research organizations, by universities, and by the Federal and State Governments There is a growing practice of co-operation among all the interests involved to this end

Simplification.—One of the important efforts of recent years has been concerted agreement for the simplification of products. In scores of branches of industry, producers, dealers and consumers have agreed to eliminate unnecessary sizes, shapes and varieties of products, concentrating production on a limited number of standard forms, with a consequent marked reduction in average unit cost. The Federal Department of Commerce has played a large part in this movement. For instance during 1927 there were 17 simplified practice recommendations for as many groups of commodities completed under the auspices of the Department of Commerce, bringing the total of completed recommendations at the end of the year to 80. Some of the reductions in variety of products made as a result of these recommendations of 1927 were as follows:

Commodity	Reductions in varieties From	Reductions in varieties To	Per cent reduction
Flashlight cases	25	14	44
Razor blades (system of packing)	2	1	50
Salt packages	35	19	46
Turnbuckles	248	115	54
Solid section steel sash	42,877	2,244	95
One-piece porcelain insulators	272	249	9
Hospital and institutional textiles	575	26	95
Composition blackboard:			
Colours	3	1	66
Widths	18	8	55
Lengths	54	13	76

It has been the past experience that a simplified line of products makes the cost less to the ultimate consumer and makes for improved quality as well. If a distributor can reduce his inventory by 75% as has been reported in some instances, and obtain better, quicker delivery from the producer, his gains are passed on to the consumer in the form of improved service, immediate replacement of items, and gradual reduction in cost of the commodity.

Large-scale Production.—American industry in 1929 was characterized by large-scale production, and increasing size of industrial units. In 1925 there were about 10,600 manufacturing establishments with an output each exceeding a million dollars in value, and these together contributed over two-thirds of the value of all factory products. There were in 1923 (the latest year for which these data are available) nearly a thousand factories each employing more than 1,000 wage earners and these reported 2·1 million employees out of an aggregate of 8·8 million in all plants. The relative importance of large plants has increased materially; in 1909 (the first year for which comparable statistics are available) 43% of all factory wage earners were in plants with more than 250 employees, whereas in 1923 considerably more than half of the total number of factory workers were in such plants. Larger-scale production is, of course, particularly conducive to low costs where processes are repetitive—that is, where large quantities of the same product are turned out. The big plant can in such cases introduce highly specialized machinery adapted to its various tasks, whereas the smaller plant must often use machines intended for more general purposes.

Another factor in the progress of American industry is the increasing use of capital per plant The combined assets of corporations in manufacturing industries in 1924 were reported at more than $49,000,000,000, of which about $24,000,000,000 was in the form of current assets—inventory, accounts receivable, and cash—and the remainder in fixed assets—plant and equipment.

A rough measure of the use of machinery is furnished by the statistics of the capacity of mechanical power. In manufacturing industries each American wage earner on the average was in 1927 aided by mechanical power of a capacity of 4 7 horsepower; in 1919 the average was 3 3 The power employed on American railways has similarly increased The average capacity of the individual locomotive has doubled since 1900 but it requires no more men to operate a locomotive than before

A still broader view of the use of power is gained from the data of the production of mineral fuels and of water power Their output, reduced to the terms of equivalent of coal, has averaged during recent years about 7½ tons per capita of the entire population, a figure four or five times greater than half a century ago, and about twice as great as in 1900 Moreover the heat and energy derived have increased much more by reason of the growing efficiency with which fuels are utilized

One important lesson learned by American industries during the World War was the great value of industrial research as a tool in peace time operation of industry To-day it is one of the basic factors in the nation's industrial progress and it has made great progress within the last few years. According to a survey made by the National Research Council in 1921 five hundred and seventy-eight industrial research laboratories, exclusive of those attached to the Government's bureaux and the universities, were at that time making studies of the processes and possibilities of industrial improvement. Another survey made by the same organization in 1927 showed that this number had grown to 1,000, an increase of nearly 75% within six years There is hardly an industry to-day that does not owe much of its progress to research, and this has been particularly true during the past seven years.

Wages are higher in the United States than in most other countries and have advanced steadily in recent years. The average annual wage in manufacturing industries for workers of all degrees of skill in 1927 was $1,310. Adjusted by the buying power of money, this was over 40% higher than in 1919, in spite of a considerable shortening of the working day This increase in real wages has served to advance efficiency of industry and to widen markets, which in turn has tended to lower unit costs. Factory workers have come to recognize that large production tends to high wages and have shown little tendency to restrict output or to oppose labour-saving machinery Factory wages in 1927 amounted to $10,849,000,000, which was equal to about 12 5% of the total national income as estimated by the National Bureau of Economic Research. The per cent distribution of factory wages in 1925 by groups of States was as follows. New England, 12·5%; Middle Atlantic, 32%; East North Central, 31·2%; West North Central, 5·2%; South Atlantic, 7%; East South Central, 3%; West South Central, 2·5%; Mountain, 1·2%; Pacific, 5·4 per cent.

To 1919 the number of workers in manufacturing plants had increased from decade to decade, but since that time has shown a declining tendency, and in 1927 there were probably nearly three-fourths of a million fewer factory workers in the United States than in 1919. This decrease in the number of factory workers, however, resulted in no general unemployment, even though the population had increased The increase in output per worker in manufacturing industries and the wider distribution of wealth have created thousands of new positions in the "servicing industries" For example, recent reports show that more than 1·2 million have found employment since 1919 in driving and ministering to motor vehicles About 150,000 in 1927 were engaged in selling and servicing radios; in 1919 such employment scarcely existed The hotel, restaurant and allied industries were in 1927 employing over 500,000 more people than in 1919; those employed in the motion picture industry (exclusive of production) increased about 150,000, those engaged in teaching in schools and colleges increased about 185,000, and so on down a long list.

Some of the outstanding developments in the manufacturing industry since 1919 have been the production of commodities that tend to increase the comforts of life and to save hand labour—such as automobiles, radio, vacuum cleaners, washing machines.

Output and Value.—The volume of production of all manufacturing industries was 9% larger in 1927 than it was in the year 1920, the increase in iron and steel industries being 5%, lumber and allied products 31%, metals and metal products, other than iron and steel, 26%, chemicals 66%, paper and printing 40%, textiles and their products 17%, food products 27%, and stone, clay and glass products 67 per cent The decline in the vehicle (land, air and water) group of industries was due to the great decline in shipbuilding The large increase (105%) in the output of rubber products between 1921 and 1927 was due to the increased production of tires Indexes of the principal individual manufacturing commodities are shown in Table II.

According to the latest complete census the mechanical power in manufacturing establishments increased 33% between 1919 and 1927, increasing from 29·3 million horsepower to 39 0 million horsepower From 1919 to 1925 the increase by groups of industries was as follows Rubber products 53%, stone, clay and glass products 48%, railroad repair shops 46%, the transportation equipment group, the machinery group, and the paper, printing and related industries groups each about 23 per cent

Three groups of industries—textiles and their products, machinery, exclusive of transportation equipment, and iron, steel and their products—employed in 1927 about 40% of the wage earners, paid about 41% of the wages, and represented about 37% of the value added to the cost of raw materials by the process of manufacture in all United States manufacturing establishments. The increase in output per person made possible a decrease in the number of wage earners in manufacturing establishments between 1919 and 1927, the number of wage earners decreasing about 7 per cent. While this condition prevailed in most industries, four of the sixteen groups showed an increase from 1919 to 1925; the textiles and their products increasing slightly, the lumber and allied products increasing 7%, the paper, printing and related industries 5%, and the stone, clay and glass products group 17% (Table III) This was not due so much to a lack of efficiency in these industries as it was to an increased volume of output.

The middle Atlantic group of States (New York, New Jersey, Pennsylvania) was the largest as measured in value of products, value added to cost of raw material by process of manufacture, and number of wage earners employed, but was followed rather closely by the East North Central group of States (Ohio, Indiana,

TABLE II. *Manufacturing Production—Indexes for Groups of Industries*

NOTE.—Monthly average 1923-25 = 100. These index numbers are not adjusted for length of month or seasonal variations.

Period	All commodities	Foodstuffs	Textiles	Iron and steel	Lumber	Leather	Paper and printing	Chemicals and oils	Stone, clay, and glass products	Metals, non-ferrous	Tobacco	Rubber products	Vehicles	Miscellaneous

TABLE IV *Density of Manufacturing in United States, 1925*

State group	Land area, 1925 (sq miles)	Value added to cost of raw material by process of manufacture: Total	Value added to cost of raw material by process of manufacture: Per square mile of land area
New England	61,976	$ 2,936,153,000	$47,376
Middle Atlantic	100,000	8,727,133,000	87,271
East North Central	245,564	8,261,929,000	33,645
West North Central	510,804	1,507,795,000	2,952
South Atlantic	269,071	1,982,754,000	7,369
East South Central	179,509	766,224,000	4,268
West South Central	429,746	824,124,000	1,918
Mountain	859,009	357,968,000	417
Pacific	318,095	1,413,986,000	4,445
Total United States	2,973,774	$26,778,066,000	$9,005

The proportion of population working in factories is largest in the New England States In 1925 for every 100 people in New England 14·1 were factory wage earners, in the Middle Atlantic States 10 3, in the East North Central states 9 9, in the Pacific States 6·3, in the South Atlantic States 5·4, while in the balance of the States less than 4 persons of each 100 were factory wage earners. For further details of the progress of manufacturing between 1919 and 1927, the reader is referred to the *Abstract of the Census of Manufactures* published biennially by the United States Department of Commerce

MINERALS

The mineral resources of the United States may be said to form the corner stone upon which its industrial structure has been reared In the steady growth of its manufactures and the increased utilization of its coal, petroleum, iron, copper and other minerals, a definite correlation is evident. The growth of the mineral industry and its present magnitude is indicated by the following table:

Total Value of Mineral Products of the United States

1909	$1,887,107,000	1923	$5,986,500,000
1910	1,987,844,000	1924	5,305,800,000
1911	1,924,081,000	1925	5,677,630,000
1912	2,237,794,000	1926	6,212,700,000
1913	2,433,545,000	1927	5,520,000,000

Iron.—In 1925 the United States contributed 55% to the world's total production of iron and steel Only 3% of this production was exported, the remainder being consumed within the country. The one outstanding factor that has advanced the American iron industry is the demand of the railways which have been the greatest consumers of iron

Production of Iron Ore in the United States, 1923-1927

(In long tons)

1923	69,351,000	1926	67,623,000
1924	54,267,000	1927	61,744,000
1925	61,908,000		

The following figures taken from the *Annual Statistical Report of the American Iron and Steel Institute* for 1927 show the quantities of materials produced and used in the iron industry of the United States in 1927

Pig iron manufactured	35,858,232 gross tons
Iron ore, mill cinder, scale, etc., consumed	69,714,806 gross tons
Coke consumed in the manufacture of pig iron only	37,375,473 bushels
Limestone consumed in the manufacture of pig iron only	14,102,028 gross tons
Total steel produced	44,935,185 gross tons

The United States is far better supplied with developed resources of iron ore than any other country, although Brazil probably ranks first in undeveloped resources. The major deposits of the United States are found in the Lake Superior region and along the Appalachian system. Of the total production of 61·7 million gross tons in 1927, 52·3 million tons were shipped from the Lake Superior district, while Alabama and Pennsylvania, next in importance, produced 6·4 million and 1·2 million gross tons, respectively.

Coal.—The growth of the bituminous coal industry during the present century up to the period of the World War, in spite of ups and downs, was relatively steady

Production of Bituminous Coal in the United States
(Million of short tons)

1909	380	1921	416
1910	417	1922	422
1911	406	1923	565
1912	450	1924	484
1913	478	1925	520
1919	466	1926	573
1920	569	1927	520

The post World War developments in the coal industry have not kept pace with the earlier part of the century, largely for two reasons First, great economies, precipitated by the war, in the use of coal have reduced the quantity required for a given unit of power. For example, the electric utilities cut their unit consumption of coal per kilowatt hour from 3 2 pounds in 1919 to 2 1 in 1925, a reduction of 34% in six years Secondly, there has been a considerable substitution by the use of petroleum, gas and water power Coal still remains the principal source of energy in the United States but in 1927 the relative use of energy sources was bituminous coal 54·8%, anthracite 8 8%, oil and gas 29 6%, and water power 6 8%, whereas in 1913, anthracite constituted 14 4% and bituminous 72 7 per cent

Although coal is produced in commercial quantities in twenty-seven States, in 1925 seven States produced over 450 million tons of the 520 million total output for the bituminous industry These seven States produced in round numbers (in millions of tons) as follows: Pennsylvania 137, West Virginia 122, Illinois 67, Kentucky 55, Ohio 28, Indiana 21 and Alabama 20

Petroleum.—Production of petroleum in America dates back to 1859 and from that date the United States has supplied the bulk of the world's output Before the general introduction of electricity, kerosene gave the world light as the successor of whale oil, lubricating oil derived from petroleum made possible the age of machinery By 1910 the automobile was creating a new demand for gasolene which has been the predominant urge in the world's petroleum development and has revolutionized the American industry

The United States is by a large margin the greatest oil consuming country in the world The annual per capita consumption

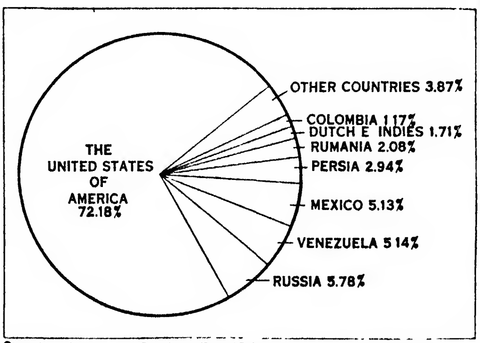

CHART SHOWING SOURCES OF THE CRUDE PETROLEUM PRODUCED IN THE WORLD IN 1927 (1,252,145,000 BARRELS, PRELIMINARY FIGURES)

in 1927 was 6 81 barrels; in 1870 it was 0·14 barrels, and as late as 1900 it was only 0·84. As has been indicated, the large increases in consumption followed 1910 in which year the consumption was 2·08 barrels for each person.

Production of Crude Oil by Decades 1860 to 1910
(In thousands of barrels of 42 gallons each)

1860	500	1890	45,824
1870	5,261	1900	63,621
1880	26,286	1910	209,557

Since the close of the World War, the production of petroleum in the United States has doubled, amounting in 1927 to 894 4 million barrels There are over 300,000 producing oil wells in the United States but less than 3% of them produce half of the oil.

Production of Crude Oil by Major Divisions—1927
(In thousands of barrels of 42 gallons each)

Eastern	Appalachian	30,458
	Lima, Indiana	1,833
	Illinois and South-west Indiana	7,751
	Mid-continent	543,343
	Gulf Coast	49,679
	Rocky Mountain	30,184
	California	230,752

As to resources, the survey of the American Association of Petroleum Geologists made at the end of 1921, gave 9,150,000,000 barrels

A comparison of the rate of growth of coal and its principal competitors, oil, gas and water power, has been made by F G

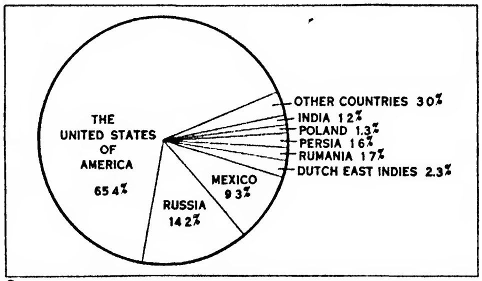

CHART SHOWING SOURCES OF THE CRUDE PETROLEUM PRODUCED IN THE WORLD 1857–1927 (15,811,437,000 BARRELS, INCLUDING PRELIMINARY FIGURES FOR 1927)

Tryon of the U S Bureau of Mines This shows that the energy derived from coal has decreased while that derived from oil and natural gas has increased Fuel oil has made its greatest gains as an energy resource in the marine world Since 1914, the tonnage of the world's oil burning merchant marine has increased from 1 7 million tons to 20 8 million tons

Copper.—The United States is by far the most important producer of copper in the world, winning its leading position in 1872 when it passed Chile From 1880 to 1900 there was an average annual increase of more than 24,000,000 pounds The output in 1900 was 606,100,000 pounds which was almost doubled by 1913

Copper Statistics (in millions of pounds)

	1923	1924	1925	1926
Copper smelter output	1,434	1,634	1,674	1,739
Electrolytic production of new copper	1,302	1,499	1,533	1,533
Metallic copper export	828	1,116	1,082	960

During recent years the United States has supplied more than one-half of the world's total production. In 1926 Arizona produced in round numbers copper ore with an equivalent of 365,000 short tons, Utah 130,000 and Montana 129,000 out of a United States total of 870,000 for that year. Low grade deposits have become the largest source of American copper.

Lead.—The United States is the largest producer as well as the largest consumer of lead in the world. The two principal lead ore producing States are Missouri and Idaho, followed by Utah, Colorado and Oklahoma. These five States account for approximately 90% of the production The technical advances which have been made in the processing of the complex lead-zinc-silver ores of the Rocky Mountain district have opened up relatively larger reserves of lead heretofore unavailable to commerce From 1909 to 1913 the annual yield was from 350,000 to a little over 400,000 tons. In 1927 the output was 668,000.

Zinc.—The United States is the largest producer as well as consumer of zinc in the world, producing almost one-half of the world's output in 1927. The outstanding deposits are situated in what is known as the Joplin District, which includes adjacent parts of the States of Missouri, Oklahoma and Kansas Other important producing states are New Jersey, Montana, Utah, Idaho and Colorado. The present potential production of zinc from the complex sulphide ores in the Rocky Mountain area, through improved processes, bids fair not only to replace the older areas, which are being depleted, but to add materially to the world's production. The position occupied by zinc during the past five years differs greatly from that of copper and lead, particularly lead, as zinc is not as essential industrially as the other metals The peak year of zinc production was 1926 with 611,000 tons In 1927 the production was 577,000 tons The outstanding development since the World War is the increase in the production of electrolytic zinc

Other Metals.—Bauxite, the ore from which aluminium is made, is produced in the United States mainly in Arkansas, with Georgia, Tennessee and Alabama in a secondary position. In 1927 the total production of the United States was 320,900 long tons of which Arkansas produced 303,800 tons During the past few years the United States produced between one-fourth and one-third of the total world output.

In 1927 the United States imported 20,200 flasks (75 pounds to the flask) of mercury and produced 11,300, the largest quantity produced in the country since 1920 when the output was 13,400 flasks. The largest part of the domestic requirements, approximately two-thirds, is met by importations. For many years the United States has required more than one-fourth of the world's total productions.

Other Non-metals.—The United States possesses about 60% of the world's high-grade deposits of phosphate rock and in 1927 produced 3,100,000 long tons. In sulphur, the reserves of the United States exceed those of the rest of the world The American sulphur deposits, situated mostly in the State of Texas, contribute the larger part of the world's production. In 1927, 2,100,000 short tons were produced in the United States Natural gas, an accompaniment of the oil industry, was produced and delivered to consumers to the extent of 1 4 trillion cubic feet in the United States in 1927. Production of gasolene from natural gas has increased greatly since the World War. In 1928 the output of this commodity was 282,000,000 gallons, in 1927 it was 1,628,000,000 gallons.

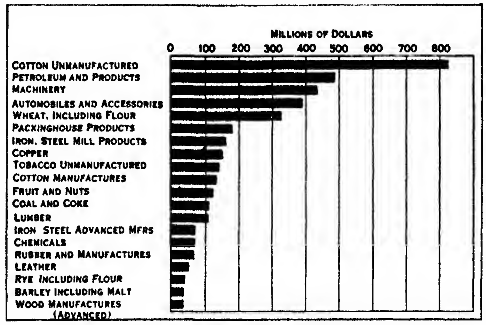
FOREIGN TRADE OF THE UNITED STATES

While the export trade of the United States accounts for only a small proportion of domestic production, it is of extreme importance to the economic well-being of the country, because of the fact that it acts as a general stabilizer of industry Each year from one-seventh to one-eighth of the total farm production is marketed abroad, representing the output of a million and a quarter persons. Of the production of United States factories, from 8 to 9% is exported, representing the output of a million industrial workers. In the case of certain commodities the export demand exceeds that within the country. In 1927, for instance, 60·6% of the total cotton crop went into overseas trade as did more than half the production of rosin, rye, motor cycles, and turpentine. Other commodities in which the proportion exported is high include copper, lard, kerosene and lubricating oil In 1927, which was a normal year, 40·2% of the total production of typewriters and parts was exported, 25·2% of the sewing machines and nearly 20% of the agricultural machinery. The ratio of finished manufactures to the total exports of the United States has been rising steadily in recent years, amounting to 44·9% in 1928, as compared with 31 9% in 1913.

In the matter of imports, the growth of American industries has been reflected in the steadily rising proportion of raw materials brought into the country as compared with finished manufactures. The bulk of imports into the United States in 1928 was made up of silk, rubber, coffee and sugar.

Early History.—During the Colonial period export trade was the chief commercial activity of the American Colonies. To Europe they shipped tobacco, furs, indigo, rice, naval stores and lumber and to the West Indies fish, lumber, agricultural products and candles. From European countries, chiefly Great Britain, they obtained manufactured goods, while the West Indies furnished a source of supply for slaves, sugar and gold.

From 1790 to 1820, as a result of extended European wars, the foreign commerce of the United States was to a large extent



VALUE OF LEADING EXPORTS FROM UNITED STATES, 1927

concerned with re-exports to Europe of foreign products which American-owned vessels gathered from the West Indies, South America, and the Orient From 1814 to 1818 there was an abnormal advance in exports, which rose from 6·9 million dollars to 93 3 million dollars, most of which rise was due to the increased shipments of agricultural products. Imports during this period showed an even greater advance than exports, rising from 13 million dollars in 1814 to 122 million in 1816 This more than nine-fold increase in imports was due in part to the receipt of surplus stocks of goods which had accumulated in Europe during the frequent wars which had occurred there from 1800–16.

This situation resulted in extreme hardship to American enterprise and in 1818 caused a general panic For the ensuing ten years American citizens found it more profitable to concentrate their energies upon the development and protection of the home market, and as a result the foreign trade of the country declined markedly This decrease involved practically every important commodity entering the country's export trade with the exception of raw cotton Partly as a result of commercial treaties between the United States and foreign countries and partly because of the development of new industries and resources, after 1830 American foreign trade began to grow The spread of agriculture in the central states and its increasing surpluses caused a demand for more oversea outlets for American products Exports of domestic merchandise increased from 59 5 million dollars in 1830 to 106 9 million dollars in 1836. From 1846 to 1860 also they grew considerably, rising from 101·7 million dollars to 316·2 million dollars.

This development was due to (*a*) the rapid increase in production of agricultural products coincident with the opening of the Mississippi Valley, whose surplus sought foreign markets; (*b*) construction of railways, affording better and quicker means of transportation; (*c*) discovery of gold, which raised prices and stimulated production; (*d*) removal of many tariff barriers in Europe; and (*e*) a reciprocity treaty with Canada. The lower tariff schedules of the United States and the rise in prices caused the imports into the country to increase in value about as rapidly as did the exports. In 1846 the imports of merchandise were 117·9 million dollars; in 1860 they were 353·6 million dollars.

During this period the character of the export trade of the United States was radically altered. Commodities such as tobacco, fish, naval stores, indigo, furs and rice, lost definitely their relative importance. The South was centering its activities upon cotton and the North was turning from fish and furs to manufacturing. The outstanding feature of the country's foreign trade during this period, however, was that its export trade was becoming a

TABLE I. *Exports and Imports of Merchandise*

NOTE.—All figures in thousands of dollars. Figures are for fiscal years ended Sept. 30, 1790 to 1842, and June 30, 1843 to 1915, subsequently for calendar years

*Period beginning Oct. 1, 1841, and ending June 30, 1850. †Period July 1, 1915, to Dec. 31, 1920.

relatively minor adjunct to the enormous expansion of internal commerce.

The Civil War and After.—The Civil War caused a temporary lull in the country's export trade, due to the serious embarrassments of the leading southern agricultural export commodities (notably cotton and tobacco) as well as the war-time pre-occupations of many northern industries, the general destruction of ships by the southern raiders and the transfer of American ships to foreign registry. In 1860 more than 66% of the country's foreign trade was carried in American ships, but by 1870 the proportion had dropped to about 35 per cent. These circumstances account in part for the fact that the exports of domestic merchandise rose only from 316.2 million dollars in 1860 to 376.6 million dollars in 1870. With appropriate allowance for price advance there was an actual decline in the volume of goods shipped.

Beginning in 1870 and continuing down to the end of the nineteenth century, there was a pronounced, though at times irregular, growth in foreign trade. This upward trend was the result of the further necessity of foreign markets to absorb surpluses of war-born industries. In 1870 the exports amounted to 376.6 million dollars, by 1900 they had increased to 1.4 thousand million dollars, multiplying almost fourfold, while the imports, which in 1870 amounted to 436 million dollars, had risen only to 850 million dollars. It should be noted further that there was a general downward trend of prices during most of the last quarter of the 19th century and consequently the actual growth in the volume of commerce was even greater than the above figures would indicate. Almost uniformly the exports exceeded the imports (Table I.) Considerably over one-half of the exports were made up of only seven commodities with cotton heading the list. In spite of the large exports of farm products the proportion of these as compared with the total volume of trade steadily declined. In 1860 about 80% of the total value of exports consisted of agricultural products, but by 1900 the proportion had declined to about 60 per cent. During this period, mineral and forest products and manufactures were increasing conspicuously.

This transformation is best indicated by the fact that whereas the foodstuffs exports rose only from a yearly average of 321 million dollars in 1876–80 to 488 million in 1896–1900, the value of manufactured exports grew during the same period from 128.8 million dollars to 351.8 million. The proportion furnished by the foodstuffs declined from 48 to 43%, whereas finished manufactures advanced from 19 to 31 per cent. An interesting and important phase of the exports of the manufactures was the rapid growth in the shipment of specialties to an increasing number of foreign lands. As the 19th century drew to a close the country's diversified manufactures were moving to markets abroad in rapidly increasing volume. The exports of copper increased from a yearly average of $749,000 in 1871–1875 to 36.7 million dollars in 1896–1900. Certain shifts in the agricultural commodities exported were of importance. The great increase in the value of provisions, comprising meat and dairy products is a notable example. These rose from about 30 million in the 1860's to 136 million dollars in 1890.

The leading group of imports and the one which advanced with greatest rapidity was that comprising crude materials for use in American industries, such as India rubber, wool, hides and skins, and raw silk. Before the Civil War the chief source of domestic exports and the leading markets for imports were the regions along the Atlantic and Gulf coasts, and the eastern part of the Mississippi valley.

The Pre-War Years.—Beginning with the turn of the century and continuing down to 1913 the foreign trade of the United States increased rapidly and underwent considerable change in character. The continued shift in exports from foodstuffs to manufactures was noteworthy. While the value of domestic exports grew from $1,400,000,000 in 1900 to $2,400,000,000 in 1913, increasing 71%, the value of foodstuffs exports declined from $545,000 to $503,000, decreasing 7 per cent.

Finished manufactures made up 32% of the total exports in 1913, as compared with 24% in 1900, while the proportion repre-

*Period July 1, 1915, to Dec. 31, 1920.

sented by foodstuffs declined to 21% from 39% at the turn of the century. Of the manufactures shipped abroad the most important products were those of iron and steel, copper and its manufactures, machinery, lumber and its re-manufactures, cotton manufactures, leather and automobiles. All of these showed outstanding growth, that of iron and steel from $38,500,000 in 1900 to $124,200,000 in 1913; copper and its manufactures from 58·9 to 143·1 million dollars; lumber and its re-manufactures from 45·1 to 107·8; machinery from 78·0 to 194·7; cotton manufactures from 24·0 to 51·5, and that of leather from 21·8 million dollars to 42·4 million dollars. One of the remarkable growths in exports was shown in the shipments of automobiles, including engines and parts, which amounted to $33,000,000 in 1913.

Europe has always taken the greatest share of American exports but since 1900 the proportion going to this continent has been declining. (Table II.) In 1913 it took only 60% of United States exports as compared with 74·6% in 1900. The markets of the rest of the world, especially those of the two American continents, took a much larger proportion in 1913 than in 1900. The proportion going to Asia, Oceania and Africa did not increase much until after the beginning of the World War.

Imports increased from $849,900,000 in 1900 to $1,813,000,000 in 1913, a rise of 113 per cent. The greatest shift in the character of imports during this period was in the proportional increase of crude materials, which amounted to $649,400,000 in 1913, and represented 36% of the total value of all imports as compared with 33% in 1900. Ten commodities made up 42% of all imports, namely, coffee, $119,000,000; hides and skins, $117,400,000; sugar, $103,600,000; crude rubber $90,200,000; silk, $82,100,000; cotton manufactures, $66,100,000, copper and tin, including ore and manufactures of each, $59,600,000 and $53,100,000 respectively, fertilizer and its materials $41,400,000; and fruits and nuts, $41,000,000.

The War Years.—The foreign trade of the United States from 1914 to 1919 was necessarily distorted. It is possible only to make the most general observations as to the commercial development of this period. The United States naturally was the major source of supply, not only for the markets of the European contestants but also for those in Latin America and Asia. The export of munitions was extremely large, but a careful examination of the data reveals the fact that much of the increase in the volume of exports was in commodities which had hitherto been unknown quantities in international trade, for example, automobiles, motion picture films, labour-saving machinery, ready-made clothing and similar American specialties. Though the exports of these commodities in large quantities date largely from about the beginning of the World War, they were really the reflex of the enormous expansion of those industries in the United States in their efforts to supply the domestic demand, rather than the attempt to take over the export trade of the preoccupied European powers. Heavy gains were made by the United States in many once exclusive trade preserves of Europe, but these gains were largely in the shipment of new and improved products which had never been supplied by Europe.

The exports of the United States rose from $2,300,000,000 in 1914 to $6,200,000,000 in 1917, and to $7,800,000,000 in 1919. The share of wholly and partly fabricated wares reached the record mark of 65% in 1917. Europe naturally provided much the

larger market, taking 63·2% of the United States exports from 1915 to 1920

Imports were correspondingly stimulated and rose in value from less than two thousand millions just before the war to three thousand millions in 1917 and to almost four thousand millions in 1919 Although many lines of once highly valued European luxuries disappeared from United States trade, these were more than compensated for by the enormous increase of raw materials imported directly from Latin America and the Far East This development was one of the outstanding phenomena of American foreign trade Many trade routes were so completely altered that, whereas the United States before the war received a large portion of its imports of raw materials through European markets—such commodities as rubber, vegetable oils, tin, wool, cacao, furs and dye-wood—during and since the war these commodities were and are being received direct from the production areas in the Far East and Latin America Such changes in trade routes account in part for the enormous increase in United States imports from Asia and Latin America.

The efficiency of American production methods, the vigorous efforts of American business men in finding markets, and the active aid of the government in promoting foreign trade are factors which have brought about a marked increase in the volume of export trade since 1919 At the same time the rising standards of living of the American people have necessitated an increased volume of imports of a number of important commodities and a number of minor ones which the country cannot at present produce economically, or can produce only in part, such as silk, rubber, jute, sisal, wool and hides and skins

One of the leading features of the country's trade position since the World War has been the profound influence of the change of the United States from a debtor to a creditor nation in world finance Another factor in the country's foreign trade has been the revival of American shipping available for overseas trade, the tonnage of which multiplied nearly ten times between 1914 and 1920 These ships have in recent years been carrying about 35% of American export trade, a figure considerably higher than in any time since 1870.

After the World War.—The readjustment in American foreign trade from a war-time to a peace-time basis naturally resulted in a decline in the value of both exports and imports because of the increased buying power of money The volume, however, gradually increased and in 1928 that of exports was 20% higher than in 1920 and that of imports 31% higher. As

compared with the pre-war period of 1910–14, not only the value but also the volume showed remarkable growth Exports increased from $2,400,000,000 to $5,000,000,000 in 1928, or 100%, while the imports increased from $1,800,000,000 to $4,800,000,000 or 128 per cent Allowing for the decrease in the buying power of money, the volume of exports increased 65% between 1913 and 1928, and the imports 81 per cent

The recent gains in exports as compared with 1913 have been most conspicuous in the shipment of fabricated wares. This is but natural in a country that is shifting rapidly from agriculture to manufactures. The demand for foodstuffs and other agricultural products in the world as a whole is limited and expands only about as fast as the population increases Farm products are for the most part necessities, and the consumption of them does not grow as rapidly as does those of fabricated products. But an increase in manufacturing means fuller employment for American workers, and a larger domestic demand for the country's products.

The example set by American industry in its rapid adoption of machinery has created an enormous expansion of demand from abroad for American products of this nature The value of machinery exports in 1927 was 175% higher than during the five-year pre-war average, increasing from an average per year of $158,200,000 in 1910–1914 to $435,500,000 in 1927 (Table III.). The aid given to foreign industrial growth is greater than these data indicate. The machinery exported in 1927 was considerably better and capable of a much larger output per dollar value than before the World War. Industrial machinery exports increased from a pre-war average of 78·6 to 201·5 million dollars in 1927, electrical machinery and apparatus from 20·9 to 84·6, and agricultural machinery and implements from 40·5 million dollars to 90·1 million dollars

Another large increase in the country's exports was in the shipments of automobiles and automobile parts and accessories, whose value rose from an average of 24·1 million dollars in 1910–1914 to 388·3 million dollars in 1927 If allowance is made for the decline in price of motor cars, the volume increase is even greater Despite the decline in the price levels of motor cars the growth as shown in the export figures would be even more outstanding, were it not for the fact that a large portion of those made in Canada and produced by branches of American plants are not included in the table.

Changes in Destination.—There have been a number of striking changes in the geographic distribution of the United States foreign trade in recent years. Before the World War the country's exports were highly concentrated in a few European countries, whereas imports were widely diversified The situation since the war has been materially modified and exports are becoming more widely scattered. Europe, which with the adjoining territory of the Near East, was taking about 63% of the country's pre-war exports, is (1928) absorbing less than 48 per cent. Latin America is gradually increasing its share, taking about 18% today, as compared with about 14% during 1910–1914, while the Far East now supplies a market for about 16% of the United States exports, as compared with about 8% during 1910 to 1914.

In the matter of imports the geographic change has been more striking. In pre-war days Europe furnished about 50% of the United States imports, while during the last few years that con-

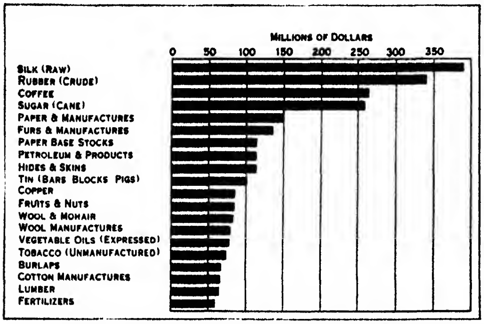
VIEWS OF COMMERCIAL ACTIVITIES IN THE UNITED STATES

1. Orange grove of California. Horticulture is one of the principal industries of this State and the orange is one of the most important of the fruits produced. The citrus industry has contributed largely to the development of the State
2. Air view of the Standard Oil Company Sugar Creek refinery at Independence, Missouri. Production of petroleum in America dates back to 1859 and from that date the United States has supplied the bulk of the world's output
3. The Homestake gold mine at Lead, S.D., in the Black Hills region. Gold is an important mineral in this part of the State and is found in a section covering about 3,500 sq.m.
4. An air view of the manufacturing plant of the National Enameling and Stamping Company, East St. Louis, Illinois. This city is across the river from St. Louis, Missouri, with which it is connected by bridges and ferries. It is an important manufacturing centre
5. The stockyards at Kansas City, Kansas. With the exception of Chicago this is the largest livestock centre in the United States. Kansas City draws largely from the south-west markets of the United States
6. Airview of "Ford City," Detroit, Michigan, principal manufacturing unit of the Ford Motor Company. This plant is operated five days a week on eight hour shifts. It is one of the 36 branches of the company in the United States, at 33 of which Ford cars are assembled

tinent has furnished only about 30%, a striking example of the discontinuance of much of the pre-war triangular trade wherein the United States received many of its imports originating in non-European countries via European markets. Latin America, meanwhile, has about maintained its position, contributing about 25% of the United States imports On the other hand, the East



VALUE OF LEADING IMPORTS INTO UNITED STATES, 1927

has double its shares and has become one of the leading suppliers of American requirements from overseas

INTERNAL COMMERCE

Large and important as has become the foreign trade of the United States it is small compared with the internal commerce For every dollar's worth of goods exported about ten dollars' worth is sold to consumers within the country. The internal trade of the country is larger than the combined export trade of the entire world.

The basis of this internal trade lies in adequate transportation facilities furnished by rail, highway, water and air, in means of rapid communication, in a large and growing national income, and in an adequate financing system In 1927 the railway lines in the United States totaled 249,000 miles; the navigable water ways, excluding 2,760 miles of the Great Lakes, 27,460 miles; the highway system 288,000 miles; motor trucks and road tractors in use numbered almost 2·9 million; the number of miles of telephone wire totaled more than 56 5 million connecting over 18 million telephones. America's national income during 1927 was estimated at approximately 90 thousand million dollars. Her Federal Reserve System established primarily for the financing of trade is serving its purpose admirably.

That the volume of the country's internal commerce has grown tremendously in recent years is indicated by the volume of freight traffic handled by the railway and internal waterways. The amount of revenue freight carried 1 mile by the railways totaled 432 thousand million tons in 1927, an increase of 405% over the yearly average of 1891–95, while volume of freight traffic handled on the internal waterways and in the coastwise trade, excluding duplication, totaled 219 million tons.

Some of the most pressing problems of American industry are those relating to domestic distribution. Unfortunately no important field of economic statistics until recently has been so sadly neglected as that of internal commerce. Many data indirectly indicative of its volume have long been collected but not until after the World War was the value in measuring the economic progress of the country of precise facts on distribution fully recognized by the business community or by the Federal Government. Recently much progress has been made in collecting this material.

The United States Department of Commerce recently undertook a series of surveys, to determine the basic business characteristics, the factors affecting distribution, and the actual status of the buying power of the various economic areas of the country in an attempt to evaluate the actual consuming capacity of the various regions and of particular trading areas within each region of the United States. The Department is also to make a census of distribution in 1930, probably the first complete tabulation of this sort ever made by any major commercial nation on a large scale.

Diverse tendencies are apparent in the United States internal trade—and some of them are strikingly at variance with the practice of the past. The lessons of mass production are being applied with increasing intensity to mass distribution. The increase in the sales of mail order houses and department stores has been remarkable. The growth of the chainstore system has been notable especially in such fields as foodstuffs and shoes In the latter line it is estimated that only 40% of the retailing is now dependent upon jobbers; in the remainder of this business the services of the middlemen have been dispensed with as the result of mass retail selling by producers.

The spread of automobiles has also reacted upon the trade in farm equipment, which since 1921 has very noticeably gravitated toward more tractors and better farming machinery of all sorts. The element of post-war style changes is apparent in several industries; for example the textile trade has felt its effect to an unusual degree This is shown by the growth of rayon yarn production in the United States from 1 6 million pounds in 1913 to nearly 75 6 million pounds in 1927 At the same time the United States silk imports increased from about 26 million pounds in 1913 to 74 million pounds in 1927. Naturally, the cotton-goods trade has been particularly affected by this shift, but even in that line there have been many plants which have readjusted their output so as to take advantage of new industrial uses for their products instead of relying solely on the apparel trade.

The distribution of electrical goods has afforded another illustration of striking changes since the World War The great increase in the use of combustion engines, both for transportation and industrial purposes, has stimulated the electrical industry to keener efforts toward better merchandising, one notable feature of which has been a remarkable development in aggressive advertising, evidently with satisfactory results

In spite of the efforts that have been made to meet these rapidly changing conditions and the salutary results obtained, trading continues to be very complex. Simplification is needed in the terms and practices of business endeavours because the absence of a uniform understanding of their meaning is costing the consumers millions of dollars a year. Neither railway, steamship bills of lading, insurance certificates, nor banking terms are properly understood or uniformly interpreted among large numbers of business men Guarantees made by many producers are indefinite and susceptible to a variety of meanings; for instance, a guarantee of "fast colors" in fabrics, and a guaranty of "15,000 miles" on automobile tires should have a more definite meaning than they have at present. Lack of standardization of such trade terms as these, and the lack of generally accepted, authoritative definitions of trade documents, terms and practices cause constant interruption to business, entail expensive arbitration and law suits, and leads to strained commercial relations Efforts are being made to simplify these trade practices and to promote internal trade, by both governmental and private organizations, and if these efforts continue valuable results may be expected. For articles giving full particulars on transportation facilities *see* RAILWAYS: *United States;* HIGHWAYS: *United States,* and CANALS AND CANALIZED RIVERS. (J. KLE.)

INLAND WATERWAYS

The development of inland waterways in America began immediately after the war of the Revolution, and by 1830 there was an extensive net work of water communication through the New England and Middle States, Virginia and Ohio.

The first canals were small affairs and were the result of private initiative, but as larger ones were undertaken state aid was sought, which in some instances was granted The introduction of railways in 1828 and their subsequent rapid growth put out of business the small canals, except the Erie, which was increased in size with the view to meet changed conditions of traffic demands.

The Erie Canal.—Of these early canals the outstanding exam-

ple was the Erie, in the State of New York between Buffalo and Albany This canal was originally projected by the Western Inland Lock Navigation company in 1792, to accommodate boats 40 ft. long, 20 ft beam and 2 ft. draft The State took over the work in 1817 and constructed a canal between the above named points whose bottom width was 28 ft, surface 40 ft. and depth 4 ft. The locks were 90 ft long by 12 ft wide An enlargement, begun in 1835 and completed in 1862 increased the surface width to 70 ft, the depth to 7 ft and the locks to 110 ft by 18 ft.

In 1895 a further enlargement was authorized, though the work was not begun until 1905 As finished in 1916, the present canal has a bottom width of 75 ft in earth and 90 ft in rock, a depth of 12 ft and locks 300 ft. long in the clear and 45 ft wide with a depth of 12 ft. on the sills The original canal as opened in 1825 was 363 m long, while the existing canal system of New York, including branches to Lakes Champlain, Ontario, Seneca and Cayuga, comprises 525 m of canal, river and lake navigation.

Erie Barge Canal.—The cost of the recent enlargement to make what is known as the Barge canal, including terminal facilities in New York and Buffalo, amounted (June 30, 1926) to $174,-859,957 22 This sum, however, does not include any allowance for the cost of the original canal, nor of the enlargement in 1835–1862, nor for interest during construction and subsequent thereto. As there are no tolls other than for the use of the terminal facilities, there can be no credit given in the interest account, and as the net cost of operation is always a liability the State's investment is steadily increasing The net annual cost of operation is nearly $3,000,000 exclusive of interest, depreciation or allowance for taxes.

On the Barge canal the towing path has been entirely suppressed so that all boats must proceed under their own power or be drawn by tugs This requirement has developed new and interesting types of vessels The navigation regulations of the canal require that boats shall not exceed 300 ft. in length. that their speed shall not exceed 6 m per hour in the canal and 10 m in lakes and canalized rivers, and that no greater number of barges shall be taken in one tow than can be passed in two lockings.

In spite of all the money spent in providing increased facilities, the tonnage using the canal has been very disappointing The average number of net tons per annum has been as follows.

For the decade ending	*Tons*	*For the decade ending*	*Tons*
1850	1,889,561	1900	3,868,504
1860	3,943,965	1910	3,286,670
1870	5,518,533	1920	1,898,601
1880	5,629,293	1927 (7 yrs)	2,068,245
1890	5,243,925		

Though tonnage has increased each year since 1921, the maximum annual tonnage during that part of the decade ending with 1927 was less than that during any year from 1846 to 1913 both inclusive. In spite of a free canal, modern improvements in vessels and mechanical propulsion and towage, the canal has been unable to compete with railway transportation and the tonnage is still, though somewhat improved, considerably below what was carried in the days of animal towing Were a toll charged sufficient to cover interest on construction and operating expense, the canal would carry no traffic at all The open season for navigation usually begins about May 8 and ends about December 1, though both limits are subject in any one year to considerable departure from the average dates, on account of seasonal variations. A boat makes about 33 m a day owing to locking delays while 517 tons constitute the average load per loaded boat Two-thirds of the traffic consists of building materials and products of agriculture

Other Interior Waterways.—Jurisdiction over interior navigable waterways is vested in the Federal Government Navigable waterways are defined as those that can be operated either in their natural state or after improvement. The control of such improvements is placed by law under the War Department and executed by the corps of engineers of the army Omitting the harbours on the coast and on the Great Lakes, which are not within the purview of this article, the federal government has expended on the interior waterways nearly $550,000,000 in improvements and spends annually in maintenance and operation over $6,000,000 including the Mississippi River, exclusive of any allowance for interest on the capital invested. The inland waterways thus developed or improved for navigation are approximately 25,000 m in length, and therefore greatly exceed any other system of inland navigation. The work has consisted in deepening by dredging, by controlling the current by jetties or revetments or by canalizing by means of dams and locks As it is impossible to discuss all the component parts of this vast undertaking it will suffice to refer to the most important elements, the Ohio and the Mississippi rivers and the Sault Ste Marie canal.

The Ohio River is navigable from Pittsburgh to its mouth, 968·5 m., and presents the longest piece of river canalization in the world. The river borne commerce is steadily increasing and amounted in 1926 to nearly 20,000,000 tons, of which, 18,500,000 consisted of non-metallic minerals with coal and coke, and sand and gravel in almost equal proportions. Practically all this material is carried in barges in tow

The Mississippi river, whose total length is almost 2,477 m. is navigable from Minneapolis to its mouth in the Gulf of Mexico, 1,950 m, in which distance there is a fall at low water stage of 685 ft.

In general terms, the river consists of a series of reverse bends in which deep water always prevails, connected by wide reaches called "crossings" in some of which obstacles to navigation occur in the form of sand reefs Below the mouth of the Ohio, improvement for navigation consists in the removal of such obstructions by dredging, and in the revetment of banks to discourage their formation Above the mouth of the Ohio these activities are supplemented by contraction works of permeable or impermeable construction, designed to promote greater uniformity of width and of depth (*See* MISSISSIPPI RIVER *Engineering*)

From the Passes to Baton Rouge the river is open for navigation throughout the year, between Baton Rouge and the mouth of the Ohio about eleven months, while above that point about eight months, depending on the seasonal variations

The first Mississippi river steamboat arrived at New Orleans in December, 1811 The steamboats carried packet freight, passengers and mail Coal, hay, etc, were still floated down by barge and railroad competition gradually enforced the more expeditious handling of bulk commodities in fleets of barges pushed by tow boats, and brought back upstream, loaded when possible The railroad definitely supplanted the packet boat, and by the beginning of the World War had so seriously encroached upon the business of the barge lines that river commerce had been reduced to a rather desultory traffic in a few classes of bulk commodities Commercial statistics for the year 1913, show for the reach Vicksburg to New Orleans, through which traffic was heaviest, a total tonnage of 2,417,859, of which 1,128,677 tons was petroleum.

During the World War the Government established a barge line as an emergency measure to relieve railroad congestion It proved a success and has been followed by the establishment of other lines as private and common carriers, and by steady increase in volume of traffic, upon the lower river. Comparative statistics covering a five year period are given in the following table.

Commercial Statistics—Mississippi River—1922–26

Stretch	Miles	Annual tonnage		
		1922	1924	1926
Minneapolis to mouth Missouri river	675	818,059	769,139	691,637
Mouth Missouri river to Cairo (mouth Ohio river)	209	548,114	738,728	1,005,979
Cairo to Memphis	227	923,386	1,153,021	1,660,188
Memphis to Vicksburg	375	1,441,048	1,666,440	4,792,780
Vicksburg to New Orleans	367	5,544,506	7,633,277	11,074,488

Since each of the above named reaches is treated as a separate stream, traffic passing through a portion of two reaches is reported by both. The figures in the table are therefore not additive.

As stated above the greatest part of the freight is in bulky commodities and is carried in barges in tow. The standard barge of the Inland Waterways Corp, owned and operated by the U.S.

Government, is of steel, 200 ft. long and 40 ft. wide, drawing 8 ft when fully loaded with 1,500 tons. The usual tow consists of 6 barges lashed three abreast with a stern wheel steamboat in the middle, *see* fig. 2. The standard coal barge is one 176 ft. by 26 ft., 28 of which make a tow carrying 16,800 tons, though there is a record of 63 barges in a single tow from Pittsburgh to New Orleans.

Connecting Lake Superior and Lake Huron is the St. Mary's river, 63 m. long with a fall of 21 ft The greater part of this fall occurs at one point and is known as the Sault Ste. Marie, or commonly as the "Soo" rapids. To provide passage over these rapids locks have been constructed by both the American and Canadian Governments, as the St Mary's river is a boundary stream. The American locks, four in number, are the more important in size.

The channel width is 300 ft. for one way and 600 ft. for two way traffic with a minimum depth of 21 ft This depth is in accordance with a depth of 22 ft in the Detroit river and the limiting depth in the lake harbours which in 65 cases varies from 19 to 21 ft. though about the same number of less important harbours have been dredged to accommodate vessels drawing 14 ft. The "Soo" canal is a very busy waterway The number of vessels passing exceeds 20,000 annually with a net registered tonnage upwards of 72,000,000 carrying nearly 90 000,000 cargo tons. The bulk of this cargo consists of three items. of iron ore, about 58,000,000 tons, of coal, 14,000,000 tons and of farm products, 10,000,000 tons.

Waterways and canals in Canada consist in improvements rendering feasible navigation through the Great Lakes to the St Lawrence river and thence to the sea. The first link in this important chain is the single Canadian lock in the St Mary's river With that lock and the proper channel regulation in the Detroit river, which is merely a strait connecting lakes Huron and Erie, it is possible for a vessel to pass from any Canadian port on Lake Superior to any port on Lake Erie through Canadian or international waterways To permit passage from Lake Erie to Lake Ontario around Niagara Falls the Canadian Government has constructed the Welland canal wholly in Canadian territory The available depth of water in the locks in this canal is but one illustration of successive progressive steps in American waterways. In 1824 it was 8 ft, increased to 9 ft in 1842, to 10 ft in 1853, to 12 ft. in 1872, to 14 ft in 1887, and will become 30 ft. by the project inaugurated in 1913 to be completed soon after 1930 The new project will provide a canal 25 m long and distribute the fall of 326 5 ft in four single locks and one flight of three double locks, each with usable lengths and widths of 820 and 80 ft Between Lake Ontario and tide water at Montreal, vessels use the St Lawrence river and canals at the rapids There is a fall of 207 5 ft. overcome at present by 26 locks with minimum dimensions of 245 ft, 45 ft and 14 ft The improvement of the St Lawrence to make it available for ocean going vessels drawing nearly 30 ft. and so have it conform with the Welland canal is now under consideration by the American and Canadian Governments, the chief deterrent consideration being the great cost of the undertaking.

The only important canal remaining in the United States constructed by private capital and operated on a commercial basis, is the Cape Cod canal, acquired by the Federal Government in the spring of 1928. This canal projected in the 18th century to connect Buzzards and Massachusetts bays and avoid the dangerous navigation on Nantucket Shoals on the outside of Cape Cod was completed in 1914. As built it had a length between shore lines of 8 m with a dredged approach channel in Buzzards bay, 5 m. long. The bottom width was 100 ft and depth at low water 25 ft. There is a considerable tidal range at both ends setting up alternating currents and giving a depth at high water of about 30 ft. There were no locks and the canal was crossed by one railroad and two highway bridges The original conception was to make a canal with a bottom width of 200 ft. and the government has in hand extensive plans for enlargement. The water distance between Boston and New York is shortened by about 80 m. (W B. Pa.)

VIII. DEFENCE

ARMY

History.—When Washington took command, on July 3, 1775, of the lines of colonial militia besieging Boston the United States army was born Although it was still a year and a day before the Declaration of Independence, the event marked the union of the forces of the 13 separate Colonies under one head. These men were largely militia and minute-men of local communities, given to going home whenever a particular danger was past, and loath to cross boundaries for service in other states. In January, 1776, the Continental Congress wisely decided that the troops it had directly raised and equipped should be separate in organization from those of local communities These "Continentals" were enlisted for longer terms, were trained more thoroughly, and thereafter provided Washington with a small, but comparatively more stable, nucleus, to work with, and they proved his chief reliance in the dark hours of the war They were the beginning of a Regular army. Washington's force varied from 8,000 troops in the operations around New York to as low as 4,000 after the winter at Valley Forge and as high as 26,000 in November, 1779 Other generals seldom had more than 6,000 men at their command, while some of the most important work of the war was done by bands of a few hundred under Sumter on the Catawba, Marion in the Peedee Swamps and Clark in the North-west.

When peace was declared Congress ordered the disbandment of the entire army except "twenty-five privates to guard the stores at Ft Pitt and fifty-five to guard the stores at West Point" Indian disturbances on the frontier soon caused an increase, and, when Washington was inaugurated President, the number of men in service was 595 Until 1812 the army passed through swift periods of rise and fall, an index of national fear From a bare single regiment when the Constitution went into force, it changed to two in 1779, three in 1791, six in 1796, nine in 1798, six in 1800, three in 1802, eleven in 1808, though the number authorized was always much higher than the number actually in service Under stress of the War of 1812 the army increased from 21 regiments in January, 1812, to a paper strength of 51 regiments a year later, though it is doubtful it a sixth of the authorized 58,000 men were ever recruited Counting militia and local combatants possibly 60,000 men at the most served during the war. The Regular army was reduced to 6,600 by 1820, the artillery stationed largely in the coast fortifications, and the infantry in the northern, western and southern frontier posts Just before the Mexican War the army had shrunk to an actual strength of 5,300 men, occupying more than 100 posts When war was declared the Regular army was recruited to war strength, and about 20,000 volunteers responded to the call, many of whom had to be sent home again because they could not be outfitted About 20,000 troops took part in the war altogether, Scott having about 10,500 with him in the Valley of Mexico In 1848 the troops were reduced to 8,000 scattered over the immense area to which the country had grown The task of dealing with the Indians in the Far West increased the army to a strength of 12,698 men by 1855, which it retained up to the Civil War

Enlistments in the Federal army during the Civil War numbered 2,898,304, including re-enlistments The number in service at one time was probably but little over 1,500,000. Estimates of the men in Confederate service vary from 700,000 to 885,000. Reduction on the usual scale in the Regular army was impossible after the Civil War because of the large number of troops (about 19,000) stationed in the South to support the military governments of the Reconstruction period, because of the threat of Maximillian in Mexico which sent Sheridan to the border with a large command, and because of increased Indian outbreaks in the West during the Civil War and immediately afterward. The Act of 1866 provided for a Regular army of 54,000 men paper strength. The actual strength was 38,540 men which decreased until in 1878 the effective strength was less than 20,000 men The force was well trained, however, because it saw almost constant service against the Indians in the West. At the beginning of 1896 the army numbered slightly less than 25,000 men, the smallest force in proportion to

population since the Revolutionary War. Calls for volunteers in the Spanish-American War increased the army to 216,029 men on Aug 31, 1898, its highest total. An Act in 1899 authorized the President to keep the strength of the Regular army at a maximum of 65,000, and in 1901 the maximum was raised by law to 100,000. The problem of administering the newly acquired overseas possessions called for this increase, the demand being so acute in 1901 that there was not a Regular infantry regiment within the borders of the United States. By 1904, however, the Regular army had dwindled to 59,000 men, and in 1907 it numbered 62,398, of whom 34,262 were stationed in the United States. (X)

History Since 1910.—On Feb. 27, 1911, Congress, besides making certain adjustments and staff increases, added 200 line officers to the regular army in order to meet the demands of the National Guard for instructors On Aug. 24, 1912, it passed an act commonly known as the "Manchu law" which required line officers to serve two years out of every six with troops. On April 27, 1914, it voted $250,000 for aircraft and on July 18, 1914, authorized an aviation section of the Signal Corps which was to have a maximum strength of 60 officers and 260 enlisted men

From the aspect of the World War while it was confined to the Eastern hemisphere and under the pressure of disturbances arising from Mexico, on whose border the entire stock of military aeroplanes of the United States proper was speedily consumed, the Government gradually realized the necessity of military upbuilding On June 3, 1916 it passed a National Defence act which provided an increase of the regular army from a war maximum of 128,653 to one of 287,846, organized the army of the United States into the regular army, volunteer army, officers' reserve corps, enlisted reserve corps and the National Guard while in the service of the United States; limited the number of enlisted men of the line to 175,000; proportioned the regular army into 65 regiments of infantry, 25 of cavalry, 21 of field artillery, seven of engineers, a coast artillery corps, two battalions of mounted engineers and other corps and bureaux of the War Department; defined the organization of a division to be three brigades of three regiments each, with auxiliary troops; made the term of enlistment seven years, three with the colours and four with the reserve, raised the aviation section of the Signal Corps to 148 officers, inaugurated vocational training; and federalized the National Guard by causing each member to take a new oath, which bound him to the will of the President as well as to State authority. The increased strength thus provided was, however, restricted in point of time by its division into five annual increments. Aug 29, 1916, another act created a Council of National Defence, composed of the secretaries of war, navy, interior, agriculture, commerce and labour, for the "co-ordination of resources for the national security"

Mexico.—When on March 9, 1916, the Mexican bandit, Pancho Villa, with about 1,500 men, killed 18 Americans and wounded many others in an attack on Columbus, N.M, units of the regular army and National Guard were concentrated along the border and Brig-gen J. J Pershing was sent into Mexico proper at the head of a punitive expedition of two brigades of cavalry and one of infantry After 12 minor engagements, Pershing's provisional division was brought north of the Rio Grande and later the National Guard organizations were ordered to their respective States (Feb 1917). These activities revealed concretely an inability to mobilize readily, an utter lack of aeroplanes and many deficiencies in staff-work, transportation and supplies. The concentration, extending approximately a year, afforded providential means of field training for the National Guard and machine-gun practice and manoeuvres for the regular army. Altogether the blow aimed by Villa against the United States proved to be an impetus toward preparation for the part America was soon to play.

The World War.—When the United States came into the World War on April 6, 1917, the regular army had received only its first increment from the act of 1916, and the National Guard was undergoing combined demobilization and reorganization. The strength of the available forces at that time was 199,705 officers and enlisted men, of whom 127,588 were regular army, 5,523 Philippine Scouts and 66,594 National Guard in the Federal service In addition, there were some 4,000 enlisted reservists, 2,192 in the Officers' Reserve Corps and some 117,500 national guards men not in the Federal service. The regular army was distributed as follows: United States, 94,076 (largely in the vicinity of Mexico); Philippines, 12,428; China, 1,383; Hawaii, 9,900; Panama Canal Department, 7,552; Porto Rico, 1,482; Alaska, 767. Of these 5,791 were officers. In addition there were, with various degrees of training, 3,199 National Guard officers in the Federal service, 6,926 not in the Federal service, 169 Philippine Scout officers and the 2,192 reservists mentioned—a total of 18,277.

Mobilization.—The three main and immediate problems for the general staff in supplementing the force on hand were. first, the acquisition of a legalized system of raising the required number of enlisted men in an equitable and efficient way; second, a quick method of improvising additional officers for training and leadership; and third, a sound and steady production of shelter and supplies for the large numbers to be summoned to the colours

The first problem was met by the Selective Service Act, May 18, 1917, which among other items allowed the regular army at once the full war strength of the 1916 Defence Act, provided for drafting into Federal service all members of the National Guard and its reserves, limited voluntary enlistment to four infantry divisions and authorized the conscription of a force of 1,000,000 men June 5, 1917, there were registered for the draft 9,925,751. July 3, 1917, the President called into service the entire National Guard which totalled 379,323 in the Federal service by Aug 5, 1917 The summoning of the first draft was delayed by lack of shelter and supplies, especially woollen clothing, until Sept 5, 1917, between which time and the spring of 1918 some 687,000 reported Dec. 15, 1917, all registrants were placed in five classes, according to personal qualifications and national needs Out of some 3,700,000 men in the army at the end of the war, about 2,800,000 had come from the draft, which had furnished a practical, uniform and just supply of recruits.

The second problem was met principally by three sets of reserve officers' training camps. The first series of 16, which began May 15, 1917, at 13 army posts in the United States, enrolled some 38,000 qualified applicants Aug 11, 1917, at the conclusion of the course, commissions in various grades up to colonel were awarded 27,341 graduates The second series of eight camps, beginning Aug. 27, 1917, enrolled over 20,000 candidates Nov 27, 1917, commissions as in the first series were awarded to 17,237 graduates These two series were composed largely of college men A special school for coloured candidates at Ft Des Moines, Ia, between June 18, 1917, and Oct. 18, 1917, graduated 630 captains and lieutenants

The third series of 27 camps, which began Jan. 5, 1918, partook more of the nature of schools, since 90% of the applicants were former enlisted men From this series there were graduated April 19, 1918, 11,659 men, who were pronounced eligible for appointments as second lieutenants The total output of all the series up to this time was over 57,000 graduates. After May 15, 1918 officers' training schools in the United States and its possessions replaced the camps until the end of the war

The Supply Question.—The third problem was not so speedily solved, principally because of the lack of preparation for undertakings of such demands and magnitude It was found necessary at once to construct camps and cantonments for the immediate occupation of troops, to organize adequate transportation, to obtain storage for current supplies and reserves, to prepare for their orderly distribution, to gain port facilities at home and abroad and to divert and almost revolutionize resources and industry on the basis of mobilization and operation of a large American army. The Council of National Defence, a functioning but restricted agency when war was declared, by means of its sub-committees and dollar-a-year men (prominent by reason of their previous efficiency, who offered their services to the country for a nominal remuneration), gained immediate contact with the commercial world and fathered the powerful War Industries Board, primarily existing on July 28, 1917, under the council with Frank A. Scott as chairman, but reorganized on March 4, 1918, as a separate administrative agency directly under the President, with Bernard M. Baruch as chairman. The new board, plenipotentiary

in character, co-ordinated and controlled resources, industry and transportation so as to produce an adequate flow of supply to the army and navy without impeding unnecessarily commercial activity in the United States. In its deliberations there took part representatives from the army, who controlled for the service through the operations and the purchase, storage and traffic divisions of the general staff

By an interlocking organization of these and other co-ordinate and subordinate agencies, tedious, duplicating and extravagant systems of supply were gradually eliminated Partly by appeals, partly by autocratic means the country, as it approached the end of the war, was made into a smoothly working plant with an output directed to meet the situation in Europe. The flow of materials to the Western front is pictured in the 9,000,000 tons of cargo that had been sent by the embarkation service at the time of the Armistice over a 3,500 m line of communications Shortly after the inauguration of the system of control made by the inland traffic service, the freight congestion in the United States was removed Between May 1917 and the Armistice the railways transported 8,714,582 men In addition to providing for 16 officers' training camps and 16 National Guard cantonments, the construction division was called upon to build 16 national army cantonments with an aggregate capacity of 640,000 men By Nov 1, 1918, it had 130,000 employes engaged upon 448 projects involving $756,000,000.

American Expeditionary Forces.—May 26, 1917, the secretary of war, in a letter to Maj -gen J. J Pershing, directed him to command the land forces of the United States operating in Continental Europe, to proceed there with his staff and to establish, after consultation with the French War Office, bases, lines of communication and depots, for active participation at the front; to co-operate with the troops of the other countries employed against the enemy and in so doing to preserve the identity of the forces of the United States (*See* under UNITED STATES section on *History, The War and Peace*) By the date of the Armistice, 29 American divisions had been engaged in active fighting, and American forces were holding 134 km or 22% of the entire Western front, having captured some 63,000 prisoners, 1,378 cannon and 9,650 machine guns The casualties for the entire American effort for the war were. Battle deaths, 50,510; wounded without mortality, 193,663, deaths other than battle deaths, 69,446, deaths from all causes, 119,956, prisoners of war, 4,423, total, 318,042.

Germany.—In accordance with the terms of the Armistice, American forces were selected to establish one of the three bridge-heads in the territory of the former German empire. The III. Army, with Maj -gen J T. Dickman commanding, and designated as the army of occupation, began its advance on Nov. 17, toward Coblenz, occupied by United States forces until 1923.

Other Fronts.—On Sept 1918 an expeditionary force of some 10,000 men was sent to Siberia About 5,000 American troops saw hard fighting in north Russia, and one regiment served in Italy.

Demobilization.—The Armistice necessitated the demobilization of some 3,700,000 in service overseas and in the United States, the termination of contracts with due regard to the interests of industry and the Government, the co-ordination with labour over the employment situation, and the prevention of congestion of ex-soldiers in the larger cities.

On the morning of Nov. 11, 1918, Gen. March issued orders for the immediate discontinuance of all mobilization; on Nov. 16 he gave specific instructions for the discharge of certain temporary forces in the United States, on Nov. 22 he issued instructions to Pershing covering procedure which would facilitate discharge in the United States of the oversea forces, but left to the commander-in-chief of the American Expeditionary Forces the order of return of units. The demobilization of personnel involved intricate problems of the care and rehabilitation of sick and wounded, the location of demobilization camps, the discharge of special classes for relief of distress and the needs of industry, the avoidance of congestion of labour, the economy to be exercised in transporting discharged soldiers, and the procedure at demobilization camps involving physical examinations and disinfection of discharged soldiers. It was necessary to retain in the service, in addition to the regular army, a large number who were indispensable to the care of billions of dollars' worth of property, and to the work connected with disembarkation, demobilization and convalescent centres, hospitals, domestic guard duty, fire protection and border police. By Jan. 4, 1919, there were discharged 732,766 men, by Feb. 1 the number had increased to 1,026,664, by May 1, to 1,936,011; and by July 1 to 2,736,654. By April 1, 1920, demobilization of enlisted men was practically completed In addition to the demobilization of personnel, the army was called upon to cause industry to return speedily to its peace time course, after labour, capital and manufacture had been occupied for a year and a half in preparing materials for war The problems confronting the War Department during the transition included the disposal of war supplies, the appropriate rate of curtailment of war production so as not to create widespread unemployment and economic disturbance, the settlement of claims and contracts, the adjustment of real estate connected with war activities, the liquidation of international obligations and of sale abroad

On Nov. 11, 1918, the equipment branch of the operations division, general staff, made a study of existing supplies, which resulted in the classification of materials and the retention of a war reserve During Jan 1919 there was established a claims board, which by the middle of the year had adjusted 25,196 contracts, besides those allowed to run By Sept 1, 1919, property in the United States costing about $700,000,000 had been sold for about $530,000,000 or 77% of its cost. Surplus property in France estimated to have cost $1,250,000,000 was sold for $500,000,000 Out of an estimated value of $3,276,349,533 worth of surplus property on hand at the Armistice, there remained in Jan 1926 only $9,278,269 worth, the materials represented by the difference having been sold at an average of 36% of their cost

Phases Since the War.—In order to overcome the waste and confusion incident to unpreparedness, Congress passed on June 4, 1920, the National Defence Act, which established the army of the United States in the approximate proportions of one-half organized reserves, one-third National Guard when called into service, and one-sixth regular army, the last factor being limited to 280,000 officers and men. For training and tactical control, the country and its possessions were divided into corps areas, all three components of the army within each area being potentially organized for prompt mobilization The regular army, the component engaged primarily in military training, was to be responsible for the instruction and proficiency of the other two components The President could change the strength of the different arms to suit varying demands of national defence and the developments of the new services, such as air, chemical warfare and tank corps. Within the regular army a single promotion list for officers throughout all branches, except the Medical Corps, equalized advancement by seniority. Provision was made for reserve officers' training corps in colleges and for training camps during summer months. Altogether the legislation was viewed generally as the first sound military policy of the United States Accordingly, in 1921, the army spent its efforts upon training and recruiting qualified personnel On June 30, 1922, Congress reduced the regular army to a maximum of 175,000 officers and men, and later in the year made the maximum for officers 12,000, so that it was necessary to separate from the service over 100,000 officers and men, many of whom had recently enlisted or been commissioned But 1925 the regular army found itself unable through lack of funds and numbers to carry on for itself and the other components of the Army of the United States the entire training contemplated by the latest Defence Act. Though $334,533,786 was voted in the Army Appropriation bill, less than half of that amount went to purely military upbuilding of the regular establishment That body, aside from its work with the reservists and National Guardsmen, lent aid to industry, commerce and public welfare The Corps of Engineers put many millions into mapping, waterways and harbours; the bureau of insular affairs increased revenues from island possessions; the medical department made signal contributions in the treatment of empyema, pulmonary tuberculosis and orthopaedic ailments for mankind and rinderpest for animals,

the judge-advocate-general's department in one particular of settling national claims before U S courts handled suits involving $55,000,000; the adjutant-general's office administered the Adjutant Compensation Act covering the cases of 5,250,000 men; the Quartermaster Corps was the only available agency for the immediate and material relief of the Miami and Mississippi flood sufferers, and rushed to Miami alone an initial lot of supplies valued at $106,000; the chemical warfare service produced means of eradicating vermin, rodents, moths, bats and flour weevils from vessels, bakeries, depots and warehouses, saving a Western plant in one instance over $75,000; the Air Corps, in its perfection of the parachute, its photography, its patrolling of forest fires, its delivery of serum and its bombing of ice jams not only proved helpful to aviation but to general comfort as well, and the Signal Corps in operating the 37 radio, cable and telegraph stations between Seattle and Alaska, in serving other departments of the Government with the largest radio net in the world and in laying 4,588m. of cable, assisted the public materially in efficiency and economy. In its educational system the army operated 43 separate schools by the end of 1927. The regular force in 1928 came to the understanding more than ever that national security and preparation to maintain peace remained its paramount duty Signal influences which have retarded progress toward that end in recent years are found in squalid housing conditions, stagnation in promotion, the country's fast diminishing reservoir of war veterans and the waning strength of a permanent establishment. Temporary war structures are the present supply of shelter for a large part of the officer and enlisted personnel Increase in junior grades since the war with subsequent curtailment has retarded promotion to such an extent that many officers could ordinarily never become colonels The asset of trained war veterans has through disability, age, death and domestic obligations materially been decreased in the decade since the war Moreover the regular army is numerically less than on April 6, 1917, notwithstanding the population has increased some 20 millions The following table, while partially disclosing the truth of the statement that national defence costs the average American citizen less than a penny a day, also reveals the trend in recent years toward a positive decline in strength

Year	Estimated population of U S	Strength of regular army (officers and men)
1917 (Apr 6)	113,854,000	127,588
1918 (June 30)	115,461,000	725,065
1919 ,,	117,064,000	836,845
1920 ,,	118,683,000	200,299
1921 ,,	120,902,000	219,527
1922 ,,	122,545,000	138,424
1923 ,,	124,539,000	113,646
1924 ,,	126,771,000	132,665
1925 ,,	128,617,000	127,523
1926 ,,	130,570,000	124,928
1927 ,,	132,256,000	125,027
1928 ,,	133,836,000	125,000 (est)

NAVY

The present United States navy was preceded by several provincial navies and a Continental navy which had their origin in the Revolutionary War. When the colonists besieged Boston the British Government sent supplies to convert the garrison into a field army. This mobilization brought many transports from England to the American coast without adequate naval protection, and in September, 1775, Washington commissioned seven ships of war and filled his own needs with stores captured from the British The most important prize was an ammunition ship which enabled him to compel the evacuation of Boston. The following summer, General Arnold retreating from his repulse at Quebec built a flotilla on Lake Champlain with which he delayed the advance of the British army into New York until workmen could be summoned from Canada to outbuild his navy This was then destroyed, but the delay thus incurred caused the British invasion to be postponed till the following year, 1777, and by that time the conditions in New York had so changed that the British force from Canada surrendered at Saratoga. This campaign on the lake was in effect the most important American naval incident of the war.

As for the State navies most of the individual States availed themselves of their sovereign power to establish local navies to defend their own commerce and seize British shipping along their respective shores The States also issued letters of marque to privateers and dealt with prizes in their admiralty courts The State navies were local in their activities, but they and the State privateers took many prizes which were counterbalanced by American losses to the British fleet and privateers.

The true forerunner of the United States navy was the Continental navy, authorized by the Continental Congress and operated by a Committee of the Congress and then by a Board of Admiralty including members of Congress. These executive organizations, holding only delegated authority, were frequently unwarrantably overridden by Congress. Congress adopted a disciplinary law, the articles of war, abridged and adapted from the British law, and as many of the principal officers and men of the new navy had served in the British fleet, the entire ship's organization and administration followed those of the British. The Committee of Congress carried on its executive work through two local supervisory boards which ordered courts-martial and procured and bought ships Under these at different ports were Continental agents to man ships and purchase supplies, shipbuilding agents for construction and prize agents to handle prize cases. The administrative system was very loose and unsatisfactory.

The total naval force was at no time over 3,000 men and 20 ships with 550 guns. The British force on the American coasts was nearly four times as large The general policy of the committee was to strike at British commerce, and many prizes were made Such operations kept open communications with France and helped to bring about the French alliance. Discipline was not well established, esprit-de-corps was lacking and the ships were short-handed, for the most efficient men preferred privateering On the other hand, the British navy was also short-handed, for the colonials, who had furnished 18,000 men to the navy, in the Seven Years' War, were now hostile

The principal accomplishment of the navy was the victory of John Paul Jones in the sinking Bon Homme Richard over H M S "Serapis." Although a minor incident of war in itself, it showed the late colonials that they were not inferior in stamina to the men of the mother country, and was the foundation of American naval tradition and esprit-de-corps By no formal Act of Congress, but by cessation of appropriations, the Continental navy went out of existence after the peace of 1783, leaving the victory of Jones as a priceless heritage to the future United States navy.

Upon the establishment of the Federal Constitution, no need was at first felt for a navy; but the depredations of the Barbary Powers upon United States shipping caused Congress to authorize a fleet under the War Department for the protection of commerce. The support of commerce is still the governing policy of the Navy Department, as the attack on hostile commerce was the objective of 1776. The six ships of 248 guns laid down under the Act of 1794 were designed and equipped by the best talent in the country and were unequalled in their class. A force of nearly 2,000 officers and men (including marines) was authorized for them.

As these ships approached completion in 1798, Congress created a Navy Department under a Secretary of the Navy as a cabinet officer, exercising delegated authority from the President as constitutional Commander-in-Chief. The disciplinary law of the navy was modelled after that of the Continental navy. With the appointment of several senior officers from the old Continental service, the new one, as was natural, again assumed for American ships the customs and organization of the British fleet. As for

the department itself, the organization and control were very rudimentary, and ships and naval stations did much as their respective commanders pleased During the administration of Jefferson, the organization, however slight, which had been wisely laid down under President Washington fell to pieces

The successes in the quasi-war with France in 1798 and the squadron operations against Tripoli in 1803–5 completed the formation of the navy. Thereafter the United States service had standards of its own of squadron administration, of heroic service, and of tradition and esprit-de-corps to live up to Just previous to the War of 1812 the navy increased its tonnage to 14,260 and its officers and men to 5,500, besides 1,300 marines, the usual complement of marines on board ship being about one for each gun (although not serving the guns).

Upon the declaration of war against Great Britain in 1812, on account of war measures affecting trade and shipping, the squadron at New York put to sea without waiting for orders from Washington and covered the return of American shipping, besides operating successfully against hostile commerce It was well done. though the administration could claim no credit. There were several frigate actions which brought much prestige to the navy, but soon the overwhelming might of the British navy drove American commerce from the seas, blockaded American ports, destroyed American towns and paralyzed American industries. The important victories of the navy were on lakes Erie and Champlain The first cut the lines of communication of the British army in Michigan and obliged it to flee to Canada, thus giving America permanent possession of the Ohio Valley, and the second turned back the British army advancing into New York The country was mortified and depressed by the failure of the army to occupy Canada and by the coastal raids, but the naval victories together with Jackson's defeat at New Orleans of the veterans of Wellington's Peninsular army gave full compensation in the exaltation of the national spirit As the campaigns in the Mediterranean in 1803–5 had knit the navy, so the naval victories of 1812–14 established the self-confidence of the people Thenceforward, the nation was independent, not only politically, but in spirit

The lack of departmental organization made itself evident during the war and the Secretary of the Navy resigned under pressure The new secretary, William Jones, proposed a complete organization based on that of the British Admiralty, yet avoiding its defects on the civil side. Congress amended his proposal, and in 1815 provided for a board of three naval commissioners The terms of the act gave the board control of the civil and military branches of the navy under the secretary. But President Monroe decided that the material side should have technical supervision by the board and the military side, the "employment" of the navy, was something to be cared for by the civil secretary and his clerk without naval advice Thus Jones' effort to provide a "General Staff" to direct strategic operations and training was postponed for a century The Board of Navy commissioners set to work to centralize naval administration, to draw up regulations and to limit the vagaries of captains by requiring them to answer to the department But the board did not give entire satisfaction and in 1842 Congress substituted for it a group of civil bureaus for the supply and maintenance of the navy.

As in 1815, so in 1842 the original bill provided for an office of operations, but Congress saw only the need of creating an organization to spend the money it appropriated. It did not see that it was equally needful to organize for the purely executive work of managing the fleet. Between the close of the war in 1815 and the Civil War in 1861 the navy was chiefly occupied in assisting commerce. Exploring and surveying expeditions went out over the world. A commercial treaty with Turkey was initiated and Japan was brought into the circle of western nations. A squadron was maintained on the coast of Africa for the suppression of the slave trade. After 1815 the navy shrunk to under 4,000 men and then increased to over 12,000 (with marines), at the time of the Mexican War in 1846–7. This war made no great demands on the navy although it took possession of California, administered the government, and escorted and landed the army at Vera Cruz for the march to Mexico City.

When the Civil War came in 1861 the navy took a great part It expanded from about 10,000 men to 60,000 and from 133,000 tons of shipping to over 500,000 at the close in 1865 Its principal task was to cut off the Confederacy and its field armies from sources of supply across the ocean. This it did by a very effective blockade of the coasts and by seizing the control of the Mississippi river in conjunction with Grant's army so that little from the south-western area got to the field armies The work was comparable to that f the British navy in isolating Germany in the World War. For this administrative task the Navy Department added new bureaus, but the principal change in organization was the appointment of an assistant secretary to direct operations and practically to assume the duties of a chief-of-staff When the war was finished the office of assistant secretary was abolished and the duties of operation of the navy were taken as a side-line of work by one of the maintenance bureaus.

For nearly 20 years after the war public interest lay in the political reconstruction of the South and the economic development of the West The navy was neglected and it grew rather stale Numbers fell to 10,000 and efficiency was not high But in the early eighties, public interest revived and by the time of the Spanish-American War in 1898, the navy had some fine ships and was gaining efficiency. The two battles of Manila and Santiago, in which two hostile squadrons were destroyed with only one American killed, made it impossible for Spain to continue the war The policy of the United States and the development of the navy were greatly modified by the war, for the country now began to realize that it was a world power with trade interests extending everywhere But for the moment sea-power was not imperative and the navy turned to contemplate the possibility of a war with Germany and to prepare itself if called upon The navy now grew rapidly and the fleet developed its organization and administration for handling large bodies of combatant ships.

In 1909 Secretary Meyer attempted to perfect the departmental organization by his executive authority without appeal to Congress He grouped the material and personnel bureaus under two aides in his office. established an inspection system under another, and most important, he established an Office of Operations under a fourth aide to manage the training and employment of the fleet The last aide headed a general staff in effect although not in name The change was a distinct betterment.

As it became apparent to the Administration after the opening of the World War in 1914 that it was necessary at least to be able to make a show of force, Congress in 1915 completed the organization of the department by establishing an office of naval operations for the direction of the fleet after the bureaus of maintenance had supplied the raw materials in ships and men The following year, 1916, at the request of the President, Congress authorized 16 capital ships of the largest size, and for the former method of promoting officers by seniority, it substituted a system of selection by merit, a measure of far-reaching efficiency After the United States entered the war in 1917, the navy personnel was increased from some 75,000 (including marines) to eight times as many, including reserves in service No major naval action occurred after American entry to the war, but the American navy added a squadron to the British Grand Fleet, laid a huge system of mines in the North Sea, and swept them up after the war, escorted convoys off Ireland and in the Mediterranean, and transported army stores and about 1,000,000 soldiers to France After the armistice, the navy was rapidly reduced to its present (1929) figure of 112,000 officers, men and marines.

Soon after the entrance of America into the World War, the shipbuilding programme of 1916 was at the request of Great Britain temporarily laid aside to build torpedo boat destroyers, merchant ships and other types of craft which the allies lacked The building programme of 1916 was resumed after the armistice When the new Administration took office in 1921 it invited Great Britain, France, Italy and Japan to a conference on the reduction of naval armaments to meet at Washington in November 1921. At the assembly the American delegation proposed to sacrifice the greater part of the 1916 programme and reduce the battleship tonnage of this country immediately and Great Britain later

to 525,000 tons and that of Japan to 315,000 tons with corresponding limitations in all other classes of combatant ships. This was promptly accepted by Great Britain as to battle-ships, but she refused to cut her cruisers. France refused to abolish submarines and Japan limited fortifications in the western Pacific outside of Japan proper, thus altering the value of the 5-5-3 ratio proposed by the United States. No new ships were authorized for several years. By 1926 many of the U.S. cruisers were old and obsolete and several cruisers of the largest size permitted by treaty (10,000 tons and 8-inch guns) were authorized. There was discussion on armaments at Geneva in 1926. Conversations then followed between representatives of America and Great Britain and, as an agreement seemed possible to the President, he called a conference at Geneva in 1927 between the five powers, but only Great Britain and Japan accepted. Contrary to the American expectation the British delegates proposed changes in the Washington Treaty which were refused, and no agreement could be reached as to cruisers, as the British desired a large total number and the United States large individual ships, each country's demands being based on her geographical needs. The following are the ships and tonnage of the American Navy (1929)

Table of Combatant Ships of the United States Navy

(1) Classes limited by treaty	No.	Tonnage
Battle-ships built, ready for service	18	525,850
Aircraft-carriers, built, ready for service	3	78,700
Aircraft-carriers, appropriated for	1	13,800
All the above ships are under 20 years of age since date of completion		
(2) Classes unlimited by treaty		
Cruisers, building, appropriated for or authorised	23	230,000
Cruisers, completed, ready for service	32	254,425
Of the above finished cruisers, 22 of 179,425 tons are over 20 years of age, and ineffective owing to deterioration of material and obsolescence of design The 23 cruisers building are largely to replace these old ships		
Destroyers, under 16 years of age since completion	260	310,429
over effective age of 16 years	10	7,986
Submarines, under 13 years of age since completion	108	81,807
over effective age of 13 years	14	5,652
building	2*	5,520*
Light mine-layers, under 16 years of age since completion	14	16,674
Mine-layers, under 20 years old since completion	2	7,600

There are many other auxiliary ships belonging to the navy as tenders, hospital ships, fuel ships and supply ships of various kinds which are not usually considered as combatant ships although most have a slight armament

*Exclusive of 3 whose design is not yet approved

AVIATION ORGANIZATION IN THE UNITED STATES

The three services in the United States, the army, navy and Marine Corps, have their own aviation forces which work with the service to which they are assigned and upon the specific problem for which they are trained.

The bureau of aeronautics of the navy department, as its designation implies, is one of the major departments under the secretary of the navy and the chief of naval operations The Bureau of Aeronautics is charged with the procurement of aircraft and all accessories necessary to operate them, and naval aviation operates as a part of the fleet at the direction of the secretary of the navy, the assistant secretary of the navy for aeronautics and the chief of naval operations. The chief of the Bureau of Aeronautics, in conjunction with the heads of his various sections, submits recommendations as to the type and number of aeroplanes required, the use to which they will be put and the extent to which they will be utilized to assist in successfully carrying out all naval missions. Aviation in the navy is generally considered to be a necessary part of the navy rather than a separate organization working in conjunction with it An air force, with naval aviators and suitable aircraft, accompanies the fleet at all times and instead of performing missions of its own, simply supplements every phase of naval operation

The aviation organization of the army is almost identical with that of the navy and is termed the Army Air Corps. It is charged, as is the bureau of aeronautics, with procurement; and questions of operations, etc., are handled through the chief of staff of the United States army Practically the only difference between the organizations of the two services is that all army personnel on aviation duty are attached to the Air Corps, while the navy has no similar organization within the naval service in general to which personnel is attached

The United States Marine Corps has an aviation branch whose duties are similar to both those of the army and navy and which is conducted in almost exactly the same way as naval aviation

The mission of aviation in the three services differs widely as the army aircraft operate primarily over land and have in a majority of cases only land problems to consider Naval aviation operates almost altogether with the fleet and along the coasts, and although practically all of their missions are carried on at sea, naval aviators are trained in land plane flying in preparation for duty on carriers. Aviators in the Marine Corps are trained primarily for expeditionary duty, which consists of a combination of both land and sea flying During the World War this aviation branch under the command of the United States navy, operated land planes against inland objectives in conjunction with the British navy. In the future it must be prepared to carry out similar missions, and also to operate from the decks of carriers or the surface of the sea in connection with the landing of forces on hostile territory, where it may be called upon to use either land or seaplanes.

The services have been criticized on numerous occasions for duplication of effort in the procurement of material and consequent useless expenditure of large sums. This statement is without foundation, as excellent co-operation is maintained Each service is kept informed of the activities of the others by means of an exchange system and any special information required is furnished upon request. Any duplication which exists takes place in connection with projects which are of such wide scope that the results cannot prove to be other than beneficial. In the opinion of the majority the aviation forces of the United States are allocated in a manner that will best increase the efficiency of the armed forces as a whole and strengthen the defence of the nation See also Air Forces (H. C. M.)

Bibliography.—Reports of the Bureau of Aeronautics are included in the *Annual Reports* of the Secretary of the Navy and those of the Air Service in the reports of the Secretary of War. *See* also *Department of Defense and Unification of Air Service* (Hearings before the Committee on Military Affairs, House of Representatives, 69·1, 1926); W Mitchell, *Winged Defense* (1925); A. Sweetser, *The American Air Service* (1919); T M. Knappen, *Wings of War* (1920)

IX. CONSTITUTION AND GOVERNMENT

An account of the governmental system of the United States must be largely descriptive of the organization of National and

State Governments. But it must also analyze certain of the fundamental characteristics that distinguish the United States Government from other Governments Bearing this two-fold object in mind, it will be convenient to discuss the general characteristics first, and to follow with a description of governmental organization. Under this plan, the discussion of the Constitution and Government of the United States is organized as follows:

1. The Federal system
2. Written Constitutions
3. Judicial construction of written Constitutions
4. Separation of powers
5. Presidential system of Executive organization
6. The National Government
7. The State Governments
8. Local Government in the States
9. The Party system

1. THE FEDERAL SYSTEM

By the Declaration of Independence in 1776, the thirteen American colonies of Great Britain expressed their action as that of "these united colonies," but the terms of the declaration implied that each became an independent State The thirteen united in declaring independence and in the conduct of war, though their co-operation was ineffective The Articles of Confederation, adopted in 1781, constituted a legal symbol of union, but the Central Government under these articles had no coercive power over the States, and no power whatever capable of exercise directly upon the citizens of the States The national Constitution framed in 1787 and put into effect in 1789, was intended to remedy this situation by creating a Central Government with large powers and with authority to exercise these powers, not merely upon the States, but directly upon all citizens of the country When the first Congress of the United States under the Constitution of 1787 assembled in New York in April, 1789, the Union had a membership of eleven States North Carolina and Rhode Island soon joined their sisters of the original thirteen States. The thirteen have now grown to forty-eight

Share of States in the Government of the Nation.—Under the Federal principle in the United States, the States, as such, are constitutionally guaranteed their territorial integrity, and are expressly recognized as units in the organization of National Government They have equal representation in the United States Senate They are treated as units in the election of president and vice-president, and of members of the Federal House of Representatives They have a decisive share in the amendment of the Constitution of the United States

When the National Government was being formed, a sharp conflict of interests arose between the small States and the large States The smaller States contended for complete equality among the States in the organization of the National Government, and the larger States contended for influence in proportion to population A compromise was reached by which the States are equally represented in the United States Senate irrespective of population, and in proportion to their population in the House of Representatives. By the terms of the Constitution no State may without its consent be deprived of its "equal suffrage in the Senate"

Representation in the National House of Representatives is based upon population. Under the Constitution, each ten years, after the decennial Federal census, the Congress of the United States determines how many members will constitute the House of Representatives, though there has now been no re-apportionment since 1911. This number is then divided into the total population of the forty-eight States. In this manner a ratio of representation is obtained. Each state is entitled to as many representatives as this ratio is contained in its population, although each State, no matter how small its population, is entitled to at least one representative. After the division of the representative ratio into the population of each of the States, large fractions of population may remain; and the states having the largest remainders have in the past received additional representatives, as long as the number agreed upon was not exceeded

In the election of the president and vice-president of the United States, the framers of the national Constitution provided for so-called electoral colleges. Each State chooses a number of presidential electors equal to the number of its members in the National House of Representatives, plus its two senators. The plan of the Constitution was that these electors should actually exercise a choice as to who should be president However, almost since the beginning of the Government, candidates for the presidency and vice-presidency have been nominated by the great political parties of the country in advance of the choice of electors. These political parties also nominate within each State their candidates for presidential electors. The candidates of any party for electors are definitely pledged in advance to vote for the candidates nominated by that party for president and vice-president For this reason, everybody knows who will be president immediately after the November election at which the electors themselves are chosen In this respect, unwritten law, developed by usage, has altered the operation of the written text of the Constitution In recognition of the fact that presidential electors are merely a device for casting a certain number of votes allotted to the State, Iowa, Nebraska, Wisconsin and Illinois provide for a direct vote for candidates for president and vice-president, and omit from their ballots the names of candidates for presidential electors

The great political parties nominate candidates in national nominating conventions, which usually meet in June or July preceding the November election for the choice of presidential electors These conventions are composed of delegates chosen either by primary elections or by party conventions in the States In the Democratic convention each State is represented by a number of delegates equal to twice the number of the State's combined representation in the Senate and House of Representatives of the United States. In the national Republican convention the representation of the States in the two houses of Congress is taken as a basis, but reductions are made in the number of delegates from States having small Republican votes The States may, however, properly be regarded as units in the machinery for nominating party candidates. And in the nomination of presidential candidates, a populous state wields a large influence—an influence greatly magnified if the State is both populous and politically doubtful.

Two methods are provided for amending the Constitution of the United States An amendment may be proposed by two-thirds of the members of both houses of Congress, and goes into effect when ratified by the legislatures of three-fourths of the States, or by conventions in three-fourths of the States, as Congress shall determine. Congress is required by the Constitution to call a convention for proposing amendments, on the application of the legislatures of two-thirds of the several States No convention has ever been called, and Congress has always provided for the ratification of Federal amendments by State legislatures rather than by conventions called for this purpose The machinery employed in the adoption of all the nineteen amendments to the Constitution of the United States has been (1) proposal by two-thirds of both houses of Congress and (2) ratification by the legislatures of three-fourths of the States

The States as governmental units still have a decisive influence with respect to any change in the National Constitution In other respects, so far as they influence the organization and Government of the nation, they have tended to become merely units for national election purposes. The State has to a large extent lost its political individuality as a unit in the Government of the nation. The decreased political importance of the State as a unit in national affairs is due mainly to the development of rapid means of travel and of communication The constant shifting of population from one State to another has prevented the newer States from developing the solidarity possessed by the original thirteen. The very increase in the number of States has reduced the importance of each as a unit in the National Government

Not only this, but, since the establishment of the Federal system, national politics has dominated The ambitious political

leader looks to advancement from State to national office. Nominations for the presidency are the most conspicuous prizes in the political organization. The popular election of United States senators by each State under the Seventeenth Amendment has itself tended to reduce emphasis upon the state as a political unit, and to treat it as merely an electoral area in the organization of the National Government. While the States still determine affirmatively who shall vote in State and national elections, the Fifteenth and Nineteenth Amendments forbid discrimination on account of race, color, previous condition of servitude or sex, and the United States Supreme Court has recently held that the Fourteenth Amendment forbids State legislation with respect to like discriminations in party primaries Of all the States, Maine alone still adheres to a date for State elections different from that for national elections. As soon as national and State elections came generally to be held upon the same day, we had a full establishment of the dominance of national politics.

Powers of the States and Nation.—In powers within their own borders and in senatorial representation the States are equal.

The States under the Federal system are units in the formation of a nation, not Governments independent of a nation. Before the Civil War a number of conflicts arose between National and State power, in which first one group of States and then another asserted its authority to proceed independently of the nation Pennsylvania, Massachusetts, Virginia and other states in turn opposed the supremacy of National power under the Constitution The Civil War settled finally and conclusively that the States are merely units, although indispensable units, in the formation of a single national organization

The limitations imposed upon the States by the Constitution of the United States clearly indicate the purpose to establish a single national organization, with the States as units in that organization States are forbidden, without the consent of Congress, "to keep troops or ships of war in time of peace, enter into any agreement or compact with another State or with a foreign power, or engage in war, unless actually invaded, or in such imminent danger as will not admit of delay." They are forbidden to enter into treaties, alliances, or confederations. These types of limitations upon the States indicate a definite purpose to deprive the States of any independent existence as organizations in themselves, and this purpose is supported by the language making the "Constitution, and the laws of the United States which shall be made in pursuance thereof, and all treaties made or which shall be made under the authority of the United States," the supreme law of the land

The powers of the National Government are such as are granted to it by the Constitution of the United States They must be found within the terms of that document It has no others This basic principle was implied but not expressed in the Constitution as first adopted. So important was its expression in the Constitutional text regarded that the Tenth Amendment, adopted in 1791, provides that "powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people" The States gave up certain powers in establishing the National Government They set out these powers in a written document, and expressly reserved all other powers to themselves or to the people. The powers of the nation, found within the terms of this written document are superior to the powers of the States.

Who is to determine, in case of doubt or conflict, whether such a superior power, asserted by the Government of the United States, is within the terms of the Constitution? Before the Civil War, States often asserted the authority to determine for themselves what powers belonged to the National Government, but such assertions were unsuccessful Since 1816 the legal principle has been established that the line between National and State powers is to be drawn by the United States Supreme Court, an organ of the National Government.

What are the powers granted to the nation? Express powers, couched in most cases in broad language, are conferred on Congress, by a series of seventeen paragraphs in Article I, section 8, of the Constitution. In even more general terms powers are conferred on the Executive and Judicial Departments of the United States In only one case is the power granted to the National Government expressed as an exclusive power. Certain powers are of such a character that they must be exercised exclusively by the National Government, as for example, the levying of Federal taxes, borrowing money on the credit of the United States, constituting Federal tribunals inferior to the Supreme Court, and the establishment of a uniform rule of naturalization. Others are made exclusively National by Constitutional prohibitions upon the States The Federal power to coin money is supplemented by forbidding States to coin money. The Federal war powers are made exclusive by prohibitions upon the States The Federal treaty-making power is supplemented by forbidding State treaties and by inhibiting State compacts without the consent of Congress Other powers are of such a character that they may be exercised by either of two Governments, but not by both The grant of such a power to the National Government makes it exclusive

Of necessity, many of the powers granted to Congress are not exclusive In such matters, States may exercise power also, provided State action does not conflict with the superior powers of the National Government in the same field Congress has complete power to regulate bankruptcies, but during a good part of the time since 1789 there has not been a Federal bankruptcy law, and the matter has been left to the States Congress has only in small part exercised its power to fix the standard of weights and measures, and there is valid State legislation upon this subject in all the States. The Constitution itself expressly provides for concurrent authority over the militia, and the Eighteenth Amendment expressly confers the concurrent power of enforcement upon "the Congress and the several States" Under a general grant of power to regulate interstate commerce, Congress has full power, but the states may legislate in regard to local needs and circumstances, unless Congress otherwise directs

Although all powers of the National Government must be found within the terms of a written document, this by no means implies that all powers must be expressly granted by that document The Constitution of the United States grants a number of important powers in broad terms to Congress and to the other departments of the National Government It further empowers Congress "to make all laws which shall be necessary and proper for carrying into execution the foregoing powers, and all other powers vested by this Constitution in the Government of the United States, or in any department or officer thereof"

Throughout the earlier decades of Government under this Constitution, political and legal contests centred about the meaning of the words "necessary and proper," one party emphasizing the word "necessary" as narrowing the powers conferred and the other the word "proper" as broadening them. The rule of broad and liberal construction announced by Chief Justice Marshall in 1819 has prevailed·

"Let the end be legitimate, let it be within the scope of the Constitution, and all means which are appropriate, which are plainly adapted to that end, and which are not prohibited, but consistent with the letter and spirit of the Constitution, are constitutional."

Substantially all powers not National belong to the States, and such powers must be determined in large part by a process of subtraction. Naturally no precise result can be obtained when the powers to be subtracted are based on broad implications and are not definitely determined The important national powers with respect to interstate commerce, taxation, treaties, post offices and post roads, and maritime jurisdiction, have been construed broadly, almost without exception

For more than a century the United States Supreme Court has been engaged in determining the line between National and State power This is a continuing duty. It is impossible to draw any definite or permanent line between National and State functions The steamboat and the railroad, the telephone and the telegraph, the aeroplane and the radio have been the potent factors in the development of National power. Railroad regulation began with the States, but has tended to come almost completely under National control. Rapid progress in this direction has been made

since the creation of the Interstate Commerce Commission in 1887. The so-called anti-trust movement began with the States, but restrictive commercial practices have largely come under National supervision with the Sherman Anti-Trust Act of 1890 and the creation of the Federal Trade Commission in 1914 Where a problem is national in character its solution will by some means fall to the National Government The broad and flexible powers of that government are capable of further expansion as new needs develop with economic, social and engineering changes

Along with the increase in National powers and in the activities of the National Government has come also a similar increase in the functions performed by the State Government With the increased complexity of modern life, the functions taken over by the nation are small as compared with the new activities of State Government. State Governments today do more than ever before and cost more in proportion

Powers of State Governments are broad and comprehensive Subject only to the condition that the Government shall be Republican in form, the States organize their own Central and Local Governments and provide revenues for the support of these Governments The State Courts administer the great body of law affecting the rights of individuals, and for the suppression of crime Education, though aided by the National Government, is under the control of the States and of the Local Governments created by them The same statement applies to the construction and maintenance of highways, and to the great mass of governmental details with which the citizen comes in daily contact. Indeed, the American of to-day is still in much the position described by James Bryce forty years ago.

"The State, or local authority constituted by State statutes, registers his birth, appoints his guardian, pays for his schooling, gives him a share in the estate of his father deceased, licenses him when he enters a trade (if it be one needing a license), marries him, divorces him, entertains civil actions against him, declares him a bankrupt, hangs him for murder The police that guard his house, the local boards which look after the poor, control highways, impose water rates, manage schools—all these derive their legal powers from his State alone."

Separate Administrative and Judicial Systems of Nation and States.—Throughout the territory of each State two governments operate—the Nation with its administrative and judicial organizations for the enforcement of National law, and the State with its administrative and judicial organizations for the enforcement of State law. Federal revenues are collected through officers controlled from Washington, State revenues are collected by independent State and local officers Taxes levied by the two are in some cases similar in character The Nation and a number of States impose income taxes, but their administration is independent Violations of State law are tried and punished in State Courts, violations of National law in separate Federal Courts In some cases the laws of the two are directed to the same purpose, and are substantially identical The Constitutions of both forbid that a person be twice put in jeopardy for the same offence, but in legal theory the two Governments are so distinct that one act, forbidden by substantially identical laws of each, may be punished by each as a separate offence

The reasons for this sharp distinction between the two Governments are historical The Articles of Confederation (1781–1789) sought to act through the Governments of the several States, and not directly upon the citizens of the States Government under these Articles failed, because each State finally determined for itself whether it would enforce the policies of the Congress The National Government, organized under the Constitution of 1787, had it thought proper, might have sought to use the States as agencies for the enforcement of National law, as is largely done under the Federal systems of Germany and Switzerland But under the circumstances it was natural to build up an independent administrative and judicial system This system has steadily grown with the expansion of National activities.

2. WRITTEN CONSTITUTIONS

Under the Federal system it is substantially necessary to have a written document defining the organization of the Central Government, and determining the respective powers of the States and the Central Government It was natural, therefore, that Articles of Confederation should be framed for the creation of the first Union of the American States, and that, when improvement was needed, these Articles should be replaced by the National Constitution of 1787

There was no similar legal necessity that written constitutions be framed for the Government of the American States. Yet the colonies were accustomed to written instruments of Government Certain of them operated under Royal Charters Massachusetts largely remained under its Charter Government until 1780, Connecticut until 1818, and Rhode Island until 1842 In other colonies the royal commissions to governors gave some written basis for government Moreover, the leaders in the colonies were familiar with and largely adherents of the theory that government is a result of social compact, and theories of natural rights were strong

It was therefore natural that, upon separation from England, the several colonies should embody in written form a declaration of their rights and the general organization of their governments Before the framing of the National Constitution in 1787, constitutions had been framed and adopted by all the original thirteen States except Connecticut and Rhode Island The framers of the National Constitution therefore had before them the texts of State constitutions and were familiar with the experience under these constitutions Each State is now governed by a written Constitution

3. JUDICIAL CONSTRUCTION OF WRITTEN CONSTITUTIONS

The Constitution was regarded from an early date as law of a superior order and of a more permanent character than legislative acts Under the first State Constitutions legislatures were the dominant organs of Government They abused their wide powers, and helped develop a feeling that legislative authority should in some measure be curbed In New Jersey in 1780 a statute was declared invalid as violative of the State Constitution Other decisions of this character gradually accumulated Apparently the framers of the Federal Constitution were in 1787 of the opinion that it would be the function of the Federal Courts to preserve the powers of State and Nation under the Federal Constitution Such a power in the Federal Courts carries with it authority, in a case involving the issue, to declare either a Federal or a State law invalid as violative of the Constitution of the United States Since Chief Justice Marshall's opinion in 1803, in *Marbury* v *Madison,* the principle of judicial power to declare laws unconstitutional has been established in the Federal system The authority of State Courts to declare State laws invalid as violative of State Constitutions is equally well established Except for a few provisions which are regarded as committed to the political organs of Government, it may therefore be said that placing language in a written Constitution makes such language judicially enforceable as against the legislative bodies Whereas Parliament is the supreme lawmaker under the English system of government, in the United States the written Constitution as finally construed by the courts is supreme Where constitutional provisions are clear and precise this supremacy of the Constitution as judicially construed makes little difficulty But where language is used that is not capable of precise definition, as that of the Fourteenth Amendment that no State shall "deprive any person of life, liberty or property without due process of law," the court in fact determines not only the constitutionality but also the wisdom of legislative action.

4. SEPARATION OF POWERS

National and State Governments in the United States are each organized into three departments The theory of separation of powers is formally announced in forty State constitutions In the remaining eight State Constitutions and in the Constitution of the United States the same constitutional result arises from the fact that these nine documents create three departments of government, and vest the legislative power in one, the executive power in another, and the judicial power in a third

There are no clear lines separating one governmental function from another, and the courts have therefore been unable to develop any logical lines of division. Legislative power having been delegated to Congress and the State legislatures, the courts frequently say that legislative power may not be delegated, but the very necessities of modern life have forced in the United States, as in England and on the Continent, the vesting of a large amount of subordinate legislative authority in permanent administrative bodies within the executive department. In order to avoid terming this a delegation, the courts have come to designate such powers as "*quasi*-legislative," rather than "legislative." In the same manner, administrative bodies within the executive department have come to exercise powers that are sustained on the ground that they are "*quasi*-judicial" rather than "judicial" The result is therefore not dissimilar from that in countries that have not attempted to set up three separate departments through judicially enforceable constitutions. But such flexibility as develops under the American plan comes more slowly, and can be achieved only with judicial approval. A study of American political institutions must, therefore, always take into account the greater rigidity in governmental structure resulting from the constitutional principle of separation of powers.

5. PRESIDENTIAL SYSTEM OF EXECUTIVE ORGANIZATION

The Federal Government and the States of the United States have adopted the presidential system of executive organization, as distinguished from the cabinet or ministerial system found in England and most other countries. Under the presidential system there is an independent executive (president or governor) elected for a fixed term, and holding office during that term irrespective of whether he is or is not in political harmony with both legislative bodies or either of them The members of the legislative bodies are elected at fixed times and for fixed terms, and no power is vested in the executive to dissolve them or to force elections at any other times than those fixed. The principle of separation of powers as applied in the United States precludes any member of the executive department from having a seat in a legislative body. Under this system the president or governor has real executive authority, and in all States but North Carolina has and exercises large power to control legislation by an executive veto. The presidential system pre-supposes that the executive and the legislature may at times not be in political harmony And in fact this is the case in many of the states and in the National system In the States of New York and New Jersey in recent years the governors have often been members of the Democratic party, while both houses of the state legislature have been controlled by the Republican party. The power ordinarily vested in the legislative bodies to impeach and remove the executive is judicial in character, and efforts have only occasionally been made to employ the power of impeachment to remove an executive politically hostile to the two houses of the legislature. Such an effort was made, unsuccessfully, to remove Andrew Johnson from the presidency of the United States.

The presidential system is more rigid than the ministerial plan of government, but it accords with the American doctrine of separation of powers. When the country faces a crisis, as during the Civil War and the World War, popular sentiment maintains political harmony between the President and Congress; and the executive tends to become the dominant factor in government. The presidential system of the United States in fact met the serious problems of the World War with less difficulty than did the ministerial systems of England and France.

6. THE NATIONAL GOVERNMENT

The National Constitution.—The Constitution of the United States, framed in 1787 and adopted in 1789, is a brief and well-drafted document. Its influence has been felt not only in the United States, but in the Federal systems of Switzerland, Argentina, Brazil, Canada and Australia. The Constitution outlines the organization of the three departments of the National Government, defines the powers of that Government, and the relationship between the Nation and the States. It provides a method of amendment, and has been nineteen times amended since its adoption. The first ten amendments, adopted in 1791, were the direct results of criticisms of the Constitution at the time of its adoption, and may almost be regarded as parts of the original document. Of the other amendments, the Eleventh, adopted in 1798, overcame a decision of the United States Supreme Court to the effect that a State might be sued by a citizen of another State. The Twelfth Amendment, adopted in 1804, corrected a defect in the original Constitution as to the method of choosing the president and vice-president. The Thirteenth, Fourteenth and Fifteenth Amendments were the immediate outcome of the Civil War. The Thirteenth abolished slavery, the Fifteenth forbade denial of the right to vote "on account of race, color or previous condition of servitude." The Fourteenth Amendment, regarded for a while by the courts as limiting itself to the protection of the freed slaves, has become, by expansion of the terms "due process of law" and "equal protection of the laws," the means through which the United States Supreme Court determines the policy of state enactments in the field of social legislation. The Sixteenth Amendment in 1913 gave Congress an effective power to levy a Federal income tax Popular election of United States senators under the Seventeenth Amendment, adopted in 1913, has somewhat reduced the importance of the State, as has the Eighteenth (1919) transferring the liquor problem to the National Government The Nineteenth Amendment (1920) nationalized women's suffrage On the whole the process of amendment, while to some extent enlarging Federal powers, has been less influential in this direction than the decisions of the United States Supreme Court.

Congress.—Legislative power in the National system is exercised by a Congress composed of two houses The two houses have grown—the Senate from 26 to 96 members, and the House of Representatives from 65 to 435 members

United States senators are elected for six year terms, and terms are so arranged that one-third of its members retire each two years Since 1913 the elections in each state are by popular vote of the whole State, except that temporary appointments to fill vacancies are permitted. Members of the House of Representatives are elected for two years, and the whole membership changes each two years. Each State is required to be divided into districts equal to the number of members it has in the House of Representatives, though where additional members are assigned to a State and it makes no reapportionment, the additional members are elected from the State as a whole Each member of the House of Representatives is required to be a resident of the State from which he is chosen; political and sectional interests make it practically impossible for a person to be elected for a district within the State in which he does not reside The result is that an able and experienced person ceases to be a member of Congress if he fails of re-election by his district. In addition to the elected members, territorial delegates sit without vote in the House of Representatives—two from the Philippines, and one each from Alaska, Hawaii and Porto Rico.

During the two year term of members of the House of Representatives, two sessions of Congress ordinarily occur—the so-called long session, beginning in December of the odd-numbered years and adjourning usually in early summer of the succeeding year; and the short session beginning in December of even-numbered years and closing on the succeeding March 4, when the terms of members of the House expire Congressional elections take place in November of even-numbered years; the terms of members then elected begin after the succeeding March 4, but the newly elected members do not come into regular session until the succeeding December, more than a year after their election. The short session is always composed in part of members who have already failed of re-election, and who may therefore be said not to represent their constituents. It is of course possible for the president to call the newly elected Congress in special session at any time after March 4, and this is occasionally done.

The organization and procedure of the two houses of Congress are to a limited extent determined by Congress, and to a larger extent by the size and traditions of the two houses. The rules of

the Senate permit great freedom of debate, those of the House of Representatives restrict debate and expedite business. Under the Senate rules obstructive tactics may be and are often resorted to, though such tactics relate in fact to relatively few measures. The House of Representatives, with its larger membership, would be helpless with complete freedom of debate, yet both houses accomplish a large amount of legislative business, as is indicated by the passage of nearly one thousand measures at the first session of the seventieth Congress which convened December 5, 1927, and adjourned May 29, 1928

The House of Representatives elects from its own members a speaker as presiding officer The vice-president of the United States is the presiding officer of the Senate The work of both houses is largely done in committee The committee systems of both houses developed largely by accident, and many committees in each house, once created for important tasks, remained long after their usefulness had ceased. The Senate in 1921 and the House of Representatives in 1927, reorganized their committees and materially reduced their number. There are now thirty-four standing committees in the Senate, and forty-seven in the House of Representatives. Although they may in some cases have different names, the committee organizations of the two houses closely parallel each other There is an appropriations committee in each house; committees on commerce and interstate commerce in the Senate, and a single committee on interstate and foreign commerce in the House, a committee on ways and means in the House, and a finance committee with similar functions in the Senate Each house has a judiciary committee The committees referred to are regarded as of distinct importance; though other committees are at times equally powerful The Senate committee on foreign relations is peculiarly important, because treaties may not be entered into without the concurrence of two-thirds of the senators

Committees in each house are controlled by the political party having a majority of the members of that house Appointment to important committees goes largely to seniority in term of service, and a member serving continuously over a long period is likely to become chairman of an important committee, if his political party is in control Seniority as such naturally plays a larger part in the House of Representatives than in the Senate with its smaller number of members, though the business of the Senate is in good part controlled by a small group of experienced members. Leadership in the two houses is always exercised by a few members of the politically dominant party In the House of Representatives for many years before 1911, the real leadership was largely vested in the speaker, who made up the appointments to standing committees Since 1911 the speaker has been relegated more distinctly to the position of presiding officer, committees have been elected by the House itself on the basis of selections first made by the party organizations The majority and minority floor leaders have large influence In the Senate there is less of individual leadership than in the House of Representatives

The Federal Executive.—In discussing the presidential system, the relation between the president and Congress has been generally described. There are no constitutional limitations upon a president's succeeding himself, but a tradition exists that a president should not serve for more than two terms, a tradition based on the example set by Washington and other early presidents.

The Constitution expressly authorizes the president to make certain appointments to office and the expansion of the National Administration has greatly increased the number of officers owing their appointment to him. The more important appointments are subject to confirmation by the Senate. The United States Supreme Court has determined that where power to appoint to office is vested in the president this carries with it a complete power to remove from office. Efforts upon the part of Congress to impose restrictions upon the president's power to remove even his more direct advisors led to the effort to impeach President Andrew Johnson in 1868, which failed.

The president's control over the National Executive Administration is primarily exercised through the heads of ten executive departments, appointed by the president. These departments are: Department of State, Department of the Treasury; Department of War; Department of Justice; Post Office Department, Department of the Navy; Department of the Interior; Department of Agriculture; Department of Commerce; Department of Labor The heads of these departments are popularly termed a cabinet. They are responsible to the president, and the extent to which he meets with them and seeks their advice rests entirely in his discretion In addition to these ten departments there are numerous boards and offices The Federal executive organization under the president is not systematically organized, and plans for its reorganization have been under consideration for about twenty years The need for such reorganization has become increasingly apparent with the expansion of activities of the National Government The great mass of the lesser employees are selected under a merit system, for whose conduct a Civil Service Commission was first created in 1883 (*See* CIVIL SERVICE, *United States*) The finances of the national government have been to a large extent systematized through the creation of a bureau of the budget in 1921, and through an improved committee organization effected in the House of Representatives in 1927 for the consideration of national appropriations and expenditures.

The president's influence in the national government rests upon (1) powers granted him by the Constitution and by Federal statute, (2) political factors not found in constitutions or statutes, (3) the personality of the president.

The president's position as head of a large executive organization, with wide powers of appointment and removal, in itself makes the position important The authority to veto legislation, subject to being overridden by two-thirds of the two houses, gives him a power that may be employed with effect The authority to recommend measures to Congress is only of such value as may be given to it by the position and influence of the president making the recommendation He is charged with the conduct of foreign relations, though here his authority is materially crippled by the requirement that two-thirds of the senators concur in treaties.

But the president's political position is equally as important as his constitutional power He is in effect the chieftain of his party. He is also the one outstanding figure in American politics His utterances are news, and appear conspicuously in every newspaper in the country. These factors supplement his constitutional power, and make it possible for him to occupy a dominant position in the Federal system

The possibilities of exercising power are great. The extent to which power is actually exercised depends upon the personality of the president and his capacity for political leadership The influence of the presidency varies with the man who occupies the office and with the circumstances that surround him In time of war, as under Lincoln and Wilson, the presidency dominates. Andrew Jackson dominated in a time of peace. James Bryce in 1886 said that leaders are not chosen for the presidency, but real and dominant leadership has in recent times been exercised by Cleveland, Roosevelt and Wilson The possibilities of the presidency were well expressed by Woodrow Wilson before he came to that office "The President is at liberty, both in law and conscience, to be as big a man as he can. His capacity will set the limit; and if Congress be overborne by him, it will be no fault of the makers of the Constitution,—it will be from no lack of constitutional powers on its part, but only because the President has the nation behind him, and Congress has not He has no means of compelling Congress except through public opinion "

Little need be said about the vice-president His chief official duty is to preside over the Senate, though he has substantially no influence in the deliberations of that body. The machinery for nominating party candidates ordinarily chooses a vice-presidential candidate almost purely on the basis of political expediency, and with little consideration of the fact that the vice-president may succeed to the presidency. Yet within the past thirty years two vice-presidents—Roosevelt and Coolidge—succeeded to the presidency as a result of death, and then were elected to the office

The Federal Judiciary.—The Constitution of the United States provides for a Supreme Court "and such inferior courts as the Congress may from time to time ordain and establish " For

the enforcement of Federal law, Congress has provided a complete judicial system paralleling that of the states The judges of these courts are appointed by the president of the United States, and hold their offices during good behaviour They are removable only by the cumbersome machinery of impeachment

At the head of the judicial system is the Supreme Court of nine judges, which sits at Washington There are nine Circuit Courts of Appeal, each with at least three circuit judges, and to each circuit is assigned a Justice of the United States Supreme Court, though pressure of business has now made it impossible for judges of the Supreme Court to go on circuit The District Court is the court of original jurisdiction In erecting districts for the organization of this court, state lines are regarded The smaller States constitute single districts, the larger are divided For the districts in which Federal judicial business is especially heavy, more than one district judge is provided For example, four districts with fifteen judges exist in New York. There are more than eighty districts, with 129 judges, and the number of judges constantly increases The enforcement of the Federal Prohibition Act has enormously increased the business of the Federal Courts, and has forced an increase in the number of judges In addition to the general system of courts here outlined, there are a Court of Claims, Court of Customs Appeals, and Federal Courts for the District of Columbia and the territories

With the two systems of courts—Federal and State—exercising jurisdiction over the same territory, it is necessary that there be certain principles as to their relationship. Such principles may be briefly summarized as follows.

(1) Upon questions of Federal constitutional law, the United States Supreme Court is the final court of review If the highest court of a State holds a Federal statute or treaty to be invalid, or a State statute valid that is alleged to violate the Federal Constitution or Federal statutes, the losing party has a right to a final decision by the highest Federal court Where Federal constitutional issues are otherwise involved in State courts, the United States Supreme Court, may, in its discretion, review the state decision

(2) All cases involving the enforcement of the criminal law of the Federal government are tried in the Federal Courts

(3) Cases of admiralty and maritime jurisdiction and bankruptcy proceedings are tried in the Federal Courts

(4) Under Federal statutes, the Federal Courts alone have jurisdiction of suits against the United States, and of suits for the enforcement of Federal revenue, immigration, and other similar laws directly affecting the administration of the Federal Government.

(5) In civil cases involving as much as $3,000, and (a) arising between citizens of different States or (b) arising under the constitution, laws or treaties of the United States, the parties have the choice of suing either in State or Federal Courts, but if the plaintiff sues in the State Court, the defendant may transfer the case to the Federal Court

Through legislation of 1925 an effort has been made to reduce the number of cases that must be decided by the United States Supreme Court That court has a limited original jurisdiction, the most important cases of such jurisdiction being cases to which a state is a party Cases not infrequently arise in which one State sues another State. Aside from its original jurisdiction, cases come to the United States Supreme Court either from the highest State Courts or from the lower Federal Courts. The decisions of the United States Supreme Court are of primary importance in the fields of constitutional and public law

7. THE STATE GOVERNMENT

The forty-eight State Governments of the United States have certain common characteristics Each State is legally the equal of every other State in the Federal system Each controls the organization of its own State and Local Governments. Each has a written Constitution providing for three departments of Government, with a legislature of two houses elected by popular vote, and a popularly elected governor as head of its executive department. Each State has a judicial system not essentially dissimilar in external organization from that of the other States. Each State has created local governing areas for the performance of certain functions. The Government of each State and of its important local areas is controlled through political parties organized on a National basis

Superficially, all the forty-eight State Governments appear to be more or less alike, and appear to be doing the same things. The constant shifting of population has prevented the development of sharp differences in governmental organization Not only this, but from one state to another there has been a great deal of copying of political and legal institutions. However, each State is distinguished from its fellow States, not only in size and population, but also in location, climatic conditions and resources and these differences reflect themselves in the political and governmental organization of the States

The State Constitution.—The Constitutions now in force in the forty-eight States vary a great deal in length and in content Some were adopted in an earlier period, and some bear recent dates. The Constitution of Connecticut, adopted in 1818, together with subsequent Amendments, requires only about sixteen printed pages, the Louisiana Constitution of 1921 requires ninety pages The present Constitutions of Oklahoma, California and a number of other States are highly detailed Massachusetts still boasts that it is governed by the Constitution of 1780, but this Constitution has been altered in form by so many Amendments that it would hardly be recognized by its original framers By Amendment or by the adoption of new Constitutions, the States have steadily readjusted their institutions to meet changing needs The National Constitution has proved a model for much of the development in the field of State constitutional history, particularly with reference to the establishment of three co-ordinate departments of Government

In most of the States the State Constitutions organize three departments of government in some detail They contain elaborate declarations or bills of rights, and most of them contain provisions regarding the organization of local government Limitations upon the power of State legislatures have multiplied Moreover, the framers of Constitutions are inclined to include in these documents regulations of any matters of great public interest at the time The State Constitution has in this way come to contain many matters of temporary detail, and such detail requires frequent amendment

The State Constitutions provide for methods of change The methods employed are three. (1) constitutional conventions, (2) legislative proposal of amendments, (3) proposal by popular initiative petition All but twelve of the State Constitutions expressly provide for constitutional conventions. in all of these twelve except Rhode Island it is recognized as proper to employ conventions for constitutional change Ordinarily conventions assemble as a result of popular vote, and submit their recommendations for popular approval

Proposals of constitutional amendment may be made by the legislatures in forty-seven States In New Hampshire changes may be made only by constitutional convention Methods of amendment through legislative proposal vary in the forty-seven States, but in all except Delaware, a legislative proposal of amendment must be submitted to and approved by popular vote before it becomes effective Details of the amending process vary In some States, as California, Louisiana, New York, the adoption of amendments through legislative proposal is easy; in others, as Illinois, Indiana and Minnesota, the constitution is substantially impossible to amend.

The proposal of constitutional amendments through popular initiative petition, followed by popular vote, is a fairly recent development, but this plan has now been adopted by thirteen States. In these States also, there is a varying ease or difficulty in employing the plan of amendment In Oregon and four other States it is as easy to amend the Constitution through initiative petition and popular vote as it is to enact a statute through the same devices In each State that has adopted the plan of popular initiative, this plan has merely been added to the two already existing devices of constitutional conventions and proposal by

legislative action. By the three methods of change more than 1,500 amendments were proposed in the forty-eight States between 1900–20, of which about three out of five were adopted

The State Legislature.—In all of the American States, legislative power is exercised by a body composed of two chambers Constitutional amendments for the organization of a legislative body composed of but one house were proposed in Oregon in 1912 and 1914, in Oklahoma in 1914, and in Arizona in 1916 All of these proposed amendments failed.

The smaller house of the legislature is in all of the States called the Senate All but eight of the States call their larger house a House of Representatives; but the eight have such varying titles as Assembly, General Assembly, and House of Delegates. Nearly half of the States use the term Legislature to designate the two houses together, but twenty use the term General Assembly, and three use the term Legislative Assembly Massachusetts still uses the term General Court, which was first employed in the Colonial Charter, and New Hampshire uses the same term In view of the fact that the legislative bodies have somewhat varying names in the several States, it has been customary to refer to the larger of the two houses as the lower house, and to the smaller as the upper house

To a large extent the exact number of members of the two houses, or of one of the two houses, is left to legislative determination, subject to constitutional restrictions The size of the two houses varies a good deal from one State to another The Minnesota senate is the largest, with sixty-seven members, and that of Delaware the smallest, with seventeen The size of the lower house ranges from thirty-five in Delaware to four hundred and fourteen in New Hampshire The membership of the lower houses is especially large in several of the New England States because of the system of town representation, but in these States the Senate is relatively small

In a majority of States, senators are elected for four years and representatives for two years In some States, one-half of the members of the Senate are elected every two years, so that the Senate has continuous membership, as contrasted with the House, whose membership is chosen as a whole at each election In Alabama, Louisiana, Maryland, South Carolina, and Mississippi, however, four-year terms have been provided for members of both houses, and a number of States have a two-year term for members of both houses

In some States financial measures must originate in the lower house, and in most of the States the Senate has certain powers with respect to confirmation of executive appointments The provisions for impeachment of public officers also ordinarily prescribe that charges shall be brought by the lower house and tried by the Senate But on the whole it may be said that, from the standpoint of legislation, the two houses of the American State Legislature have equal powers and do not represent different points of view in the community Distinct differences that existed in many States in earlier times have substantially ceased to exist, although in a number of States differences in territorial representation have grown up.

In the earlier State Governments the substantially equal representation of local areas was not grossly unfair, because of the absence of great inequalities in their population. To a large extent, the idea of geographical representation survives in a number of States. The lower houses of Connecticut, New Hampshire, and Vermont, and both houses of Rhode Island, are based upon town representation; and with the growth of large urban communities this basis has become highly unequal In 1920, New Haven with 162,000 inhabitants, had two representatives in the lower house of the Connecticut legislature, but so also did the town of Union with 257 inhabitants. Such inequality is not confined to New England.

The present representative system is the result of two conflicting forces. In most of the States some attention is paid to local governmental areas It is common for constitutional provisions to forbid the crossing of county boundaries in the establishment of representative areas On the other hand, the principle of equal representation upon the basis of population has steadily developed. The more common plan today is to provide for the periodical reapportionment of membership in the two houses, upon the basis of population Delaware, however, permits a reapportionment only by constitutional change; and other States, while providing for periodical reapportionment, limit the basis of representation in such a manner as to preserve an inequality

Members of the State legislature are chosen from local districts by popular vote Proportional representation has been proposed, but has not been adopted by any State All States adopt the plan under which a candidate is elected who receives a plurality of the votes in his district, though Illinois since 1870 has provided for three members of the lower house in each electoral district, and that each voter may vote for three or cumulate his votes for one or two candidates

Under the first State Constitutions provision was generally made for the annual election of members of legislative bodies and for annual legislative sessions Frequent and regular sessions of the legislature were deemed essential safeguards of popular rights, and were at this time thought sufficient safeguards Most State legislative bodies now meet in January of odd years, and Constitutions ordinarily prescribe the number of days for which the session may continue In Alabama the State legislature meets in regular session only once each four years

As is the case with Congress, the work of state legislatures is largely done through committees There is little of an effective legislative program or of organized leadership in the two houses An efficient and influential governor occasionally exercises a distinct leadership in important matters of constructive legislation, but over legislative enactments in general his influence is negative rather than affirmative

He now has a veto power over legislation in all of the States except North Carolina, and the veto can, in most of the States, be overcome only by a two-thirds vote, although only a three-fifths vote is required in some States, and a bare majority in others There has also been a definite increase of the governor's control over appropriations, through the vesting in him of a power to veto items in appropriation bills Such a power now exists in all but ten of the States There has been a tendency in some States to extend the governor's veto power still farther The Washington and South Carolina constitutions confer upon the governor the power to veto any item or section of a bill presented to him In addition, several States have recently given the governor wide powers with respect to the State budget

The veto power is not an idle weapon in the governor's hands Its use and effectiveness depend upon several factors—the extent of the governor's constitutional power, the personality of the governor, and the political agreement or disagreement at the time between the governor and the two houses Of some 16,500 measures passed in 1923 by the legislatures of forty-four States, more than eleven hundred were disapproved in their entirety, and more than one thousand parts of bills were disapproved Of the bills disapproved, 104 were re-passed by legislatures, and of the parts vetoed only 40 were re-passed

The State Executive.—In the first State Constitutions the executive department was subordinate to the legislature In most States, the governor and certain other state officers were chosen by the legislature, and an executive council, also chosen by the legislature, was substantially placed on guard to prevent executive usurpation. Such an attitude toward the governor was natural in 1776; but the governor's power almost immediately began to grow. New York in 1777 made its governor popularly elective, though it at the same time created two councils—the Council of Revision and the Council of Appointments—to share with the governor the powers of veto and of appointment to office Massachusetts (1780) and New Hampshire (1784) soon followed with the plan of popular election Executive councils now remain only in Massachusetts, Maine and New Hampshire

In all States the governor became a popularly elected officer, and hence independent of legislative dominance Other State officers became popularly elective, though some such officers are still chosen by State legislatures Until about fifty years ago, the functions of State Government were few, and were chiefly con-

ducted by a small group of popularly elected officers. As new needs have developed, the Constitution itself has provided for new offices, which have usually been filled by popular election Illinois has six such officers in addition to the governor; Idaho and Nebraska, seven each Chief among the state executive offices, independent of the governor in most states are. lieutenant governor; secretary of state; superintendent of public instruction; attorney general; treasurer; and auditor or comptroller

By creating a group of State officers, all popularly elected in the same manner, State Constitutions in fact create a plural executive, although the theory of American State Government presupposes a single head of the executive department But only to a slight extent are constitutional powers directly conferred upon the lieutenant governor, secretary of State, and other popularly elected State officers The governor has thus had the opportunity to become the chief State executive in fact as well as in constitutional theory. The increase in the governor's executive power has come about primarily through the creation of new offices by statute, and the vesting in the governor of power to appoint to such offices In this manner, as new state functions were assumed, numerous offices were created, without reference to any efficient supervision by the governor Some States had as many as two hundred independent officers, most if not all of whom were appointed by the governor, but over whom it was physically impossible for the governor to exercise an effective supervision A recent movement in the States has sought to organize executive functions into a small group of departments, each under a director appointed by and responsible to the governor. One of the chief difficulties in building up an effective State executive system is that the governors of half the States are elected for terms of only two years. In the other States the term is four years, except in New Jersey where it is three

The State Judiciary.—Generally the states have courts of three types:

(1) Justices of the peace, having a limited and inferior jurisdiction in both civil and criminal cases Justices of the peace are ordinarily elected from towns or townships or from districts created for the purpose within the county The jurisdiction of justices of the peace is strictly limited by statute, and their courts are not courts of record. Appeals are allowed from their action to a court of general trial jurisdiction; and ordinarily the trial in the higher court is a trial *de novo*

(2) In all States there are courts of general trial jurisdiction, known as Superior Courts, District Courts, Circuit Courts, and in some States by still a different name The court of general trial jurisdiction has ordinarily a general authority to try all cases in law and equity. Six States still retain the old English plan of separate courts for the trial of cases at law and in equity, but most of the States have abolished the distinction between law and equity. In some States, as in Arizona, California, and Ohio, the court of general trial jurisdiction is organized upon a county basis, and there is a separate court for each county The more common plan, however, is to have the court of general trial jurisdiction go on circuit from one county to another, at least in the smaller counties of the State

(3) Each State has a court of review whose function is chiefly that of hearing appeals from the courts of general trial jurisdiction. This court is ordinarily termed the supreme court But in Kentucky, Maryland, and New York it is called the Court of Appeals, and slightly different names are used in several other states. The highest court is usually given some original jurisdiction, but ordinarily this original jurisdiction is small, and its use is strictly limited by the court itself, in order that time may be available to hear appeals from other courts

Once these three features are outlined, State judicial organization becomes to a large extent a mass of diversities. In many larger communities a municipal court has been organized, which not only replaces justices of the peace, but is granted a much more extended jurisdiction than has ever been conferred upon justices of the peace. In a number of the States there is also a so-called County Court, with some jurisdiction, both civil and criminal, and also usually a fairly large authority with respect to rather distinctly administrative matters, such as those relating to county affairs, elections, and charities. Where county courts exist independently of the court of general trial jurisdiction, they are often vested with authority in probate matters as well.

There are also other types of trial courts with special jurisdiction. Every large community now has a juvenile court. Other specialized courts, such as domestic relations courts, morals courts, boys' courts, speeders' courts, and small claims courts have been established in many larger communities, often as branches of a municipal court In some cases there are separately organized criminal courts, although ordinarily criminal jurisdiction is exercised by the courts of general trial jurisdiction

The State judicial organization has placed great emphasis upon appeals from lower to higher courts No case of any importance is regarded as settled until it has been taken to the highest court Increased complexity of appellate court organization has been forced by the growing number of appeals to be heard The increased mass of appellate work has been handled in three ways (a) by increasing the number of judges of State supreme courts, (b) by authorizing such courts to sit in sections; and (c) by creating intermediate appellate courts, standing midway between the trial courts of general jurisdiction and the highest court.

There are now three methods of selecting judges in the United States· (1) In thirty-eight States, judges of the highest court are elected by the people In all of these States except one the trial judges are chosen in the same manner (2) In four States the judges are elected by the legislature, and in one they are appointed by the legislature upon the nomination of the governor (3) In five States the highest judges are appointed by the governor, subject to confirmation by the governor's council in Maine, Massachusetts, and New Hampshire, and to confirmation by the Senate in Delaware and New Jersey Certain inferior judges in other states are also appointed by the governor

8. LOCAL GOVERNMENT IN THE STATES

What is ordinarily referred to as the "State Government" is the central organization located at the State capital But this central organization does much the smaller part of the work of the State Unlike the National Government, which establishes its central organization for substantially all national activities, the State conducts a large part of its governmental business through locally elected officers There is no one system of local Government for the forty-eight States or for any of these States The geography of local Government in each state is a patchwork, with the same territory often occupied by from ten to a dozen separate governing bodies, each with slightly varying boundaries, and with independent powers.

Certain types of organization may be termed the usual forms of local government These are (a) the county, which is found in all of the States, though the name "parish" is employed for a similar unit of local Government in Louisiana, (b) towns or townships, which in most of the States where they are found are merely subdivisions or units of the county, although the New England town was the original area for local Government and is more important than the county; (c) the city In addition to the city, which is theoretically the chief unit of local Government for urban areas, most state laws provide for the incorporation of small communities as villages, with a simpler form of Government than that provided or permitted for cities

In addition to these usual types of local Government, other forms will be found in each of the States Park and sanitary districts in more settled areas, drainage and irrigation districts in rural communities, road districts, school districts, and numerous others will be found oftentimes occupying the whole or a part of the same territory as that covered by the usual types. Aside from several New England States in which the county is merely a convenient area for direct state administration, county Government has certain common characteristics. There is a locally elected county board, of varying size and composition, and there are a number of locally elected county officers who perform their duties largely without subordination to the county board, except as they may oftentimes depend upon the county

board for appropriations. County boards are usually grouped into two classes: (1) small boards of commissioners elected at large by the county; (2) large boards elected by townships and cities within the counties. But in a number of States, counties are divided into districts for the election of a small county board. In each county will be found a clerk (or clerks) of court and a sheriff. Each county provides a court house and a jail Locally elected county judges and county treasurers will ordinarily be found, and a prosecuting officer elected by the voters of the county. In many States the county is a unit of school administration, and there is a county superintendent of schools, usually elected by the voters of the county A movement is now actively under way toward a more centralized executive organization in the county

The terms "town" and "township" are usually employed to designate areas of local Government into which the county is divided, though in New England the town is the most important unit of local Government. New England towns have areas of from twenty to thirty sq m , and usually include both rural territory and more compact village settlements About three-fourths of them have less than 2,500 inhabitants each, and hence may properly be classed as rural communities The large communities usually become incorporated as cities, and generally the creation of city Government terminates the existence of town Government within the city's limits The town meeting is the chief organ of government in the New England towns

So-called town or township systems of Government are found in the great central group of States extending from New York to Nebraska. The forms of township Government in these States may be classified as follows: (1) Those which, as in New York, have the town meeting and township representation on the county board; (2) those, as in Minnesota, which have the town meeting but no township representation on the county board, and (3) those, as in Pennsylvania, which have merely a local township organization, but no representation on the county board and no town meeting.

Efforts have been made to introduce the township system in the States of the South and of the West, but in these States the counties are ordinarily divided into subordinate districts, largely for administrative purposes; and such districts, though sometimes called townships, usually have little, if anything, of independent authority in the field of local Government

The growth of urban population has naturally led to the development of cities as the chief agencies to meet local needs occasioned by more compact population. The chief forms of city Government in the United States are primarily three: (a) the mayor-council, or Federal, plan; (b) the commission plan; and (c) the manager plan

The mayor-council or Federal plan is still the most general. It is to a large extent organized upon the analogy of the National Government There is a popularly elected mayor with large powers, which have tended steadily to develop The mayor normally has a veto power and a fairly large power of appointment; although several of the more important officers, such as clerk and treasurer, are usually elected by the voters of the city, just as is the mayor. There are ordinarily under the mayor a group of departments whose heads are appointed either by the mayor alone or by the mayor with the approval of the council. Usually there is a council composed of a single house, whose members are elected from wards into which the city is divided, although occasionally some or all of the members are elected from the city at large.

The fundamental characteristic of the commission plan of city Government is an elective commission, usually of three or five members, having large municipal powers, both legislative and executive. Each of the commissioners is the head of a department, and there are as many main city departments as there are commissioners. Along with this system has come ordinarily the initiative and the referendum on municipal ordinances, and a power to recall the members of the commission by petition and popular vote.

The so-called manager type of city Government had its origin about 1908, though it first received serious consideration upon its adoption by the City of Dayton, Ohio, in 1913. More than three hundred cities in the U S are now governed under the manager plan. Under this plan there is a small commission or council, whose members are usually elected from the city at large This body determines the policy of city Government, and selects a manager to administer the affairs of the city

Through the commission plan, which originated in 1901 and which for perhaps fifteen years had great sway in American city development, and through the manager plan, which originated in 1912 and has in recent years tended to replace the commission plan, much has been done since 1901 toward the reconstruction of city Government in the United States

9. ELECTIONS AND POLITICAL PARTIES

The State Government has the primary responsibility for the conduct of elections, National, State and local State Constitutions and State laws set up machinery for the conduct of elections, and determine the qualifications for voting, subject to the federal restrictions against discriminations on account of race, colour, previous condition of servitude, or sex.

Through a succession of changes, the States have now come to have substantially universal suffrage for males and females above the age of twenty-one years Suffrage for women became national in 1920, through the adoption of the Nineteenth Amendment to the Constitution of the United States Educational qualifications for voting have been imposed in some States, as in New York; and qualifications as to education or tax-paying have been imposed in a number of Southern States, which discourage voting by negroes State laws require registration of voters in the larger communities, to identify those qualified to vote

Few officers are chosen by popular vote in the Federal system—the president, vice-president, members of the two houses of Congress, and presidential electors are so chosen A much larger group of State officers are chosen by popular vote; and an even larger number of county, city and other local officers When all of these types of offices are united on one ballot or in one election, the voter is oftentimes faced with the problem of choosing one hundred or more officials from among several times that number of candidates Moreover the so-called initiative and referendum have been adopted in 18 States; constitutional amendments are proposed for popular approval by State legislatures, and under many State laws, proposals of municipal bond issues and other local questions must be submitted for popular approval The voter is somewhat at a loss when forced to express himself upon perhaps 30 technical proposals, and upon several hundred candidates for public office. His choice upon the measures submitted to him is largely hap-hazard, except upon the occasional measure of real importance His choice among candidates for National, State and local officers is primarily guided by political parties.

Practically throughout its history, the United States has been a country of two parties. A third party has occasionally been important, as was the case with the Progressive party under the leadership of Theodore Roosevelt in 1912. In the early years of the nation, the Federalist party represented the interests of a stronger nationalism; the Republican party under Jefferson, the interests of the States. In the period of Andrew Jackson, the name of the then dominant party changed from Republican to Democratic, and, the Federalists having disappeared, the Whigs became the other great party The Whigs were replaced by the Republicans, who elected Abraham Lincoln to the presidency in 1860. During all of this period lesser parties have existed, and have occasionally cast a vote sufficient to determine which of the two major parties should control

Political parties originated as voluntary organizations But they soon came to control the election to local, State and National offices; for in the election no one except a candidate of one of the two leading parties had or has the possibility of being elected The methods of the political party thus became of importance to the Government itself Today political parties are in reality no longer voluntary organizations, but are rather organs of the Gov-

ernment itself, controlled in great detail by State legislation One of the first respects in which political parties came under official control was the printing of the ballot Before 1888 parties printed their own ballots, and naturally determined also the conditions under which the names of their party candidates should appear upon such ballots Serious abuses arose under this arrangement, particularly with respect to the secrecy of the ballot Beginning in 1888, the States adopted the official or so-called Australian ballot Under the official ballot plan, ballots are printed at governmental expense This expense is usually borne not directly by State government but by the local bodies charged by the State with the conduct of elections. In providing for the printing of ballots, State laws at the same time necessarily determine the conditions under which party organizations shall be entitled to have the names of their candidates appear upon such ballots.

But with the adoption of the so-called Australian ballot political parties still had, and have, sufficient power to determine the form of that ballot. Massachusetts and a few other States have adopted a plan under which the names of the candidates are grouped under the titles of the offices, though under the Massachusetts plan the party to which each candidate belongs follows the name of the candidate This arrangement of the ballot makes it necessary for the voter to mark separately on his ballot the name of each candidate for whom he desires to vote Most of the States, however, have adopted the so-called "party-column" ballot. The party-column ballot varies in different States, but its fundamental idea is that all of the candidates for one party shall appear in a single column, so that a voter may vote for all of them by placing one mark upon the ballot If the voter does not wish to vote the party ticket, he is put to the burden of marking each of the candidates for whom he wishes to vote, or at least each candidate not belonging to his own party

The methods of party nomination next came under State control Serious abuses in the party convention system for the nomination of candidates and the framing of party platforms led to legislation regulating the convention, but such regulation did not appear sufficient The primary election system (*see* PRIMARIES) has now been established in some form in all but three of the States, although recently there has been a strong political movement against primary elections and some gain for the older convention system Where the primary system has been adopted, conventions normally remain, with more limited functions

Control by law over the official ballot and over the methods of party nomination has naturally been followed by a detailed regulation of the machinery of party organization Through primary elections, the party voters in most of the States choose their party committeemen. State laws determine the power of such party committeemen, and also determine the manner in which they shall form the various party governing bodies State laws also determine how party organizations shall frame platforms Governmental regulation of political parties has largely been occasioned by a feeling that party organizations themselves control the government, and that they should, rather, be controlled by the Government. But governmental regulation has not weakened political parties.

When it is first created, a party usually stands for some political principle as opposed to other parties. Ordinarily, however, parties are merely convenient devices for the operation of Government, and for presenting political issues to the voters when such issues arise Political issues are not created merely by the existence of two opposing parties, and during much of the time no real issues exist upon the basis of which parties may oppose each other. At such times parties proclaim principles, but have no sharp differences When issues are altogether absent, parties still perform the functions of narrowing the choice of the voter, and of uniting candidates into groups for final elections.

The political expert (who is termed "boss" if sufficiently successful) has the tasks of keeping the party organization together; getting party members to the polls; and rewarding political service He can perhaps be more successful if he holds no office, because by holding office he divides his energies and subjects himself to personal criticism for possible errors of political conduct. Each political group has its precinct and ward committeemen, who are normally on the public payroll (local, State or National), if their group is in power, and whose continuance on that payroll depends upon their efficiency, not as public employees, but in controlling the vote of the precinct or ward. The spoils of office and the grosser forms of political corruption are the lesser coin of political organizations Gross corruption reacts upon those who practice it But there are contracts to be let, without too great an insistence on standards, and other similar opportunities for continuous profit Furthermore, important business and professional interests in a community usually cooperate with the organization in return for special favours.

With party organization a vast and complex mechanism, nomination and election to office almost of necessity come, in most cases, as a reward for service in the party organization No man or woman who lacks the support of a party organization has much opportunity either to be nominated or elected, though an independent candidate may occasionally win, in case of great popular upheaval Even under such conditions, the independent candidate who wins must almost necessarily have financial resources sufficient to set up a rival organization of his own Many States have enacted statutes limiting expenditures of candidates in party primaries and in elections, but such laws have not been effectively enforced When enforced they operate in favour of the candidate sponsored by the political organization. Those who come to office usually do so only after a long apprenticeship in party service, which has worn off the fine edge of youthful idealism

The recognition that national parties should not control in the election of local and judicial officers has led to a movement for non-partisan elections In a number of States judicial officers are nominated and elected through ballots required to contain no party designations But a candidate must actually be sponsored by a political organization if he is to fare well in any election The non-partisan election has accomplished more in municipal than in State elections

Parties are organized on the basis of national issues Few such issues are important in State Government, and fewer still in local Government But the party organization, though national in scope, supports itself largely through the offices and other profits derivable from State and local Government In spite of the movement for non-partisan elections, it is still possible to apply to the American party system the statement made by James Bryce in the eleventh edition of the ***Encyclopædia Britannica:***

"The national parties have been so pervasive in their influence and the working of their machinery has formed so important a part of the political history of the United States, that it is necessary here to call attention to the high significance of this element in the system of the Republic The party system has made nearly all elections, including those for state offices and city offices, the functions of which have, as a rule, nothing whatever to do with national party issues, matters of party strife fought upon party lines It has disposed voters in state and city elections to support party candidates, of whom they might otherwise have disapproved, for the sake of maintaining in full strength for national purposes the local party organization, and it has thereby become a fruitful source of municipal misgovernment It has thrown great power into the hands of party managers, because where the strife between the two great parties is keen and the result of a contest doubtful, discipline and obedience are deemed needful for success It has tended to efface state lines, and to diminish the interest in state issues, and has thus helped to make the nation overshadow the states"

The democratic movement in the United States places upon the voter the duty of electing numerous officers of whose qualifications he cannot have knowledge, and of expressing an opinion upon numerous measures of whose merit he cannot be informed The most intelligent citizen, devoting all of his time to public affairs, would in a large number of cases, of necessity, cast an unintelligent ballot. But the functions so imposed upon the voter must be exercised, and the political party has been devised for their exercise. So long as the voter is asked to vote too much party organization rather than political principles will dominate American policies except in the occasional case where the issue as to a candidate or a principle becomes sufficiently important to force the party organization into the background.

AUTHORITIES —James Bryce, *The American Commonwealth* (2 vols., new ed. 1910) is a valuable description of the American Government. Briefer and more recent descriptions will be found in Charles A. Beard, *American Government and Politics* (5th ed, 1928), W B Munro, *The Government of the United States* (revised ed, 1925); Frederic A. Ogg and P. Orman Ray, *Introduction to American Government* (3d ed, 1928) For the State Government, reference may be made to Walter F Dodd, *State Government* (2d ed, 1928) and Arthur N. Holcombe, *State Government in the United States* (2d ed, 1926) The best general discussion of local Government is John A. Fairlie, *Local Government in Counties, Towns and Villages* (new ed, 1914) Adequate discussions of city Government will be found in W. B. F. D)

X. HISTORY

BEGINNINGS OF SELF-GOVERNMENT, 1578–1783

The American nation owes its origin to colonizing activities in which the British, Dutch, Swedes, French and Spaniards bore a share, and which were continued during a period of more than two centuries at the beginning of the modern era The settlements of the Dutch and Swedes (New Netherland and New Sweden) were soon merged in those of the British, and of the territory colonized by Frenchmen and Spaniards the United States, as it was in 1783, included only certain outlying regions All the European nations which were interested in colonization shared in the enterprise, and the population of the region was therefore cosmopolitan from the outset; but the British, especially after 1660, secured a controlling influence

Permanent settlements on the Atlantic seaboard were first made in the early years of the 17th century, and they continued steadily to increase until after 1680 Relatively speaking, that was the period of settlement, but population continued slowly to advance westward. In the 18th century occurred a large immigration of Germans and Scottish-Irish, who settled in Pennsylvania and New York and thence overflowed into the western parts of Virginia and the Carolinas The only Colony founded in the 18th century was Georgia (1732), by means of which British outposts on the Florida frontier were strengthened

General Aspects of Colonization.—British colonization originated chiefly in private initiative, though it acted in half-conscious obedience to certain general principles To this fact is due the trend toward self-government, which was fundamental and controlling in the history of the British on the American continent. But to an extent the tendencies which favoured self-government were counteracted by the influence of the British Crown and parliament The influence of the Crown was continuous, except during the period of the Civil War and Commonwealth (1642–60), while that of parliament was not felt until the middle of the 17th century, and its colonial legislation subsequent to that time was chiefly confined to matters of trade The activities of Crown and parliament were directed toward the securing of imperial interests and of that degree of subordination and conformity which, in States that have developed from Roman and feudal origins, attaches to the condition of colonies or dependencies. The term "imperial control" therefore suggests the second tendency in colonial affairs, to the discussion of which the historian must address himself.

Among the colonists the trend toward local independence and self-government was in harmony with the spirit of the English. Neither was it lacking among the other nationalities represented in the Colonies But in the case of the British it was greatly strengthened by the fact that the Colonies were founded by private initiative, the government legalizing the efforts of the "adventurers" and planters, but leaving them in many cases almost wholly to themselves Hence many small Colonies and settlements were founded A variety of motives—economic, religious and political—contributed to the founding of these Colonies, and naturally people correspondingly different in type came to inhabit them The remoteness of the Colonies from Europe and the difficulties under which communication with them was maintained confirmed and perpetuated the tendency toward independence Somewhat similar conditions controlled intercolonial relations, kept the colonists apart from one another and checked co-operation Thus it was that the causes which confirmed the colonists in the spirit of independence toward the mother country also made them jealous of external authority.

Chartered Colonies.—The term "chartered Colonies" is the one which best describes the forms under which the British-American settlements were founded and under which they all continued for varying periods They were the direct and characteristic results of private initiative The discoverers and would-be colonizers, acting individually or in groups, collected the ships, men and resources necessary for their enterprises, and procured from the Crown a charter By this document the King conveyed to them a claim to the soil which would be valid in English law, gave them the right to transfer Englishmen thither, to trade with them and with the natives, and to govern the Colony, subject to the conditions of allegiance and of British sovereignty in general The rights and liberties of the colonists as British subjects, without attempt to define what they were, were guaranteed by the charters, and the grantee was prohibited from passing laws or issuing orders which were repugnant to those of England In only a part of the charters—those chiefly which were issued subsequent to 1660—was express reference made to the calling of assemblies So general were the provisions of the charters that they only remotely determined the forms which government should assume and what the rights of the colonists should be A considerable variety of institutions and social types existed under them But their very indefiniteness made them valuable as objects of appeal to those who in time of controversy were upholding local rights and liberties

London and Plymouth Colonies.—Of the chartered Colonies there were two varieties—proprietary provinces and corporate Colonies Though alike in the fact that the patentees who founded them were mesne tenants of the Crown, they were quite unlike in their internal organization and to a considerable extent also in the character of the people who inhabited them The proprietary province was a development from the principle of the fief, though with many variations The early charters of discovery, those for example which were granted to John and Sebastian Cabot and to Sir Humphrey Gilbert, contemplated the founding of feudal principalities in the New World The grant to Sir Walter Raleigh, which resulted in the abortive colonial experiment at Roanoke, was of the same character At the period of transition from the rule of the Tudors to that of the Stuarts, trading companies and companies for colonization were increasing in number and importance. The joint companies which were chartered by James I. in 1606, one to have its residence at London and the other at Plymouth, were of this character. They were granted the right to colonize, the one in northern and the other in southern "Virginia"; the intervening territory, three degrees in breadth, being left common to the two The rights of the companies were confined to settlement and trade. The Plymouth patentees achieved no permanent result; but those of London founded Jamestown (1607) and other settlements along the James river, which later became the province of Virginia

But before this result had been reached the London patentees had secured in succession two new charters, one in 1609 and another in 1612. By means of these grants they had practically separated from the Plymouth company, had secured a concession of territory 400m. broad and extending through the con-

tinent, and had been able to perfect the organization of their company. By the grant of 1606 the right to govern the Colonies had been reserved to councils of royal appointees, but by their later charters the London patentees were fully incorporated, and in connection therewith received not only the power to grant land but rights of government as well This made the Virginia Company of London the proprietor of the province which it was founding It now appointed resident governors, councillors and other officials and instructed and controlled them in all ways, subject of course to the general supervision of the King in council Under the charter of 1606, in order to facilitate colonization on a strange continent, joint management of land and trade was temporarily instituted But under the fully organized company this system was abandoned, and private property in land and the control of trade through private "magazines" were established A number of distinct plantations and settlements were founded. From these localities, in 1619, under authority from the company, representatives were elected who met with the governor and council at Jamestown and formed the first colonial assembly held on American soil. Its acts were duly submitted to the company in London for its approval or disapproval. Other assemblies were called, the tobacco industry was established and the principles upon which traffic in that staple was to be conducted with Europe were announced. Thus Virginia assumed the form of a proprietary province, with an English trading company as its proprietor

New England Council.—Meantime west of England men had been making fishing voyages and voyages of discovery to northern "Virginia," which now was coming to be known as New England In 1620 a new charter was procured, the reorganized company being known, in brief, as the New England Council Like the London patentees, this body was now fully incorporated and received a grant of the vast territory between 40° and 48° N lat. and extending through to the South Sea (Pacific). Full rights of government, as well as of trade and settlement, were also bestowed The moving spirit in this revived enterprise was Sir Ferdinando Gorges (*q v*), an Anglican and royalist from the west of England For a time John Mason (*q v.*) was his most active coadjutor. Such backing as the company received came from nobles and courtiers, and it had the sympathy of the court. But lack of resources and of active interest on the part of most of the patentees, together with the development of a Puritan interest in New England, led to the failure of this enterprise No Colony was established directly by the council itself, but that part of its vast territory which lay adjacent to the coast was parcelled out among the patentees and by them a few weak and struggling settlements were founded They were all proprietary in character But, as events proved, Plymouth Colony (founded in 1620), which was Puritan and Separatist to the core, became a patentee of the New England council; and the Colony of Massachusetts Bay (founded 1628–30), which was to become the citadel of Puritanism in America, procured the original title to its soil from the same source At the outset both Massachusetts and Plymouth must be classed as proprietary settlements, though far different from such in spirit and destiny. Massachusetts soon (in 1629) secured a royal charter for its territory between the Merrimac and Charles rivers, and thus took a long step towards independence of the council. At the same time the Plymouth settlers were throwing aside the system of joint management of land which, as in the case of Virginia, had been imposed upon them by adventurers who had lent money for the enterprise; were paying their debts to these same adventurers, and were establishing a system of self-government similar to that of Massachusetts Thus a strong Puritan interest grew up in the midst of the domain granted to the New England council, and in connection therewith the type of colony to which we have given the name corporate came into existence.

Corporate Colonies.—In order to understand the nature of the corporate colony, it is necessary to explain the internal organization of that type of company which, like the Virginia Company of London, was founded for purposes of trade and colonization It was composed of stockholders, who became members as the result of the purchase of shares or of migration to the Colony as planters, or of both acts combined. In the Virginia company they were known as the "generality," in the Massachusetts and other companies as the "freemen." In them, when met as a democratically organized body under the name of "quarter court" or "general court," was vested the governing power of the company. It elected the officers, chief among whom were a treasurer or governor, and a council or board of assistants These, as well as the subordinate officers, held annual terms only Membership in such companies might be indefinitely increased through the issue and sale of shares They were, in other words, open companies, whereas the New England council was a closed body, its membership being limited to 40.

Massachusetts.—In 1629 the prospects of Protestantism at large, and of Puritanism in England, were so dark that the founders of the Massachusetts company, who were decidedly Puritan in spirit and inclined to nonconformity in practice, resolved to remove with their charter and the governing body of their company into New England Preparatory to this, John Winthrop was elected governor and a settlement was made of their business relations in England After the removal had been made, the assistants and general court met in New England and business was carried on there exclusively by planters An order was soon passed that none should vote or hold office who were not members of some one of the churches within the Colony As all these churches were Independent or Congregationalist in form and doctrine, this order gave a wholly new definition to the term "freemen " It made of this colony something approximating to a biblical commonwealth, and subordinated trade, landholding and settlement to the interests of the Puritan faith. As local settlements about Massachusetts Bay were founded, the general court, which before had been a primary assembly—simply the freemen of the company—came to consist partly of representatives elected by the freemen of the towns In this way a second chamber—that of the deputies—was added to the assistants to form the general court of the Colony Taxes were levied by this body, and laws and orders proceeded from it which related to all functions of government It elected or appointed the governor and other chief officials

Of primary importance in the affairs of the Colony was everything which concerned religious belief and church government The churches and their relation to the civil power presented the great questions upon which hinged its policy. This was true not only in its internal affairs, but in its relations with other Colonies and with the mother country. An ecclesiastical system was developed in which Independent and Presbyterian elements were combined By a rigid system of tests this was upheld against Antinomians, Baptists, Quakers and dissenters of all sorts.

Connecticut and Rhode Island.—As a consequence of the Puritan migration from England and of the expulsion of dissenters from Massachusetts, Plymouth and Connecticut, the New Haven Colony, and the towns about Narragansett Bay which became the Colony of Rhode Island were settled. These all were corporate Colonies, organized upon fundamentally the same plan as Massachusetts Their settlers at the outset had no charters, but by means of plantation or town covenants assumed powers of government, which ultimately were vested in general courts similar to that of Massachusetts Rhode Island was formed by a union of towns, but elsewhere the Colony was coeval with or antedated the town Connecticut and Rhode Island, in 1662 and in 1663 respectively, secured royal charters by which they were incorporated within New England itself and the governments which they had established there were legalized. New Haven was absorbed by Connecticut in 1664 under the charter of 1662 and Plymouth remained without a charter from the King until, toward the close of the 17th century, it became a part of the enlarged province of Massachusetts.

The most prominent feature of the New England land system was the "town grant," which in every case became the territorial basis of a group settlement. Throughout New England, and in the outlying districts which were colonized by New Englanders, settlement was effected by groups. The process began in Ply-

mouth and was extended through the entire section. The Puritan migration from Europe was of the same general character. Groups of people, animated by a common religious or political ideal, broke away from their original or temporary abiding-places and pushed farther into the wilderness, where tracts of land were granted to them by the general court.

Over the founding of towns the general courts, as a rule, exercised a watchful supervision. Not only did the courts fix and maintain their bounds, but they issued regulations for the granting of lands, for common fields, fences, herds, the punishment of trespass, the admission of inhabitants and freeholders, and the like But subject to these general regulations, the allotment and management of its land was left to each town The Colonies had no land system apart from the town It was partly in order to manage their lands that the towns were made centres of local government and town meetings or boards of town proprietors were established. By means of town action, taken in town meetings and by local officials, the land of each settlement was laid off as house lots, common and common fields, meadow and pasture. Detailed regulations were made for the management of common fields and for their ultimate division and allotment among their proprietors The same was true of fences and herds The result was an organization similar to the English manor, but with the lord of the manor left out To this peculiarity in the form of New England settlement is due the prominence of the town, as compared with the county The town was the unit for purposes of taxation and militia service as well as of elections It was also an important ecclesiastical centre

As a result of the process thus sketched, southern New England was settled by a population of English origin, with similar instincts and a form of political organization which was common to them all Gorges, meantime, had secured (1639) a royal charter for his province of Maine, but Mason had died before he obtained such a guaranty for his settlements on the Piscataqua river. The small communities along that entire coast remained weak and divided In 1635 the New England council surrendered its charter The helplessness of the Gorges family was insured by its adherence to the royalist cause in the English Civil War Massachusetts availed itself of a forced interpretation of the language of its charter respecting its northern boundary to extend its control over all the settlements as far N E as the Kennebec river. This was accomplished soon after 1650, and for the time Anglican and royalist interests throughout New England seemed hopelessly wrecked New England had thus developed into a clearly defined section under Puritan domination. This fact was also clearly indicated by the organization, in 1643, of the New England Confederacy, or the United Colonies of New England (*see* NEW ENGLAND)

Middle and Southern Colonies.—The Colonies of the middle and southern sections of the territory which later became the United States were wholly proprietary in form This was true of New Netherland (founded by the Dutch West India Company in 1621) and of New Sweden (settled under the authority of the Swedish Royal Company in 1638), as well as of the English Colonies In the case of Virginia and of the Dutch and Swedish settlements, trading companies were the proprietors But the later English Colonies, beginning with Maryland in 1632, and continuing with the Carolinas (1663), New York (1664), New Jersey (1665), Pennsylvania and the Lower Counties, afterwards Delaware (1681), were founded by individual proprietors or proprietary boards. Georgia (1732), the only English Colony settled after 1681 on the continent, existed for 20 years under a proprietary board of trustees By the efforts of adventurers of this class, put forth chiefly during the period of the Restoration, the entire coast-line from Florida to Acadia was permanently occupied by the English. But, unlike New England, the population was of a mixed character, as were the economic and religious systems, and to an extent also the political institutions.

As has already been stated, in their internal structure and in the course of their history the proprietary provinces differed very materially from the corporate Colonies. Those of later English origin also differed in some important respects from Virginia under the company and from New Netherland and New Sweden. The system of joint management of land and trade, which was so characteristic of early Virginia, was outgrown before the other proprietary provinces were founded. Neither did it prevail in the Dutch and Swedish provinces.

In the proprietary province the proprietor, or board of proprietors, was the grantee of powers, while in the corporate Colony it was the body of the freemen organized as an assembly or general court. He might exercise his powers in person, or, as was usually the case, delegate them to one or more appointees In any case, the form of government of the proprietary province was essentially monarchical in character The powers that were bestowed were fundamentally the same as those which were enjoyed during the middle ages by the counts palatine of Chester and Durham The normally developed provinces which resulted were miniature kingdoms, and their proprietors petty kings This character arose from the fact that the grantee of power was the executive of the province This branch of government was thereby brought into the forefront At the beginning and for a long time thereafter it continued to bear the leading part in affairs. It was not so in the corporate Colony, for there the freemen and the general court stood at the centre of the system In most of the corporate Colonies the executive was strong, but that was due to the political and social influence which its officials had gained, and not to their tenure of office

Proprietary Colonies.—In every case, apart from the ordinary rights of trade and the guarantees of the liberties of the colonists, the powers which were bestowed on the proprietors were territorial and governmental The territory of the provinces was granted under the conditions which by English law controlled private estates of land An entire province, or any part of it, could be leased, sold or otherwise disposed of like a private estate It was an estate of inheritance, descending to heirs The attitude of proprietors toward it was that of landlords, investors or speculators in land. They advertised for settlers, and, in doing so, an ever present motive with them was the desire to secure more private income from land In 1664 the duke of York sold New Jersey to Berkeley and Carteret, and the sale was effected by deeds of lease and release In 1708 William Penn mortgaged Pennsylvania, and under his will devising the province legal complications arose which necessitated a suit in chancery

In all the later proprietary charters, except that of New York, the operation of the statute *Quia emptores* was suspended, so far as relations between the proprietor and his immediate grantees were concerned By virtue of this provision each proprietor, or board, became the centre from which originated an indefinite number of grants These were held directly of the proprietor and through him of the Crown In practice the same was true also of New York The proprietors were thus left free to make grants on such conditions as they chose. Preparatory to the exercise of this power, the proprietors issued so-called "concessions" or "conditions of plantation," stating the terms on which they would grant lands to colonists Under a system of head rights, analogous to that which existed in Virginia, land was thus bestowed on settlers upon easy terms. Proportional amounts of land were granted upon the importation of servants, and in this way a traffic in servants and their head rights to land was encouraged among planters and masters of merchant vessels In all the provinces, except New Netherland, a quit-rent was imposed on all grants. In the Dutch province rents were sometimes imposed, but they varied in character and differed from the English quit-rent. In Maryland fines were levied on alienations. In Maryland and Pennsylvania the demand for land became so great that it was sold

In all the provinces territorial affairs were administered directly by the provincial authorities, and not by towns as in New England In Maryland a land office was fully organized, towns developed only to a very limited extent, and when they did originate they were in no sense village communities Lots in them were granted by provincial authorities and they were subject to a quit-rent They were simply more densely populated parts of the counties, and, unless incorporated as boroughs, had no distinct

institutional life. In almost all cases land, in the provinces, was granted to individuals, and individual ownership, with direct relations between the owners or tenants and the proprietary authorities, was the rule

Had governmental powers not accompanied the territorial grants, these grants would have been estates of land, unusually large, no doubt, but nothing more In cases where the governmental rights of proprietors were suspended or resigned into the hands of the Crown, they remained thereafter only private landlords But the rights of government bestowed with the land made the territory a province and the proprietor its political head.

The provincial charters made the proprietors of the proprietary provinces the executives of their provinces and for the most part left it to them to determine how and under what forms the governmental powers which they had received should be exercised The powers which were definitely bestowed were executive and judicial in character, giving to the proprietor an importance, especially at the outset, which was comparable with that enjoyed by the general courts in the corporate Colonies It made him in a derived and inferior sense the source of office and honour, the fountain of justice, the commander of the militia, the recipient of the provincial revenue, the constituent part of the legislature But in most cases the proprietors did not attempt to exercise these powers in person By means of commissioners they appointed a group of leading officials for their provinces, as a governor, councillors, a secretary, surveyor general, receiver general or treasurer, and somewhat later an attorney general These all held office at the pleasure of the proprietor.

The Governor.—The governor was *par excellence* the agent for the proprietor for all purposes of administration In making appointments the proprietor was usually guided by the governor's recommendations In some cases he was a relative of the proprietor, family influence in Maryland after the Restoration came to dominate the government of the province In all his important acts the governor was required to take the advice of his council, and that body was expected to co-operate closely with him, but the governor was not bound to follow their advice The relations between the two were the same as that between the King and his privy council in England As settlements multiplied and counties and other local subdivisions were formed, other and inferior offices were created, the right of appointment to which rested with the governor By means of an executive, thus organized, land was granted and the revenue from it collected, counties and other local divisions were established, early preparations were made for defence, courts were opened and the administration of justice begun

In the later proprietary charters generally, with the exception of that issued to the duke of York, provision was made for assemblies It was made, however, in very general terms, and it was left to the option of the proprietors to determine when, where and how they would call them These legislatures did not originate in the natural or pre-existent rights of Englishmen, nor did the existence of a parliament in England make them necessary, though it greatly increased the difficulties of governing the Colonies without them These legislatures were immediately proven to be indispensable and their activity in the provinces gradually opened the way for the growth of modern democratic institutions

The Legislature.—When met in regular form, the provincial legislature consisted of the governor, the council or upper house, and the assembly or deputies These deputies, who were elected by the localities, constituted the only representative part of the legislature. In tenure and functions the governor and council were largely independent both of the deputies and of the electors They were a part of the executive and were naturally swayed by a regard for the interests of the proprietor and by administrative traditions In many cases the importance of the councils was increased by the fact that, with the governor, in early times they formed the highest judicial tribunal in the province. As the governor had the sole power of calling, proroguing and dissolving the general assembly, the council might advise him in such a way as to destroy the body itself or thwart its plans The joint work of the council and assembly was subject to the veto of the proprietor, or of both the proprietor and his governor. The legislature of the province, therefore, differed materially from the general court, though in practice this was somewhat offset by the fact that in the New England Colonies the magistrates were usually re-elected for a long series of terms.

In the province, as in the kingdom, the legislature was in a sense an expansion of the executive, developed out of it, and was to an extent controlled by it Out of this relation arose the possibility of conflict between the two parts of the legislature—that which represented the people and that which represented the proprietor. In the history of the provinces this formed the central line of cleavage From the first the assemblies largely controlled taxation Using this as a lever, they endeavoured to limit and define the powers of the executive and to extend the sphere of legislation more widely Fees, from which officials derived most of their support, were a favourite object of their regulation Occasionally offices which had originally been appointive were made elective Protests of various kinds were made against official cliques Now and again the lower house came to a deadlock with council or governor. Threatened or actual revolt was sometimes necessary to bring the executive to terms. By such tactics as these the popular elements in the constitutions of the provinces asserted themselves The sphere of ordinance was gradually limited and that of statute extended

Constitutions.—In a number of provinces—the Carolinas, New Jersey and Pennsylvania—the proprietors at various times initiated elaborate constitutions, in which not only a land system, but forms and functions of government were prescribed on a large scale These were variously known as fundamental constitutions, concessions and agreements, and frames of government, and in every case were submitted to the general assembly for its acceptance or rejection. Long struggles often ensued over the question of acceptance, which usually ended in the modification or rejection of the schemes

Course of Development.—The history of these provinces was not uniform In New Netherland and New York occurred a struggle for the establishment of a legislature, which continued at intervals for 40 years and was not permanently successful until after New York had become a royal province The proprietors of New Jersey never secured a royal charter, and therefore were not able to establish satisfactorily their claim to rights of government Within the vast reaches of the Carolina grant developed two provinces One of these—North Carolina—was almost entirely neglected by the proprietors, and the weakened executive repeatedly succumbed to popular violence In South Carolina many violent controversies occurred, especially over the efforts of the proprietors to compel the acceptance of the Fundamental Constitutions, which originated with Locke and Shaftesbury. But in the end this failed, and a simple form of government, such as was adapted to the needs of the province, was developed In Pennsylvania the liberal policy of the proprietor led at the beginning to unusual concessions in favour of the colonists, one of the most characteristic of these being the grant of an elective council The total neglect of provision for defence by the Quaker province led to the suspension of Penn's powers of government for about two years after the English Revolution and the outbreak of the war with France. This did away with the elective council for the time, and an appointive council was soon substituted. Finally, in 1701, the council was deprived of its powers of legislation and thereafter the legislature of Pennsylvania consisted of only one house—the assembly.

Imperial Control, 1606–1760.—Imperial control over the Colonies, it is to be noted, proceeded chiefly from the English Crown It was exercised through the secretary of State, the privy council and a succession of boards subordinate to it which were known as commissioners of plantations or the board of trade; by the Treasury and Admiralty boards and their subordinate bureaux; by the attorney general and the solicitor general and by the bishop of London The more continuous and intimate supervision proceeded from the privy council and the commissioners subordinate to it, and from the Treasury board,

which caused the auditing of such revenue as came from the Colonies, supervised expenditures for them and had an oversight over appointments in the colonial service The privy council received letters and petitions on almost every kind of colonial business, caused hearings and inquiries to be held, and issued letters, instructions and orders in council on an equally great variety of matters It also acted as the regular court of appeal for the plantations As time advanced, more of the administrative business passed directly into the office of one of the secretaries of State and the privy council became less active The Admiralty was concerned with the equipment of the navy for service in the Colonies, and the high court of admiralty with the trial of prize cases and of cases arising from violations of the acts of trade. The bishop of London had supervision over the appointment and conduct of clergymen of the English Church in the colonies and over parish schools there

Parliamentary Control.—The parliament by mentioning the dominions in its statutes could extend their provisions to the colonies The early acts of supremacy and uniformity contained such reference, but it was dropped after the Restoration and no serious attempt was ever made to enforce uniformity in the Colonies Parliament did not begin to legislate seriously for the colonies until after the Restoration Then the acts of trade and navigation were passed, to which additions were made in the reign of William III and from time to time during the 18th century This body of legislation comprised the most important acts relating to the Colonies which were passed by Parliament A few statutes relating to military affairs were passed about the middle of the 18th century About 100 statutes in all were passed prior to 1760 The colonists themselves imitated in a general way the organization and procedure of the English courts The main features of the common law came spontaneously into force in the Colonies The legislatures of several of the Colonies adopted large parts of the statute law of England The colonists were always accustomed to avail themselves, as far as possible, of the great English statutes which guaranteed liberty After about 1690 the obligation was very generally enforced upon the Colonies of sending the acts of their assemblies to England for acceptance or rejection by the King in council

But this, though far-reaching, was only one of the objects which were sought through the exercise of imperial control Its chief object was to maintain the rights of Great Britain over the Colonies and her interests in them in all respects The diplomacy of Great Britain concerned itself to an increasing extent, as the 18th century advanced, with the acquisition or losses of colonial territory, with the fixing of boundaries and with the securing of commercial interests The interests of trade more than any other subject, determined the colonial policy of England The church and her interests also demanded attention In all these matters the English executive—the Crown—continuously, and for the most part exclusively, managed colonial affairs During the Commonwealth in the 17th century, parliament was the source of all activity, whether legislative or executive, but at other times its legislation was confined chiefly to the subject of trade

Isolation of the Colonies.—A natural condition which affected colonial administration as a whole and to a large extent determined its limits and character was the remoteness of the Colonies from England At best three months were required for sending a dispatch from London to America and procuring a return This explains the large degree of self-government which the Colonies possessed and the indifference with which their affairs were usually viewed, even by British officials Only a relatively small part of colonial business came before English officials or received their serious attention Only at long intervals and in summary fashion was it brought to the attention of Parliament It is believed that the affairs of the continental Colonies were never seriously debated in Parliament until after the beginning of the controversy which led to the American War of Independence Social and political intercourse with the colonists and governmental control over them were therefore very imperfectly developed In fact, the control over them was almost wholly executive, and during most of the period it was to a degree unintelligent and weak; in fact it was something more resembling a federation

Chartered Colonies.—The central fact in colonial history during the 17th century was the development of the chartered Colonies. At their founding, as we have seen, the Crown delegated rights of settlement and subordinate rights of government to proprietors, who used them in a variety of ways The effect of this was to introduce a number of mesne lords between the king and his colonial subjects, a phenomenon which centuries before had vanished from England itself The patentees governed the colonists, and the Crown interfered only at intervals to adjust matters Under the first two Stuarts some rather desultory efforts were made to check the development of such a system in the early stages After a controversy over a contract for the sole importation of tobacco, which became involved with the political struggles of the time in England the charter of the Virginia Company of London was revoked (1624) A royal commission was appointed to readjust the affairs of Virginia and to inaugurate its government as a royal province In 1634 a board of commissioners of plantations was created and it received very large powers over the Colonies The year following the New England council resigned its charter, a writ of *quo warranto* was issued against the Massachusetts charter, and a plan was nearly perfected for sending out Sir Ferdinando Gorges as royal governor, or rather governor general, to New England But means were lacking, the suit against the Massachusetts patent failed to accomplish its purpose, and troubles at home soon absorbed the attention of the Government

During the Great Rebellion in England New England was left practically to itself Strife broke out in Maryland, over which the home Government was scarcely able to exercise even a moderating influence The Dutch from New Netherland and Europe were able to monopolize a large part of the carrying trade in tobacco and European goods Virginia assumed an attitude of distrust or hostility toward the new Government in England In 1651 and 1652 Parliament sent out a commission, with an armed force, which adjusted affairs in Virginia by suspending Government under Sir William Berkeley, the royalist governor, and leaving control in the hands of the assembly By a stretch of power the commissioners also took control of affairs in Maryland, but there they intensified rather than allayed the strife Baltimore, however, managed to save his interests from total wreck, and at the Restoration was able to re-establish his authority

Navigation Acts.—During this time of unstable government in England the seeds were planted of a colonial policy which was henceforth to dominate imperial relations It was then that England entered upon the period of commercial rivalries and wars The Cromwellian Government determined to wrest the control of the carrying trade from the Dutch, and the Navigation Act of 1651 and the first Dutch War were the result Gen Robert Sedgwick was sent against New Netherland, but ended in attacking Acadia At this time also the national hatred of Spain, which had so characterized the age of Elizabeth, reasserted itself and the Spanish seas were invaded In connection with these events plans were formed for a more systematic colonial administration which Cromwell did not live to execute, but which were taken up by Clarendon, the duke of York, the earl of Shaftesbury and a large group of officials, lawyers and merchants who surrounded them They took definite shape after the Restoration in the creation of a council for trade and a council for foreign plantations, in the passage of the acts of trade, in the conquest of New Netherland, in the settlement of the Carolinas, and in a resolute attempt to adjust disputes in New England These events and their consequences give greater importance to the next three or four decades than to any later period until the colonial revolt

The council for foreign plantations was continued, sometimes under a patent and sometimes as a committee of the privy council, until in 1696 it was commissioned as the board of trade As a board of inquiry and report, subordinate to the privy council, the most important business relating to the Colonies was transacted before it The acts of trade, in which the principles of the system were laid down, were passed in 1660, 1663, 1673 and 1696 They expanded and systematized the principles of mercantilism as they had long been accepted The import and export trade of the

Colonies was required to be carried on in English and colonial built ships, manned and commanded by Englishmen. The policy of the staple was applied to the trade of the Colonies by the enumeration of their chief products which could not be raised in England and the requirement that such of these as were exported should be brought to England and pay duties there, and that the supplies not needed for the English market should be sent thence to foreign countries. The same policy was applied to all colonial imports by the requirement that they should pass through English ports In order to prevent intercolonial traffic in enumerated commodities, which might lead to smuggling, the act of 1673 provided for the levy of an export duty on them in the Colonies in cases where a bond was not given to land them in the realm

In the 18th century severe restrictive measures were passed to prevent the growth of manufactures in the Colonies; but these acts proved mostly a dead letter, because the Colonies had not reached the stage where such industries could be developed on any scale. Certain compensations favourable to the Colonies also appear in the system, *e g*, the measures to suppress the raising of tobacco in England and Ireland, in order that the colonists might have the monopoly; the payment of bounties on the importation of naval stores and on the production of indigo by the colonists; the allowance, on the re-exportation of colonial products, of drawbacks of part or all of the duties paid on importation; the admission of colonial imports at lower rates of duty than were charged on the same products from foreign countries In order to ensure the enforcement of these acts elaborate provisions became necessary for the issue of bonds, and this, with the collection of a duty in the Colonies, led to the appointment of colonial customs officers who were immediately responsible to the commissioners of the customs and the Treasury Board in England. With them the governors were ordered to co-operate. Courts of vice admiralty, with authority to try cases without a jury, were established in the Colonies; and just before the close of the 17th century they were given jurisdiction over violations of the acts of trade, a power which they did not have in England It thus appears that the resolve to enforce the policy set forth in the acts of trade resulted in a noteworthy extension of imperial control How far it was successful in the immediate objects sought it is impossible to say. In some of the Colonies and at some times the acts were practically nullified Illegal trading was always carried on, especially in time of war. But in the large it is probable that the acts were effective, and their existence always furnished a standard to which officials were required to conform.

By the Act of Union of 1707 Scotland was admitted to the advantages of the English trade system. In 1733, in order to check the development of the French colonies and prevent the importation of their products into English possessions, the Molasses Act was passed. This provided for high specific duties on rum, molasses and sugar, when imported from foreign colonies into those of Great Britain. So high were these rates that they could not be collected, and little attempt was made to enforce the act.

Returning to the 17th century, the conquest of New Netherland by the British in 1664 was an event of great importance. Taken in connection with the settlement of the Carolinas, it completed the hold which the English had upon the North American coast and gave them for the first time an extent of territory which could be profitably developed The occupation of New Netherland was effected by a royal commission, which was also empowered to hear complaints and report a plan for the settlement of disputes in New England. A little more than ten years later a similar body, accompanied by a military force, was sent to Virginia to adjust matters at the close of Bacon's rebellion. But the commission of 1664 was the most noteworthy example of its kind. Yet, though it succeeded at New Amsterdam and in the southern Colonies of New England, it failed at Boston. Massachusetts would not admit its right to hear appeals. It did not succeed in wresting from Massachusetts the territory of New Hampshire and Maine, which the heirs of Gorges and Mason claimed.

Dominion of New England.—In 1676 Edward Randolph was sent as a special agent to Massachusetts, to require it to send agents to England. He returned to England the sworn enemy of that Colony and continued to be its tireless prosecutor. A series of negotiations ensued which lasted for almost a decade, and ended in the revocation of the Massachusetts charter by a decree in chancery, 1684. New Hampshire had already been organized as a royal province. Government under the charters of Rhode Island and Connecticut was soon after suspended. All New England was then organized as a dominion or viceroyalty under Sir Edmund Andros Assemblies were everywhere abolished and government was left wholly in the hands of the executive. New York—also without an assembly—and New Jersey were soon after incorporated with the Dominion of New England, its boundary being extended to the Delaware river After Bacon's rebellion in 1676 the lines of executive control were strengthened in Virginia, but the assembly continued active. These rapid changes involved the downfall of the former system of chartered colonies and the substitution of royal provinces in their place. The effect of this was to introduce into the Colonies a large number of officials of royal appointment. The entire executive and judiciary in a royal province was appointed directly or indirectly by the king. Its members held under commissions subject to the king's pleasure and were controlled by his instructions

Colonial Reorganization.—By the abolition of assemblies and the union of Colonies on a large scale James II. did violence to the strongest feelings and traditions of the colonists The New Englanders not only viewed the levy of taxes by prerogative with the utmost aversion, but they feared a general unsettlement of land titles, the destruction of much that was valuable in their system of town government, and the introduction of Anglican worship They shared also in the fear, which was widespread among the colonists, that the Crown intended by an alliance with the French and Indians to force Roman Catholicism upon them. Therefore the fall of the Stuart Government in England was the signal for an uprising at Boston (April 1689) followed by a less successful one at New York. The Dominion of New England at once collapsed and the old Colony Governments were generally restored A revolt against the Catholic proprietor in Maryland resulted in the suspension of his powers of government and the organization of Maryland as a royal province. William III. granted a new charter to Massachusetts (1691) in which full provision was made for an assembly, but also for a governor and secretary of royal appointment. Rhode Island and Connecticut were allowed to remain under their corporate charters New York and New Hampshire were organized as royal provinces with assemblies. Proprietary government struggled back into existence in New Jersey In Pennsylvania the governmental powers of the proprietor were suspended from 1692–94, because of his neglect of provision for defence; then they were restored and Pennsylvania continued under proprietary government until the War of Independence

The transition from the system of chartered colonies to that of royal provinces was thus well advanced towards completion. But it was a gradual process, and the later stages of it were not reached until the second decade of the 18th century South Carolina became provisionally a royal province in 1719, and a parallel change was completed in North Carolina a decade later. Georgia received a royal government in 1752. But in 1715 Maryland was permitted to resume its proprietary form After the Revolution of 1689 the change to royal governments did not involve in any case the abolition of colonial assemblies. Henceforward the Crown had a fully equipped executive in every royal province. The governors exercised the royal rights of calling, proroguing and dissolving the assemblies; they assisted in initiating legislation and exercised the right of veto. All bills passed by the assemblies were required to be submitted to the King in council for acceptance or disallowance. The upper houses of the legislature were the councils of the provinces. These were small bodies and consisted, in every case except Massachusetts, of royal appointees. Their support was in most cases given to the governors, and by that means they were greatly assisted in resisting the encroachments of the lower houses of assembly which were elected by the freeholders. But, as a rule, the Crown made no provision for the salaries of its governors and other officials, and left them largely dependent for support on appropriations by the assem-

blies. Under this system of balanced forces, analogous in general to that which was reached after the Revolution in England, the Colonies entered upon the long period of the French wars.

Struggle with the French, 1690–1760.—Early French discoveries and colonization in North America were confined chiefly to the valley and gulf of the St. Lawrence. These led in the early seventeenth century to the establishment of the province of Canada. By 1610 the French had possessed themselves of the valley of the lower St. Lawrence, and the relations with the Indian tribes were being determined During the next 50 years Canada grew slowly into an autocratically governed province, in which the Roman Catholic church was so strong as to contest supremacy at times with the civil power. The fur trade became from the first a most important industry. The Jesuits and other priestly orders undertook missionary work on a large scale among the natives. The fur trader and the missionary soon extended French influence through the region of the Great Lakes. Between the Iroquois and the French, wars were almost continuous, but with the other Indian tribes the French were in general on friendly terms. The Iroquois maintained friendly relations with the Dutch and afterwards with the English. This deeply affected relations between the English and the French, as well as the entire development of the province of New York.

French Expansion.—Exploration was a most important incident of both the fur trade and the missionary enterprises of the French. Between 1670 and 1690 their work culminated in the great exploring activity of Marquette, Joliet and La Salle The Ohio and Mississippi rivers were discovered and their courses were mainly or wholly traced Explorers also penetrated far into the regions beyond the Mississippi Posts were established at various points along the Great Lakes During the first two decades of the 18th century the French also established themselves on the Gulf of Mexico, Mobile being founded in 1702 and New Orleans in 1718. Quebec and the Gulf ports were then connected by a series of forts which, though few and weak, sufficed for communication and for the establishment of a claim to the Mississippi valley. They were Niagara and Detroit, commanding the approaches to lakes Erie and Huron; Fort Miami, on the Maumee river, Fort St. Joseph, at the southern end of Lake Michigan; Vincennes and French Fort, on the Wabash; Fort Chartres, on the Mississippi opposite St Louis; Michilimackinac and Ste Marie, which guarded the upper lakes French zeal and enterprise had thus seized upon the heart of the continent It seemed possible that English settlements might be confined to the coast, for they expanded slowly and no genius for exploration or sympathy with Indian life was shown The tendency of British commercial policy was likewise to confine them there The Indian alliances of the English were also far less extensive than those of the French The provinces of South Carolina and Georgia had conflicts with the Spanish on the Florida frontier, and in these the Indian tribes of the south were also involved. But these rivalries were slight and local in character when compared with the struggle for supremacy which was preparing between the French and English

The conflict with the French was precipitated by events in Europe. It was the English Revolution of 1689 that opened the great conflict between France and England. The question of Protestantism versus Catholicism was involved, but at bottom the struggle was one for the balance of power among European States. Rival claims, too, existed between the two powers in America, Africa and Asia. Questions of commercial and naval supremacy world-wide in extent were involved, and the colonial possessions of the two States were necessarily drawn into the struggle. In America it involved four intercolonial wars (Dutch War with France, War of Queen Anne or Spanish Succession, War of Austrian Succession and Seven Years War), which were closed respectively by the treaties of Ryswick (1697), Utrecht (1713), Aix-la-Chapelle (1748), and Paris (1763). On the American continent during the first two wars the struggle was confined to the northern frontier, and consisted of devastating raids by the French and Indians, which in turn provoked retaliatory efforts on the part of the English. These took the form in part of attacks on Acadia and of unsuccessful efforts to conquer Canada by means of joint expeditions by sea and land. The favourite land route was that from New York by way of Lake Champlain to Montreal, while the expeditions by sea were forced to make the long and perilous voyage round Nova Scotia and through the Gulf and River St. Lawrence to Quebec. In 1690 and again in 1711 an enterprise of this kind was actually undertaken Acadia, "with its ancient limits," and the claim of France to Newfoundland and the Hudson Bay territory were, however, ceded to England by the Treaty of Utrecht.

Wars Between French and British in America.—As the great world conflict progressed the relative importance of the colonial and maritime issues which were involved increased The first two wars had their origin primarily in European questions. The third war had its beginning in the Spanish West Indies, and clearly revealed the existence of the Bourbon Family Compact, which bound France and Spain together On the American continent its most striking event was the capture, in 1745, of Louisburg, a stronghold which the French had recently fortified on Cape Breton. This victory was secured largely by the efforts of the New England colonists In the following year another plan for the conquest of Canada was thwarted by the necessities of war in Europe. At the close of the war Louisburg, too, was restored to the French After this fashion did the world struggle react upon the special interests of the English in North America, and perplex and irritate the colonists.

In the fourth intercolonial war (1754–63) the struggle between the two nationalities in North America was decided Events which immediately preceded this war—the occupation of the Ohio valley and the building of Fort Duquesne—clearly revealed an intention on the part of the French to exclude the English from the Mississippi valley. A persistent effort was also made to recover Acadia. The western, as well as the northern, frontier was now threatened, and the war which followed affected all the Colonies. Great Britain sent over a succession of commanders-in-chief. Great improvement was made upon the crude efforts at joint colonial action which had characterized the earlier wars. the Albany congress of 1754 greatly surpassed in importance the meetings of governors and military officers which had occasionally been held in previous times, though its plan of colonial union failed. The campaigns of this war were all upon a comparatively large scale. Campaigns were carried on not merely along the line of Lake Champlain and in Acadia, but against Fort Duquesne, Oswego and Fort Frontenac, Louisburg and Quebec itself. The weak Spanish power was overthrown in Florida and expeditions were sent against the southern Indians In all quarters, and especially after Pitt became secretary of State, the British assumed the offensive The Navy of Great Britain, as well as its Army, was called into action on a much larger scale in America than ever before The result was the conquest by the British of Canada, and all North America east of the Mississippi river; the French claim to territory west of this river was ceded to Spain in 1762.

The wars with the French brought the problem of colonial defence among the English into greater prominence than ever and added it to the other questions at issue Against the Indians the colonists in the 17th century had provided for their own defence. Chiefly with this object in view, each Colony had developed a militia system But such a force was not fitted for long campaigns or large operations: it was comparatively undisciplined; the commissariat was poor or totally lacking, and the men were able to remain away from their homes for only brief periods. The colonists possessed no navy So poor were means of communication and so isolated were the Colonies from one another, that co-operation was very difficult. Equally difficult was it to secure proportional contributions of money from the Colonies Early in the French wars the British Government prescribed quotas both of men and money to be raised by the Colonies, but little attention was paid to these except by the Colonies in immediate peril Because of the limited amount of available money and the modest resources of the colonists heavy taxation was impossible. The assemblies resorted to the issue of bills of credit, to which they gave legal tender quality, and for the redemption of which in nearly all cases they made inadequate provision. The

paper depreciated and in some Colonies became worthless. Great confusion resulted, involving loss to all, and among the sufferers were British merchants Strained relations were produced between the assemblies and the colonial executive, who, acting under royal instructions, persisted in vetoing bills for additional issues of currency. For this reason, in addition to others, the assemblies withheld the salaries of governors and other officials, and in this way sought to coerce the executives In some Colonies the assembly secured the right of electing the treasurer, and in most of them appropriations were made specific Thus by skilfully utilizing their control over the purse, and that during a long period of war, the colonial assemblies were able materially to limit the authority of the executives It was in such ways as these that the Constitutions of the provinces became developed and liberalized during the French wars

The Canadian Government.—The quality of the rank and file of the Canadian militia was not essentially different from that of the British Colonies But the Canadian Government was autocratic The power of the French was also concentrated in a single large province These conditions greatly promoted military efficiency. When taken in connection with their Indian alliances, they enabled the French to take the offensive in the earlier wars much oftener than did the English, and with much greater effect The English frontier was more accessible and more exposed than was the lower part of the valley of the St. Lawrence. Quebec was in every sense a citadel to which additional security was given during a large part of every year by the intense cold of the Canadian winter But so superior were the training and enterprise of the French *coureur de bois* that, with his Indian allies, he was far better able than the English farmer or artisan to penetrate the wilderness, whether in winter or in summer, and massacre the exposed dwellers on the frontier It was this class which gave the French the superiority in the long succession of raids by which the English frontier was laid waste

Though the French by their skill and boldness achieved a remarkable success, their defects and weaknesses were equally evident. The flow of population from France to America was never great, and was diminished by the exclusion of Huguenots The natural growth of population within New France was not rapid and the French colonists did not become sufficiently numerous to maintain the interests to which their vast claims and possessions gave rise At the opening of the last intercolonial war the proportion of English to French colonists was approximately 15 to one. The resources of the British exceeded those of the French colonists to a corresponding degree Had the decision of the questions at issue depended upon population and wealth alone, the issue could not long have remained doubtful But they were so offset by other circumstances, already alluded to, that the result of the struggle was for a long time uncertain The motherlands were to be the decisive factors in the problem, which thus depended to an extent on complications which existed in Europe or even on remoter seas and continents When the climax of the struggle was reached the result might have been different if France at the time had not been so deeply involved in the politics of central Europe

Of the first importance in reaching a decision were the fleets and armies of Great Britain and France, or those parts of them which were available for use on the continent of North America During the larger part of the period under review the French neglected their fleet, while the English steadily advanced toward naval and commercial supremacy But the first conspicuous service on the northern coasts was that which was rendered by Commodore Peter Warren and his squadron at the capture of Louisburg in 1745. In the next year a large French fleet was despatched to North America, but it accomplished nothing. In the last intercolonial war the operations before Louisburg in 1758 and at Quebec in 1759 decisively proved the superiority of the British Navy. The Colonies also, in the later stages of the struggle, contributed loyally toward the result. France failed to make her natural military superiority effective in North America, and her power on that continent had to yield before the combined attacks of Great Britain and her Colonies by land and sea.

Colonial Revolt, 1763–76.—The Treaty of Paris (1763), by which the period of colonial wars was concluded, added vast stretches of territory to the dominions of Great Britain in North America The Floridas, Canada and Louisiana as far west as the Mississippi river now came into the possession of the English. Of the islands which were occupied, the two most important—Guadaloupe and Martinique—were restored to the French The retention of Canada in preference to these involved an important change in the nature and objects of British colonization Hitherto tropical colonies had been preferred to those in northern climes. But it was now bent upon continental expansion. Canada and the West were retained and the most important French islands were given back The development of modern industry—the so-called industrial revolution had already begun in Great Britain Its effect was vastly to increase the population of the British Isles and to necessitate an overflow into the unoccupied regions of the globe Henceforth, as time progressed, colonies were to be valued as homes for a surplus population quite as much as sources of raw materials and food supplies The retention of Canada and the West also coincided exactly with the desires of the continental Colonies The chief gains of the war went therefore to them and not to the island colonies They now possessed a continental domain which was adequate to their need for expansion, and their long-cherished desire to be rid of the French was gratified The conquest of the French removed the sense of dependence on Great Britain for military aid previously felt by the northern Colonies in particular

Increase of Imperial Control.—In consequence of the policy thus adopted, largely increased burdens were devolved on the Imperial Government, while the conquest and the events which led to it strengthened imperialist sentiment. The course of action which was at first favoured by leading officials, both in England and the Colonies, was a more systematic administration of Indian affairs, the employment of sufficient regular troops under the commander-in-chief to defend the newly acquired territory, the maintenance of posts with English settlers in the interior on a scale sufficient to prevent the French or Spanish from securing the trade of the region Improved methods of administration were urged, French methods were praised and the shortcomings of the surviving chartered Colonies were again emphasized This all required additional revenue, as well as administrative vigour, and that at a time when Great Britain was especially burdened with debt and when several of the Colonies had recently incurred heavy expenditures The large acquisitions of territory also necessitated some changes in the acts of trade The necessity for their more vigorous enforcement was revealed by the existence of a large contraband trade between the colonists and the enemy during the later years of the war and also of a considerable illegal trade with Europe These conditions, together with the conviction that, as the continental Colonies had reaped the chief advantages of the war, some favour should be extended to the islands, led to the passage of the Sugar Act by the Grenville ministry in 1764 It also caused a resort to writs of assistance in two of the Colonies, and finally the legalization of them in all the Colonies by Act of Parliament (1767) The aid of the Navy was directly invoked in the enforcement of the trade laws, and the activity of the customs officials and of the admiralty courts in the Colonies was increased Garrisons of regular troops—numbering several thousand —with a commander-in-chief were now present in the Colonies in time of peace, and their aid might possibly be invoked by the civil power to suppress disorder The Sugar Act itself was a trade and revenue act combined, and the fact was expressed in the preamble of the measure It was intended directly to affect the traffic between the northern Colonies and the foreign West Indies in lumber and food-stuffs, molasses and rum The duty on foreign molasses, for which provision had been made in the Molasses Act of 1733, was halved; but now it was proposed really to collect this duty. A cry was immediately raised in New England that, if the duty was collected, the manufacture of rum—of which molasses was the staple material—would be lessened or wholly prevented and a most important industry sacrificed The fisheries would incidentally suffer. In spite, however, of the opposition which it provoked in the northern Colonies, it is probable that the Sugar Act could have

been permanently enforced. The Act of Trade of 1673 and the Molasses Act—though it was not fully executed—were two early instances of the exercise by Parliament of the right to tax the colonies. Had the Sugar Act been enforced, a clear and decisive precedent in favour of this right would have been established In view of the general situation, that was probably as far as the British Government should have gone at that time But it immediately committed itself to another and still more significant measure, and the two acts combined caused an outburst of protest and resistance from the colonists

The Stamp Act.—Repeatedly in earlier years the imposition of a stamp duty upon the Colonies had been suggested The cost of the regular troops which must be stationed in America was estimated at about £300,000 annually The Sugar Act was expected to yield about £45,000 a year It was thought that the colonies should raise about £100,000 more as their reasonable share of the cost. George Grenville resolved to secure this by means of a stamp duty. This would fall upon the island colonies equally with those of the continent, though it would be expended chiefly for the enlarged military force on the mainland Though its simplicity and ease of collection recommended it, the Stamp Act was a purely fiscal measure, and its character was not concealed by any features which allied it to the earlier acts for the regulation of trade It was passed by Parliament in 1765, almost without debate and with scarcely a thought that it would be resisted It provided for the appointment of officials to distribute the stamped papers in the colonies and further extended the power of the admiralty courts by giving them jurisdiction over violations of this act The legal theory upon which the act was based was that of the unqualified sovereignty of Parliament as the representative body for the whole empire, and that its authority, if it chose to use it, was as effective for purposes of taxation as for the regulation of trade or other objects of legislation But never before, during the century and a half of colonial history, had the taxing power been so unqualifiedly exercised It followed close on the heels of the Sugar Act, which itself had aroused much hostile criticism The two measures also came at a time when the consciousness of strength among the Colonists had been increased by the defeat and expulsion of the French Moreover, at the time when the policy was initiated, George III had undertaken to crush the Whig party and to revive the latent prerogatives of his office This resulted in the formation of a series of coalition ministries Vacillation and uncertainty were thus introduced into the colonial policy of the Government The royal policy also brought into the public service in England and kept there an unusually large group of inferior men who persistently blundered in the treatment of colonial questions It was only with the accession of the North ministry, in 1770, that permanence and a certain consistency were secured But, in the view of the colonists, the prestige of the Government had by that time been seriously lowered

Resistance to the Stamp Act.—Determined opposition to the Stamp Act was shown in all the Colonies, by or before the time (Nov 1) when it was to go into effect. The forms assumed by this opposition were such as characterized the entire controversy with Great Britain until the opening of hostilities in 1775 It consisted in the passage of resolutions of protest by the lower houses of some of the colonial legislatures; in the calling of a congress at New York which was attended by delegates from nine of the Colonies, in the activity of mobs organized under the name of the "Sons of Liberty"; and, finally, in a somewhat widely extended movement against the importation of British, or even foreign, goods and in favour of frugality and the encouragement of home manufactures The newspaper press also sprang into much greater activity than ever before, and many notable pamphlets were published The most important resolutions at the outset were those adopted by the Virginia House of Burgesses and by the House of Representatives of Massachusetts. Through the first-named body the dramatic eloquence of Patrick Henry forced five resolutions Two others, which threatened resistance and the coercion of any who should venture to uphold the home Government, failed to pass, but the whole seven were published broadcast through the Colonies. The calling of a general congress was proposed by the House of Representatives of Massachusetts Prominent among its members was James Otis, who had already distinguished himself by radical opposition to measures of the Government, especially in the case against writs of assistance which was argued before the superior court in 1761 Samuel Adams, already a prominent man, was now elected a member of the House from Boston He almost immediately became its leader, drafting its most important resolutions and papers, and to a large extent directing its policy With the aid of others he was able greatly to increase the activity of the town-meeting in Boston, and in the course of a few years to develop it on occasion into a great popular convention Throughout New England the town and its institutions served well the purposes of opposition and facilitated its extension over large areas The intense Puritan spirit, with its century and a half of pronounced independence, both in polity and temper, was lacking outside New England; though on the frontiers of the provinces from Pennsylvania southward was a Scottish-Irish population which exhibited many of the New England characteristics But the tenant farmers of New York, the German pietist sects of Pennsylvania, the Quakers wherever they had settled, and in general the adherents of the English Church were inclined toward indifference or, as the controversy progressed, toward positive loyalism Hence the mixture of nationalities in the middle colonies greatly increased the difficulty of rousing that section to concerted action In Pennsylvania the issues were obscured by a struggle on the part of the western counties to secure equal representation with those of the east This helped to make loyalists of the Quakers Special grievances also produced among the frontier settlements of North and South Carolina quite as much dislike of the officials and social leaders of the tide-water region as they could possibly feel toward Crown and Parliament. Throughout the struggle New England and Virginia exhibited a unity and decision in action which were not equalled elsewhere

Increased Opposition.—But to return to the Stamp Act. Before the meeting of the congress at New York outbreaks of mob violence in Boston had forced the stamp distributor there to resign, and had wrecked the house of Thomas Hutchinson, the chief justice Owing largely to the indecision of the elective council, the Government had proved powerless to check the disorder The resolutions passed by the Congress, as well as its petitions to the home Government, gave authoritative form to the claims of the colonial opposition in general, though the body which issued them, like all the congresses which followed until 1776, was extra-legal In these utterances, as later, the colonists sought to draw their arguments from British precedents and their own history The two British rights which, it was claimed, were violated by the Stamp Act were the right to trial by jury and the right to be taxed only by an assembly in which they were represented The first grievance was simply an incident of the second, and was occasioned by the extension of the jurisdiction of the admiralty courts The tax was a direct grievance For purposes of legislation like this these bodies denied that Parliament was representative of the whole empire For purposes of taxation, their assemblies, they affirmed, were the only representative bodies they had known Therefore, ignoring the earlier and tentative measures by which Parliament had actually taxed the Colonies, and falling back upon the sweeping declarations of their assemblies, they denied the right of Parliament to tax them They declared that the recent policy of Parliament was wholly an innovation and insisted upon a return to the constitution as it was before 1763 The doctrine of natural right and compact was also resorted to with increasing emphasis in New England utterances.

Repeal of the Stamp Act.—The decisive blows, however, were struck by the mobs in the Colonies and by the Government itself in England As the time for the execution of the Stamp Act approached, more or less violent demonstrations occurred in New York and in many other localities The stamp distributors were forced to resign Everywhere in the original continental Colonies the use of stamped papers was prevented, except to a slight extent in Georgia Business requiring the use of stamps was in part suspended, but far more generally it was carried on

without their use. Without the aid of the militia, which in no case was invoked, the colonial executives proved indisposed or powerless to enforce the act and it was effectively nullified. In England the petitions of the colonists produced little effect. There the decisive events were the accession of the Rockingham ministry to power and the clamours of the merchants which were caused by the decline in American trade. The serious lack of adjustment between British politics and colonial government is illustrated by the fact that, more than three months before the Stamp Act was to go into effect, the ministry whose measure it was resigned, and a cabinet which was indifferent, if not hostile, to it was installed in office. Preparations were soon made for its repeal. The slight extent to which relations with the Colonies had been defined is indicated by the fact that the debates over the repeal contain the first serious discussion in parliament of the constitution of the British empire. While the Colonies were practically united in their views a great variety of opinions was expressed in parliament. On the question of right Lord Mansfield affirmed the absolute supremacy of parliament in dominions, while Camden and Pitt drew the same sharp line of distinction between taxation and legislation upon which the colonists insisted, and denied the right of parliament to tax the Colonies. Motives of expediency, arising both from conditions in the colonies and in England, proved decisive, and in the spring of 1766 the Stamp Act was repealed, while its repeal was accompanied with the passage of a statute (The Declaratory Act) affirming the principle that Great Britain had the right to bind the Colonies in all cases whatsoever. This measure was received with joy in the Colonies, but the prestige of the home Government had received a severe blow, and the colonists were quick to resent further alleged encroachments.

Townshend Acts.—These soon came in the form of a colonial Mutiny Act and of the so-called Townshend Acts (1767). The Mutiny Act was intended largely to meet the needs of the troops stationed in the west and in the new Colonies, but it also affected the older Colonies where garrisons of regular soldiers existed. The act provided for a parliamentary requisition for barrack supplies, and partly because it included certain articles which were not required for the soldiers in Europe, the New York legislature at first refused to make the necessary appropriation. Partly through the influence of the governor it later came to think better of it and in a non-committal way appropriated the supplies required. But meantime in England the Pitt-Grafton ministry had come into office, in which the brilliant but reckless Charles Townshend was chancellor of the exchequer. Pitt himself was disabled by illness, and the ministry, lacking his control, steadily disintegrated. Townshend availed himself of this situation to spring upon his colleagues and upon Parliament a new measure for colonial taxation, and with it a bill legalizing writs of assistance and establishing a board of commissioners of the customs in America, and a third bill suspending the functions of the assembly of New York until it should comply with the terms of the Mutiny Act. These bills all became law. Before the last-mentioned one reached the colonies, the New York Assembly had complied, and therefore the necessity for executing this Act of Parliament was avoided. The establishment of a customs board at Boston did not, of itself, provoke much criticism. But the Act of Trade and Revenue, which provided for the collection in the Colonies of duties on glass, lead, painters' colours, paper and tea, and that out of the revenue raised therefrom salaries should be paid to the governors and judges in America, opened anew the controversy over taxation.

John Dickinson, in his *Letters of a Farmer* (1767–68), denied *in toto* the authority of Parliament to tax the Colonies, and his argument was widely accepted. Massachusetts petitioned the home Government, and in a circular letter conveyed its views to the other colonies and asked an expression of theirs in return. The activity of the customs officials at Boston in seizing John Hancock's sloop, "Liberty," occasioned rioting, which in turn was followed by the transfer of two regiments to Boston. Several vessels of war were also stationed in its harbour (autumn of 1768). Deprived of their assembly, the towns of Massachusetts chose deputies, who met in convention, but without important result. Favourable replies to its circular letter were, however, received from a majority of the Colonies. Resolutions against the new act were passed by many colonial assemblies, and in several cases petitions were sent to England. The King and ministers expressed the view that the Americans were opposed to all restrictions, and that in Massachusetts treason or misprision of treason had already been committed. In this they had the support of large majorities in Parliament. The statute of 35 Henry

THE BOSTON "MASSACRE," MARCH 5, 1770, AFTER AN ENGRAVING ATTRIBUTED TO PAUL REVERE (1735–1818), REVOLUTIONARY PATRIOT

VIII., for the punishment in England of such offences when committed outside the realm, was now revived, and the royal officials in Massachusetts were instructed to collect evidence against suspected popular leaders with a view to their deportation across sea for trial. Though sufficient evidence was not found, nothing could have been better calculated to increase the exasperation of the colonists than a threat of this kind. It drew from the Virginia burgesses strong addresses and resolutions of protest. Fear lest the English Church would induce the Government to establish a colonial episcopate caused much discussion at this time, especially in New England, and led to plans for joint action on the part of Dissenters, in self-defence. In the course of 1769 the policy of commercial non-intercourse was again revived, and resolutions in favour of its enforcement were passed by many local bodies. But it was found difficult to enforce these, and, as the Colonies were prosperous, trade, open and illicit, with Europe continued to be large. The British merchants did not clamour for relief, as they had done at the time of the Stamp Act, but gave loyal support to the policy of the Government. The King was also steadily gaining an ascendancy, which in 1770 was permanently established by the accession of Lord North to the premiership. Thus, on both sides of the ocean, parties were bracing themselves for a struggle, the one for and the other against the principle of the Declaratory Act. The question of revenue was now largely obscured by that of right and power.

The Tea Tax.—It cannot be said that the Townshend Revenue Act was nullified, for to a certain limited extent it was executed. But in 1770, on the specious plea that the duties were uncommercial because they were levied on British manufactures, all except the duty on tea—3d. per lb.—were repealed, and a drawback of one-fourth and later of three-fifths of this duty was granted on the re-exportation of tea to the Colonies. But the preamble of the act was retained, and with it the principle of taxation. For this reason opposition continued and non-importation agreements, especially against tea, were maintained. But after the collision which occurred between the troops and the people in Boston, in

March 1770, the soldiers were removed from that town and affairs became more quiet. For more than a year it seemed as if the controversy was wearing itself out and that the old relations would be restored. But the conduct of certain naval officers and small vessels of war which had been trying to suppress illegal trade in Narragansett bay led, in June 1772, to the destruction of the schooner "Gaspee" The inquiry which necessarily followed this, together with legislation for the protection of the royal dockyards, ships and supplies, again revealed the possibility that colonists might be removed to England for trial. About the same time provision was made for the payment by the home Government of the salaries of the governors and of the judges of the superior court of Massachusetts while those officials continued to hold at the pleasure of the Crown These events occasioned a movement in Massachusetts and Virginia which led at once to the organization of committees of correspondence, and these ultimately extended far and wide throughout the Colonies. At the same time in England the East India Company appealed to Parliament for relief from the losses caused by the transfer of the American trade so largely to the Dutch, and in response the Tea Act was passed authorizing the company to import its teas into the Colonies and providing that the English duties should be wholly drawn back on exportation, and that no compensation need be made to the Government for consequent loss of revenue. This, it was expected, would enable the company to out-compete the Dutch But popular uprisings prevented the reception or sale of the tea at any of the ports and culminated in the destruction (Dec 16, 1773) of 340 chests at Boston As the King and the North ministry were now fully entrenched in power, coercion was at once resorted to and affairs were thus brought to a crisis.

The Quebec Act.—Those among the colonists who were intelligent enough to watch the course of events had long felt that they were being enveloped in a network of relations over which they had no control This was a result of the development of the empire, with its world-wide interests The Quebec Act, which was passed by Parliament near the close of the session of 1774, furnished a case in point Owing to the failure of the Imperial Government to secure the revenue which it had hoped to collect under the Stamp Act and the later statutes, it had been forced to abandon its plans for the vigorous administration of Indian affairs and of the West. In view of these facts, it was thought wisest and cheapest to commit the immediate charge of the west to the province of Quebec, and therefore to extend its bounds southward to the Ohio The Roman Catholic religion was recognized as legal within Quebec, and no provision was made for an assembly Its extension also indicated a purpose to prevent the westward movement of population across the mountains, which was already beginning from the middle and southern Colonies

First Continental Congress.—But the acts of the session of 1774 which were of most immediate importance were those which directly affected Massachusetts, where lay the centre of disturbance One of these closed the port of Boston, another substituted an appointed for an elected council in Massachusetts and took the selection of jurors out of the hands of the people, and a third made possible the removal from Massachusetts of the trials of persons indicted for capital offences committed in support of the Government into neighbouring Colonies or to Great Britain, where a fair hearing was considered possible. Gen. Thomas Gage, who had been commander-in-chief in America, was now appointed governor of Massachusetts, with authority to uphold the new acts with military force. As soon as knowledge of the fate impending over Boston reached the other Colonies, conventions, local and provincial, were held, and the plan of a general congress, as proposed by Massachusetts and Virginia, was adopted. Delegates were chosen from all the Colonies except Georgia, though that province fell into line when the second Congress met. The members were instructed to the general effect that they should consult together and adopt such measures as were best calculated to secure the just rights of the colonists. Voting by Colonies, but occasionally listening to utterances which implied that Americans were now thrown into a single mass, this body sent addresses to the King, to the people of the Colonies, of Quebec and of Great Britain, and prepared a declaration of rights It is a significant fact that no address was sent to either of the Houses of Parliament In its statement of rights the Congress (known as the First Continental Congress) limited itself to those which it believed had been infringed since 1763 These acts they described as innovations, and claimed themselves to be the true conservatives who only desired peace on the basis of the former constitution The opposition which Massachusetts was making to the recent Acts of Parliament was approved, and the view was expressed that, if an attempt were made to execute them by force, all America should support Massachusetts Though the work of this Congress was deliberative, it performed one positive act which contained the germ out of which new governments were to develop That was the issue of the Association, or non-importation and non-exportation agreement, accompanied with resolutions for the encouragement of agriculture and home manufactures and for the organization of committees to carry these measures into effect. Coercion, according to the principle of the boycott, was to be applied by the Colonies and other local bodies to all who declined to accept and obey the terms of the Association. This policy had been followed at intervals since the time of the Stamp Act It had been revived by many local and provincial bodies for the past few months The Association became the touchstone by which loyalty to the Colonies, or to the King, was determined. Those whose loyalty to the King forbade their submission to the new regulations now felt the power of committees, even to the extent of virtual trial, imprisonment or banishment From this action the First Continental Congress derived its chief significance.

Increase of Friction.—The Association, with its threats and dependence upon extra-legal bodies for enforcement, was a direct blow at the commercial system of the empire and could scarcely help provoking retaliation When the Congress adjourned, some of its members predicted war In New England the impression that war was inevitable was widespread In Massachusetts a provincial congress was at once organized, which assumed the reins of government and began to prepare for defence A committee of safety was chosen to carry on the work during recesses of the Congress. Thomas Gage, the governor, began fortifying Boston, while he looked about for opportunities to seize military stores which the colonists were accumulating. The raising of voluntary militia companies was soon begun in Virginia In South Carolina, as earlier in Boston and New York, a quantity of tea was now actually destroyed, and a general committee assumed practical control of the province. From New York city and Philadelphia, as centres, the process of revolutionizing the two most conservative provinces was carried on. When Parliament met, at the close of 1774, the King and ministers declared that a most daring spirit of resistance existed in Massachusetts, which was countenanced by the other Colonies, where unlawful combinations against the trade of Great Britain were already widely extended In these opinions the Government had the support of the majority in the two Houses, and in a joint address the rebellion in Massachusetts was declared to be a fact As a conciliatory measure Chatham proposed that Parliament agree by resolution not to levy any tax upon the Colonies, but that the Continental Congress be required to make a free grant of a perpetual revenue which should be fully at the disposition of Parliament, the Congress fixing the quota which should be paid by each province. But the imperialist and mercantilist ideas of Chatham were expressed in the further provisions that the system of trade and navigation should not be changed and that the Army might be lawfully kept in any part of the dominions, though it should never be used to violate the just rights of the people. Edmund Burke, in his great speech on conciliation, advocated a return to the system of requisitions and did not consider a representation of the colonists in Parliament as a possibility. But these motions were rejected, and a resolution introduced by Lord North was passed. This contained no recognition of extra-legal bodies, but provided that when the assembly of any Colony should engage to support civil government within the Colony and contribute according to its ability to the common defence, the King and Parliament would then forbear to levy any more taxes on that province except what

were necessary for the regulation of trade. The Colonies, with the exception of New York, North Carolina and Georgia, were excluded from the fisheries, as a counterstroke to the Association. North's resolution proved futile, and the two parties drifted steadily toward war, though the British Government in its military estimates made no adequate provision for meeting the crisis.

Lexington and Concord.—On April 19, 1775, hostilities began in Massachusetts A force was sent overland to Concord, 20m from Boston, to seize or destroy the military stores which the colonists had brought together at that village. The minutemen were warned to oppose the approaching force, and at Lexington, a village situated on the road to Concord, occurred a skirmish in which the first blood of the American War of Independence was shed. The troops marched on to Concord and destroyed such of the stores as had not been removed or concealed On their return march they were pursued by a galling fire from behind fences and buildings, and had it not been for the arrival of a relieving force the command would have been destroyed before it reached the protection of the British vessels of war at Boston. The "Lexington alarm" brought in throngs of militiamen from all parts of New England Officers were appointed by the provincial congress of Massachusetts and by similar bodies in the other Colonies, and immediately the so-called siege of Boston began Cannon, as well as every other form of military equipment, were now in great demand. In order to secure supplies and at the same time strike a telling blow at British authority in the north, Ticonderoga was surprised and taken on May 10 Men from Connecticut, Massachusetts, and the New Hampshire Grants (later Vermont) co-operated in this enterprise It was soon followed by a dash into Canada, by steps which involved New York in the affair, and by the organization of a military force under Gen Philip Schuyler for permanent service on the northern frontier Meantime reinforcements reached Boston, led by Howe, Clinton and Burgoyne, and it was resolved to extend the British lines by occupying the heights of Dorchester on the south and those of Charlestown on the north

Bunker Hill.—The Americans, hearing of this, seized Breed's Hill, overlooking Charlestown, where they hastily threw up a redoubt on the night of June 16 The British might easily have entrapped them, but instead on the next day the American position was assaulted on the left and carried, though with much difficulty and after a loss to the assailants of more than 1,000 men. Such was the battle of Bunker Hill, one of the most dramatic encounters in the war. In connection with all these events the Americans claimed to be acting on the defensive But it was not difficult to perceive that, especially in New England, this claim only imperfectly concealed an intensely aggressive spirit.

Second Continental Congress.—The news of the outbreak of hostilities aroused strong feeling throughout the Colonies. The Second Continental Congress met under its influence. Its members, however, had been chosen and instructed before the clash of arms, and for that reason the course which had been workedout for them differed only slightly, if at all, from that which had been followed by their predecessors To a certain extent the new body adhered to the former course of action. But a state of war now existed in New England and on the Canadian border. Troops were expected soon to arrive at New York Reports of these events were thrust upon the attention of Congress at once, and the provinces involved asked for advice as to what course they should pursue. As a result of these events in the Colonies generally, the Association was being changed from a system of co-operation against British trade into a union for purposes of defence. This new situation the Congress was forced to meet. This it did largely by resolutions of advice to the Colonies, but also by positive orders Of the former class were the resolutions about the procuring of military supplies, the assumption of powers of government by the various Colonies, and concerning defence at New York city, on the northern frontier and, later, in the highlands of the Hudson. Of a more decisive character was the appointment of officers for the army, George Washington being made commander-in-chief, the prescribing of their pay, the issue of continental bills of credit, the issue of articles of war, the regulation of trade and of Indian affairs, and the establishment of postal communication. As the revolutionary movement progressed through 1775 and the early months of 1776, executive authority in the royal and proprietary provinces collapsed. The assemblies were either dissolved or ceased to meet. The governors, their authority gone, retired on board British vessels of war, returned to England or, perchance, found themselves prisoners. This gradual fall of the old governments, imperial and colonial, was the revolution on its negative side. The rise of the system of congresses, conventions and committees, deriving their authority from the people, was the revolution on its positive side, and foreshadowed the new federal system which was rising on the ruins of the half-federated empire.

Collapse of the Royal Governments.—In Connecticut and Rhode Island the corporate system of government, which they had inherited from the 17th century, necessitated no change. The general assemblies always had been the centres of power, and the leading officials were elective for short terms and were subject to the control of the electorate. So far as the internal organization of the Colonies was concerned that was all which the revolution demanded. In the two proprietary provinces—Pennsylvania and Maryland—the executives were not so directly interested and pledged to support the Imperial Government as were those of the royal provinces But Governor Robert Eden of Maryland was so tactful that, though the last assembly met in 1774, he was able, with the courts, to keep up some form of government there in the name of the Crown and proprietor until the early summer of 1776. In Pennsylvania the proprietors, though in sympathy with the British Government, never sought actively to influence events in their province. In the royal provinces the prorogation of the legislatures for indefinite or prolonged periods caused them early to disappear—that of Massachusetts in October, 1774. The burgesses of Virginia last met for business in May, 1774. They were prorogued to several later dates, but the governor was never again able to meet them. The long and important session of January–March, 1775, was the last ever held by the New York assembly. In April, 1775, Governor John Martin of North Carolina met the assembly for the last time, and even then the provincial convention was in session at the same time and place and the membership of the two bodies was the same In May, 1775, disappeared the assembly of Georgia; in June those of New Hampshire and South Carolina met for the last time Governor William Franklin was able to meet the assembly of New Jersey as late as November, but months before that date the provincial convention had practically assumed the control of affairs

Washington in Command.—After Bunker Hill the command at Boston had been transferred from Gage to Sir William Howe In July, Washington took command of the colonists and gradually established some degree of order and discipline among them. Though the American levies were raw and ever fluctuating in numbers, the British never seriously attempted to break through their lines. Indeed, it was not the plan of the British to make New England the chief seat of war As early as Aug 2, 1775, Lord Dartmouth wrote to General Gage on "the obvious advantages that would attend the taking Possession of New York and the hazard of the Army's continuing at Boston." Rhode Island was considered as a convenient naval station, and steps were soon taken to secure possession of it and its surrounding waters. The British wished to so plan the war as to secure the maximum of advantage from their fleet. This would give them an easy command of the entire coast, and enable them to secure a foothold at strategic centres. Hence it was that, though the arrival of a fresh supply of cannon enabled Washington to fortify Dorchester Heights, this simply enabled him to hasten a process for which Howe had long been preparing. The evacuation occurred on March 17, 1776, and the British force withdrew temporarily to Halifax. Meantime the bold expeditions of Arnold and Montgomery against Canada had met with only a partial success Montreal had been occupied, but the assault upon Quebec had failed.

The view, as it was now repeatedly expressed by King and Parliament, was that the colonists were in open rebellion. North's offer of conciliation was peremptorily rejected by Congress. The acts of Parliament were being openly resisted, and Congress in its

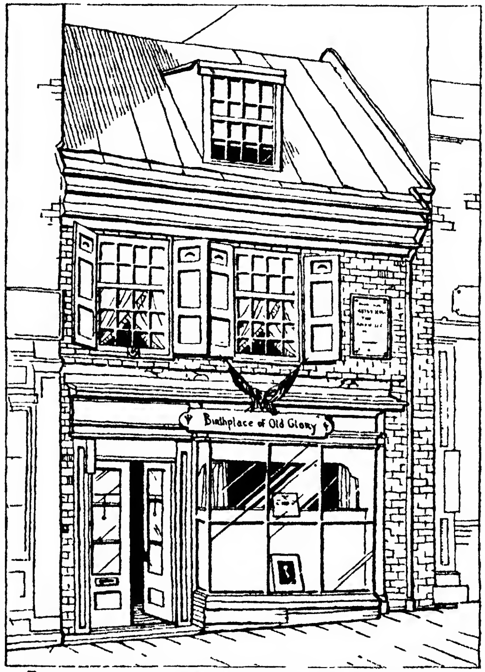
manifestos had ignored the two houses Therefore the British Government stood committed to coercion That was the meaning of the legislation of the winter of 1776—the prohibition of trade with the rebellious Colonies, the increase of the estimates for the Army and Navy, the employment of German auxiliaries for service in America Preparations were made to send a large military and naval force the following season, which should operate in part against the insurgents in New York and the southern Colonies and in part through Canada New England was no longer to be the direct object of attack The Howes, as commanders of the royal Army and Navy, were appointed commissioners to grant assurance of peace and pardon and the repeal of the obnoxious acts, provided submission was made and some way could be found by Parliament in which an imperial revenue for purposes of defence could be secured from the Colonies Military operations, meanwhile, should be directed against points of least resistance, and in that way, if possible, the union of the Colonies should be broken. The trend of British policy indicated that an invasion from Canada might be attempted and an effort made to hold Charleston, Philadelphia, and especially New York as strategic points on the coast

The course of events in the Colonies by which this situation was met was the erection of a system of feeble defences about New York and the removal thither of the Army of about 9,000 men in the spring of 1776; the fitting out of privateers to prey on British commerce, the disarming of loyalists; the opening of American ports to the trade of all peoples who were not subject to the British Crown, and the tentative opening of relations with France. As the result of a combination of ill luck, bad management and American energy the British suffered a repulse at Charleston, South Carolina, in June, which was analogous to the affair of the year before at Bunker Hill, and which necessitated a postponement of their plans in the south

The Congress and the various revolutionary bodies in the Colonies were forced to carry on war upon a constantly increasing scale They had to assume powers of government and gradually to perfect their organization for the purpose Committees in Congress became more permanent Conditions approximating to those which existed the year before in New England extended through the Colonies generally.

The Declaration of Independence.—On May 15, 1776, as the result of various earlier applications and especially of one from certain Whigs in New York, the Congress recommended to the assemblies and conventions of the Colonies where no Government sufficient to the exigencies of their affairs had been established, "to adopt such government as shall, in the opinion of the representatives of the people, best conduce to the happiness of their constituents in particular and of America in general" The preamble to this resolution set forth as facts the statements that the Colonies had been excluded from the protection of the Crown, that no answer had been given to their petitions for redress, and that the whole force of the kingdom was to be used for their destruction, and therefore that it was no longer reasonable or honest for the colonists to take the oaths or affirmations necessary for the support of Government under the Crown. Though the preamble was warmly debated, it was adopted And this act marked a turning-point, for the progress of events from that time to the Declaration of Independence was rapid and decisive. The Colonies—now becoming States—one after another, in response to letters from Philadelphia, empowered their delegates to concur in declaring independence. On June 7, R H. Lee of Virginia introduced in Congress a resolution "that these United Colonies are and of right ought to be free and independent states," that it was expedient forthwith to take effectual measures for securing foreign allies, and that a plan of confederation should be formed The debate showed that the delegates from the middle colonies and South Carolina could not act, and the decision was postponed for three weeks. In the interval steps were taken to draft a plan of treaties and articles of confederation. A board of war and ordnance, the earliest germ of an executive department, was also created by Congress

At the end of the three weeks the delegates from all the Colonies except Georgia, South Carolina and New York had received instructions favourable to independence The two former left their delegates free, and under the influence of the British attack on Charlestown they voted for independence News had just come that Howe had landed with a large force at Sandy Hook. Under the impression of these stirring events the Declaration, substantially in the form given to it by Thomas Jefferson, was agreed to (July 4, 1775), only three adverse votes being cast The delegates from New York took no part, but a few days later the act was approved by the convention of that State The signing of the document by



THE HOME OF BETSY ROSS, MAKER OF THE FIRST AMERICAN FLAG
The little house on Arch Street, Philadelphia, where Mrs. Ross lived at the time she is said to have made the first American flag (1777), was converted into public property by the Betsy Ross Memorial Association in 1905 and has since been known as the American Flag House

the members took place at a later time. Thus triumphed the tendencies toward self-government which had been predominant in the continental Colonies from the first, and which the system of imperial control had only superficially modified and restrained But the most significant part of the document for the future was the preamble, in which the democratic aspirations of the new nation were set forth, the spirit to which Thomas Paine had just made so powerful an appeal in his *Common Sense* Governments, it was said, derive their just powers from the consent of the governed, and when any system becomes destructive of these ends it is the right of the people to abolish it and to institute a new Government, establishing it upon such principles and under such forms as seem most likely to effect their safety and happiness (*See* DECLARATION OF INDEPENDENCE)

Weakness of the General Government.—Viewed from one standpoint, the Declaration of Independence was apparently an act of the utmost recklessness. The people were by no means a unit in its support, and in several of the States widespread indifference to it, or active sympathy with the British, prevailed The United States, as yet, had no international status, and it would seem that that must be secured, if at all, by a series of victories which would ensure independence But how could these be won against the greatest naval power on the globe, supported

by veteran armies of continental and British troops? The Colonies had no money; the few vessels which, as a collective body, they did send out, were more like privateers than anything else Their Army was an undisciplined throng of militiamen, serving on short enlistments, without organized commissariat, and for the most part under inexperienced officers Its numbers, too, were far inferior to those of the British Taxation by the Continental Congress for the support of the war was not among the possibilities of the case A strong tendency toward the provision for immediate needs by the issue of bills of credit had been inherited from the period of the French wars, and that device was again resorted to The battle of Bunker Hill had been immediately followed by an order of Congress for the issue of $2,000,000 in that form of currency Issues followed in rapidly increasing amounts, until by the close of 1779 $241,000,000 had been authorized The States put out nearly as much ($209,000,000) The continental paper money depreciated until it became worthless, as to a large extent did that of the States also The States decreed it to be legal tender, and dire threats were uttered against those who refused to receive the bills; but all to no purpose The Congress also tried to induce the States to tax themselves for the general cause and was forced to rely on requisitions for the purpose These measures proved as complete a failure as when resorted to by the Crown The revolution was therefore never financed It early became necessary to resort to loans and that chiefly from foreign sources It was therefore an absolute necessity that the Colonies should secure international recognition and status Then loans were obtained from the Government of France and Spain and from private bankers in Holland to the amount of about $7,830,000

The collapse of royal Government left the Colonies in a chaotic state. The old institutions had disappeared and new ones could not be immediately developed to take their place But the institutions of local Government, the town and county systems, were left intact, and upon these as a basis the new fabrics were erected It was therefore easier to construct the Governments of the States than to define and develop the general Government At first little else was intended than that the Congress should be the mouthpiece of the patriot party It proceeded mainly by way of recommendation, and looked to the States, rather than to itself, as the ultimate sources of authority Upon them it depended for the execution of its measures As the war proceeded the States grew jealous of the central body and tried to prevent appeals to it from the State courts in prize cases Under the pressure of war, moreover, the enthusiasm, which had been strong at the outset, declined, and it became increasingly difficult to secure co-operation or sacrifice toward any general enterprise

Difficulty of Congress.—At the same time, war devolved upon Congress an enormous burden of work It was forced to devise general policies and provide for their execution, and also to attend to an infinite number of administrative details Most of the able members were drawn off into the Army, into diplomatic service or official service in the States Sectional and State jealousies also developed and became intense As the Congress voted by States the smaller commonwealths were often moved by jealousy of their larger rivals to thwart important measures But, above all, the conduct of the war and foreign relations occasioned infinite jealousies and cabals, while many of the most important measures seemed to meet with downright indifference. Washington's correspondence abounds in evidence of these facts, while it is well known that he was the object against whom one of the cabals of the time was directed Benjamin Franklin was the object of somewhat similar jealousies. But, as time passed, rudimentary executive departments, beginning with the board of war and the postmaster general, were developed, and some advance was made toward a working and permanent system In 1781 the offices of foreign secretary, superintendent of finance, secretary of war and secretary of marine were created.

Military Disasters.—Until almost its very close the campaign of 1776 was a disheartening failure. The battle of Long Island was lost by the Americans and, as at Bunker Hill, it would have been quite possible for the British to have captured the entire force which opposed them on Long Island Howe compelled Washington to evacuate New York city. On Nov. 16 the practical abandonment of the State of New York by the main army was necessitated by the capture of Ft Washington Earlier in the year the Americans had been compelled to retire from Canada, while the Tories in northern New York were contributing valuable aid to the British.

The Tide Turns.—But there was another side to the picture, and already certain faint outlines of it were being discerned The British commander was, at practically every step failing to seize the advantages that were within his reach, while Washington was learning to play a losing game with consummate patience and tact After Washington had crossed the Delaware, Howe, instead of seizing Philadelphia and driving Congress and the American Army to some remote places of refuge, as he might have done, prepared for winter quarters Washington seized the opportunity to return across the Delaware and surprise the British outposts at Trenton (Dec. 26, 1776) and Princeton (Jan. 3, 1777), and thus secured a safe post of observation for the winter at Morristown. Confidence was to an extent restored, the larger part of New Jersey was regained, and many loyalists were compelled to take the oath of allegiance Howe's plan for the next campaign involved the strengthening of his army by large reinforcements With this force he proposed to capture Philadelphia and thereby to bring the War of Independence to an end in Pennsylvania, New Jersey and New York New England and the states farther south could then be dealt with in detail. But Howe was overruled by Lord George Germain, the colonial secretary, whose plan included an invasion from Canada, in which Tories and Indians should share, while Howe should advance up the Hudson and meet the northern forces at Albany. If this ambitious scheme should succeed, the British would occupy the valley of the Hudson and New England would be cut off from the rest of the colonies Gen. Burgoyne was appointed to command the northern expedition But the failure of the plan was almost ensured from the outset by the neglect on the part of British officials to instruct Gen Howe as to his part in its execution Burgoyne was forced to surrender near Saratoga on Oct 17 Meanwhile, Howe, who had long waited for instructions respecting the northern expedition, was finally informed that he might undertake the Pennsylvania campaign, but with the hope that at its close he would still be able to march up the Hudson Thereupon, embarking his army, Howe sailed for Chesapeake Bay, at the head of which he landed and advanced towards Philadelphia Washington's army opposed his march at the Brandywine (Chad's Ford), but was defeated (Sept. 11, 1777) and forced to retire beyond Philadelphia The British then entered the city (Sept 26) and the Congress withdrew to Lancaster, and later to York, in the interior of Pennsylvania The British fleet had in the meantime arrived in Delaware Bay, and, after a prolonged and brave defence, had captured Forts Mercer and Mifflin. When winter began the Delaware, as well as lower New York and Rhode Island, was in the possession of the British With the fragments of an army Washington retired to Valley Forge

French Alliance.—But the influence of Burgoyne's surrender in Europe was to prove a turning-point in the war. Since 1763 a strong sentiment at the French court had been favourable to a resumption of war with Great Britain An opportunity was now presented by the colonial revolt In February 1776 Silas Deane was sent to Paris, ostensibly as a business agent, and with the connivance of the French Government supplies were sent to America and American vessels were received into French ports Soon American privateers were bringing their prizes into French harbours, and British commerce began to suffer from these attacks. On the French side Beaumarchais and others actively co-operated in this. In the autumn of 1776 Congress appointed three commissioners to France, and resolved that Spain, Prussia, Austria and other European States should be approached with a view to securing recognition and aid. In December 1776 Franklin, who, with Deane and Arthur Lee, had been appointed commissioner to France, arrived at Paris, bringing with him proposals for treaties of commerce and alliance But, though the attitude of the French court toward the Americans was friendly,

and though it continued to send secret aid, and to exert a favourable influence upon Spain, yet it could not be induced to abandon its outward appearance of neutrality until after the news of Burgoyne's surrender arrived. Then the real purpose of the French Government was revealed. On Feb. 6, 1778, the treaties were signed, and in the following summer war between France and England began The influence of France under the Family Compact, brought Spain into the alliance in April 1779 In October 1779 Henry Laurens was elected minister to the Netherlands, and sailed for Europe, taking with him a plan of a commercial treaty But Laurens and his papers were captured by the British at sea, and partly by that event the Netherlands were forced into war with England With the other States of northern Europe they undertook to defend the interests of neutrals against the arrogant enforcement by Great Britain of the rights of search at sea. Thus the conflict expanded into a commercial and naval war, Great Britain being confronted by the larger part of Europe

Philadelphia Recaptured.—The conclusion of the treaty of alliance by France was immediately followed by the equipment of a fleet under the comte d'Estaing, which sailed from Toulon in April 1778. Sir Henry Clinton had now succeeded Howe in command of the British army. The certainty that a French fleet would soon appear in American waters made it necessary for the British to evacuate Philadelphia and return to a point on the coast where the army could be in easy communication with the fleet. This fact shows how the French alliance had changed the nature of the war It now became to a large extent a contest between the two navies, the principal evolutions of which occurred in West Indian and European seas In the north the British now relatively neglected the land war, and refrained from sending such forces to the eastern coast as had supported Howe in 1776 The Americans, on the other hand, had a naval force upon which they relied, in the hope that the blockade of their coasts might be raised and trade routes opened more freely On the evacuation of Philadelphia in June Washington's army pursued the British as they retired toward New York, and the indecisive battle of Monmouth was fought on June 28 It did not prevent Clinton from reaching New York, and that city continued to be the centre of British power and operations in the north until the close of the war The Congress returned to Philadelphia Washington's army came gradually to occupy a line of forts, of which West Point in the highlands of the Hudson was the citadel From there as a centre it was possible to communicate with Newport on the east and with the Delaware region on the south, and at the same time to prevent the British from gaining access to the interior of the country Though the fleet of D'Estaing carried a heavier equipment of cannon than did that of Admiral Howe, the French commander did not choose to risk an attack on New York, but passed eastward to Newport Howe followed him, while Washington and his generals planned active co-operation with the new allies by land But a sudden storm so dispersed and injured the fleets that the French admiral retired to Boston for repairs and later sailed for the West Indies

State Constitutions.—While the war and foreign relations were thus developing, the States were organizing their governments and Congress was beginning to consider articles of confederation between the States In this way an effort was made to gather up and make permanent the positive results of the revolution As under the chartered and royal governments of the colonial period the source of political authority had been the Crown, now by a necessary reaction this was sought in the people This principle had been stated in the Declaration of Independence, and had been implied throughout the earlier controversy. The Colonies had insisted on a more precise definition of the powers of government; they had opposed Parliament because its powers were undefined and therefore dangerous. Following these ideas, the States now described their institutions of government and defined their powers by means of written constitutions These were formulated by the provincial congresses—which had now become the legislatures—or, as they came to insist upon a more specific expression of the popular will, by conventions chosen for the purpose by the electors. Connecticut and Rhode Island retained their colonial charters In the earlier days of hasty and temporary devices, the constitutions, like statutes, had been promulgated by the legislatures which formed them and had been put into force by their authority alone But as time passed and more permanent arrangements became necessary an express popular approval of the instruments was obtained before they were put into force The establishment of State governments in this way began before the issue of the Declaration of Independence It was actively continued during 1776 and the early months of the following year, by which time all of the States had secured at least a temporary constitution Of the constitutions of the revolutionary period the two most striking features were the bills of rights and the provisions which were made concerning the executives and their relations to the legislatures The men of that generation were jealous of government They insisted upon individual rights, not as acquired and guaranteed by the State, but as original, natural and inhering in time prior to all governments Governments were instituted for the common benefit, protection and security Officials were trustees and were accountable to the people There should be no hereditary title to office or power There should be no titles of nobility, and in Virginia the system of entails was swept away Monopolies were declared to be inconsistent with the spirit of a free State. Freedom of the press and of conscience was asserted, and no obstacles to fair and speedy jury trials were to be tolerated Elections should be free and frequent, and a preference was expressed for short terms of office The legislature was universally regarded as the most important department of government Although the principle of the separation of powers was recognized, in eight States provision was made that the executives should be elected by the legislatures, 11 withheld from them the veto, and the States generally provided for a council to advise them So manifold and important, however, were the restrictions on suffrage that the States were as yet far from being democracies

The Articles of Confederation.—The first draft of the Articles of Confederation between the States was prepared by John Dickinson in the early summer of 1776 and was reported Owing to the pressure of war it was then laid aside until the autumn of 1777 By that time the feeling in favour of State sovereignty had so increased that the impossibility of securing assent to the articles in any form had begun to be feared But the document was completed and submitted to the States in November 1777, when all were encouraged by the news of Burgoyne's surrender The system for which provision was made in this document was a "confederacy," or "firm league of friendship" between the States The Congress was to be continued, and was to consist of delegates annually appointed by the legislature of each State and paid by their States. No attempt was made to create an executive for the confederacy, though authority was given to Congress to appoint a council of State which should manage general affairs, especially during recesses of Congress To Congress various general powers were entrusted, as deciding on peace and war and superintending the conduct of the same, building a navy, controlling diplomatic relations, coining money and emitting bills of credit, establishing post offices, regulating Indian trade, adjusting boundary disputes between the States The financial powers entrusted to Congress included those of borrowing money and determining necessary expenditures, but not the power to tax For supplies the general government had to depend on requisitions from the States The same system also had to suffice for the raising and equipment of troops Congress could not make its laws or orders effective in any matter of importance This was simply a continuation of the policy under which the revolution was being conducted The control of trade was practically left with the States, the Americans in this matter failing to live up to the requirements of the British system. The predominance of the States was further ensured by the provision that no votes, except those for daily adjournment, could be carried without the assent of a majority of all the States, and no important measure without the consent of nine States But a common citizenship was declared to exist, and Congress received authority to establish a court of appeal which might pass finally

on all disputes between States. Taken as a whole, the Articles of Confederation would bear favourable comparison with other schemes of their kind, and they fairly represented the stage of development to which the American States had then attained.

The West.—We have seen that, on the whole, the attitude of Great Britain, after the peace of 1763, was not favourable to the colonization of the Mississippi valley. To the colonists the Quebec Act gained in offensiveness by seeming to imply that it was intended to exclude them from the West But all such plans were swept away by the outbreak of the War of Independence Already, before the beginning of hostilities, emigrants had begun to flock across the mountains. Plans were on foot for the establishment of a number of commonwealths, or proprietary provinces, as the case might be. Daniel Boone and his associates pushed farther west into the Kentucky region, and there it was proposed to establish the commonwealth of Transylvania. Other similar projects were started, all repeating in one form or another the political methods which were used when the seaboard colonies were first settled The backwoodsmen who managed these enterprises were extreme individualists, believed in the propriety of resistance to governments, and were in full sympathy with the War of Independence. The States which had claims in the West opposed the founding of independent settlements there and, if possible, induced the settlers to be content with the status of counties within some one of the eastern States. After the beginning of the War of Independence, the British from Detroit incited Indian raids for the purpose of destroying or driving out the settlers, especially in Kentucky. These provoked the important expeditions of George Rogers Clark in 1778 and 1779. With a force of Virginians he seized Kaskaskia and later, after a long march, captured Vincennes and compelled General Henry Hamilton, who had come with a relief force from Detroit, to surrender. This secured to the Americans a permanent hold upon the north-west But Spain, after she entered upon the war, was determined, if possible, to wrest the valley of the Mississippi from the British and to keep all, or the larger part of it, for herself. To that end, operating from New Orleans, her troops took possession of Natchez, and other posts on the lower Mississippi, and occupied Mobile and Pensacola.

Articles of Confederation Ratified.—Within the Confederacy a fundamental line of cleavage was that between the large and small States. It was jealousy on the part of the small ones, their fear lest they might be absorbed by their larger neighbours, which had necessitated the adoption of the plan that in the Congress the delegates should vote by States. When the articles were referred to the States for ratification, the difficulty reappeared. Massachusetts, Connecticut and New York, with Virginia and the three States to the south of it, had large claims to territory between the Appalachians and the Mississippi. New Hampshire, Rhode Island, New Jersey, Delaware and Maryland, which were without hope of westward extension, hesitated to enter the Confederacy, if the large States were to be still further increased by additions to their areas of vast stretches of western country. They insisted that before ratification the States which had claims to western lands should surrender these for the common benefit of the United States. Maryland insisted upon this until, in the end, the cause of State equality and of nationality triumphed. Congress declared that the ceded lands should be formed into States, which should become members of the union with the same rights as other States. When in 1781 the course of action had become possible, Maryland ratified the articles and they came into effect.

War in the South.—So far as the north American continent was concerned, the character of the last stage of the struggle with Great Britain was determined by the fact that the British resolved to transfer the main seat of war to the southern States, in the hope that Georgia and South Carolina might be detached from the union. At the close of 1778 Savannah was captured. In September 1779 D'Estaing returned and assaulted Savannah, but, failing to capture it, sailed for France. In 1780 Clinton sailed from New York, besieged Charleston with a force much superior to that of Lincoln, and captured it (May 12). State government in South Carolina ceased. But the chance of detaching those States from the union and of bringing the war in that region to an end was finally lost by the British. This was chiefly due to an order which recalled the paroles of many of those who had surrendered at Charleston and required that they should perform military service under the British. The attempt to enforce this order, with the barbarities of Colonel Banastre Tarleton and certain Tory bands, provoked a bloody partisan conflict in the upper districts, especially of South Carolina, which contributed more than any other cause to run the scale against the British in the remote south. By the winter of 1781 they were forced back to Charleston and Savannah.

Yorktown.—During the summer of 1780, Washington was prevented from accomplishing anything in the north by the demoralized condition of the finances and by the decline of public spirit. It was very difficult to secure recruits or supplies. The pay of the troops had fallen so into arrears that some of them had already begun to mutiny. A second French squadron and military force, under De Ternay and Rochambeau, landed at Newport, but they were at once shut up there by the British Clinton and Cornwallis were now planning that Cornwallis, having put down resistance in the remote south, should march through North Carolina and Virginia to Baltimore and Philadelphia and that a junction of the two British forces should be effected which, it was believed, would complete the ruin of the American cause. But the turn of the tide in favour of the Americans began with the partisan warfare in South Carolina, which delayed the northward march of Cornwallis, who retired to Wilmington and thence marched north with a small force into Virginia, and in July retired to Yorktown, in the peninsula of Virginia. Washington and Rochambeau had meantime been planning a joint move against the British at New York, or possibly in Virginia, and a letter was sent to De Grasse, the French admiral in the West Indies, suggesting his co-operation. De Grasse replied that he would sail for the Chesapeake. This confirmed Washington and Rochambeau in the opinion that they should march at once for Virginia and, after junction with the force of Lafayette, co-operate with De Grasse against Cornwallis. By well-timed movements the forces were brought together before Yorktown and Cornwallis was forced to surrender on Oct. 19, 1781.

Treaty of Peace.—This proved to be the last important operation of the war in America The King was compelled to give way. Rockingham was called into office at the head of a cabinet which considered the recognition of American independence to be indispensable. The negotiations fell into the hands of Shelburne, the friend of Franklin and disciple of Adam Smith Richard Oswald was the leading British agent, while Franklin, Jay, John Adams and Henry Laurens were the American negotiators. From the first the acknowledgment of independence, the settlement of the boundaries and the freedom of fishing were insisted on as necessary terms by the Americans The three points were early conceded by the British. They also agreed to restrict Canada to its ancient limits. But discussions later arose over the right to dry fish on the British coasts, over the payment of debts due to British subjects prior to the war and over the compensation of the loyalists. Adams vigorously insisted upon the right to dry and cure fish on British coasts, and finally this concession was secured. Franklin was opposed to the demands of the loyalists, and they had to be content with a futile recommendation by Congress to the States that their claims should be adjusted. It was also agreed that creditors on either side should meet with no lawful impediment to the collection of their debts. Both France and Spain considered the claims of the Americans to be excessive, and were not inclined to yield to them. But the Americans negotiated directly with the British and the articles were signed without consultation with the French government. Peace was formally ratified on Sept. 3, 1783.

The American army was now disbanded. Since the close of active military operations both officers and men had been striving to secure their pay, which was hopelessly in arrears. Congress had voted half-pay to the officers for life, and many had agreed to accept a commutation of this in the form of full pay for a certain number of years. Certificates for these amounts were issued. But

UNITED STATES PRESIDENTS FROM 1789 TO 1861

1. George Washington (term of office, 1789–1797). Portrait by Gilbert Stuart. 2. John Adams (1797–1801) by James Sharpless. 3. Thomas Jefferson (1801–1809) by Rembrandt Peale. 4. James Madison (1809–1817) by Asher B. Durand. 5. James Monroe (1817–1825) by Gilbert Stuart. 6. John Quincy Adams (1825–1829) by Chester Harding. 7. Andrew Jackson (1829–1837) by E. F. Andrews. 8. Martin Van Buren (1837–1841) by Henry Inman. 9. William Henry Harrison (1841 for 1 month) by George Catlin. 10. John Tyler (1841–1845) by George P. A. Healy. 11. James Knox Polk (1845–1849) by George P. A. Healy. 12. Zachary Taylor (1849–1850) by George P. A. Healy. 13. Millard Fillmore (1850–1853) by George P. A. Healy. 14. Franklin Pierce (1853–1857) by George P. A. Healy. 15. James Buchanan (1857–1861) by E. F. Andrews

in this, as in other cases, it was found impossible to procure the money for the purpose from the States. Parts of the army repeatedly mutinied, and it was only the influence of Washington which prevented a general outbreak. When the disbandment was finally effected the officers found their certificates depreciated in value and the States indisposed to honour them. They consequently received only a small part of their due, and the privates scarcely anything. The country was left in a most demoralized condition, the result of the long war and the general collapse of public and private credit which had accompanied it. (H. L. O.)

BIBLIOGRAPHY.—*Sources:* Each of the original 13 colonies has published part of its official colonial records in series which are known under the general names of colonial records, archives, documents or provincial papers. The *Calendar of State Papers, Colonial Series 1574–1715,* still in progress (30 vols., 1928), the *Acts of the Privy Council, Colonial Series, 1613–1776* (6 vols., 1908–12), and the *Calendar of Treasury Papers, 1557–1745* (11 vols, 1868–1903) cover official relations between the British government and the colonies. Additional matter may be found in many of the *Reports* of the British Historical MSS. Commission. For unpublished manuscript material in the archives of various European countries, Cuba and Mexico *see* the series of guides published by the Carnegie Institution of Washington B. Perley Poore's *Federal and State Constitutions* (1877) contains the texts of colonial charters and state constitutions; and a similar collection was edited by F. N Thorpe (7 vols, 1909) The *Original Narratives of Early American History* (19 vols, 1906–17) edited by J. F. Jameson, contains reprints of much source material, and R. G. Twaites, *The Jesuit Relations and Allied Documents* (73 vols., 1896–1901), provides the original sources for the French in the interior. Of official matters relating to the Revolutionary War, special reference should be made to the *Journals of the Continental Congress, 1774–1883* (25 vols, 1904–22), edited by W. C. Ford; to F. Wharton's *Revolutionary Diplomatic Correspondence of the United States* (6 vols., 1889), and to Peter Force's *American Archives* (9 vols, 1837–53). Semi-official are the writing of the statesmen of the period—John and Samuel Adams, Jefferson, Franklin, Washington, Dickinson, Jay—all of which exist in satisfactory editions. The States all have historical societies which have published much source material on the colonial era, and there are private and local societies in addition. Prominent among these are the societies of Massachusetts, New York, New York City, New Jersey, Pennsylvania, North Carolina, Illinois and Wisconsin. Mention should also be made of the Prince Society of Boston, the Colonial Society of Massachusetts, the American Antiquarian Society of Worcester, Mass., the Essex Institute at Salem, Mass, and the Narragansett Club of Providence, R.I The American Historical Association (Washington, D C) publishes valuable monographs, bibliographies and sources

G. Griffin, *Writings on American History* (annually since 1906). (X.)

STRUGGLE FOR NATIONAL GOVERNMENT, 1783-1865

The long struggle to secure the ratification of the Articles of Confederation had given time for careful consideration of the new scheme of government. Maryland's persistent criticism had prepared men to find defects in them Conventions of New England States, pamphlets, and private correspondence had found flaws in the new plan, but a public trial of it was a necessary preliminary to getting rid of it The efforts of the individual States to maintain the war, the disposition of each State to magnify its own share in the result, the popular jealousy of a superior power, transferred now from parliament to the central government, were enough to ensure the articles some lease of life.

Territorial Cessions.—Congress and its committees had already begun to declare that it was impossible to carry on a government efficiently under the articles. Its expostulations were to be continued for several years before they were heard. In the meantime it did not neglect the great subject which concerned the essence of nationality—the western territory. Virginia had made a first offer to cede her claims, but it was not accepted. A committee of Congress now made a report (1782) maintaining the validity of the rights which New York had transferred to Congress; and in the next year Virginia made an acceptable offer. Her deed was accepted (March 1, 1784); the other claimant States followed, and Congress, which was not authorized by the articles to hold or govern territory, became the sovereign of a tract of some 430,000 square miles

In this territory Congress had now on its hands the same question of colonial government in which the British Parliament had so signally failed. The manner in which Congress dealt with it has made the United States the country that it is. The leading feature of its plan was the erection, as rapidly as possible, of States, similar in powers to the original States. The power of Congress over the territories was to be theoretically absolute, but it was to be exerted in encouraging the development of thorough self-government, and in granting it as fast as the settlers should become capable of exercising it. Copied in succeeding acts for the organization of territories, and still controlling the spirit of such acts, the ordinance of 1787 (July 13, 1787) is the foundation of almost everything which makes the modern American system peculiar.

Difficulties of the Confederation.—In the interval of the settlement of the territorial question the affairs of the "league of friendship," known as the United States, had been going from bad to worse, reaching a crisis in 1786. The public debt amounted in 1783 to about $42,000,000, of which $8,000,000 was owed abroad—in Holland, France and Spain. Congress had no power to levy taxes for the payment of interest or principal; it could only make requisitions on the States. In the four years ending in 1786 requisitions had been made for $10,000,000 and the receipts from them had amounted to but one-fourth of what had been called for. Even the interest on the debt was falling into arrears, and the first instalment of the principal fell due in 1787. To pay this, and subsequent annual instalments of $1,000,000, was quite impossible. Robert Morris, the financier of the War of Independence, resigned in 1783 rather than "be the minister of injustice," hoping thus to force upon the States the necessity of granting taxing powers to Congress. Washington, on retiring from the command-in-chief, wrote a circular letter to the governors of all the States, urging the necessity of granting to Congress some power to provide a national revenue. Congress (April 18, 1783) appealed to the States for power to levy specific duties on cer-

tain enumerated articles, and 5% on others It was believed that with these duties and the requisitions, which were now to be met by internal taxation, $2,500,000 per annum could be raised. The proposal never received the necessary ratification of all the States. The obedience to the requisitions grew more lax In 1786 a committee of Congress reported that any further reliance on requisitions would be "dishonourable to the understandings of those who entertain such confidence."

The States and Congress.—In the States the case was even worse. Some of them had been seduced into issuing paper currency in such profusion that they were almost bankrupt. Great Britain, in the treaty of peace, had recognized the independence of the individual States, naming them in order; and her Government followed the same system in all its intercourse with its late Colonies. Its restrictive system was maintained, and the States, competing with each other for more commerce, could adopt no system of counteracting measures. Every possible burden was thus shifted to American commerce; and Congress could do nothing, for, though it asked for the power to regulate commerce for 15 years, the States refused it Several States, towards the end of this period, began to prepare or adopt systems of protection of domestic productions or manufactures, aimed at preventing competition by neighbouring States The Tennessee settlers were in insurrection against the authority of North Carolina; the Kentucky settlers were disposed to cut loose from Virginia Poverty, with the rigid execution of process for debt, drove the farmers of western Massachusetts into an insurrection (Shays's Insurrection) which the State had much difficulty in suppressing; and Congress was so incompetent to aid Massachusetts that it was driven to the expedient of imagining an Indian war in that direction, in order to transfer troops thither Congress itself was in danger of disappearance from the scene The necessity for the votes of nine of the 13 States for the passage of important measures made the absence of a State's delegation quite as effective as a negative vote Congress even had to make repeated appeals to obtain a quorum for the ratification of the treaty of peace with Great Britain In 1784 Congress broke up in disgust, and the French minister reported to his government—"There is now in America no general government—neither Congress, nor president, nor head of any one administrative department"

Congress was evidently incompetent to frame a new plan of national government; its members were too dependent on their States, and would be recalled if they took part in framing anything stronger than the articles The idea of a convention of the States, independent of Congress, was in the minds and mouths of many; Thomas Paine had suggested it as long ago as his *Common Sense* pamphlet: "Let a continental conference be held . . . to frame a continental charter"

Convention of 1786.—The country drifted into a convention by a roundabout way. The navigation of Chesapeake Bay and the Potomac needed regulation, and the states of Maryland and Virginia, having plenary power in the matter, appointed delegates to arrange such rules The delegates met (1785) at Alexandria (Va), and at Washington's house, Mount Vernon (Va), in adopting their report, proposed that Pennsylvania and Delaware be asked to nominate commissioners Virginia went further and proposed a meeting of commissioners from all the States to frame commercial regulations for the whole. The convention met (1786) at Annapolis (Md), but only five States were represented, and their delegates adjourned, after recommending another convention at Philadelphia in May 1787.

Constitutional Convention.—Congress had failed in its last resort—a proposal that the States should grant it the impost power alone; New York's veto had put an end to this last hope. Confessing its helplessness, Congress approved the call for a second convention; 12 of the States (all but Rhode Island) chose delegates; and the convention met at Philadelphia (May 25, 1787) with an abler body of men than had been seen in Congress since the first two Continental Congresses Among others, Virginia sent Washington, James Madison, Edmund Randolph, George Mason and George Wythe; Pennsylvania: Franklin, Robert, Gouverneur Morris and James Wilson; Massachusetts: Rufus King, Elbridge Gerry and Caleb Strong; Connecticut: William S. Johnson, Roger Sherman and Oliver Ellsworth; New York: Alexander Hamilton; New Jersey: William Paterson; and South Carolina the two Pinckneys and John Rutledge. With hardly an exception the 55 delegates were clear-headed, moderate men, with positive views of their own and firm purpose, but with a willingness to compromise.

The Virginia Plan.—Washington was chosen to preside, and the convention began the formation of a new Constitution, instead of proposing changes in the old one. Two parties were formed at once The Virginia delegates offered a plan proposing a Congress, of two houses, having power to legislate on national subjects, and to compel the States to fulfil their obligations. This was a "large-State" plan, proposed by those States which had or hoped for a large population It meant to base representation in both houses on population, so that the large States could control both of them, and it left the appointment of the president or other executive and the Federal judges to Congress—so that the whole administration of the new government would fall under large-State control.

The New Jersey Plan.—On behalf of the "small States" Paterson of New Jersey brought in another plan It continued the old Confederation, with its single house and equal State vote, but added the power to regulate commerce and raise a revenue, and to compel the States to obey requisitions. The large States had a general majority of six to five, but the constant dropping off of one or more votes, on minor features, from their side to that of the small States prevented the hasty adoption of any radical measures Nevertheless, the final collision could not be evaded, the basis of the two plans was in the question of one or two houses, of equal or proportionate State votes, of large-State supremacy or of State equality In July the large States began to show a disposition to force their plan through, and the small States began to threaten a concerted withdrawal from the convention

The Compromise.—The Connecticut delegates, from their first appearance in the convention, had favoured a compromise They had been trained under the New England system, in which the assemblies were made up of two houses, one representing the people of the whole State, according to population, and the other giving an equal representation to the towns. They proposed that the new Congress should be made up of two houses, one representing the States in proportion to their population, the other giving an equal vote to each State. At a deadlock the convention referred the proposition to a committee, and it reported in favour of the Connecticut compromise Connecticut had been voting in the large-State list, and the votes of her delegates could not be spared from their slender majority; now another of the large States, North Carolina, came over to Connecticut's proposal, and it was adopted Thus the first great struggle of the convention resulted in a compromise, which took shape in an important feature of the Constitution, the Senate

The small States were still anxious, in every new question, to throw as much power as possible into the hands of their special representative, the Senate; and that body thus obtained its power to act as an executive council as a restraint on the President in appointments and treaties. This was the only survival of the first alignment of parties, but new divisions arose on almost every proposal introduced The election of the President was given at various times to Congress and to electors chosen by the State legislatures; and the final mode of choice, by electors chosen by the States, was settled only two weeks before the end of the convention, the office of vice president coming in with it. The opponents and supporters of the slave trade compromised by agreeing not to prohibit it for 20 years Another compromise included three-fifths of the slaves in enumerating population for representation. This provision gave the slave-holders abnormal power as the number of slaves increased.

Any explanation of the system introduced by the Constitution must start with the historical fact that, while the national Government was practically suspended, from 1776 until 1789, the only power to which political privileges had been given by the people was the States, and that the State legislatures were, when

the convention met, politically omnipotent, with the exception of the few limitations imposed on them by the early State constitutions. The general rule, then, is that the Federal Government has only the powers granted to it by the Federal Constitution, while the State has all governmental powers not forbidden to it by the State or the Federal Constitution. But the phrase defining the Federal Government's powers is no longer "expressly granted," as in the Articles of Confederation, but merely "granted," so that powers necessary to the execution of granted powers belong to the Federal Government, even though not directly named in the Constitution. This question of the interpretation or "construction" of the Constitution is at the bottom of real national politics in the United States.

The Constitution.—Popular sovereignty, then, is the basis of the American system But it does not, as does the British system, choose its legislative body and leave unlimited powers to it. It makes its "Constitution" the permanent medium of its orders or prohibitions to all branches of the Federal Government and to many branches of the State Governments. they must do what the Constitution directs and leave undone what it forbids. The people, therefore, are continually laying their commands on their governments; and they have instituted a system of Federal courts to ensure obedience to their commands. A British court must obey the Act of parliament; the American court is bound and sworn to obey the Constitution first, and the Act of Congress or of the State legislature only so far as it is warranted by the Constitution But the American court does not deal directly with the act in question; it deals with individuals who have a suit before it. One of these individuals relies on an Act of Congress or of a State legislature, the act thus comes before the court for examination, and it supports the act or disregards it as "unconstitutional," or in violation of the Constitution If the court is one of high rank, or one to which a decision may be appealed, as the U S Supreme Court, other courts follow the precedent, and the law falls to the ground.

The preamble states that "we, the people of the United States," establish and ordain the Constitution. Events have shown that it was the people of the whole United States that established the Constitution, but the people of 1787 seem to have inclined to the belief that it was the people of each State for itself. This belief was never changed in the south; and in 1861 the people of that section believed that the ordinances of secession were merely a repeal of the enacting clause by the power which had passed it, the people of the State For an account of the form of Government established by the Constitution *see* UNITED STATES: *Constitution and Government.*

The Constitution's leading difference from the Confederation is that it gives the national government power over individuals The Federal courts are the principal agents in securing this essential power; without them, the Constitution might easily have been as dismal a failure as the Confederation It has also been a most important agent in securing to the national government its supremacy over the States. From this point of view the most important provision of the Constitution is the grant of jurisdiction to Federal courts in cases involving the construction of the Constitution or of laws or treaties made under it The 25th section of the Judiciary Act of 1789 permitted any Supreme Court justice to grant a writ of error to a State court in a case in which the constitutionality of a Federal law or treaty had been denied, or in which a State law objected to as in violation of the Federal Constitution had been maintained In such cases, the defeated party had the right to carry the "Federal question" to the Federal courts. It was not until 1816 that the Federal courts undertook to exercise this power; it raised a storm of opposition, but it was maintained, and has made the Constitution what it professed to be—"the supreme law of the land."

Sovereignty.—The system of the United States is almost the only national system, in active and successful operation, as to which the exact location of the sovereignty is still a mooted question. The contention of the Calhoun school—that the separate States were sovereign before and after the adoption of the Constitution, that the Union was purely voluntary, and that the whole people, or the people of all the other States, had no right to maintain or enforce the Union against any State—has been ended by the Civil War. But that did not decide the location of the sovereignty. The prevalent opinion is still that first formulated by Madison· that the States were sovereign before 1789; that they then gave up a part of their sovereignty to the Federal Government; that the Union and the Constitution were the work of the States, not of the whole people; and that reserved powers are reserved to the people of the States, not to the whole people.

By whatever sovereignty the Constitution was framed and imposed, it was meant only as a scheme in outline, to be filled up afterwards, and from time to time, by legislation The idea is most plainly carried out in the Federal judiciary the Constitution only directs that there shall be a Supreme Court, and marks out the general jurisdiction of all the courts, leaving Congress, under the restriction of the President's veto power, to build up the system of courts But the same idea is visible in every department, and it has carried the Constitution safely through a period which has radically altered every other civilized Government It has combined elasticity with the limitations necessary to make democratic government successful over a vast territory, having infinitely diverse interests, and needing, more than almost anything else, positive opportunities for sober second thought by the people. A sudden revolution of popular thought or feeling is enough to change the House of Representatives from top to bottom; it must continue for several years before it can make a radical change in the Senate, and for years longer before it can carry this change through the judiciary, which holds for life; and all these changes must take place before the full effects upon the laws or Constitution are accomplished But minor changes are reached easily and naturally in the course of legislation.

Submission to Congress.—The convention adjourned on Sept 17, 1787, having adopted the Constitution Its last step was a resolution that the Constitution be sent to the Congress of the Confederation, with the recommendation that it be submitted to conventions elected by the people of each State for ratification or rejection, that, if nine States should ratify it, Congress should appoint days for the popular election of electors, and that then the new Congress and President should, "without delay, proceed to execute this Constitution" Both Congress and the convention were careful not to open the dangerous question, How was a Government which was not to be changed but by the legislatures of all the States to be entirely supplanted by a different system through the approval of conventions in three-fourths of them?

Action of the States.—Before the end of the year Delaware, Pennsylvania and New Jersey had ratified, and Georgia, Connecticut and Massachusetts followed during the first two months of 1788. Thus far the only strong opposition had been in Massachusetts, a "large State" In it the struggle began between the friends and the opponents of the Constitution, with its introduction of a strong Federal power; and it raged in the conventions, legislatures, newspapers and pamphlets In a classic series of papers, the *Federalist,* Alexander Hamilton, with the assistance of James Madison and John Jay, explained the new Constitution and defended it

The seventh and eighth States—Maryland and South Carolina—ratified in April and May 1788, and, while the conventions of Virginia and New York were still wrangling over the great question, the ninth State, New Hampshire, ratified, and the Constitution passed out of theory into fact. The Anti-Federalists of the Virginia and New York conventions offered conditional ratifications of all sorts; but the Federalists stubbornly refused to consider them, and at last, by very slender majorities, these two states ratified North Carolina refused to ratify the Constitution, and in Rhode Island it was referred to the several towns instead of to a convention and was rejected by an overwhelming majority, the Federalists, who advocated the calling of a convention, refraining from voting. Congress named the first Wednesday of January 1789 as the day for the choice of electors, the first Wednesday in February for the choice of President and vice president, and the first Wednesday in March for

the inauguration of the new Government, at New York city The last date fell on March 4, which has been the limit of each President's term since that time.

When the votes of the electors were counted before Congress, it was found that Washington had been unanimously elected President, and that John Adams, standing next on the list, was vice president. Long before the inauguration the Congress of the Confederation had expired of mere inanition, its attendance simply ran down until (Oct 21, 1788) its record ceased, and the United States got on without any national government for nearly six months. The struggle for nationality had been successful, and the old order faded out of existence

Slavery.—The first census (1790) followed so closely upon the inauguration of the Constitution that the country may fairly be said to have had a population of near four millions in 1789 Something over half a million of these were slaves, of African birth or blood. Slavery of this sort had taken root in almost all the Colonies its original establishment being everywhere by custom. When the custom had been sufficiently established statutes came in to regulate a relation already existing. But it is not true, as the Dred Scott decision held long afterwards, that the belief that slaves were chattels simply, things, not persons, held good at the time of the adoption of the Constitution. Times had changed somewhat. The peculiar language of the Constitution itself, describing a slave as a "person held to service or labour," under the laws of any State, puts the general feeling exactly: slaves were persons from whom the laws of some of the States withheld personal rights for the time In accordance with this feeling most of the Northern States were on the high road towards abolition of slavery. Vermont had never allowed it In Massachusetts it was swept out by a summary court decision that it was irreconcilable with the new State Constitution. Other States soon began systems of gradual abolition, which finally extinguished slavery north of Maryland, but so gradually that there were still 18 apprentices for life in New Jersey in 1860, the last remnants of the former slave system In the new States north of the Ohio slavery was prohibited by the ordinance of 1787 and the prohibition was maintained in spite of many attempts to get rid of it and introduce slavery

The sentiment of thinking men in the south was exactly the same, or in some cases more bitter from their personal entanglement with the system. Jefferson's language as to slavery is irreconcilable with the chattel notion; no abolitionist agitator ever used warmer language than he Washington, George Mason and other southern men were almost as warm against slavery as Jefferson, and there were societies for the abolition of slavery in the south In the Constitutional Convention of 1787 the strongest opposition to an extension of the period of non-interference with the slave trade from 1800 to 1808 came from Virginia, whereas every one of the New England States voted for this extension Like most slave laws, the laws of the southern states were harsh. rights were almost absolutely withheld from the slave, and punishments of the severest kind were legal; but the execution of the system was milder than its legal possibilities might lead one to imagine The country was as yet so completely agricultural that southern slavery kept all the patriarchal features possible to such a system.

Industries.—Indeed, the whole country was almost exclusively agricultural, and, in spite of every effort to encourage manufactures by State bounties, they formed the meagrest element in the national production. Connecticut, which now teems with manufactures, was just beginning the production of tinware and clocks; Rhode Island and Massachusetts were just beginning to work in cotton from models of jennies and Arkwright machinery surreptitiously obtained from England, and other States, beyond local manufactures of paper, glass and iron, were almost entirely agricultural, or were engaged in industries directly dependent on agriculture.

Population.—There were but five cities in the United States having a population of more than 10,000—New York (33,000), Philadelphia (28,500), Boston (18,000), Charleston (16,000) and Baltimore (13,000). The revenues of the new Government in 1790 were only $4,000,000; the expenditures, excluding interest on the public debt, but $1,000,000. It is not easy for the modern American to realize the poverty and weakness of his country at the inauguration of the new Government.

Travel.—Outside the cities communication was slow. One stage a week was enough for the connection between the great cities, and communication elsewhere depended on private conveyance. The western settlements were just beginning to make the question more serious Enterprising land companies were the moving force which had impelled the passage of the ordinance of 1787; and the first column of their settlers was pouring into Ohio and forming connection with their predecessors in Kentucky and Tennessee. Marietta and Cincinnati had been founded. But the intending settlers were obliged to make the journey down the Ohio river from Pittsburgh in bullet-proof flat-boats, for protection against the Indians, and the return trip depended on the use of oars. For more than 20 years these flat-boats were the chief means of river commerce in the West; and in the longer trips, as to New Orleans the boats were generally broken up at the end and sold for lumber. John Fitch and others were already experimenting on what was soon to be the steamboat; but the statesman of 1789, looking at the task of keeping under one government a country of such distances, with such difficulties of communication, naturally felt anxiety as to the future.

Literature.—The comparative isolation of the people everywhere, the lack of books, the poverty of the schools and newspapers, were all influences which worked strongly against any pronounced literary development Poems, essays and paintings were feeble imitations of European models, history was annalistic, if anything, and the drama hardly existed In two points the Americans were strong, and had done good work Such men as Jonathan Edwards had excelled in various departments of theology, and American preaching had reached a high degree of quality and influence, and, in the line of politics, the American State papers rank among the very best of their kind Having a very clear perception of their political purposes, and having been restricted in study and reading to the great masters of pure and vigorous English, and particularly to the English translators of the Bible, the American leaders came to their work with an English style which could hardly have been improved. The writings of Franklin, Washington, the Adamses, Hamilton, Jefferson, Madison, Jay and others show the secret of their strength in every page Much the same reasons, with the influences of democracy, brought oratory, as represented by Patrick Henry, Fisher Ames, John Randolph and others, to a point not very far below the mark afterwards reached by Daniel Webster. The effect of these facts on the subsequent development of the country is not often estimated at its full value

Limits of Settlement.—The cession of the "North-west Territory" by Virginia and New York had been followed by similar cessions by Massachusetts (1785), Connecticut (1786) and South Carolina (1787). North Carolina did not cede Tennessee until early in 1790, nor Georgia her western claims until 1802 Settlement in all these regions was still very sparse. The centres of western settlement, in Tennessee and Kentucky, had become more firmly established, and a new one, in Ohio, had just been begun. The whole western limits of settlement of the old 13 States had moved much nearer their present boundaries; and the acquisition of the western title, with the liberal policy of organization and government which had been begun, was to have its first clear effects during the first decade of the new government. Almost the only obstacle to its earlier success had been the doubts as to the attitude which the Spanish authorities, at New Orleans and Madrid, would take towards the new settlements. They had already asserted a claim that the Mississippi was an exclusively Spanish stream from its mouth up to the Yazoo, and that no American boat should be allowed to sail on this part of it. To the western settler the Alleghenies and bad roads were enough to cut him off from any other way to a market than down the Mississippi; and it was not easy to restrain him from a forcible defiance of the Spanish claim. The northern States were willing to allow the Spanish claim for

a period of years in return for a commercial treaty; the southern States and the western settlers protested angrily; and once more the spectre of dissolution appeared, not to be laid again until the new Government had made a treaty with Spain in 1795 securing common navigation of the Mississippi.

The Development of Democracy, 1789–1801.—All the tendencies of political institutions in the United States had been towards democracy; but the leading men were not unanimous in their agreement with this tendency Not a few of them were pronounced republicans even before 1775, but the mass of them had no great objections to a monarchical form of government until the war spirit had converted them The Declaration of Independence had been directed rather against *the* King than against *a* king. Even after popular sovereignty had pronounced against a king, class spirit was for some time a fair substitute for aristocracy As often happens, democracy at least thought of a Caesar when it apprehended class control Certain discontented officers of the Continental Army proposed to Washington that he become king, but he promptly and indignantly put the offer by

The State constitutions were democratic, except for property or other restrictions on the right of suffrage, or provisions carefully designed to keep the control of at least one house of the State legislature "in the hands of property" The Federal Constitution was so drawn that it would have lent itself kindly either to class control or to democracy The electoral system of choosing the President and vice president was altogether anti-democratic, though democracy has conquered it: not an elector, since 1796, has disobeyed the purely moral claim of his party to control his choice Since the Senate was to be chosen by the State legislatures, "property," if it could retain its influence in those bodies, could control at least one house of Congress. Whether the Constitution was to have a democratic or an anti-democratic interpretation was to be settled in the next 12 years

Immigration.—The States were a strong factor in the final settlement, from the fact that the Constitution had left to them the control of the elective franchise they were to make its conditions what each of them saw fit Religious tests for the right of suffrage had been quite common in the Colonies; property tests were almost universal The religious tests disappeared shortly after the War of Independence, the property tests survived in some of the States far into the constitutional period But the desire to attract immigration was always a strong impelling force to induce States, especially frontier States, to make the acquisition of full citizenship and political rights as easy and rapid as possible This force was not so strong at first as it was after the great stream of immigration began about 1848, but it was enough to tend constantly to the development of democracy

Organization of the New Government.—The Anti-Federalists had been a political party, but a party with but one principle. The absolute failure of that principle deprived the party of all cohesion; and the Federalists controlled the first two Congresses almost entirely Their pronounced ability was shown in their organizing measures, which still govern the American system very largely The departments of State, of the Treasury, of War, of Justice and of the Post Office were rapidly and successfully organized; acts were passed for the regulation of seamen, commerce, tonnage duties, lighthouses, intercourse with the Indians, territories and the militia; a national capital was selected; a national bank was chartered; the national debt was funded, and the State debts were assumed as part of it The first four years of the new system showed that the States had now to deal with a very different power from the impotent Congress of the Confederation. The new power was even able to exert pressure upon the two States which had not ratified the Constitution As a first step, the higher duties imposed on imports from foreign countries were expressly directed to apply to imports from North Carolina and Rhode Island North Carolina having called a second convention, her case was left to the course of nature; the second convention ratified the Constitution (Nov 21, 1789). The Rhode Island legislature asked that their State might not be considered altogether foreigners, made their duties agree with those of the new government, and reserved the proceeds for "continental" purposes. Still no further steps were taken. A bill was therefore introduced, directing the President to suspend commercial intercourse with Rhode Island, and to demand from her her share of the continental debt This was passed by the Senate, and needed but two steps further to become law Newspaper proposals to divide the little State between her two nearest neighbours were stopped by her ratification of the Constitution (May 29, 1790). The "old 13" were thus united under the Constitution; and yet, so strong is the American prejudice for the autonomy of the States that these last two were allowed to enter in the full conviction that they did so in the exercise of sovereign freedom of choice.

Protection.—Protection was begun in the first tariff act, whose object, said its preamble, was the protection of domestic manufactures. The duties, however, ranged only from 7½ to 10%, averaging about 8½% The system, too, had rather a political than an economic basis Until 1789 the States had controlled the imposition of duties The separate State feeling was a factor so strong that secession was a possibility which every statesman had to take into account Hamilton's object, in introducing the system, seems to have been to create a class of manufacturers, running through all the States, but dependent for prosperity on the new Federal Government and its tariff. This would be a force which would make strongly against any attempt at secession The same feeling seems to have been at the bottom of his establishment of a national bank, his assumption of State debts, and most of the general scheme which his influence forced upon the Federalist Party.

The First Cabinet.—In forming his cabinet Washington had paid attention to the opposing elements which had united for the temporary purpose of ratifying the Constitution The national element was represented by Hamilton, secretary of the Treasury, and Henry Knox, secretary of War, the particularist element (using the term to indicate support of the States, not of a State) by Jefferson, secretary of State, and Edmund Randolph, Attorney General At the end of 1792 matters were in train for the general recognition of the existence of two parties, whose struggles were to decide the course of the Constitution's development The occasion came in the opening of 1793, when the new nation was first brought into contact with the French Revolution.

Jefferson.—The controlling tendency of Jefferson and his school was to the maintenance of individual rights at the highest possible point, as the Hamilton school was always ready to assert the national power to restrict individual rights for the general good. The Jefferson school supported the States, in the belief that they were the best bulwarks for individual rights When the French Revolution began its course in America by agitation for the "rights of man," it met a sympathetic audience in the Jefferson party and a cold and unsympathetic hearing from the Hamilton school of Federalists, who were far more interested in securing the full recognition of the power and rights of the nation than in securing the individual against imaginary dangers, as they thought them For ten years the surface marks of distinction between the two parties were to be connected with the course of events in Europe

Hamilton.—The new Government was not yet four years old; it was not familiar, nor of assured permanency The only national governments of which Americans had had previous experience were the British Government and the Confederation: in the British they had had no share, and the Confederation had had no power. The only places in which they had had long-continued, full and familiar experience of self-government were their State Governments The governing principle of the Hamilton school, that the construction or interpretation of the terms of the Constitution was to be such as to broaden the powers of the Federal Government, necessarily involved a corresponding trenching on the powers of the States. It was natural, then, that the Jefferson school should look on every feature of the Hamilton programme as "anti-republican" The disposition of the Jefferson school to claim for themselves a certain peculiar title to the position of "republicans" developed into the appearance of the first Repub-

lican, or the Democratic-Republican, Party, about 1793.

Parties.—Many of the Federalists were shrewd and active business men, who naturally took prompt advantage of the opportunities which the new system offered. The Republicans therefore believed and asserted that the whole Hamilton programme was dictated by selfish or class interest; and they added this to the accusation of monarchical tendencies These charges, with the fundamental differences of mental constitution, exasperated by the passion which differences as to the French Revolution seemed to carry with them everywhere, made the political history of this decade a very unpleasant record The provision for establishing the national capital on the Potomac (1790) was declared to have been carried by a corrupt bargain, and accusations of corruption were renewed at every opportunity In 1793 a French agent, Edmond Charles Edouard Genet (1765–1834), appeared to claim the assistance of the United States for the French republic, and went to the length of commissioning privateers, and endeavouring to secure recruits Washington decided to issue a proclamation of neutrality, the first act of the kind in American history. It was the first indication, also, of the policy which has made the course of every President, with the exception of Polk, a determined leaning to peace, even when the other branches of the Government have been intent on war. Genet, however, continued his activities, and made outrageous demands upon the Government, so that finally Washington demanded and secured (1794) his recall. The proclamation of 1793 brought about the first distinctly party feeling, and it was intensified by Washington's charge that popular opposition in western Pennsylvania (1794) to the new excise law (*see* WHISKY INSURRECTION) had been fomented by the extreme French party Their name, Democrat, was applied by the Federalists to the whole Republican Party as a term of contempt, but it was not accepted by the party for some 20 years, then the compound title "Democratic-Republican" became, as it long remained, the official title of the party There was no party opposition, however, to the re-election of Washington in 1792, or to the admission of Vermont (1791), Kentucky (1792) and Tennessee (1796) as new States

Jay's Treaty.—The British Government had accredited no minister to the United States, and it refused to make any commercial treaty or to give up the forts in the western territory of the United States, through which its agents still exercised a commanding influence over the Indians In the course of its war with France, the neutral American vessels, without the protection of a national navy, fared badly A treaty negotiated in 1794 by Chief Justice John Jay settled these difficulties for the following 12 years But, as it engaged the United States against any intervention in the war on behalf of France, was silent on the subject of the right of search, and agreed to irksome limitations on the commercial privileges of the United States, the Republicans made it very unpopular, and the bitter personal attacks on Washington grew out of it In spite of occasional Republican successes, the Federalists retained a general control of national affairs, they elected John Adams President in 1796, though Jefferson was chosen vice president with him, and the national policy of the Federalists kept the country out of entangling alliances with any of the European belligerents To the Republicans, and to the French republic, this last point of policy was only a practical intervention against France and against the rights of man

At the end of Washington's Administration the French Directory broke off relations with the United States, demanding the abrogation of Jay's treaty and a more pronounced sympathy with France Adams sent three envoys, C. C Pinckney, John Marshall and Elbridge Gerry, to endeavour to re-establish the former relations; they were met by demands for "money, a great deal of money," as a prerequisite to peace They refused; their letters home were published, and the Federalists at last had the opportunity of riding the whirlwind of an intense popular desire for war with France. Intercourse with France was suspended by Congress (1798), the treaties with France were declared at an end; American frigates were authorized to capture French vessels guilty of depredations on American commerce, and the President was authorized to issue letters of marque and reprisal; and an American Army was formed, Washington being called from his retirement at Mount Vernon to command it. The war never went beyond a few sea fights, in which the little American Navy did itself credit, and Napoleon, seizing power the next year, renewed the peace which should never have been broken

Decline of the Federalists.—The reaction in Great Britain against the indefinite "rights of man" had led Parliament to pass an alien law, a sedition law suspending the writ of *habeas corpus* and an act giving wide and loosely defined powers to magistrates for the dispersion of meetings to petition for redress of grievances The Federalists were in control of a Congress of limited powers; but they were strongly tempted by sympathies and antipathies of every sort to form their programme on the model furnished from England The measures which they actually passed were based only on that construction of the Constitution which is at the bottom of all American politics, they only tended to force the Constitution into an anti-democratic direction But it was the fixed belief of their opponents that they meant to go farther, and to secure control by some wholesale measure of political persecution

The Alien and Sedition Laws.—Three alien laws were passed in June and July, 1798 The first (repealed in April, 1802) raised the number of years necessary for naturalization from five to 14 The third permitted the arrest or removal of subjects of any foreign power with which the United States should be at war The second, which is usually known as the Alien Law, was limited to a term of two years, it permitted the President to arrest or order out of the country any alien whom he should consider dangerous to the country As many of the Republican editors and local leaders were aliens, this law really put a large part of the Republican organization in the power of the President The Sedition Law (to be in force until March, 1801, and not renewed) made it a crime, punishable by fine and imprisonment, to publish or print any false, scandalous and malicious writings against the Government of the United States, either house of Congress, or the President, or to stir up sedition or opposition to any lawful act of Congress or of the President, or to aid the designs of any foreign power against the United States In its first form the bill was even more sweeping than this and alarmed the opposition

Most of the ability of the country was in the Federalist ranks, the Republicans had but two first-rate men—Jefferson and Madison In the sudden issue thus forced between individual rights and national power, Jefferson and Madison could find but one bulwark for the individual—the power of the States; and their use of it gave their party a pronounced list to State sovereignty from which it did not recover for years They objected to the Alien Law on the grounds that aliens were under the jurisdiction of the State, not of the Federal Government; that the jurisdiction over them had not been transferred to the Federal Government by the Constitution, and that the assumption of it by Congress was a violation of the Constitution's reservation of powers to the States; and, further, because the Constitution reserved to every "person," not to every citizen, the right to a jury trial. They objected to the Sedition Law on the grounds that the Constitution had specified exactly the four crimes for whose punishment Congress was to provide; that criminal libel was not one of them; and that the 1st amendment forbade Congress to pass any law restricting freedom of speech or of the press.

Virginia and Kentucky Resolutions.—The Republican objections might have been made in court, on the first trial. But the Republican leaders had strong doubts of the impartiality of the Federal judges, who were Federalists They resolved to entrench the party in the State legislatures The Virginia legislature in 1798 passed a series of resolutions prepared by Madison, and the Kentucky legislature in the same year passed a series prepared by Jefferson. Neglected or rejected by the other States, they were passed again by their legislatures in 1799. The leading idea expressed in both was that the Constitution was a "compact" between the States, and that the powers (the States) which had made the compact had reserved the power to restrain the creature of the compact, the Federal Government, whenever it undertook

to assume powers not granted to it. Madison's idea seems to have been that the restraint was to be imposed by a second convention of the States. Jefferson's idea is more doubtful; if it meant that the restraint should be imposed by any state which should feel aggrieved, his scheme was merely Calhoun's idea of nullification; but there are some indications that he agreed with Madison

The first Congress of Adams's term of office ended in 1799. Its successor, elected in the heat of the French war excitement, kept the Federalist policy up to its first pitch Out of Congress the execution of the objectionable laws had taken the shape of political persecution. Men were arrested, tried and punished for writings which the people had been accustomed to consider within legitimate political methods The Republican leaders made every trial as public as possible, and gained votes constantly, so that the Federalists began to be shy of the very powers which they had sought Every new election was a storm signal for the Federalist Party, and the danger was increased by schism in their own ranks

Election of 1800.—Hamilton was now a private citizen of New York; but he had the confidence of his party more largely than its nominal head, the President, and he maintained close and confidential relations with the cabinet which Adams had taken unchanged from Washington The Hamilton faction saw no way of preserving and consolidating the newly acquired powers of the Federal Government but by keeping up and increasing the war feeling against France, Adams had the instinctive leaning of an American President towards peace Amid cries of wrath and despair from his party he accepted the first overtures of the new Napoleonic Government, sent envoys to negotiate a peace, and ordered them to depart for France when they delayed Then, discovering flat treachery in his cabinet, he dismissed it and blurted out a public expression of his feeling that Hamilton and his adherents were "a British faction" Hamilton retorted with a circular letter to his party friends, denouncing the President; the Republicans intercepted it and gave it a wider circulation than its author had intended The result depended on the electoral vote of New York; and Aaron Burr, who had introduced the drill and machinery of a modern American political party there, had made the State Republican and secured a majority for the Republican candidates These (Jefferson and Burr) received the same number of electoral votes (73) and the House of Representatives (controlled by the Federalists) was thus called upon to decide which should be President There was an effort by the Federalists to disappoint the Republicans by making Burr President; but Jefferson obtained that office, Burr becoming vice president for four years This disputed election, however, led to the adoption in 1804 of the 12th amendment to the Constitution, which prescribed that each elector should vote separately for president and vice president, and thus prevent another tie vote of this kind

The "Revolution of 1800" decided the future development of the United States The new dominant party entered upon its career weighted with the theory of State sovereignty; and a civil war was necessary before this dogma, put to use again in the service of slavery, could be banished But the democratic development never was checked As the Republicans obtained control of the States they altered the State constitutions so as to cut out all the arrangements that favoured property or class interests, and reduced political power to the dead level of manhood suffrage In most of the States outside of New England this process was completed before 1815; but New England tenacity was proof against the advancing revolution until about 1820 For 20 years after its downfall of 1800 the Federalist party maintained its hopeless struggle, and then it faded away into nothing, leaving as its permanent memorial the excellent organization of the Federal Government, which its successful rival hardly changed. Its two successors—the Whig and the second Republican party—have also been broad-constructionist parties, but they have admitted democracy as well.

The New Capital.—The disputed election of 1800 was decided in the new capital city of Washington, to which the Government had just been removed, after having been for ten years at Philadelphia. Its streets and parks existed only on paper. The Capitol had been begun; the Executive Mansion was unfinished, and its audience room was used by Mrs Adams as a drying room for clothes; the congressmen could hardly find lodgings The inconveniences were only an exaggeration of the condition of other American cities Their sanitary conditions were bad, and yellow fever and cholera from time to time reduced several of them almost to depopulation More than once during this decade the fever visited Philadelphia and New York, drove out most of the people, and left grass growing in the streets The communication between the cities was still wretched The traveller was subject to every danger that bad roads, bad carriages, bad horses, bad inns and bad police protection could combine to inflict upon him

The West.—About this time the term "the West" appears It meant then the western part of New York, the new territory north of the Ohio, and Kentucky and Tennessee In settling land boundaries New York had transferred (1786) to Massachusetts, whose claims crossed her territory, the right to (but not jurisdiction over) a large tract of land in central New York, and to another large tract in the Erie basin The sale of this land had carried population considerably west of the Hudson Between 1790 and 1800 the population of Ohio had risen from almost nothing to 45,000, that of Tennessee from 36,000 to 106,000, and that of Kentucky from 74,000 to 221,000—the last-named State now exceeding six of the "old 13" in population The difficulties of the western emigrant, however, were still enormous He obtained land of his own, fertile land and plenty of it, but little else. The produce of the soil had to be consumed at home, or near it, ready money was scarce and distant products scarcer, and comforts, except the very rudest substitutes of home manufacture, were unobtainable. The number of post offices rose during these ten years from 75 to 903, the miles of post routes from 1,900 to 21,000, and the revenue from \$38,000 to \$231,000

Patents.—The power of Congress to regulate patents was already bearing fruit Until 1789 this power was in the hands of the States, and the privileges of the inventor were restricted to the territory of the patenting State Now he had a vast and growing territory within which all the profits were his own Twenty patents were issued in 1793, and 23,471 100 years later One of the inventions of 1793 was Eli Whitney's cotton gin

Cotton.—When the Constitution was adopted it was not known that the cultivation of cotton could be made profitable in the southern States The "roller gin" could clean only 6 lb a day by slave labour In 1784 eight bags of cotton, landed in Liverpool from an American ship, had been seized on the ground that so much cotton could not be the produce of the United States Eli Whitney invented the saw-gin, by which the cotton was dragged through parallel wires with openings too narrow to allow the seeds to pass; and one slave could now clean 1,000 lb a day The exports of cotton leaped from 189,000 lb in 1791 to 21,000,000 lb in 1801, and doubled in three years more The influence of this one invention, combined with the wonderful series of British inventions which had paved the way for it, can hardly be estimated in its commercial aspects. Its political influences were even wider, but more unhappy The introduction of the commercial element into the slave system of the South robbed it at once of the patriarchal features which had made it tolerable, while it developed in slaveholders a new disposition to defend a system of slave labour as a "positive good"

Slavery.—The development of a class whose profits were merely the extorted natural wages of the black labourer was certain; and its political power was as certain, though it never showed itself clearly until after 1830 And this class was to have a peculiarly distorting effect on the political history of the United States. Aristocratic in every sense but one, it was ultra-Democratic (in a purely party sense) in its devotion to State sovereignty, for the legal basis of the slave system was in the laws of the several States. In time the aristocratic element got control of the party which had originally looked to State rights as a bulwark of individual rights; and the party was finally committed to the employment of its original doctrine for an entirely different purpose—the suppression of the black labourer's wages.

Democracy and Nationality, 1801–29.—When Jefferson took office in 1801 his party, ignoring the natural forces which

tied the States together even against their wills, insisted that the legal basis of the bond was in the power of any State to withdraw at will This was no nationality; and foreign nations naturally refused to take the American national coin at any higher valuation than that at which it was current in its own country. The urgent necessity was for a reconciliation between democracy and nationality; and this was the work of this period. An underlying sense of all this has led Democratic leaders to call the war of 1812–15 the "Second War of Independence"; the result was independence of past ideas as the first had been of Great Britain

Louisiana.—The first force in the new direction was the acquisition of Louisiana in 1803. Napoleon had acquired it from Spain, and, fearing an attack upon it by Great Britain, offered it to the United States for $15,000,000. The Constitution gave the Federal Government no power to buy and hold territory, and the party was based on a strict construction of the Constitution. Possession of power forced the strict-construction party to broaden its ideas, and Louisiana was bought, though Jefferson quieted his conscience by talking for a time of a futile proposal to amend the Constitution so as to grant the necessary power. The acquisition of the western Mississippi basin more than doubled the area of the United States, and gave them control of all the great river systems of central North America. The difficulties of using these rivers were removed almost immediately by Robert Fulton's utilization of steam in navigation (1807). Within four years steamboats were at work on western waters; and thereafter the increase of steam navigation and that of population stimulated one another. The centre of population during this period advanced from about the middle of Maryland to its earlier extreme western limit; that is, the centre of population was in 1830 nearly at the place which had been the western limit of population in 1770.

The Oregon Country.—Jefferson also laid the basis for a further acquisition in the future by sending an expedition under Meriwether Lewis and William Clark to explore the territory north of the then Spanish territory of California and west of the Rocky Mountains—the "Oregon country" as it was afterwards called The explorations of this party (1804–06), with Capt. Robert Gray's discovery of the Columbia river (1792), made the best part of the claims of the United States to the country 40 years later.

Election of 1804.—Jefferson was re-elected in 1804 His great success as President was the acquisition of Louisiana, which was a violation of his party principles; but all his minor successes were, like this, recognitions of the national sovereignty which he disliked so much After a short and brilliant naval war the Barbary pirates were reduced to submission (1805). The long-continued control of New Orleans by Spain, and the persistent intrigues of the Spanish authorities, looking towards a separation of the whole western country from the United States, had been ended by the acquisition of Louisiana. There still existed a dangerous ignorance of Federal power and control, of which Aaron Burr took advantage (1806–07). Organizing an expedition in Kentucky and Tennessee, probably for the conquest of the Spanish colony of Mexico, he was arrested on the lower Mississippi and brought back to Virginia. He was acquitted; but the incident opened up a vaster view of the national authority than democracy had yet been able to take.

Jefferson and his party persistently refused to recognize the inherent power of the nation in international affairs. The Jay treaty expired in 1806 and American commerce was left to the course of events, Jefferson refusing to accept the only treaty which the British Government was willing to make. All the difficulties which followed may be summed up in a few words. the British Government was then the representative of the ancient system of restriction of commerce, and had a powerful Navy to enforce its ideas; the American Government was endeavouring to force into international recognition the system of neutral rights and unrestricted commerce, but its suspicious democracy refused to give it a navy sufficient to command respect.

Neutral Commerce.—Great Britain was now at war, from time to time, with almost every other nation of Europe. In time of peace European nations followed generally the old restrictive principle of allowing another nation, like the United States, no commercial access to their colonies; but, when they were at war with Great Britain, whose Navy controlled the ocean, they were very willing to allow the neutral American merchantmen to carry away their surplus colonial produce. Great Britain had insisted for 50 years that the neutral nation, in such cases, was really intervening in the war as an ally of her enemy; but she had so far modified her claim as to admit that "transhipment," or breaking bulk, in the United States was enough to qualify the commerce for recognition. The neutral nation thus gained a double freight, and grew rich in the traffic; the belligerent nations no longer had commerce afloat for British vessels to capture; and the "frauds of the neutral flags" became a standing subject of complaint among British merchants and naval officers. About 1805 British prize courts began to disregard transhipment and to condemn American vessels which made the voyage from a European colony to the mother country by way of the United States.

Impressment.—The question of expatriation, too, furnished a good many burning grievances Great Britain maintained the old German rule of perpetual allegiance, though she had modified it by allowing the right of emigration. The United States, founded by immigration, was anxious to establish the right of the subject to divest himself of allegiance by naturalization under a foreign jurisdiction. Four facts thus tended to break off friendly relations. (1) Great Britain's claim to allegiance over American naturalized subjects; (2) her claim to the belligerent right of search of neutral vessels; (3) her claim of right to impress for her vessels of war her subjects who were seamen wherever found; and (4) the difficulty of distinguishing native-born American from British subjects, even if the right to impress naturalized American subjects were granted British naval officers even undertook to consider all who spoke the English language as British subjects, unless they could produce proof that they were native-born Americans. The American sailor who lost his papers was thus open to impressment. A particularly flagrant case of seizure of Americans occurred in 1807. On June 27 the British ship "Leopard" fired upon the American frigate "Chesapeake," which, after having lost three men killed and 18 wounded, hauled down its flag; the British commander then seized four of the "Chesapeake's" crew. This action aroused intense anger throughout the country, and but for the impotence of the Government would undoubtedly have led to immediate war. The American Government in 1810 published the cases of such impressments since 1803 as numbering over 4,000, about one-third of the cases resulting in the discharge of the impressed man.

In May, 1806, the British Government, by orders in council, declared a blockade of the whole continent of Europe from Brest to the Elbe, about 800 miles. In November, after the battle of Jena, Napoleon answered by the "Berlin decree," in which he assumed to blockade the British Isles, thus beginning his "continental system." A year later the British Government answered by further orders in council, forbidding American trade with any country from which the British flag was excluded, allowing direct trade from the United States to Sweden only, in American products, and permitting American trade with other parts of Europe only on condition of touching in England and paying duties Napoleon retorted with the "Milan decree," declaring good prize any vessel which should submit to search by a British ship; but this was evidently a vain fulmination

The Navy.—The Democratic Party of the United States was almost exclusively agricultural and had little sympathy with commercial interests; it was pledged to the reduction of national expenses and the debt, and did not wish to take up the responsibility for a navy; and, as the section of country most affected by the orders in council, New England, was Federalist, a tinge of political feeling could not but colour the decisions of the dominant party. Various ridiculous proposals were considered as substitutes for a necessarily naval war; and perhaps the most ridiculous was adopted. Since the use of non-intercourse agreements as revolutionary weapons against Great Britain, an overweening confidence in such measures had sprung up, and one of them was now resorted to—the embargo of Dec. 22, 1807, forbidding foreign commerce altogether. It was expected to starve Great Britain

into a change of policy; and its effects may be seen by comparing the $20,000,000 exports of 1790, $49,000,000 of 1807 and $9,000,000 of 1808. It does not seem to have struck those who passed the measure that the agricultural districts also might find the change unpleasant; but that was the result, and their complaints reinforced those of New England. The pressure had been slightly relieved by the substitution of the Non-Intercourse Law of March 1, 1809; it prohibited commercial intercourse with Great Britain and France and their dependencies, leaving other foreign commerce open, prohibited the importation from any quarter of British and French goods, and forbade the entrance of British or French vessels, public or private, into any port of the United States. Madison, Jefferson's secretary of State, who succeeded Jefferson in 1809, assumed in the Presidency a burden which was not enviable. New England was in a ferment, and was suspected of designs to resist the restrictive system by force; and the Administration did not face the future with confidence

The War of 1812.—The Non-Intercourse Law was to be in force only "until the end of the next session of Congress" and was to be abandoned as to either belligerent which should abandon its attacks on neutral commerce, and maintained against the other In 1810 the American Government was led to believe that France had abandoned its system Napoleon continued to enforce it in fact, but his official fiction served its purpose of limiting the non-intercourse for the future to Great Britain, and thus straining relations between that country and the United States still further. The elections of 1811–12 resulted everywhere in the defeat of "submission men" and in the choice of new members who were determined to resort to war against Great Britain. Henry Clay, John C Calhoun, William H Crawford and other new men seized the lead in the two houses of Congress, and forced Madison, it is said, to agree to a declaration of war as a condition of his renomination in 1812 Madison sent to Congress a confidential "war message" on June 1 and on the 18th war was declared The national democracy meant to attack Great Britain in Canada, partly to gratify its western constituency, who had been harassed by Indian attacks, asserted to have been instigated from Canada Premonitions of success were drawn from the battle of Tippecanoe, in which William Henry Harrison had defeated in 1811 the north-western league of Indians formed by Tecumseh Between the solidly settled Atlantic States and the Canadian frontier was a wide stretch of unsettled or thinly settled country, which was itself a formidable obstacle to war. Ohio had been admitted as a State in 1802, and Louisiana was admitted in 1812; but their admission had been due to the desire to grant them self-government rather than to their full development in population and resources Cincinnati was a little settlement of 2,500 inhabitants; the fringe of settled country ran not very far north of it; all beyond was a wilderness The case was much the same with western New York. It would have been far less costly, as events proved, to have entered at once upon a naval war; but the crusade against Canada had been proclaimed all through Kentucky and the west, and their people were determined to wipe out their old scores before the conclusion of the war (For the military and naval events of the war *see* AMERICAN WAR OF 1812)

The war opened with disaster—Gen. William Hull's surrender of Detroit; and disaster attended it for two years. Political appointments to positions in the regular army were numerous and such officers were worse than useless Futile attempts at invasion were followed by defeat or abortion, until the political officers were weeded out at the end of the year 1813, and Jacob Brown, Winfield Scott, E. W. Ripley and others who had fought their way up were put in command. Then for the first time the men were drilled and brought into effective condition; two successful battles in 1814—Chippewa and Lundy's Lane—threw some glory on the end of the war. So weak were the preparations even for defence that a British expedition in 1814 met no effective resistance when it landed and burned Washington.

The American Navy was but a puny adversary for the British Navy, which had captured or shut up in port all the other navies of Europe. But the small number of American vessels, with the superabundance of trained officers, gave them one great advantage: the training and discipline of the men, and the equipment of the vessels, had been brought to the very highest point. "The art of handling and fighting the old broadside sailing frigate" had been carried in the little American Navy to an excellence which unvarying success and a tendency to fleet-combats had now made far less common among British captains Altogether the American vessels gave a remarkably good account of themselves

Hartford Convention.—The home dislike to the war had increased steadily with the evidence of incompetent management by the administration. The Federalists, who had always desired a navy, pointed to the naval successes as the best proof of folly with which the war had been undertaken. New England Federalists complained that the Federal Government utterly neglected the defence of their coast, and that southern influence was far too strong in national affairs They showed at every opportunity a disposition to adopt the furthest stretch of State sovereignty, as stated in the Kentucky resolutions, and every such development urged the national democracy unconsciously further on the road to nationality When the New England States sent delegates to meet at Hartford (Conn), and consider their grievances and the best remedies, treason was suspected, and a readiness to suppress it by force was plainly shown. The recommendations of the convention came to nothing; but the attitude of the dominant party towards it is one of the symptoms of the manner in which the trials of actual war were steadily reconciling democracy and nationality The object which Hamilton had sought by high tariffs and the development of national classes had been attained by more natural and healthy means.

Peace.—In April, 1814, the first abdication of Napoleon took place, and Great Britain was able to give more attention to her American antagonist The main attack was to be made on Louisiana, the weakest and most distant portion of the Union A fleet and army were sent thither, but the British assault was completely repulsed (Jan. 8, 1815) by the Americans under Andrew Jackson Peace had been made at Ghent 15 days before the battle was fought, but the news of the battle and the peace reached Washington almost together.

The United States secured a fairly good treaty. It is true that it said not a word about the questions of impressment, search and neutral rights, the grounds of the war; Great Britain did not abandon her position on any of them But everybody knew that circumstances had changed The new naval power whose frigates alone in the past 20 years had shown their ability to fight English frigates on equal terms was not likely to be troubled in future with the question of impressment; and in fact, while not renouncing the right, the British Government no longer attempted to enforce it.

End of Federal Party.—The remainder of this period is one of the barrenest in American history. The opposition of the Federalist Party to the war completed the measure of its unpopularity, and it had only a perfunctory existence for a few years longer Scandal, intrigue and personal criticism became the most marked characteristics of American politics until the dominant party broke at the end of the period, and real party conflict was renewed But the seeds of the final disruption are visible from the peace of 1814. The old-fashioned Republicans looked with intense suspicion on the new form of Republicanism generated by the war, a type which instinctively bent its energies toward the further development of national power Clay was the natural leader of the new Democracy, but John Quincy Adams and others of Federalist antecedents or leanings took to the new doctrines kindly; and even Calhoun, Crawford and others of the southern interest were at first strongly inclined to support them. One of the first effects was the revival of protection and of a national bank

The Bank.—The charter of the national bank had expired in 1811, and the dominant party had refused to recharter it. The attempt to carry on the war by loans resulted in almost a bankruptcy and in a complete inability to act efficiently. As soon as peace gave time for consideration, a second bank was chartered (April 10, 1816) for 20 years with a capital of $35,000,000, one-fifth of which was to be subscribed for by the national Govern-

ment. It was to have the custody of the Government revenues, but the secretary of the Treasury could divert the revenues to other custodians, giving his reasons for such action to Congress.

Protection.—Protection was advocated again on national grounds, but not quite on those which had moved Hamilton. The additional receipts were now to be expended for fortifications and other national defences, and for national roads and canals. The war and blockade had been an active form of protection, under which American manufactures had sprung up. As soon as peace was made English manufacturers drove their American rivals out of business or reduced them to desperate straits Their cries for relief had a double effect. They gave the spur to the nationalizing advocates of protection, and, as most of the manufacturers were in New England or New York, they developed in the citadel of Federalism a class which looked for help to a Republican Congress This was the main force which brought New England into the Republican fold before 1825. An increase in the number of spindles from 80,000 in 1811 to 500,000 in 1815, and in cotton consumption from 500 bales in 1800 to 90,000 in 1815, the rise of manufacturing towns, and the rapid development of the mechanical tendencies of a people who had been hitherto almost exclusively agricultural, were influences which were to be reckoned with in the politics of a democratic country

Tariff of 1816.—The tariff of 1816 imposed a duty of about 25% on imports of cotton and woollen goods, and specific duties on iron imports, except pig-iron, on which there was an *ad valorem* duty of 20% In 1818 this duty also was made specific (50 cents a cwt) The *ad valorem* duties carried most of the manufacturers through the financial crisis of 1818–19, but the iron duties were less satisfactory In English manufacture the substitution of coke for charcoal in iron production led to continual decrease in price. As the price went down the specific duties were continually increasing the absolute amount of protection Thus spared the necessity for improvements in production, the American manufacturers felt English competition more keenly as the years went by, and called for more protection.

Era of Good Feeling.—James Monroe succeeded Madison as President in 1817, and, re-elected with hardly any opposition in 1820, he served until 1825 So complete was the supremacy of the Republican Party that this is often called "the era of good feeling." It came to an end when a successor to Monroe was to be elected; the two sections of the dominant party then had their first opportunity for open struggle During Monroe's two terms of office the nationalizing party developed the policy on which it proposed to manage national affairs. This was largely the product of the continually swelling western movement of population. The influence of the steamboat was felt more and more every year, and the want of a similar improvement in land transport was correspondingly evident. The attention drawn to western New York by the war had filled that part of the State with a new population The southern Indians had been completely overthrown by Andrew Jackson during the war of 1812, and forced to cede their lands The admission of the new States of Indiana (1816), Mississippi (1817), Illinois (1818), Alabama (1819), Maine (1820) and Missouri (1821)—all but Maine the product and evidence of western growth—were the immediate results of the development consequent upon the war. All the territory east of the Mississippi, except the northern part of the North-west Territory, was now formed into self-governing States; the State system had crossed the Mississippi; all that was needed for further development was the locomotive engine. The 4,000,000 of 1790 had grown into 13,000,000 in 1830

The "American System."—The urgent demand of western settlers for some road to a market led to a variety of schemes to facilitate intercourse between the east and the west—the most successful being that completed in New York in 1825, the Erie canal. The Hudson river forms the great natural breach in the barrier range which runs parallel to the Atlantic coast. When the traveller has passed up the Hudson through that range he sees before him a vast champaign country extending westward to the Great Lakes, and perfectly adapted by nature for a canal. Such a canal, to turn western traffic into the lake rivers and through the lakes, the canal, and the Hudson to New York city, was begun by the State through the influence of De Witt Clinton. It was derisively called "Clinton's big ditch" until its completion laid the foundations for the great commercial prosperity of New York State and city. Long before it was finished the evident certainty of its success had enticed other States into far less successful enterprises of the kind and had established as a nationalizing policy the combination of high tariffs and expenditures for internal improvements which was long known as the "American system." The tariffs or duties on imports were to be carried as high as revenue results would justify; the superabundant revenues were to be expended on enterprises which would tend to aid the people to subdue the continent. Protection was now to be for national benefit, not for the benefit of classes Western farmers were to have manufacturing towns at their doors, as markets for the surplus which had hitherto been rotting on their farms; competition among manufacturers was to keep down prices; and Henry Clay's eloquence was to commend the whole policy to the people. The old democracy, particularly in the south, insisted that the whole scheme really had its basis in benefits to classes, that its communistic features were not such as the Constitution meant to cover by its grant of power to Congress to levy taxation for the general welfare The dissatisfaction in the South rose higher when the tariffs were increased in 1824 and 1828 The proportion of customs revenue to dutiable imports rose to 37% in 1825 and to 44% in 1829; and the ratio to aggregate imports to 33% in 1825 and 37% in 1829

The Monroe Doctrine.—In international relations the action of the Government was strong, quiet and self-respecting Its first weighty action took place in 1823 It had become pretty evident that the Holy Alliance meant to aid Spain in bringing her revolted South American colonies to obedience. Great Britain had been drifting steadily away from the alliance, and George Canning, the new secretary, determined to call in the weight of the transatlantic power as a check upon it A hint to the American minister was followed by a few pregnant passages in Monroe's annual message in December. "We could not view," he said, "any interposition for the purpose of oppressing them [the South American States], or controlling in any other manner their destiny by any European power, in any other light than as the manifestation of an unfriendly disposition towards the United States" If both the United States and Great Britain were to take this ground the fate of a fleet sent by the Alliance across the Atlantic was not in much doubt, and the project was at once given up.

It was supposed at the time that Spain might transfer her colonial claims to some stronger power; and Monroe therefore said that "the American continents, by the free and independent condition which they have assumed and maintained, are henceforth not to be considered as subjects for future colonization by any European powers" This declaration and that quoted above constitute together the "Monroe Doctrine" as originally proclaimed The doctrine has remained the rule of foreign intercourse for all American parties

Oregon.—By a treaty with Russia (1825) that power gave up all claims on the Pacific coast south of the present limits of Alaska. The northern boundary of the United States had been defined by the treaty of 1783; and, after the acquisition of Louisiana, a convention with Great Britain (1818) settled the boundary on the line of 49° N. lat as far west as the Rocky Mountains. West of these mountains the so-called Oregon country, on whose limits the two powers could not agree, was to be held in common possession for ten years. This common possession was prolonged by another convention (1827) indefinitely, with the privilege to either power to terminate it, on giving 12 months' notice. This arrangement lasted until 1846.

Election of 1824.—Monroe's term of office came to an end in March 1825. He had originally been an extreme Democrat, who could hardly speak of Washington with patience; he had slowly modified his views, and his tendencies were now eagerly claimed by the few remaining Federalists as identical with their own. All the candidates for the Presidency in 1824—Andrew Jackson, a private citizen of Tennessee; William H. Crawford, Monroe's

secretary of the treasury; John Quincy Adams, his secretary of State; and Henry Clay, the Speaker of the House of Representatives—claimed to be Republicans alike; but the personal nature of the struggle was shown by the tendency of their supporters to call themselves "Adams men" or "Jackson men," rather than by any real party title. Calhoun was supported by all groups for the vice presidency, and was elected without difficulty. The choice of a president was more doubtful.

Party Changes.—None of the four candidates had anything like a party organization behind him. Adams and Clay represented the nationalizing element, as Crawford and Jackson did not, but there the likeness among them stopped. The strongest forces behind Adams were the new manufacturing and commercial interests of the East; behind Clay were the desires of the West for internal improvements· and the two elements were soon to be united into the National Republican or Whig Party. Crawford was the representative of the old Democratic Party, with all its Southern influences and leanings. Jackson was the personification of the new democracy—not very cultured, perhaps, but honest, and hating every shade of class control instinctively As he became better known the whole force of the new drift of things turned in his direction Crawford was taken out of the race, just after the electors had cast their votes, by physical failure, and Adams, later, by the revival of ancient quarrels with the Federalists of New England, and the future was to be with Clay or with Jackson But in 1824 the electors gave no one a majority; and the House of Representatives, voting by States, gave the presidency to Adams.

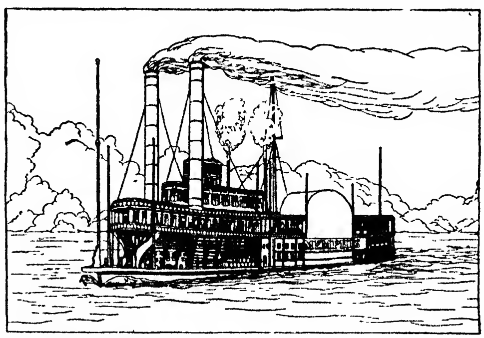
Adams' election in 1825 was due to the fact that Clay's friends in the House—unable to vote for him, as he was the lowest in the electoral vote, and only three names were open to choice in the House—very naturally gave their votes to Adams As Adams appointed Clay to the leading position in his cabinet, the defeated party at once raised the cry of "bargain and intrigue," one of the most effective in a democracy, and it was kept up throughout Adams' four years of office Jackson had received the largest number of electoral votes, though not a majority and the hazy notion that he had been injured because of his devotion to the people increased his popularity. Though demagogues made use of it for selfish purposes, this feeling was an honest one, and Adams had nothing to oppose to it. He tried vigorously to uphold the "American system," and succeeded in passing the tariff of 1828; he tried to maintain the influence of the United States on both the American continents; but he remained as unpopular as his rival grew popular In 1828 Adams was easily displaced by Jackson, the electoral vote being 178 to 83. Calhoun was reelected vice president.

Triumph of Jackson.—Jackson's inauguration in 1829 closes this period, as it ends the time during which a disruption of the Union by the peaceable withdrawal of any State was even possible. The party which had made State sovereignty its bulwark in 1798 was now in control of the Government again; but Jackson's proclamation in his first term, in which he warned South Carolina that "disunion by armed force is treason," and that blood must flow if the laws were resisted, speaks a very different tone from the speculations of Jefferson on possible future divisions of the United States. Even the sudden attempt of South Carolina to exercise independent action shows that some interest dependent upon State sovereignty had taken alarm at the drift of events, and was anxious to lodge a claim to the right before it should slip from its fingers for ever.

Slavery.—When the vast territory of Louisiana was acquired in 1803 the new owner found slavery already established there. Congress tacitly ratified existing law by taking no action; slavery continued legal, and spread further through the territory; and the State of Louisiana entered as a slave State in 1812. The next State to be carved out of the territory was Missouri, admitted in 1821. A territory, on applying for admission as a State, brings a Constitution for inspection by Congress; and when it was found that the new State of Missouri proposed to recognize and continue slavery, a vigorous opposition spread through the North and West, and carried most of the senators and representatives from those sections with it In the House of Representatives these two sections had a greatly superior number of members; but, as the number of Northern and Southern States had been kept about equal, the compact Southern vote, with one or two Northern allies, generally retained control of the Senate. Admitted by the Senate and rejected by the House, Missouri's application hung suspended for two years until it was successful by the admission of Maine, a balancing Northern State, and by the following arrangement, known as the Missouri Compromise of 1820· Missouri was to enter as a slave State; slavery was forever prohibited throughout the rest of the Louisiana Purchase north of lat 36° 36′, the main southern boundary of Missouri; and, though nothing was said of the territory south of the compromise line, it was understood that any State formed out of it was to be a slave State, if it so wished. Arkansas entered under this provision in 1836.

The question of slavery was thus set at rest for the present, though a few agitators were roused to more zealous opposition to the essence of slavery itself In the next decade these agitators succeeded only in the conversion of a few recruits, but these recruits were the ones who took up the work at the opening of the next period It is plain now, however, that North and South had already drifted so far apart as to form two sections, and it became evident during the next forty years that the wants and desires of these two sections were so divergent that it was impossible for one Government to make satisfactory laws for both

The Settled Area.—The vast flood of human beings which had been pouring westward for years had now pretty well occupied the territory east of the Mississippi, while, on the west side of that stream, it still showed a disposition to hold to the river valleys The settled area had increased from 240,000sq m in 1790 to 633,000sq m in 1830, with an average of 20·3 persons to the sq mile There was still a great deal of Indian territory in the Southern States of Georgia, Alabama, Mississippi and Florida, for the Southern Indians were among the finest of their race; they had become semi-civilized, and were formidable antagonists to the encroaching white race The States interested had begun preparations for their forcible removal, in public defiance of the attempts of the Federal Government to protect the Indians



BY COURTESY OF S KENNEDY AND CO

A MISSISSIPPI RIVER STEAM BOAT IN THE EARLY DAYS

Before the advent of the steamboat the river trip from Louisville to New Orleans consumed from three to four months In 1820 steamboats made the trip in less than 20 days; and in 1838, in 6 days. This improved facility of transportation was influential in increasing the population of the Mississippi Valley

(1827); but the removal was not completed until 1835. In the North, Wisconsin and Michigan, with the northern halves of Illinois and Indiana, were still very thinly settled, but everything indicated early increase of population. The first lake steamboat, the "Walk-in-the-Water," had appeared at Detroit in 1818, and the opening of the Erie canal in 1825 added more vessels.

The land system of the United States had much to do with the early development of the West From the first settlement, the universally recognized rule had been that of absolute individual property in land, with its corollary of unrestricted competitive

or "rack" rents; and this rule was accepted fully in the national land system. The public lands were to be divided into "hundreds" each ten miles square and containing 100 mile-square plots. The hundred was called a "township," and was afterwards reduced to six miles square, of 36 mile-square plots of 640ac. each. From time to time principal meridians and east and west base lines have been run, and townships have been determined by their relations to these lines. The price fixed in 1790 as a minimum was $2 per ac ; in 1820 it was reduced to $1.25 per ac.; it has tended to decrease, and no effort has ever been made to gain a revenue from it. When the nation acquired its western territory it secured its title to the soil, and always made it a fundamental condition of the admission of a new State that it should not tax United States lands. To compensate the new States for the freedom of unsold public lands from taxation, one township in each 36 was reserved to them for educational purposes; and the excellent public school systems of the Western States have been founded on this provision. The cost of obtaining a quarter section (160ac), under the still later homestead system of granting lands to actual settlers, came to be only about $26 to cover fees for filing claim and granting title; the interest on this, at 6%, represents an annual rent of one cent per acre—making this, says F A. Walker, as nearly as possible the "no-rent land" of the economists.

The bulk of the early westward migration was of home production; the great immigration from Europe did not begin until about 1847. The West as well as the East thus had its institutions fixed before being called upon to absorb an enormous foreign element.

Industrial Development and Sectional Divergence, 1829–50.—The years 1829–37 have been called "the reign of Andrew Jackson"; his popularity, long struggle for the presidency, and his feeling of his official ownership of the subordinate offices gave to his administration at least an appearance of Caesarism. But it was a strictly constitutional Caesarism; the restraints of written law were never violated, though the methods adopted within the law were new to national politics. Since about 1800 State politics in New York and Pennsylvania had been noted for the systematic political use of the offices. The presence of New York and Pennsylvania politicians in Jackson's cabinet taught him to use the same system. Removals, except for cause, had been relatively rare before; but under Jackson men were removed almost exclusively for party purposes and a clean sweep was made in the civil service. Other parties adopted the system, and it remained the rule at a change of administration until near the end of the century.

Parties.—The system brought with it a semi-military reorganization of parties. Hitherto nominations for the more important offices had been made mainly by legislative caucuses; candidates for president and vice-president were nominated by caucuses of congressmen, and candidates for the higher State offices by caucuses of the State legislatures. Late in the preceding period "conventions" of delegates from the members of the party in the State were held in New York and Pennsylvania; and in 1831–32 this became the rule for presidential nominations. It rapidly developed into systematic State, county and city "conventions"; and the result was the appearance of that complete political machinery, the American political party. The Democratic machinery was the first to appear, in Jackson's second term (1833–37). Its workers were paid in offices, or hopes of office, so that it was said to be built on the "cohesive power of public plunder"; but its success was immediate and brilliant. The opposing party, the Whig Party, had no chance of victory in 1836; and its complete overthrow drove its leaders into the organization of a similar machinery of their own, which scored its first success in 1840.

Bank of the U.S.—The Bank of the United States had hardly been heard of in politics until the new Democratic organization came into hostile contact with it. A semi-official demand upon it for a political appointment was met by a refusal; and the party managers called Jackson's attention to an institution which he could not but dislike the more he considered it. His first message spoke of it in unfriendly terms, and every succeeding message brought a more open attack. The old party of Adams and Clay had by this time taken the name of Whigs, probably from the notion that they were struggling against "the reign of Andrew Jackson," and they adopted the cause of the bank with eagerness. The bank charter did not expire until 1836, but in 1832 Clay brought up a bill for a new charter. It was passed and vetoed; and the Whigs made the veto an important issue of the presidential election of that year. They were beaten; Jackson was re-elected, receiving 219 electoral votes, and Clay, his Whig opponent, only 49, and the bank party could never again get a majority in the House of Representatives. But the President could not obtain a majority in the Senate. He determined to take a step which would give him an initiative, and which his opponents could not induce both houses to unite in overriding or punishing. Taking advantage of the provision that the secretary of the Treasury might order the public funds to be deposited elsewhere than in the bank or its branches, he directed the secretary to deposit *all* the public funds elsewhere. Thus deprived of its great source of dividends, the bank fell into difficulties, became a State bank after 1836, and then went into bankruptcy.

All the political conflicts of Jackson's terms of office were close and bitter. Loose in his ideas before 1829, Jackson showed a steady tendency to adopt the strictest construction of the powers of the Federal Government, except in such official perquisites as the offices He grew into strong opposition to all traces of the "American system," and vetoed bills for internal improvements unsparingly; his feeling of dislike to all forms of protection is as evident, though he took more care not to make it too public.

Nullification. Calhoun and Jackson.—Calhoun and Jackson were of the same stock—Scottish-Irish—much alike in appearance and characteristics, Calhoun representing the trained and educated logic of the race, Jackson its instincts and passions. Jackson was led to break off his friendly relations with Calhoun in 1830, and he had been led to do so more easily because of the appearance of the doctrine of nullification which was generally attributed, correctly enough, to Calhoun Asserting, as the Republican Party of 1798 had done, the sovereign powers of each State, Calhoun held that, as a means of avoiding secession and violent struggle upon every occasion of the passage of an act of Congress which should seem unconstitutional to any State, the State might properly suspend or "nullify" the operation of the law within its jurisdiction. The passage of the tariff act of 1832, which organized and systematized the protective system, forced his party into action. A State convention in South Carolina on Nov. 24, 1832, declared the tariff act null, and made ready to enforce the declaration.

But the time was past when the power of a single State could withdraw it from the Union. The President issued a proclamation, warning the people of South Carolina against any attempt to carry out the ordinance of nullification; he ordered a naval force to take possession of Charleston Harbour to collect the duties under the act; he called upon Congress for additional executive powers, and Congress passed what nullifiers called the "bloody bill," putting the land and naval forces at the disposal of the president; and he is said to have announced, privately and profanely, his intention of making Calhoun the first victim of any open conflict. Affairs looked so threatening that an unofficial meeting of "leading nullifiers" agreed to suspend the operation of the ordinance until Congress should adjourn; whence it derived the right to suspend has never been stated.

Tariff of 1833.—The President had already asked Congress to reduce the duties; and many Democratic members of Congress, who had yielded to the popular clamour for protection, were very glad to use "the crisis" as an excuse for now voting against it. A compromise tariff act, scaling down all duties over 20% by one-tenth of the excess every two years until 1842, when the remaining excess over 20% should be dropped, was introduced by Clay and became law. Calhoun and his followers claimed this as all that the nullification ordinance had aimed at; and the ordinance was formally repealed. But nullification had received its death-blow, even those southern leaders who maintained the right of secession refused to recognize the right of a State to remain in the Union while nullifying its laws.

Railways.—All the internal conditions of the United States were completely altered by the introduction of railways. For 20

years past the Americans had been pushing in every direction which offered a hope of the means of reconciling vast territory with enormous population. Stephenson's invention of the locomotive came just in time, and Jackson's two terms of office marked the outburst of modern American life. The miles of railway were 23 in 1830, 1,098 in 1835, some 2,800 in 1840, and thereafter they about doubled every five years until 1860.

A railway map of 1840 shows a fragmentary system, designed mainly to fill the gaps left by the means of communication in use in 1830. One or two short lines run back into the country from Savannah and Charleston; another runs north along the coast from Wilmington to Baltimore; several lines connect New York with Washington and other points; and short lines elsewhere mark the openings which needed to be filled at once—a number in New England and the Middle States, three in Ohio and Michigan, and three in Louisiana. Year after year new inventions came in to increase and aid this development. The anthracite coal of the Middle States was now successfully applied to railways (1836), and to the manufacture of iron (1837) Steam navigation across the Atlantic was established in 1838. The telegraph came next, S. F B Morse's line being erected in 1844 No similar period in American history of the 19th century is so extraordinary for material development as the decade 1830–40. At its beginning the country was an overgrown type of colonial life; at its end American life had been shifted to entirely new lines, which it has since followed

Western Settlements.—The steamboat had aided western development, but the railway aided it far more The steamboat influenced the railway, and the railway gave the steamboat new powers Vacant places in the States east of the Mississippi were filling up; the long lines of emigrant wagons gave way to the new and better methods of transport. Chicago was but a frontier fort in 1832, within a half-dozen years it was a flourishing town, with eight steamers connecting it with Buffalo, with dawning ideas of its future development of railway connections Two new States, Arkansas and Michigan, were admitted (1836 and 1837). The population of Ohio grew from 900,000 to 1,500,000, that of Michigan from 32,000 to 212,000, and that of the country from 13,000,000 to 17,000,000, between 1830 and 1840.

Social Conditions.—With the change of material surroundings and possibilities came a steady amelioration of social conditions and a development of social ideals. Such features of the past as imprisonment for debt and the cruel indifference of old methods of dealing with crime began to disappear, the time was past when a State could use an abandoned copper mine as its State prison, as Connecticut had formerly done The domestic use of gas and anthracite coal, the introduction of expensive aqueducts for pure water, and the changing life of the people forced changes in the interior and exterior of American dwellings Wood was still the common building material; imitations of Greek architecture still retained their vogue; but the interiors were models of comfort in comparison with the houses even of 1810. In the "new" regions this was not yet the case, and here social restraints were still so few that society seemed to be reduced almost to its primitive elements. Western steamers reeked with gambling, swindling, duelling and every variety of vice Public law was almost suspended in some regions; and organized associations of counterfeiters and horse-thieves terrorized whole sections of the country. But this state of affairs was altogether temporary, as well as limited in its area; the older and more densely settled States had been well prepared for the change and had never lost command of the social forces, and the process of settling down went on, even in the newer States, with far more rapidity than could have been expected.

Literature.—A distinct American literature dates from this period. Most of the publications in the United States were still cheap reprints of foreign works; but native productions no longer followed foreign models with servility. Between 1830 and 1840 Whittier, Longfellow, Holmes, Poe, Hawthorne, Emerson, Bancroft and Prescott joined the advance-guard of American writers —Bryant, Dana, Halleck, Drake, Irving and Cooper; and even those writers who had already made their place in literature showed the influence of new conditions by their growing tendency to look less to foreign models and methods. Popular education was improved. The new States had from the first endeavoured to secure the best possible system of common schools The attempt came naturally from the political instincts of the class from which the migration came; but the system which resulted was to be of incalculable service during the years to come Their absolute democracy and their universal use of the English language have made the common schools most successful machines for converting the raw material of immigration into American citizens This supreme benefit is the basis of the system and the reason for its existence and development, but its incidental advantage of educating the people has been beyond calculation It was an odd symptom of the general change that American newspapers took a new form during these ten years. The old "blanket-sheet" newspaper, cumbrous to handle and slow in all its ways, met its first rival in the type of newspaper which appeared first in New York city, in the *Sun*, the *Herald* and the *Tribune* (1833, 1835 and 1841). Swift and energetic in gathering news, and fearless, sometimes reckless, in stating it, they brought into American life, with very much that is evil, a great preponderance of good.

Speculation.—The chaos into which a part of American society had been thrown had a marked effect on the financial institutions of the country, which went to pieces before it for a time. It had not been meant to make the public lands of the United States a source of revenue so much as a source of development. The sales had touched their high-water mark during the speculative year 1819, when receipts from them had amounted to $3,274,000, in other years they seldom went above $2,000,000 When the railway set the stream of migration moving faster than ever, and cities began to grow like mushrooms, it was natural that speculation in land should feel the effects. Sales rose to $3,200,000 in 1831, and to $25,000,000 in 1836. In 1835 the President announced to Congress that the public debt was extinguished, and that some way of dealing with the surplus should be found Calhoun's proposal, that after the year 1836 any surplus in excess of $5,000,000 should be divided among the States as a loan, was adopted, as regards the surplus (almost $37,000,000) of that year; and some $28,000,000 were actually distributed before the crisis of 1837 put an end to the surplus and to the policy The States had already taken a hand in the general speculation by beginning works of public improvement. Foreign, particularly English, capital was abundant, and States which had been accustomed to think a dozen times over a tax of $100,000 now began to negotiate loans of millions of dollars and to appropriate the proceeds to the digging of canals and the construction of railways. Their enterprises were badly conceived and badly managed. The imaginations of individuals ran riot. Every one wanted to buy, prices rose, and every one was growing richer on paper. The assessed value of real estate in New York city in 1832 was $104,000,000, in 1836 it had grown to $253,000,000. In Mobile the assessed value rose from $1,000,000 to $27,000,000

When Jackson in 1833 ordered the Government revenues to be deposited elsewhere than in the Bank of the United States, there was no Government agent to receive them. The secretary of the Treasury selected banks at various points in which the revenue should be deposited by the collecting officers, but these banks were organized under charters from their States The Democratic feeling was that the privilege of forming banking corporations should be open to all citizens, and it soon became so Moreover, it was not until after the crash that New York began the system of compelling such deposits as would really secure circulation. In most of the States banks could be freely organized with or without tangible capital, and their notes could be sent to the West for the purchase of Government lands, which needed to be held but a month or two to gain a handsome profit "Wild-cat banks" sprang up all over the country; and the "pet banks," as those chosen for the deposit of Government revenues were called, went into speculation as eagerly as the banks which hardly pretended to have capital.

Panic of 1837.—The Democratic theory denied the power of Congress to make anything but gold or silver coin legal tender There have been "paper-money heresies" in the party, but there was none such among the new school of Democratic leaders which came in in 1829, they were "hard-money men." In July 1836

Jackson's secretary of the Treasury ordered land agents to take nothing in payment for lands except gold or silver. In the following spring the full effects of the order became evident; they fell on the administration of Van Buren, Jackson's successor. Van Buren had been Jackson's secretary of State, the representative man of the new Democratic school, and it seemed to the Whigs poetic justice that he should bear the weight of his predecessor's errors The "specie circular" turned the tide of paper back to the East, and when it was presented for payment most of the banks suspended specie payment. There was no longer a thought of buying; everyone wanted to sell, and prices ran down with a rapidity even more startling than that with which they had risen Failures on a scale unprecedented in the United States made up the "panic of 1837." Many of the States had left their bonds in the hands of their agents, and, on the failure of the agents, found that the bonds had been hypothecated or disposed of, so that the States got no return from them except a debt which was to them enormous Saddled suddenly with such a burden, and unable even to pay interest, some of the States "repudiated" their obligations; and repudiation was made successful by the fact that a State could not be sued except by its own consent Even the U S Government felt the strain, for its revenues were locked up in suspended banks A little more than a year after Congress had authorized the distribution of its surplus revenues among the States, Van Buren was forced to call it into special session to provide some relief for the Government itself

The Sub-treasury.—Van Buren held manfully to the strictest construction of the powers of the Federal Government. He insisted that the panic would best right itself without Government interference, and, after a four years' struggle, he succeeded in making the "sub-treasury scheme" law (1840) It cut off all connection of the Government with banks, putting collecting and disbursing officers under bonds to hold money safely and to transfer it under orders from the Treasury, and restricting payments to or by the United States to gold and silver coin Its passage had been preceded by another commercial crisis (1839), more limited in its field, but more discouraging to the people

Election of 1840.—Van Buren's firmness was unpopular, and the Whig Party now adopted methods which were popular if somewhat demagogical It nominated William H. Harrison in 1840, it contrasted his homely frontier virtues with Van Buren's "ostentatious indifference to the misfortunes of the people" and after the first of the modern "campaigns" of mass meetings and processions Harrison was elected, receiving 234 electoral votes and Van Buren only 60. He died only a month after his inauguration, and the vice-president, John Tyler, became President.

Tyler was of the extreme Calhoun school, which had shown some disposition to grant to Van Buren a support which it had refused to Jackson, and the Whigs had nominated Tyler to retain his faction with them Now he was the nominal leader of the party, while his politics were opposite to theirs, and the real leader of the party, Clay, was ready to force a quarrel upon him. The quarrel took place, the Whig majority in Congress was not large enough to pass any measures over Tyler's veto, and the first two years of his administration were passed in barren conflict with his party. The "sub-treasury" law was repealed (1841); the tariff of 1842 introduced a modified protection; and there the Whigs were forced to stop. Their dissensions made Democratic success comparatively easy. The success of the Democratic machinery, and the reflex of its temporary check in 1840, with the influences brought to bear on it by the returning Calhoun faction, were such as to take the control of the party out of the hands of the leaders who had formed it They had had high regard for political principle, even though they were willing to use doubtful methods for its propagation, these methods had now brought out new men, who looked mainly to success, and to close connection with the controlling political element of the South as the easiest means of attaining success. When the Democratic convention of 1844 met it was expected to renominate Van Buren, but James K. Polk was nominated. The Whigs nominated Clay.

Abolitionist Movement.—The beginning of the abolitionist movement in the United States, the establishment of the *Liberator* (1831), and of the American Anti-slavery Society (1833), and the subsequent divisions in it, are dealt with elsewhere (*see* GARRISON, WILLIAM LLOYD). Up to that time "abolition" had meant *gradual* abolition; Garrison called for *immediate* abolition. The basis of the American system was in the reserved rights of the States, and slavery rested on their will. The mission of the Abolitionists was to force the people to think of the question; and, in spite of riots, assaults and persecution of every kind, they fulfilled it manfully. In truth, slavery was more and more out of harmony with the new economic conditions which were taking complete control of the North and West, but had hardly been felt in the South Thus the two sections, North and South, were more and more disposed to take opposite views of everything in which slavery was involved, and it had a faculty of involving itself in almost everything The status of slavery in the Territories had been settled in 1820; that of slavery in the States had been settled by the Constitution; but even in minor questions the intrusive element had to be reckoned with The Abolitionists sent their documents through the mails, and the South wished the Federal Government to stop the practice. The Abolitionists persisted in petitioning Congress for the passage of various measures which Congress regarded as utterly unconstitutional; and the disposition of Congress to deny or regulate the right of petition in such matters excited the indignation of Northern men who had no sympathy with abolition. But the first occasion on which the views of the two sections came into flat contrast was on the question of the annexation of Texas.

Texas and Oregon.—The United States had had a vague claim to Texas until 1819, when the claim was surrendered to Spain in part compensation for Florida On the revolt of Mexico, Texas became a part of that republic It was colonized by Americans, mainly southerners and slave-holders, seceded from Mexico in 1835, and defeated the Mexican armies and established its independence in the following year. Southern politicians desired its annexation to the United States. People in the North were either indifferent or hostile to the proposal, Van Buren had declared against it, and his action was a reason for his defeat in the Democratic convention On the other hand, there were indications that the joint occupation of the Oregon country could not last much longer American immigration into it had begun, while the Hudson's Bay Company, the British tenant of the soil was the natural enemy of immigration The two points were coupled; and the Democratic convention declared for the reannexation of Texas and the reoccupation of Oregon.

Election of 1844.—One of the cardinal methods of the political Abolitionists was to nominate candidates of their own against a doubtful friend, even though this secured the election of an open enemy. Clay's efforts to guard his condemnation of the Texas annexation project were just enough to push the Liberty party, the political Abolitionists, into voting for candidates of their own in New York; on a close vote their loss was enough to throw the electoral votes of that State to Polk, and its votes decided the result. Polk was elected (Nov 1844); and Texas was annexed to the United States in the following spring. At the next meeting of Congress (1845) Texas was admitted as a State.

West of Texas the northern prolongation of Mexico ran right athwart the westward movement of American population; and though the movement had not yet reached the barrier the Polk Administration desired further acquisitions from Mexico. The western boundary of Texas was undefined; a strip of territory claimed by Texas was settled exclusively by Mexicans; but the Polk Administration directed Gen. Zachary Taylor, the American commander in Texas, to cross the Nueces river and seize the disputed territory. Collisions with Mexican troops followed; they were beaten in the battles of Palo Alto and Resaca de la Palma, and were chased across the Rio Grande. Taylor followed and took the city of Monterrey.

War with Mexico.—On the news of the first bloodshed, Congress declared war against Mexico, over the opposition of the Whigs. A land and naval force took possession of California, and a land expedition occupied New Mexico, so that the authority of Mexico over all the soil north of her present boundaries was

abruptly terminated (1846). At the opening of 1847 Taylor fought the last battle in northern Mexico (Buena Vista), defeating the Mexicans, and Gen. Winfield Scott, with a new army, landed at Vera Cruz for a march upon the City of Mexico. Scott's march was marked by one successful battle after another, usually against heavy odds; and in September he took the capital city and held it until peace was made (1848) by the Treaty of Guadalupe Hidalgo. Among the terms of peace was the cession of the present California, Utah, Arizona and New Mexico, the consideration being a payment of $15,000,000 by the United States and the assumption of some $3,000,000 of debts due by Mexico to American citizens. With a subsequent rectification of frontier (1853) by the Gadsden Treaty (*see* GADSDEN, JAMES), this cession added some 500,000sq m to the area of the United States; Texas itself made up a large additional area. The settlement of the north-east and north-west boundaries by the Webster-Ashburton and Buchanan-Pakenham treaties (1842, 1846) with the Texas and Mexican cessions, gave the United States the complete territorial form retained until the annexation of Alaska in 1867.

Slavery in the New Territory.—In the new territory slavery had been forbidden under Mexican law, and its annexation brought up the question of its status under American law If slavery was to be excluded from the new territory, the States which should ultimately be formed out of it would enter as free States, and the influence of the South in the Senate would be decreased For the first time the South appears as a distinct *imperium in imperio*

"Squatter Sovereignty."—The first appearance of these difficulties brought out in the Democratic Party a solution which was so closely in line with the prejudices of the party that it bade fair to carry the party through the crisis without the loss of its Southern vote This was "squatter sovereignty," the notion that it would be best for Congress to leave the people of each Territory to settle the question of the existence of slavery for themselves. The broader and democratic ground for the party would have been that which it at first seemed likely to take—the "Wilmot Proviso," a condition proposed to be added to the act authorizing acquisitions of territory, providing that slavery should be forbidden in all territory to be acquired under the act In the end apparent expediency carried the dominant party off to "squatter sovereignty," and the Democratic adherents of the Wilmot Proviso, with the Liberty Party and the anti-slavery Whigs, united in 1848 under the name of the Free Soil Party The Whigs had no solution to offer; their entire programme consisted in a persistent effort to evade or ignore all difficulties connected with slavery

Election of 1848.—Taylor, after the battle of Buena Vista, resigned and came home, considering himself ill-used by the Administration He refused to commit himself to any party; and the Whigs were forced to accept him as their candidate in 1848. The Democrats nominated Lewis Cass; the "Free-Soilers" nominated Van Buren. Taylor was elected President, receiving 163 electoral votes, while Cass received 127. Taking office in March 1849, he had on his shoulders the whole burden of the territorial difficulties, aggravated by the discovery of gold in California and the sudden rise of population there. Congress was so split into factions that it could for a long time agree upon nothing; and the Californians, with the approval of the President, proceeded to form a Constitution and apply for admission as a State. They had so framed their Constitution as to forbid slavery, and this was really the application of the Wilmot Proviso to the richest part of the new territory, and the South felt that it had been robbed of the cream of what it alone had fought cheerfully to obtain.

Compromise of 1850.—The admission of California was not secured until Sept. 1850, soon after Taylor's sudden death (July 9), and then only by the addition of a bonus to Texas, the division of the rest of the Mexican cession into the Territories of Utah and New Mexico without prohibition of slavery, and the passage of a fugitive slave law. The slave trade, but not slavery, was forbidden in the District of Columbia. The whole was generally known as the Compromise Measures of 1850. Two of its features need notice As has been said, slavery was not mentioned in the act; and the status of slavery in the Territories was thus left uncertain. Congress can veto any legislation of a Territorial legislature but, in fact, the two houses of Congress were hardly ever able to unite on anything after 1850, and both these Territories did establish slavery before 1860, without a congressional veto The advantage here was with the South The other point, the fugitive slave law was a special demand of the South The Constitution contained clauses directing that fugitive criminals and slaves should be delivered up, on requisition, by the State to which they had fled. In the case of criminals the delivery was directed to be made by the executive of the State to which they had fled, in the case of slaves no delivering authority was specified, and an act of Congress in 1793 had imposed the duty on Federal judges or on local State magistrates. Some of the States had passed "personal liberty laws," forbidding or limiting the action of their magistrates in such cases, and the act of 1850 transferred the decision of such cases to United States commissioners, with the assistance of United States marshals.

Tariff of 1846.—The question of slavery had taken up so much time in Congress that its other legislation was comparatively limited The rates of postage were reduced to five and ten cents for distances less and greater than 300m. (1845); and the naval school at Annapolis was established in the same year. The military academy at West Point had been established as such in 1802. When the Democratic Party had obtained complete control of the Government, it re-established (by act of Aug 6, 1846), the "sub-treasury," or independent Treasury In the same year, a tariff bill was passed, it reduced duties, and moderated the application of the protective principle Apart from a slight reduction of duties in 1857, this remained in force till 1861.

New States.—Five States were admitted during the last ten years of this period. Florida (1845), Texas (1845), Iowa (1846), Wisconsin (1848) and California (1850). The early entrance of Iowa, Wisconsin and Florida had been due largely to Indian wars, after each of which the defeated Indians were compelled to cede lands The extinction of Indian titles in northern Michigan brought about the discovery of the great copper fields of that region Elsewhere settlement followed the lines already marked out, except in the new possessions on the Pacific coast, whose full possibilities were not yet known Railways in the Eastern States were beginning to show something of a connected system, in the South they had hardly changed since 1840, in the West they had been prolonged only on their original lines. The telegraph was brought into use in 1844; but it was not until the census of 1860 that its effects were seen in the fully connected network of railways which then covered the whole North and West.

Invention.—The sudden development of wealth in the country gave an impetus to the spirit of invention. Charles Goodyear's method of vulcanizing rubber (1839) had come into use Cyrus Hall McCormick had made an invention the results of which have been hardly less than that of the locomotive in their importance to the United States. He had patented a reaping machine in 1834, and this, further improved and supplemented by other inventions, had brought into play the whole system of agricultural machinery A successful sewing-machine came in 1846, the power-loom and the surgical use of anaesthetics in the same year; and the rotary press for printing in 1847.

The Mormons.—All the conditions of life were changing so rapidly it was natural that the minds of men should change with them This was the era of new sects, of communities, of transcendentalism in literature, religion and politics. The most successful of these was the sect of Mormons. They settled in Utah in 1847, calling their capital Salt Lake City, and spread through the neighbouring Territories They became a menace to the American system; their numbers were so great that it was against American instincts to deprive them of self-government, while their polygamy and total submission to their hierarchy made it impossible to erect them into a State having complete control of marriage and divorce. The difficulty was lessened by their renunciation of polygamy in 1890

The South.—The material development of the United States since 1830 had been extraordinary, but every year made it more evident that the South was not sharing in it It is plain now that

the fault was in her labour system: her only labourers were slaves, and a slave who was fit for anything better than field labour was *prima facie* a dangerous man. The divergence had as yet gone only far enough to awaken intelligent men in the South to its existence, and to stir them to efforts as hopeless as they were earnest, to find some artificial stimulus for Southern industries. In the next ten years the process was to show its effects on the national field

Slavery had put the South out of harmony with its surroundings Even in 1850, though they hardly yet were aware of it, the two sections had drifted so far apart that they were practically two different countries

The Slave Power.—The South remained much as in 1790; while other parts of the country had developed, it had stood still. The remnants of colonial feeling, of class influence, which advancing democracy had wiped out elsewhere, retained their force here. The ruling class had to maintain a military control over the labouring class, and a class influence over the poorer whites It had even secured in the Constitution provision for its political power in the representation given to three-fifths of the slaves. The 20 additional members of the House of Representatives were not simply a gain to the South; they were still more a gain to the "black districts," where whites were few, and the slave-holder controlled the district Slave-owners and slave-holders together, there were but 350,000 of them; but they had common interests, the intelligence to see them, and the courage to contend for them The first step of a rising man was to buy slaves, and this was enough to enroll him in the dominant class From it were drawn the representatives and senators in Congress, the governors and all the holders of offices over which the "slave power," as it came to be called, had control

Immigration.—Immigration into the United States was not an important factor in its development till about 1847. The immigrants, so late as 1820, numbered but 8,000 per annum; their number did not touch 100,000 till 1842, and then it fell for a year or two almost to half that number In 1847 it rose again to 235,000, in 1849 to 300,000, and in 1850 to 428,000; all told, more than 2,225,000 persons from abroad settled in the United States between 1847 and 1854 Leaving out the dregs of the immigration, which settled down in the seaboard cities, its best part was a powerful nationalizing force It had not come to any particular State, but to the United States, yet all the influences of this enormous immigration were confined to the North and West; the immigration avoided slave soil as if by instinct And as the sections began to differ further in aims and policy the North began to gain heavily in ability to ensure its success.

Congress.—Texas was the last slave State ever admitted; and, as it refused to be divided, the South had no further increase of numbers in the Senate. Until 1850 the admission of a free State had been so promptly balanced by the admission of a slave State that the senators of the two sections had remained about equal in number in 1860 the free States had 36 senators and the slave States only 30. As the representation in the House had changed from 35 free State and 30 slave State members in 1790 to 147 free State and 90 slave State in 1860, and as the number of presidential electors is the sum of the numbers of senators and representatives, political power had passed away from the South in 1850. If at any time the free States should unite they would be supreme

Tendencies to Disunion.—In circumstances so critical a cautious quiescence and avoidance of public attention was the only safe course for the "slave power," but that course had become impossible The numbers interested had become too large to be subject to complete discipline; not all could be held in cautious reserve; and when an advanced proposal came from any quarter of the slave-holding lines the whole army was shortly forced up to the advanced position. If collision came it must be on some question of the rights of the States; and on such a question the whole South would move as one man.

The Protestant churches of the United States had reflected in their organization the spirit of the political institutions under which they lived. Acting as purely voluntary associations, they had been organized into governments by delegates; much like the "conventions" which had been evolved in the political parties. The omnipresent slavery question intruded into these bodies, and split them. Only the Episcopal and Roman Catholic Churches retained their national character.

Party Changes.—The political parties showed the same tendency. Each began to shrivel up in one section or the other. The notion of "squatter sovereignty," attractive at first to the Western democracy, and not repudiated by the South, enabled the Democratic Party to pass the crisis of 1850 without losing much of its Northern vote, while Southern Whigs began to drift in, making the party continually more pro-slavery This could not continue long without beginning to decrease its Northern vote, but this effect did not become plainly visible until after 1852. The efforts of the Whig Party to ignore the great question alienated its anti-slavery members in the North, while they did not satisfy its Southern members. The Whig losses were not at first heavy, but, as the electoral vote of each State is determined by the barest plurality they were enough to defeat the party almost everywhere in the presidential election of 1852. The Whigs nominated Gen Winfield Scott and the Democrats Franklin Pierce; Pierce carried all but four of the 31 States, and was elected, receiving 254 out of the 296 electoral votes. This revelation of hopeless weakness was the downfall of the Whig Party; it maintained its organization for four years longer, but the life had gone out of it The future was with the Free Soil Party, though it had polled but few votes in 1852

During the Administration of Taylor (and vice-president Millard Fillmore, who succeeded him) Clay, Webster, Calhoun, Polk and Taylor were removed by death, and there was a steady drift of other political leaders out of public life. New men were pushing in everywhere, and in both sections they showed the prevailing tendency to disunion. The best of them were unprecedentedly radical Charles Sumner, William H Seward and Salmon P Chase came into the Senate, bringing the first accession of recognized force and ability to the anti-slavery feeling in that body The new Southern men, such as Jefferson Davis, and the Democratic recruits from the Southern Whig Party, such as Alexander H. Stephens, were ready to take the ground on which Calhoun had always insisted—that Congress was bound not merely to the negative duty of not attacking slavery in the Territories, but to the positive duty of protecting it. This, if it should become the general Southern position, was certain to destroy the notion of "squatter sovereignty," and thus to split the Democratic Party, which was almost the last national ligament that now held the two fragments of the Union together.

Progress of Disunion.—The social disintegration was as rapid. Northern men travelling in the South were naturally looked upon with increasing suspicion, and were made to feel that they were on a soil alien in sympathies Some of the worst phases of democracy were called into play in the South; and, in some sections, law openly yielded supremacy to popular passion in the cases of suspected Abolitionists. Southern conventions, on all sorts of subjects, became common, and, permeated by a dawning sense of Southern nationality, hardly any proposition looking to Southern independence of the North was met with disfavour.

Calhoun, in his last and greatest speech, called attention to the manner in which one tie after another was snapping. But he ignored the real peril of the situation—its dangerous facts: that the South was steadily growing weaker in comparison with the North, and more unable to secure a wider area for the slave system; that it was therefore being steadily forced into demanding active Congressional protection for slavery in the Territories; that the North would never submit to this; and that the South must submit or bring about a collision by attempting to secede.

Kansas-Nebraska Act.—Anti-slavery feeling in the North was stimulated by the manner in which the fugitive slave law was enforced immediately after 1850. The chase after fugitive slaves was prosecuted in many cases with circumstances of revolting brutality. The added feeling showed its force when the Kansas-Nebraska Act was passed by Congress (1854). It organized the two new Territories of Kansas and Nebraska. Both of them were

forever free soil by the terms of the Missouri Compromise. But the success of the notion of squatter sovereignty in holding the Democratic Party together while destroying the Whig Party had intoxicated Stephen A. Douglas and other Northern Democrats; and they now applied the doctrine to these Territories. They did not desire "to vote slavery up or down," but left the decision to the people of the two Territories.

The Republican Party.—The Kansas-Nebraska Act was the grossest political blunder in American history. The status of slavery had been settled, by the Constitution or by the compromises of 1820 and 1850, on every square foot of American soil; right or wrong, the settlement was made The new act took a great mass of territory out of the settlement and flung it down as a prize for which the sections were to struggle. The first result of the act was to throw parties into chaos. An American or "Know-Nothing" Party, a secret oath-bound organization, pledged to oppose the influence or power of foreign-born citizens, had been formed to take the place of the defunct Whig Party. It had been quite successful in State elections for a time, and was now beginning to have larger aspirations. It, like the Whig Party, intended to ignore slavery, but, after a few years of life, the questions complicated with slavery divided it also. Even in 1854 many of its leaders in the North were forced to take position against the Kansas-Nebraska Act, while hosts of others joined in the opposition without any party organization. No American party ever rose so swiftly as this; with no other party name than the awkward title of "Anti-Nebraska men," it carried the congressional elections of 1854 in the North, forced many of the former Know-Nothing leaders into union with it, and controlled the House of Representatives of the Congress which met in 1855 The Democratic Party, which had been practically the only party since 1852, had now to face the latest and strongest of its broad-constructionist opponents. It acknowledged, at first, no purpose aimed at slavery, only an intention to exclude slavery from the Territories, but, under such principles, it was the only party which was potentially an anti-slavery party. The new party had grasped the function which belonged of right to its great opponent, and it seized with it its opponent's original title. The name Democrat had quite taken the place of that first used—Republican—but Republican had never passed out of popular remembrance and liking in the North The new party took quick and skilful advantage of this by assuming the old name, and early in 1856 the two great parties of the present—Democratic and Republican—were drawn up against one another.

Foreign Relations.—The foreign relations during Pierce's term of office were overshadowed by the domestic difficulties, but were of importance. In the Koszta case (1853) national protection had been afforded on foreign soil to a person who had taken only the preliminary steps to naturalization. Japan had been opened to American intercourse and commerce (1854). But the question of slavery was more and more thrusting itself even into foreign relations. A great Southern republic, to be founded at first by the slave States, but to take in gradually the whole territory around the Gulf of Mexico and include the West Indies, was soon to be a pretty general ambition among slave-holders, and its first phases appeared during Pierce's administration. Efforts were begun to obtain Cuba from Spain; and the three leading American ministers abroad, meeting at Ostend, united in declaring the possession of Cuba to be essential to the well-being of the United States (1854). "Filibustering" expeditions against Cuba or the smaller South American States, intended so to revolutionize them as to lay a basis for an application to be annexed to the United States, became common. But these yielded in importance to the affairs in Kansas.

Kansas.—Nebraska was then supposed to be a desert, and attention was directed almost exclusively to Kansas. No sooner had its organization left the matter of slavery to be decided by its "people" than the anti-slavery people of the North and West felt it to be their duty to see that the "people" of the Territory should be anti-slavery in sympathy. Emigrant associations were formed, and these shipped men and families to Kansas, arming them for their protection in the new country. Southern newspapers called for similar measures in the South, but the call was less effective. Southern men without slaves, settling a new State, were uncomfortably apt to prohibit slavery, as in California Only slave-holders were trusty pro-slavery men; and such were not likely to take slaves to Kansas and risk their ownership But for the people of Missouri, Kansas would have been free soil at once. Lying across the direct road to Kansas, the Missouri settlers blockaded the way of free-State settlers, crossed into Kansas, and voted profusely at the first Territorial election The struggle passed into a real civil war, the two powers fighting battles, capturing towns and paroling prisoners The struggle was really over in 1857, and the South was beaten There were, however, many obstacles yet to be overcome before the new State of Kansas was recognized by Congress, after the withdrawal of the senators of the seceding States (1861)

Election of 1856.—In the heat of the Kansas struggle came the presidential election of 1856 The Democrats nominated James Buchanan, declaring, as usual, for the strictest limitations of the powers of the Federal Government and reaffirming the principle of the Kansas-Nebraska act—the settlement of slavery by the people of a Territory The remnant of the Whig Party, including the Know-Nothings of the North and those Southern men who wished no further discussion of slavery, nominated Millard Fillmore. The Republican Party nominated John C Frémont; the bulk of its manifesto was taken up with protests against attempts to introduce slavery into the Territories; but it showed its broad-construction tendencies by declaring for appropriations of Federal moneys for internal improvements The Democrats were successful in electing Buchanan; but the position of the party was quite different from the triumph with which it had come out of the election of 1852. It was no longer master of 27 of the 31 States; all the free States but five had gone against it; its candidate no longer had a majority of the popular vote. For the first time in the history of the country a distinctly anti-slavery candidate had obtained an electoral vote, and had even come near obtaining the Presidency Fillmore had carried but one State, Maryland, Buchanan had carried the rest of the South, with a few States in the North, and Frémont the rest of the North and none of the South.

Dred Scott.—Oddly enough the constitutionality of the Compromise of 1820 had never happened to come before the Supreme Court for consideration In 1856–57 it came up for the first time. One Dred Scott, a Missouri slave who had been taken in 1834 to Illinois, a free State, and in 1836 to Minnesota, within the territory covered by the compromise, and had some years after being taken back to Missouri in 1838 sued for his freedom, was sold (1852) to a citizen of New York Scott then transferred his suit from the State to the Federal courts, under the power given them to try suits between citizens of different States, and the case came by appeal to the Supreme Court Its decision, announced on March 6, 1857, put Scott out of court on the ground that a slave, or the descendant of slaves, could not be a citizen of the United States or have any standing in Federal courts The opinion of Chief Justice Taney went on to attack the validity of the Missouri Compromise, for the reasons that one of the Constitutional functions of Congress was the protection of property, that slaves had been recognized as property by the Constitution, and that Congress was bound to protect, not to prohibit, slavery in the Territories Most of the Northern people held that slaves were looked upon by the Constitution not as property but as "persons held to service or labour" by State laws A large part of the North flouted the decision of the Supreme Court, and the storm of angry dissent which it aroused did the disunionists good service in the South From this time the leading newspapers in the South maintained that the radical Southern view first advanced by Calhoun, and but slowly accepted by other Southern leaders, as to the duty of Congress to protect slavery in the Territories, had been confirmed by the Supreme Court; that the Northern Republicans had rejected it; even the "squatter sovereignty" of Northern Democrats could no longer be submitted to by the South.

John Brown.—The population of the United States in 1860

was over 31,000,000, an increase of more than 8,000,000 in ten years. As the decennial increases of population became larger, so did the divergence of the sections in population, and still more in wealth and resources. Two more free States came in during this period—Minnesota (1858) and Oregon (1859)—and Kansas was clamouring loudly for the same privilege. The free and slave States, which had been almost equal in population in 1790, stood now as 19 to 12 And of the 12,000,000 in slave States, the 4,000,000 slaves and the 250,000 free blacks were not so much a factor of strength as a possible source of weakness and danger No serious slave rising had ever taken place in the South, but John Brown's attack (1859) on Harper's Ferry, as the first move in a project to rouse the slaves and the alarm which it carried through the South, were tokens of a danger which added a new horror to the chances of civil war.

Democratic Party Split.—Northern Democrats, under the lead of Douglas, had been forced already almost to the point of revolt by the determination of Southern senators to prevent the admission of Kansas as a free State, if not to secure her admission as a slave State. When the Democratic convention of 1860 met at Charleston the last strand of the last national political organization parted; the Democratic Party itself was split by the slavery question The Southern delegates demanded a declaration in favour of the duty of Congress to protect slavery in the Territories It was all that the Douglas Democrats could then do to maintain themselves in a few Northern States; such a declaration meant political suicide everywhere, and they voted it down. The convention divided into two bodies. The Southern body adjourned to Richmond, and the Northern and border State convention to Baltimore Here the Northern delegates, by seating some delegates friendly to Douglas, provoked a further secession of border State delegates, who, in company with the Richmond body, nominated John C Breckinridge and Joseph Lane for President and vice-president. The remainder of the original convention nominated Douglas and H V Johnson.

The remnant of the old Whig and Know-Nothing parties, now calling itself the Constitutional Union Party, met at Baltimore and nominated John Bell and Edward Everett The Republican convention met at Chicago Its "platform" of 1856 had been somewhat broad-constructionist but a strong Democratic element in the party had prevented it from going too far The election of 1856 had shown that, with the votes of Pennsylvania and Illinois, the party would have then been successful, and the Democratic element was now ready to take almost anything which would secure the votes of these States This state of affairs will go to explain the nomination of Abraham Lincoln, of Illinois, for President, with Hannibal Hamlin, a former Democrat, for vice-president, and the declaration of the platform in favour of a protective tariff. The mass of the platform was still devoted to the necessity of excluding slavery from the Territories

Election of 1860.—No candidate received a majority of the popular vote, Lincoln standing first and Douglas second But Lincoln and Hamlin had a clear majority of the electoral vote, and so were elected, Breckinridge and Lane coming next It is worthy of mention that, up to the last hours of Lincoln's first term of office, Congress would always have contained a majority opposed to him but for the absence of the members from the seceding States The interests of the South and even of slavery were thus safe enough under an anti-slavery president. But the drift of events was too plain. Nullification had come and gone, and the nation feared it no longer Even secession by a single State was now almost out of the question; the letters of Southern governors in 1860, in consultation on the state of affairs, agree that no State would secede without assurances of support by others. If this crisis were allowed to slip by without action, even a sectional secession would soon be impossible.

Secession.—In Oct. 1860 Gov. W. H. Gist of South Carolina sent a letter to the governor of each of the other cotton States except Texas, asking co-operation in case South Carolina should resolve upon secession, and the replies were favourable. The democratic revolution which, since 1829, had compelled the legislature to give the choice of presidential electors to the people of the States had not affected South Carolina; her electors were still chosen by the legislature. That body, after having chosen the State's electors on Nov. 6, remained in session until the telegraph had brought assurances that Lincoln had been elected; it then (on the 10th) summoned a State convention and adjourned The State convention on Dec. 20 unanimously passed an "ordinance of secession," repealing the acts by which the State had ratified the Constitution and its amendments, and dissolving "the union now subsisting between South Carolina and other states, under the name of the 'United States of America.'" The convention took all steps necessary to prepare for war, and adjourned. Similar ordinances were passed by conventions in Mississippi (Jan 9, 1861), Florida (Jan 10), Alabama (Jan. 11), Georgia (Jan. 19), Louisiana (Jan. 26) and Texas (Feb 1)

The Confederate States.—The opposition in the South did not deny the right to secede, but the expediency of its exercise. Their effort was to elect delegates to the State conventions who would vote not to secede. They were beaten, says A H Stephens, by the cry, originally uttered by T. R R Cobb before his State legislature (Nov 12, 1860), "We can make better terms out of the Union than in it" That is, the States were to withdraw individually, suspend the functions of the Federal government within their jurisdiction for the time, consider maturely any proposals for guarantees for their rights in the Union, and return as soon as satisfactory guarantees should be given When the conventions of the seceding States had adopted the ordinances of secession, they proceeded to other business They appointed delegates, who met at Montgomery, the capital of Alabama, formed a provisional Constitution (Feb 8) for the "Confederate States," chose a provisional President and vice-president (Jefferson Davis and A H Stephens), and established an Army, Treasury, and other executive departments. The president and vice-president were inaugurated on Feb 18 The permanent Constitution, adopted on March 11, was copied from that of the United States, with variations meant to maintain state Sovereignty, to give the Cabinet seats in Congress, and to prevent the grant of bounties or any protective features in the tariff or the maintenance of internal improvements at general expense; and it expressly provided that in all the territory belonging to the Confederacy but lying without the limits of the several States "the institution of negro slavery, as it now exists in the Confederate States, shall be recognized and protected by Congress and by the Territorial Government"

Under what claim of constitutional right all this was done passes comprehension That a State convention should have the final power of decision on the question which it was summoned to consider is quite as radical doctrine as has yet been heard of; that a State convention, summoned to consider the one question of secession, should go on, with no appeal to any further popular authority or mandate, to send delegates to meet those of other States and form a new National Government, which could only exist by warring on the United States, is a novel feature in American constitutional law. It was revolution or nothing. Only in Texas, where the call of the State convention was so irregular that a popular vote could hardly be escaped, was any popular vote allowed Elsewhere the functions of the voter ceased when he voted for delegates to the State convention.

The Border States.—The border States were in two tiers—North Carolina, Tennessee and Arkansas next to the seceding States, and Delaware, Maryland, Virginia, Kentucky and Missouri next to the free States. None of these was willing to secede. There was, however, one force which might draw them into secession. A State which did not wish to secede, but believed in State sovereignty and the abstract right of secession, would be inclined to take up arms to resist any attempt by the Federal Government to coerce a seceding State. In the following spring, the original seven seceding States were reinforced by four border States.

In the North and West surprisingly little attention was given to the systematic course of procedure along the Gulf. The people of those sections were very busy; they had heard much of this talk before, and looked upon it as a kind of stage thunder. Republican politicians, with the exception of a few, were inclined to refrain from public declarations of intention. Some of them such

as Seward, showed a disposition to let the "erring sisters" depart in peace, expecting to make the loss good by accessions from Canada. A few, like Senator Zachariah Chandler, believed that there would be "blood-letting," but most of them were still doubtful as to the future. In the North the leaders and the people generally shrank from the prospect of war. Among the various proposals to this end, that offered in the Senate by John J Crittenden, of Kentucky, and known as the Crittenden compromise, was perhaps received with most favour. This took the form of six proposed amendments to the Constitution, of which two were virtually a re-phrasing of the essential feature of the Missouri Compromise and of the principle of squatter sovereignty, and others provided that the National Government should pay to the owner of any fugitive slave, whose return was prevented by opposition in the North, the full value of such slave, and prohibited the abolition of slavery in the District of Columbia "so long as it exists in the adjoining states of Virginia and Maryland or either." This proposed compromise was rejected by the Senate by a close vote on March 2, 1861. A peace congress, called by Virginia, met in Washington from Feb 4 to 27, 1861, 21 States being represented, and proposed a constitutional amendment embodying changes very similar to those of the Crittenden compromise, but its proposal was not acted upon by Congress Congress did nothing, except to admit Kansas as a free State and adopt the protective Morrill tariff; even after its members from the seceding States had withdrawn, those who remained made no preparations for conflict, and, at their adjournment in March 1861, left the Federal Government naked and helpless

The War Governors.—The only sign of life in the body politic, the half-awakened word of warning from the Democracy of the North and West, was its choice of governors of States A remarkable group of men, soon to be known as the "war governors"—Israel Washburn of Maine, Erastus Fairbanks of Vermont, Ichabod Goodwin of New Hampshire, John Albion Andrew of Massachusetts, William Sprague of Rhode Island, William Alfred Buckingham of Connecticut, Edwin Dennison Morgan of New York, Charles Smith Olden of New Jersey, Andrew Gregg Curtin of Pennsylvania, William Dennison of Ohio, Oliver Perry Morton of Indiana, Richard Yates of Illinois, Austin Blair of Michigan, Alexander Williams Randall of Wisconsin, Samuel Jordan Kirkwood of Iowa, and Alexander Ramsey of Minnesota —held the executive powers of the Northern States in 1861–62 Some of these governors, such as Andrew and Buckingham, as they saw the struggle come nearer, went so far as to order the purchase of warlike material for their States on their private responsibility, and their action saved days of time

U.S. Property Seized.—The little Army of the United States had been almost put out of consideration; wherever its detachments could be found in the South they were surrounded and forced to surrender and were transferred to the North. After secession, and in some of the States even before it, the forts, arsenals, mints, custom-houses, shipyards and public property of the United States had been seized by authority of the State, and these were held until transferred to the new Confederate States organization

Only a few forts, of all the magnificent structures with which the nation had dotted the Southern coast, remained to it—the forts near Key West, Fortress Monroe at the mouth of Chesapeake Bay, Ft. Pickens at Pensacola and Ft. Sumter in Charleston Harbour. Both the last-named were beleaguered by hostile batteries, but the Administration of President Buchanan, intent on maintaining the peace until the new Administration should come in, instructed their commanding officers to refrain from any acts tending to open conflict. The Federal officers, therefore, were obliged to look idly on while every preparation was made for their destruction, and even while a vessel bearing supplies for Ft Sumter was driven back by the batteries between it and the sea.

The divergence between the two sections of the country had thus passed into disunion, and was soon to pass into open hostility. The legal recognition of the custom of slavery, acting upon and reacted upon by every step in their economic development and every difference in their natural characteristics and institutions, had carried North and South farther and faster apart, until the elements of a distinct nationality had appeared in the South

Secession had taken away many of the men who had for years managed the Federal Government, and who understood its workings Lincoln's party was in power for the first time; his officers were new to the routine of Federal Administration; and the circumstances with which they were called upon to deal were such as to daunt any spirit The Government had become so nearly bankrupt in the closing days of Buchanan's Administration that it had escaped only by paying double interest The Army had been almost broken up by captures of men and material and by resignations of competent and trusted officers The Navy had come to such a pass that, in Feb 1861, a House committee reported that only two vessels, one of 20, the other of two guns, were available for the defence of the entire Atlantic coast. And, to complicate all difficulties, a horde of clamorous office-seekers crowded Washington

Civil War, 1861–65.—Soon after Lincoln's Administration began, the starting of an expedition to provision Ft Sumter brought on an attack by the batteries around the fort, and after a bombardment of 36 hours the fort surrendered (April 14, 1861). It is not necessary to rehearse the familiar story of the outburst of feeling which followed this event and the proclamation of President Lincoln calling for volunteers The 75,000 volunteers called for were supplied three or four times over.

There had been some belief in the South that the North-west would take no part in the impending conflict, and that its people could be persuaded to keep up friendly relations with the new nationality In the spring months of 1861 Douglas, who had long been denounced as the tool of the Southern slave-holders, was spending the closing days of life in expressing the determination of the North-west that it would never submit to have "a line of custom-houses" between it and the ocean The batteries which Confederate authority was erecting on the banks of the Mississippi were fuel to the flame. California, considered neutral by all parties, pronounced as unequivocally for the national authority.

The shock of arms put an end to opposition in the South as well The peculiar isolation of life in the South precluded the more ignorant voter from any comparisons of the power of his State with any other; to him it was almost inconceivable that his State should own or have a superior The better educated men, of wider experience, had been trained to think State sovereignty the foundation of civil liberty, and, when their State spoke, they felt bound to "follow their State" The president of the Confederate States issued his call for men, and it also was more than met

The Border States.—Lincoln's call for troops met with an angry reception wherever the doctrine of State sovereignty had a foothold The governors of the border States generally returned it with a refusal to furnish any troops. Two States, North Carolina and Arkansas, seceded and joined the Confederate States In two others, Virginia and Tennessee, the State politicians formed "military leagues" with the Confederacy, allowing Confederate troops to take possession of the States and then submitted the question of secession to "popular vote" The secession of these States was thus accomplished, and Richmond became the Confederate capital. The same process was attempted in Missouri, but failed, and the State remained loyal The politician class in Maryland and Kentucky took the extraordinary course of attempting to maintain neutrality, but the growing power of the Federal Government soon enabled the people of the two States to resume control of their governments and give consistent support to the Union. Kentucky, however, had troops in the Confederate armies; and one of her citizens, the late vice-president, John C Breckinridge, left the Senate and became an officer in the Confederate service Delaware cast her lot from the first with the Union.

Civil War.—The first blood of the war was shed in the streets of Baltimore, when a mob attempted to stop Massachusetts troops on their way to Washington (April 19) For a time there was difficulty in getting troops through Maryland because of the active hostility of a part of its people, but this was overcome, and the national capital was made secure The Confederate lines had been pushed up to Manassas Junction, about 30m from Washington. When Congress, called into special session by the President for

July 4, came together, the outline of the Confederate States had been fixed. The length of the line, including also the Atlantic and Gulf coasts, has been estimated at 11,000 miles. The territory within it comprised about 800,000sq.m., with a population of over 9,000,000 and great natural resources. Its cotton was almost essential to the manufactories of the world; in exchange for it every munition of war could be procured; and it was hardly possible to blockade a coast over 3,000m. in length, on which the blockading force had but one port of refuge, and that at about the middle of the line. Nevertheless, President Lincoln issued his first call for troops on April 15. President Davis then issued a proclamation (on the 17th) offering letters of marque and reprisal against the commerce of the United States to private vessels, and on the 19th Lincoln answered with a proclamation announcing the blockade of the Southern coast. The news brought out proclamations of neutrality from Great Britain and France.

The President found himself compelled to assume powers never granted to the executive authority, trusting to the subsequent action of Congress to validate his action He had to raise and support armies and navies; he even had to authorize seizures of necessary property, of railroad and telegraph lines, arrests of suspected persons, and the suspension of the writ of *habeas corpus* in certain districts. Congress supported him, and proceeded in 1863 to give the President power to suspend the writ anywhere in the United States; this power he promptly exercised. The Supreme Court, after the war, in the Milligan case (4 Wallace, 133) decided that no branch of the Government had power to suspend the writ in districts where the courts were open—that the *privilege* of the writ might be suspended as to persons properly involved in the war, but that the writ was still to issue, the court deciding whether the person came within the classes to whom the suspension applied.

When Congress met (July 4, 1861) the absence of Southern members had made it heavily Republican It decided to consider no business but that connected with the war, authorized a loan and the raising of 500,000 volunteers, and made confiscation of property a penalty of rebellion While it was in session the first serious battle of the war—Bull Run, or Manassas—took place (July 21), and resulted in the defeat of the Federal Army.

The "Trent" Case.—The over-zealous action of a naval officer in taking the Confederate envoys James M Mason and John Slidell out of the British steamer "Trent" sailing between two neutral ports almost brought about a collision between the United States and Great Britain in November. But the American precedents were all against the United States, and the envoys were given up.

The broad-construction tendencies of the Republican party showed themselves more plainly as the war grew more serious; there was an increasing disposition to cut every knot by legislation, with less regard to the constitutionality of the legislation. A paper currency commonly known as "greenbacks," was adopted and made legal tender (Feb. 25, 1862). Slavery was prohibited (April 16) in the District of Columbia and the Territories (June 19); the Army was forbidden to surrender escaped slaves to their owners; and slaves of insurgents were ordered to be confiscated. In addition to a homestead act giving public lands to actual settlers at reduced rates, Congress began a further development of the system of granting public lands to railways. Another important act (1862) granted public lands for the establishment of agricultural and mechanical colleges.

Railways.—The railway system of the United States was but 20 years old in 1850, but it had begun to assume some consistency. The day of short and disconnected lines had passed, and the connections which were to develop into railway systems had appeared. Consolidation of smaller companies had begun; the all-rail route across the State of New York was made up of more than a dozen original companies at its consolidation in 1853. The Erie railway, chartered in 1832, was completed from Piermont to Dunkirk (N.Y.), in 1851; and another line—the Pennsylvania—was completed from Harrisburg to Pittston (Pa.), in 1854. These were at least the germs of great trunk lines. The cost of American railways has been only from one-half to one-fourth of the cost of European railways; but an investment in a Far-western railway in 1850–60 was an extra-hazardous risk. Not only did social conditions make any form of business hazardous; the new railway often had to enter a territory bare of population, and there create its own towns, farms and traffic. Whether it could do so was so doubtful as to make additional inducements to capital necessary. The means attempted by Congress in 1850, in the case of the Illinois Central railroad, was to grant public lands to the corporation, reserving to the United States the alternate sections. At first grants were made to the States for the benefit of the corporations; the act of 1862 made the grant directly to the corporation

The vital military and political necessity of an immediate railway connection with the Pacific coast was hardly open to doubt in 1862; but the necessity scarcely justified the terms which were offered and taken. The Union Pacific railroad was incorporated; the United States Government was to issue to it bonds, on the completion of each 40m., to the amount of $16,000 per mile, to be a first mortgage; through Utah and Nevada the aid was to be doubled, and for some 300m of mountain building to be trebled; and, in addition to this, alternate sections of land were granted. The land-grant system, thus begun, was carried on extensively, the largest single grants being those of 47,000,000ac. to the Northern Pacific (1864) and of 42,000,000ac. to the Atlantic and Pacific line (1866).

Paper Prices.—Specie payments had been suspended almost everywhere towards the end of 1861; but the price of gold was but 102·5 at the beginning of 1862. About May its price in paper currency began to rise. It touched 170 during the next year, and 285 in 1864; but the real price probably never went much above 250 Other articles felt the influence in currency prices.

Tariff and Taxes.—The duties on imports were driven higher than the original Morrill tariff had ever contemplated The average rates, which had been 18% on dutiable articles and 12% on the aggregate in 1860–61, rose, before the end of the war, to nearly 50% on dutiable articles and 35% on the aggregate. Domestic manufactures sprang into new life under such encouragement, everyone who had spare wealth converted it into manufacturing capital. The probability of such a result had been the means of getting votes for an increased tariff, free traders had voted for it as well as protectionists For the tariff was only a means of getting capital into positions in which taxation could be applied to it, and the "internal revenue" taxation was merciless beyond precedent The annual increase of wealth from capital was then about $550,000,000; the internal revenue taxation on it rose in 1866 to $310,000,000, or nearly 60%

Bonds.—The stress of all this upon the poor must have been great, but it was relieved in part by the bond system on which the war was conducted While the armies and navies were shooting off large blocks of the crops of 1880 or 1890, work and wages were abundant for all who were competent for them It is true, then, that the poor paid most of the cost of the war; it is also true that the poor had shared in that anticipation of the future which had been forced on the country, and that, when the drafts on the future came to be redeemed, it was done mainly by taxation on luxuries. The destruction of a Northern railway meant more work for Northern iron mills and their workmen The destruction of a Southern road was an unmitigated injury; it had to be made good at once, by paper issues; the South could make no drafts on the future, by bond issues, for the blockade had put cotton out of the game, and Southern bonds were hardly salable. Every expense had to be met by paper issues; each issue forced prices higher. *A Rebel War-Clerk's Diary* gives the following as the prices in the Richmond market for May 1864: "Boot, $200; coats, $350; pantaloons, $100; shoes, $125; flour, $275 per barrel; meal, $60 to $80 per bushel; bacon, $9 per pound; no beef in market; chickens, $30 per pair; shad, $20; potatoes, $25 per bushel; turnip greens, $4 per peck; white beans, $4 per quart or $120 per bushel; butter, $15 per pound; wood, $50 per cord."

Manufactures.—The complete lack of manufactures told heavily against the South from the beginning. As men were drawn from agriculture in the North and West, the increased de-

UNITED STATES PRESIDENTS FROM 1861 TO 1929

16. Abraham Lincoln (term, 1861–1865) by William E. Marshall. 17. Andrew Johnson (1865–1869) by E. F. Andrews. 18. Ulysses Simpson Grant (1869–1877) by Thomas LeClear. 19. Rutherford Birchard Hayes (1877–1881) by Daniel Huntington. 20. James Abram Garfield (1881–1881) by E. F. Andrews. 21. Chester Alan Arthur (1881–1885) by Daniel Huntington. 22–24. Grover Cleveland (1885–1889, 1393–1897) by Eastman Johnson. 23. Benjamin Harrison (1889–1893) by Eastman Johnson. 25. William McKinley (1897–1901) by William D. Murphy. 26. Theodore Roosevelt (1901–1909) by John Singer Sargent. 27. William Howard Taft (1909–1913) by Anders Zorn. 28. Woodrow Wilson (1913–1921) by Stanley G. Middleton. 29. Warren Gamaliel Harding (1921–1923) by Howard Chandler Christy. 30. Calvin Coolidge (1923–1929) by Ercole Carlotto. 31. Herbert Clark Hoover (1929–) by Edmund C. Tarbell

mand for labour was shaded off into an increased demand for agricultural machinery; every increased percentage of power in reaping-machines liberated so many men for service at the front. The reaping-machines of the South—the slaves—were incapable of any such improvement and, besides, required the presence of a portion of the possible fighting men at home to watch them. But no insurrection took place.

The pressing need for men in the Army made the Confederate Congress utterly unable to withstand the growth of executive power. Its bills were prepared by the Cabinet, and the action of Congress was quite perfunctory. The suspension of the writ of *habeas corpus*, and the vast powers granted to President Davis, or assumed by him, made the Confederate Government almost a despotism. It was not until the closing months of the war that the expiring Confederate Congress mustered up courage enough to oppose the President's will.

Banking.—Another act of Federal legislation—the National Bank Act (Feb 25, 1863; supplemented by the act of June 3, 1864)—should be mentioned here, as it was closely connected with the sale of bonds. The banks were to be organized and, on depositing United States bonds at Washington, were to be permitted to issue notes up to 90% of the value of the bonds deposited As the redemption of the notes was thus assured, they circulated without question all over the United States. By a subsequent act (1865) the remaining State bank circulation was taxed out of existence

West Virginia.—At the beginning of 1862 the lines of demarcation between the two powers had become plainly marked. The western part of Virginia had separated itself from the parent State, and was admitted as a State (1863) under the name of West Virginia. It was certain that Delaware, Maryland, Kentucky and Missouri had been saved to the Union, and that the battle was to be fought out in the territory to the south of them.

The Emancipation Proclamation.—At the beginning of the war the people and leaders of the North had not desired to interfere with slavery, but circumstances had been too strong for them. Lincoln had declared that he meant to save the Union as best he could—by preserving slavery, by destroying it or by destroying part and preserving part Just after the battle of Antietam (Sept. 17, 1862) he issued his proclamation calling on the revolted States to return to their allegiance before the next year, otherwise their slaves would be declared free men. No State returned and the threatened declaration was issued on Jan. 1, 1863. As President, Lincoln could issue no such declaration; as commander-in-chief of the armies and navies of the United States he could issue directions only as to the territory within his lines; but the Emancipation Proclamation applied only to territory outside of his lines. It has therefore been debated whether the proclamation was in reality of any force It may fairly be taken as an announcement of the policy which was to guide the Army and as a declaration of freedom taking effect as the lines advanced. At all events, this was its exact effect. Its international importance was far greater. The locking up of the world's source of cotton supply had been a general calamity, and the Confederate Government and people had steadily expected that the English and French Governments would intervene in the war. The conversion of the struggle into a crusade against slavery made intervention impossible.

Confederate Privateers.—Confederate agents in England were numerous and active. Taking advantage of every loophole in the British Foreign Enlistment Act, they built and sent to sea the "Alabama" and "Florida," which for a time almost drove Federal commerce from the ocean. Whenever they were closely pursued by United States vessels they took refuge in neutral ports until a safe opportunity occurred to put to sea again. Another, the "Georgia," was added in 1863. All three were destroyed in 1864. Confederate attempts to have iron-clads equipped in England and France were unsuccessful.

The Victory of the North.—The turning-point of the war was evidently in the early days of July 1863, when the victories of Vicksburg and Gettysburg came together. The National Government had at the beginning cut the Confederate States down to a much smaller area than might well have been expected; its armies had pushed the besieging lines far into the hostile territory; and the war itself had developed a class of generals who cared less for the conquest of territory than for destroying the opposing armies. The great drafts on the future which the credit of the Federal Government enabled the North to make gave it also a startling appearance of prosperity; so far from feeling the war, it was driving production of every kind to a higher pitch than ever before.

The war had not merely developed improved weapons and munitions of war; it had also spurred the people on to a more careful attention to the welfare of the soldiers, the fighting men drawn from their own number. The sanitary commission, the Christian commission, and other voluntary associations for the physical and moral care of soldiers, received and disbursed very large sums. The National Government was paying an average amount of $2,000,000 per day for the prosecution of the war and, in spite of the severest taxation, the debt grew to $500,000,000 in June 1862, to twice that amount a year later, to $1,700,000,000 in June 1864 and reached its maximum on Aug 31, 1865—$2,845,907,626. But this lavish expenditure was directed with energy and judgment. The blockading fleets were kept in perfect order and with every condition of success. The railway and telegraph were brought into systematic use for the first time in modern warfare. Late in 1863 Edwin M. Stanton, the secretary of War, moved two corps of 23,000 men from Washington to Chattanooga, 1,200m., in seven days.

Conscription.—On the other hand, the Federal Armies now held almost all the great southern through lines of railway, except the Georgia lines and those which supplied Lee from the South. The want of the Southern people was merely growing in degree, not in kind. The conscription, sweeping from the first, had become omnivorous; towards the end of the war every man between 17 and 55 was legally liable to service, and in practice the only limit was physical incapacity. In 1863 the Federal Government also was driven to conscription. The first attempts to carry it out resulted in forcible resistance in several places, the worst being the "draft riots" in New York (July), when the city was in the hands of the mob for several days All the resistance was put down; but exemptions and substitute purchases were so freely permitted that the draft in the North had little effect except as a stimulus to the States in filling their quotas of volunteers by voting bounties.

Election of 1864.—In 1864 Lincoln was re-elected with Andrew Johnson as vice-president. The Democratic convention had declared that, after four years of failure to restore the Union by war, during which the Constitution had been violated in all its parts under the plea of military necessity, a cessation of hostilities ought to be obtained, and had nominated Gen George B. McClellan and G H. Pendleton Farragut's victory in Mobile Bay (Aug 5), by which he sealed up the last port, except Wilmington, of the blockade-runners, and the evidently staggering condition of the Confederate resistance in the East and the West, were the sharpest commentaries on the Democratic platform; its candidates carried only three of the 25 states taking part in the election. The 36th State—Nevada—had been admitted in 1864

Surrender of Lee.—The actual fighting of the war ended with the surrender of Gen. Robert E Lee to Gen U.S. Grant at Appomattox, Va, April 9, 1865. All the terms of surrender named by Grant were generous: no private property was to be surrendered; both officers and men were to be dismissed on parole, not to be disturbed by the United States Government so long as they preserved their parole and did not violate the laws; and he instructed the officers appointed to receive the paroles "to let all the men who claim to own a horse or mule take the animals home with them to work their little farms." Gen. Joseph E. Johnston, with the only other considerable army in the field, surrendered on much the same terms at Durham Station, N.C. (April 26), after an unsuccessful effort at a broader settlement. All organized resistance had now ceased; Union cavalry were ranging the South, picking up Government property or arresting leaders; but it was not until May that the last detached parties

of Confederates gave up the contest.

Death of Lincoln.—Just after Lee's surrender President Lincoln died by assassination (April 15), the crime of a half-crazed enthusiast. Even this event did not impel the American people to any vindictive use of their success for the punishment of individuals. In the heat of the war, in 1862, Congress had so changed the criminal law that the punishment of treason and rebellion should no longer be death alone, but death or fine and imprisonment. Even this modified punishment was not inflicted. There was no hanging; some of the leaders were imprisoned for a time, but never brought to trial.

The Armies.—The Armies of the Confederacy are supposed to have been at their strongest (700,000) at the beginning of 1863; and it is doubtful whether they contained 200,000 men in March 1865. The dissatisfaction of the Southern people at the manner in which Davis had managed the war seems to have been profound, and it was only converted into hero worship by the ill-advised action of the Federal Government in arresting and imprisoning him. Desertion had become so common in 1864, and the attempts of the Confederate Government to force the people into the ranks had become so arbitrary, that the bottom of the Confederacy had dropped out of it before Sherman moved northward from Savannah. On the contrary, the numbers of the Federal Armies increased steadily until March 1865, when they were a few hundreds over 1,000 000. As soon as organized resistance ceased, the disbanding of the men began; they were sent home at the rate of about 300 000 a month, about 50,000 being retained in service as a standing Army.

Cost of the War.—The direct cost of the Civil War has been variously estimated, the best estimate including the first three years of reconstruction being $5,000,000,000 to the North and $3,000 000,000 to the South. But if pensions, interest and other such items up to 1910 are included, the result is a total of between $11,000,000,000 and $12 000,000,000 for the North alone. But the cost to the South also was enormous, $4,000,000 000 cannot be an exaggeration.

Results.—In return for such an expenditure, and the death of between 750 000 and 1,000,000 men, the abiding gain was incalculable. The rich section, which had been kept back in the general development by a single institution, and had been a clog on the advance of the whole, had been dragged up to a level with the rest of the country. Free labour was soon to show itself far superior to slave labour in the South, and the South was to reap the largest material gain from the destruction of the Civil War. The persistent policy of paying the debt immediately resulted in the higher taxation falling on the richer North and West. As a result of the struggle the moral stigma of slavery was removed. The power of the nation, never before asserted openly, had made a place for itself; and yet the continuing power of the States saved the national power from a development into centralized tyranny. And the new power of the nation, by guaranteeing the restriction of government to a single nation in central North America, gave security against any introduction of international relations, international armament, international wars and continual war taxation into the territory occupied by the United States. Finally, democracy in America had certainly shown its ability to maintain the unity of its empire. (A. J., X.)

Bibliography.—*Sources:* The debates of Congress from 1789 to 1824, were collected from newspapers, abridged and published under the title of *The Annals of Congress* (43 vols, 1834–1856). The principal debates from 1825 to 1837 are in the *Register of Debates in Congress* (29 vols, 1825–1837), and from 1833 to 1873 the debates are in the *Congressional Globe* (108 vols, 1834–1873). *See* also *United States Statutes at Large*, from 1789 to 1865 (13 vols, 1845–1866), and *Indian Affairs, Laws and Treaties*, edited by C. J. Kappler (1904). Treaties of the United States have been published in *Treaties, Conventions, International Acts, Protocols and Agreements between the United States of America and Other Powers, 1776–1909* (1910). The decisions of the United States Supreme Court from 1789 to 1874 occupy 90 volumes. The important executive documents are contained in *The Messages and Papers of the Presidents, 1789–1897*, compiled by J. D. Richardson (10 vols, 1896–1899), and the *American State Papers: Documents Legislative and Executive* (38 vols, 1832–1861). The framing and ratification of the Constitution is dealt with in M. Farrand, *Records of the Federal Convention* (3 vols., 1909–11), and *The Debates in the Several State Conventions on the Adoption of the Federal Constitution*, by Jonathan Elliot (5 vols., 2nd ed, 1888). For the Civil War by far the most important source is the vast compilation of the *Official Records of the Union and Confederate Armies*, in four series, an atlas and a general index (Washington, 1880–1900). The material in William MacDonald's *Select Documents Illustrative of the History of the United States, 1776–1861* (1924) relates almost wholly to constitutional development, foreign relations and banking. A. B. Hart's *American History told by Contemporaries* (1901), consists largely of correspondence narratives, correspondence and extracts from diaries. For social and economic sources see *The Documentary History of American Industrial Society* (10 vols, 1909–11), J. R. Commons, editor. The writings of the statesmen of the period—George Washington, Alexander Hamilton, John Jay, John Adams, Thomas Jefferson, James Madison, James Monroe, John Quincy Adams, Henry Clay, Daniel Webster, Andrew Jackson, John Calhoun, James Buchanan, Abraham Lincoln, Jefferson Davis, William H. Seward, Charles Sumner—exist in good editions. Thomas H. Benton's autobiographical *Thirty Years' View* (1854–56) is invaluable as is also *The Diary of James K. Polk* (4 vols, 1910). Valuable reports on manuscript material are published in the *Annual Reports* of the American Historical Association. *See* also C. H. Van Tyne and W. G. Leland, *Guide to the Archives of the Government of the United States* (1907).

FROM 1865 TO 1910

The capitulation of Lee (April 9, 1865), followed by the assassination of Lincoln (April 15) and the surrender of the last important Confederate army, under J. E. Johnston, marked the end of the era of war and the beginning of that of reconstruction, which involved a revolution in the social and political structure of the South, in the relation of State and nation in the American Federal Union, and in the economic life of the whole country.

Condition of the South.—Economically the condition of the

South was desperate The means of transport were destroyed; railways and bridges were ruined, Southern securities were valueless, the Confederate currency system was completely disorganized Emancipated negroes wandered idly from place to place, trusting the Union armies for sustenance, while their former masters toiled in the fields to restore their plantations.

The social organization of the South had been based on negro slavery Speaking generally, the large planters had constituted the dominant class, especially in the cotton States, and in the areas of heaviest negro population these planters had belonged for the most part to the old Whig Party Outside of the larger plantation areas, especially in the hill regions and the pine barrens, there was a population of small planters and poor whites who belonged in general to the Democratic Party In the mountain regions, where slavery had hardly existed, there were Union areas, and from the poor whites of this section had come Andrew Johnson, senator and war governor of Tennessee, who was chosen vice-president on the Union ticket with Lincoln in 1864 as a recognition of the Union men of the South

The North.—The importance of personality in history was clearly illustrated when the wise and sympathetic Lincoln, who had the confidence of the masses of the victorious North, was replaced by Johnson, opinionated and intemperate, whose antecedents as a Tennessean and Democrat, and whose State rights principles and indifference to Northern ideals of the future of the negro made him distrusted by large numbers of the Union Republican Party

The composition of this party was certain to endanger its stability when peace came It had carried on the war by a coalescence of Republicans War Democrats, Whigs, Constitutional Unionists and Native Americans, who had rallied to the cause of national unity At the outset it had asserted that its purpose was not to interfere with the established institutions in slave States but to defend the Constitution, and to preserve the Union But the war had destroyed slavery, as well as preserved the Union, and the civil status of the negro and the position of the revolted States now became burning questions To the extremists of the Radical wing it seemed in accordance with the principles of human liberty that the negro should not only be released from slavery but should also receive full civil rights, including the right to vote This group was also ready to revolutionize Southern society by destroying the old ascendancy of the great planter-class

For many years before the war, parties had differed on such important questions as the tariff, internal improvements and foreign policy, and the South had used its alliance with the Northern Democracy to resist the economic demands of the industrial interests of the North A return of Southern congressmen might mean a revival of the old political situation, with the South and the Northern Democracy once more in the saddle

Attitude of the Two Sections.—Any attempt to restore the South to full rights, therefore, without further provision for securing for the freedmen the reality of their freedom, and without some means of establishing the political control of the victorious party, would create party dissension Even Lincoln had aroused the bitter opposition of the radical leaders by his generous plan of reconstruction Johnson could have secured party support only by important concessions to the powerful leaders in Congress, and these concessions he was temperamentally unable to make The masses of the North, especially in the first rejoicings over the peace, were not ungenerous in their attitude, and the South as a whole, accepted the results of defeat in so far as to acquiesce in the permanence of the Union and the emancipation of the slaves, the original issues of the war

Reconstruction.—In the settlement of the details of reconstruction, however, there were abundant opportunities for the hatred engendered by the war to flame up once more As it became clear that the Northern majority was determined to exclude the leaders of the South from political rights in the reconstruction of the Union, and especially as the radicals disclosed their purpose to ensure Republican ascendancy by subjecting the section to the rule of the loyalist whites and, later to that of the emancipated negroes, good will disappeared, and the South entered upon a fight for its social system The natural leaders of the people, men of intelligence and property, had been the leaders of the section in the war Whatever their views had been at first as to secession, the great majority of the Southern people had followed the fortunes of their States To disfranchise their leaders was to throw the control into the hands of a less able and small minority of whites; to enfranchise the blacks while disfranchising the white leaders was to undertake the task of subordinating the former political people of a section to a different race, just released from slavery, ignorant, untrained and without property.

These underlying forces were in reality more influential than the constitutional theories which engaged so much of the discussion in Congress, theories which, while they afford evidence of the characteristic desire to proceed constitutionally were really urged in support of, or opposition to, the interests just named

The most extreme Northern Democrats, and their Southern sympathizers, starting from the premise that constitutionally the Southern States had never been out of the Union, contended that the termination of hostilities restored them to their former rights in the Federal Union unimpaired and without further action This theory derived support from President Lincoln's view that not States, but assemblages of individuals, had waged war against the Government The theory of the extreme Republican Radicals was formulated by Sumner and Stevens Sumner contended that, while the States could not secede, they had by waging war reduced themselves to mere Territories, entitled only to the rights of Territories. Stevens, appealing to the facts of secession, declared the Southern States conquered provinces, subject to be disposed of at the will of the conqueror. In the end Congress adopted a middle ground, holding that while the States could not leave the Union, they were, in fact, out of normal relations, and that the constitutional right of the Federal Government to guarantee republican Governments to the various States gave to Congress the power to impose conditions precedent to their rehabilitation

It is necessary to recall the initiation of reconstruction measures by President Lincoln rightly to understand the position which was taken by President Johnson. Impatient of theoretical discussion, Lincoln laid down practical conditions of restoration in his proclamation of Dec 8, 1863 In this he offered amnesty to those who would take an oath of loyalty for the future and accept the acts of Congress and the proclamation of the President with reference to slaves From the amnesty he excepted the higher military, civil and diplomatic officers of the Confederacy as well as those who had relinquished judicial stations, seats in Congress, or commissions in the Army or Navy and those who had treated persons in the Federal service otherwise than lawfully as prisoners of war The proclamation provided, further, that when in any of the seceding States (except Virginia, where the President had already recognized the loyal Government under Gov Francis H Pierpont) a number of persons not less than one-tenth of the voters in 1860 should have taken the above described oath, and, being qualified voters under the laws of the State in 1860, should have established a State Government, republican in form, it should be recognized

The First Reconstruction Bill.—Although Lincoln expressly pointed out that the admission of the restored States to representation in Congress rested exclusively with the respective houses, and announced his readiness to consider other plans for reconstruction, heated opposition by the radicals in Congress was called out by this proclamation They feared that it did not sufficiently guarantee the abolition of slavery, which up to this time rested on the war powers of the President, and they asserted that it was the right of Congress, rather than of the President, to determine the conditions and the process of reconstruction. In a bill which passed the House by a vote of 73 to 59 and was concurred in by the Senate, Congress provided that reconstruction was to be begun only when a majority of the white male citizens of any one of the Confederate States should take oath to support the Constitution of the United States The President should then invite them to call a Constitutional Convention The electors of this convention would be required to take an oath of

allegiance which excluded a much larger class than those deprived of the benefit of the amnesty proclamation, for it eliminated all who had voluntarily borne arms against the United States, or encouraged hostility to it, or voluntarily yielded support to any of the Confederate Governments The bill also required that the State Constitution should exclude a large proportion of the civil and military officers of a Confederate Government from the right of voting, and that it should provide that slavery be forever abolished and that State and Confederate debts of the war period should never be paid In July 1864 Lincoln gave a "pocket veto" to the bill and issued a proclamation explaining his reasons for refusing to sign The triumph of Lincoln in the election of 1864 did not clearly signify the will of the people upon the conditions of reconstruction, for the declaration of the Democratic convention that the war was a failure overshadowed the issue, and the Union Party which supported Lincoln was composed of men of all parties

Thirteenth Amendment.—On Jan 31, 1865, the House concurred in the vote of the Senate in favour of the 13th amendment to the Constitution abolishing slavery throughout the Union Four years earlier Congress had submitted to the States another 13th amendment by the terms of which no amendment should ever authorize Congress to interfere with slavery within the States. But owing to the war this amendment had remained unratified, and now Congress proposed to place beyond constitutional doubt, or the power of States to change it, the emancipation of slaves By Dec 18, 1865, the amendment had been ratified and was proclaimed in force.

In the meantime, Louisiana, in accordance with Lincoln's proclamation, had adopted a Constitution and abolished slavery within the State Owing to the obstructive tactics of Sumner, aided by Democrats in the Senate, Congress adjourned on March 4, 1865, without having recognized this new State Government as legitimate "It we are wise and discreet," said Lincoln, "we shall reanimate the states and get their governments in successful operation with order prevailing and the Union re-established before Congress comes together in December"

President Johnson.—Such was the situation when Johnson took up the Presidency upon Lincoln's death After an interval of uncertainty in which he threatened vengeance against various Southern leaders, President Johnson accepted the main features of Lincoln's policy Congress not being in session, he was able to work out an executive reconstruction on the lines of Lincoln's policy during the summer and autumn of 1865 On May 29, he issued a proclamation of amnesty, requiring of those who desired to accept its provisions an oath to support the Constitution and Union, and the laws and proclamations respecting the emancipation of slaves Certain specified classes of persons were excepted, including certain additions to those excluded by Lincoln, especially "all persons who have voluntarily participated in said rebellion and the estimated value of whose taxable property is over twenty thousand dollars" This provision was characteristic of Johnson, who disliked the Southern planting aristocracy, and aimed at placing the preponderant power in the hands of the Democratic small farmers As part of his system he issued another proclamation in which he appointed a governor for North Carolina and laid down a plan for reconstruction. By this proclamation it was made the duty of the governor to call a convention chosen by the loyal people of the State, for the purpose of altering the State Constitution and establishing a State Government The right to vote for delegates to this convention was limited to those who had taken the oath of amnesty and who had been qualified to vote prior to the secession of the State

Already Virginia, Tennessee, Louisiana and Arkansas had Governments which had been recognized by Lincoln. Between June 13 and July 13, 1865, Johnson applied the same process which he had outlined for North Carolina to the remaining States of the Confederacy Before Congress met in December all the Confederate States, except Texas (which delayed until the spring of 1866), had formed Constitutions and elected Governments in accordance with the presidential plan. All of their legislatures, except that of Mississippi, ratified the 13th amendment

Gradually, however, the South turned to its former leaders to shape its policy, and the radical Republicans of the North were alarmed at the rapidity of the process of restoration on these principles. The disorganized and idle condition of the former slaves constituted a serious element in the Southern situation, as Lincoln had foreseen The negroes expected a grant of land from confiscated Southern estates, and it was difficult to preserve order and to secure a proper labour supply.

Under these conditions the efforts of the South to provide security for their communities by bodies of white militia were looked upon with apprehension by the North, and there was sufficient conflict between the two races to give colour to charges that the South was not accepting in good faith the emancipation of the slaves. Especially irritating to Northern sentiment were the so-called "black codes" or "peonage laws," passed by the newly elected Southern legislatures. They rested on the belief that it was necessary that the former slaves should be treated as a separate and dependent class. Some of these imposed special disabilities upon the negro in the matter of carrying weapons and serving as witnesses Vagrancy laws and provisions regarding labour contracts which had precedents in colonial and English legislation, but were specifically framed to restrain the negroes only, were common. Mississippi denied them the right to own land, or even to rent it outside of incorporated towns; South Carolina restricted them to husbandry and to farm or domestic service, unless specially licensed

The Freedmen's Bureau.—The problem of succouring and protecting the negroes had forced itself upon the attention of the North from the beginning of the war, and on March 3, 1865, Congress had created the Freedmen's Bureau with the power to assign abandoned lands, in the States where the war had existed, to the use of the freedmen, to supervise charitable and educational activities among them; to exercise jurisdiction over controversies in which a freedman was a party, and to regulate their labour contracts. The local agents of the bureau were usually Northern men, some of them gave the worst interpretation to Southern conditions and aroused vain hopes in the negroes that the lands of the former masters would be divided among them, and later many became active in the political organization of the negro

Although the National Government itself had thus recognized that special treatment of the freedmen was necessary, Congress, on assembling in Dec. 1865, was disposed to regard the course of the South in this respect with deep suspicion Moreover, as the 13th amendment was now ratified, it was seen that the South, if restored according to the presidential policy, would return to Congress with added representatives for the freed negroes Only three-fifths of the negro slaves had been counted in apportioning representatives in Congress, though now free they were not allowed to vote Under the leadership of the Radicals, Congress refused, therefore, to receive the representatives of the States which had met the conditions of the President's proclamations A joint committee of 15 took the whole subject of reconstruction under advisement, and a bill was passed continuing the Freedmen's Bureau indefinitely When this was vetoed by President Johnson (Feb 19, 1866) Congress retaliated by a concurrent resolution (March 2) against admitting any reconstructed State until Congress declared it entitled to recognition, thus asserting for the legislative body the direction of reconstruction.

While the measure was under consideration the President in an intemperate public address stigmatized the leaders of the Radicals by name as labouring to destroy the principles of the Government and even intimated that the assassination of the President was intended It was hardly possible to close the breach after this, and the schism between the President and the leaders of the Union Republican Party was completed when Congress passed (April 9, 1866) the Civil Rights bill over Johnson's veto. The act declared the freedmen to be citizens of the United States with the same civil rights as white persons and entitled to the protection of the Federal Government.

The Fourteenth Amendment.—To place this measure beyond the danger of overthrow by courts or by a change of party majority, on June 13, 1866, Congress provided for submitting to

the States a 14th amendment to the Constitution. This gave constitutional guarantee of citizenship and equal civil rights to freedmen, and in effect provided that when in any State the right to vote should be denied to any of the male inhabitants 21 years of age and citizens of the United States, except for participation in rebellion or other crime, the basis of representation in the State should be reduced in the proportion which the number of such citizens bore to the whole number of male citizens 21 years of age in the State. This section of the amendment, therefore, left the States the option between granting the suffrage to the negro or suffering a proportionate reduction in the number of representatives in Congress It was a fair compromise which might have saved the South from a long period of misrule and the North from the ultimate breakdown of its policy of revolutionizing Southern political control by enfranchisement of the blacks and disfranchisement of the natural leaders of the whites

In order to ensure the passage of this amendment the radical leaders proposed bills which declared that, after its adoption, any of the seceding States which ratified it should be readmitted to representation But it also provided that the higher classes of officials of the Confederacy should be ineligible to office in the Federal Government These bills were allowed to await the issue of the next election

For further protection of the rights of the negro, Congress succeeded in passing, over President Johnson's veto, an act continuing the Freedmen's Bureau for two years Tennessee, having ratified the 14th amendment, was (July 24, 1866) restored to representation and Congress adjourned, leaving the issue between the President and the legislative body to the people in the Congressional elections

Party Changes.—The campaign brought with it some realignment of party. President Johnson, having broken with the leaders of the Union Republican Party, was more and more forced to rely upon Democratic support, although his executive appointments were still made from the ranks of the Republicans The so-called National Union convention, which met in Philadelphia in midsummer in an effort to abate sectionalism, and to endorse the President's policy, included a large number of war Democrats who had joined the Union party after the secession of the South, many moderate Southerners, a fragment of the Republican Party, and a few Whigs, especially from the border States They claimed that the Southern States had a right to be represented in Congress Other meetings friendly to the Radicals were called, and under the designation of Union-Republican Party they declared for the congressional policy While the campaign for elections to Congress was in progress the President made a journey to Chicago, speaking at various cities *en route* and still further alienating the Republicans by abuse of his opponents. As a result of the autumn elections two-thirds of the members of the House of Representatives were opposed to him. Almost contemporaneously every seceding State except Tennessee rejected the 14th amendment, paving the way for the entire triumph of the Northern extremists

Tenure of Office Act.—In the ensuing winter and spring Congress completed the conquest of the President, awed the Supreme Court, and provided a drastic body of legislation to impose negro suffrage on the South By the Tenure of Office Act (March 2, 1867) Congress forbade the President to remove civil officers without the consent of the Senate, and at the same time by another act required him to issue military orders only through the general of the Army (Grant), whom the President was forbidden to remove from command or to assign to duty at another place than Washington, unless at the request of the officer or by the prior assent of the Senate. These extraordinary invasions of the presidential authority were deemed necessary to prevent Johnson from securing control of the military arm of the Government, and to protect Edwin Stanton, the secretary of war, and Gen Grant. Fearing the President might take advantage of the interim when Congress would not be in session, the 40th Congress was required to meet on March 4, immediately following the expiration of the 39th.

Other Legislative Acts.—The Reconstruction Act of March 2, 1867, provided for the military Government of the Southern States while the drastic policy of Congress was being carried out It was passed over the veto of the President and declared that no legal Governments or adequate protection for life or property existed in the seceding States, except Tennessee. These States it divided into five military districts, each to be placed under the command of a general of the Army, whose duty it was to preserve law and order. But the existing civil Governments were declared provisional only and subject to the paramount authority of the United States to abolish, modify, control, or supersede them. The act further provided that a Constitutional Convention might be elected by the adult male citizens of the State, of whatever race, colour or previous condition, resident in the State for a year, except such as might be disfranchised for rebellion or felony.

When the convention, thus chosen under negro suffrage, and with the exclusion of Confederate leaders, should have framed a State Constitution conforming to the Federal Constitution and allowing the franchise to those entitled to vote for the members of the convention, the Constitution was to be submitted for the approval of Congress If this were obtained and if the State adopted the 14th amendment, and this amendment became a part of the Federal Constitution, then the State should be entitled to representation in Congress, but the senators and representatives sent to Congress were required to take the "iron-clad oath," which excluded those who had fought in the Confederate service, or held office under any Government hostile to the United States, or given support to any such authority.

By the pressure of military control Congress thus aimed at forcing the adoption of the 14th amendment, as well as the acceptance of negro suffrage in the State Constitutions of the South A supplementary act of March 23, 1867, and an act of interpretation passed on July 19 completed this policy of "thorough" In the registration of voters the district commanders were required to administer an oath which excluded those disfranchised for rebellion and those who after holding State or Federal office had given aid and comfort to the enemies of the United States

Supreme Court Decisions.—Against this use of military power to govern States in time of peace the Supreme Court interposed no effective obstacle. Like the executive it was subordinated to Congress. It is true that in the case *ex parte* Milligan, decided in Dec 1866, the court held military commissions unlawful where the ordinary civil tribunals were open. In the case of Cummings v. Missouri (Jan. 14, 1867) it decided also that a State test oath excluding Confederate sympathizers from professions was a violation of the prohibition of *ex post facto* laws; and the court (*ex parte* Garland) applied the same rule to the Federal test oath so far as the right of attorneys to practise in Federal courts was concerned.

But threats were made by the radicals in Congress to take away the appellate jurisdiction of the court, and even to abolish the tribunal by constitutional amendment. The judges had been closely divided in these cases and, when the real test came, the court refused to set itself in opposition to Congress When Mississippi attempted to secure an injunction to prevent the president from carrying out the reconstruction acts, and when Georgia asked the court to enjoin the military officers from enforcing these acts in that State, the Supreme Court refused (April and May 1867), pleading want of jurisdiction. Chief Justice Salmon P. Chase argued that if the President refused to obey, the court could not enforce its decree, while if he complied with the order of the court, and if the House of Representatives impeached him for refusing to enforce the law, the Supreme Court would be forced to the vain attempt to enjoin the Senate from sitting as a court of impeachment

In one instance it seemed inevitable that the court would clash with Congress; the McCardle case involved an editor's arrest by military authority for criticizing that authority and the reconstruction policy. But Congress, apprehending that the majority of the court would declare the reconstruction acts unconstitutional, promptly repealed that portion of the act which gave the court jurisdiction in the case, and thus enabled the judges to dismiss the appeal. Afterwards, when the reconstruction policy had been accomplished, the court, in the case of Texas v White

(1869), held that the Constitution looked to "an indestructible Union composed of indestructible states"; and that although the secession acts were null, and the Federal obligations of the seceding States remained unimpaired, yet their rights were suspended during the war

Impeachment of President Johnson.—The powerful leaders of the Republicans in Congress had been awaiting their opportunity to rid themselves of President Johnson by impeachment For full details of these efforts *see* JOHNSON, ARTHUR His trial in the spring of 1868, however, by the Senate resulted in a verdict of acquittal.

"Carpet-baggers."—Meanwhile the military reconstruction of the South and the organization of the negro vote progressed effectively The party management of the negroes was conducted by "carpet-baggers," as the Northern men who came South to try their fortunes were nicknamed, and by the white loyalists of the South, to whom was given the name "scalawags" In the work of marshalling the freedmen's vote for the Republican Party secret societies like the Loyal League, or Union League played an important part As the newly enfranchised mass of politically untrained negroes passed under Northern influence politically, the Southern whites drew more and more together and although they were unable under the existing conditions to take control, they awaited their opportunity A "Solid South" was forming in which old party divisions gave way to the one dominant antagonism to Republican ascendancy by negro suffrage. Politically the important fact was that the Republicans had rejected the possibility of reviving the old party lines in the South, and had gambled upon the expectation of wielding the united coloured vote with such leadership and support as might be gained from former Northerners and loyal whites In the end negro rule failed, as was inevitable when legal disabilities and military force were removed, but the masses of the Southern whites emerged with a power which they had not possessed under the old rule of the planting aristocracy For the time being, however, negro votes gave control to the Republicans In South Carolina, Florida, Alabama, Mississippi and Louisiana the negroes were in a majority, in Virginia, North Carolina, Arkansas and Texas they were in the minority; while in Georgia the two races were nearly evenly balanced

Ku-Klux Klan.—The white leaders of the South were divided as to the best means of meeting the problem Some advocated that those entitled to vote should register, and then refrain from the polls, in order to defeat the Constitutions made under negro suffrage, for the law required them to be ratified by a majority of the qualified voters Others would have the white race bear no part in the process Societies such as the "Ku-Klux Klan" and the "Knights of the White Camelia" were organized to intimidate or restrain the freedmen But for the present the Republicans carried all before them in the South Some of the new State Constitutions imposed severe disfranchisement upon the former dominant class, and before the end of July 1868 all of the former Confederate States, except Virginia, Mississippi and Texas, had ratified the 14th amendment, which was proclaimed in effect By the beginning of 1870 these three States had also ratified the amendment, as had Georgia a second time, because of her doubtful status at the time of her first ratification

The Southern States Restored to the Union.—By the summer of 1868 Arkansas, South Carolina, North Carolina, Georgia, Alabama, Louisiana and Florida, having satisfied the requirements of the reconstruction acts, were entitled to representation in Congress But Georgia did not choose her senators until after the adjournment of Congress, and, inasmuch as the State excluded the negro members of the legislature in September, Congress on reassembling returned the State to military rule until its submission Alabama was restored in spite of the fact that her white voters had remained away from the polls in sufficient numbers to prevent a majority of all the voters registered from having ratified the constitution. The nominating conventions and the campaign of 1868 gave interesting evidence of the trend of political and economic events. Party lines, which had broken down in the North when all united in saving the Union, were once more reasserting themselves President Johnson, who had been elected by the Union Republican Party, had found his most effective support among the Democrats. The Republicans turned to Gen Grant, a Democrat before the outbreak of the war.

Grant Nominated.—The Republican nominating convention met on May 20, 1868, a few days after the failure of the impeachment proceedings, and it chose Grant as the candidate for the Presidency The platform supported the congressional reconstruction measures Upon the vital question whether universal negro suffrage should be placed beyond the power of States to repeal it by a new constitutional amendment, the platform declared. "The guarantee by Congress of equal suffrage to all loyal men at the South was demanded by every consideration of public safety, of gratitude and of justice, and must be maintained; while the question of suffrage in all the loyal states properly belongs to the people of those states" Nowhere in the North was the negro an important element in the population, but the North had shown an unwillingness to apply to itself the doctrines of negro rights which had been imposed upon the South Between 1865 and 1868 Connecticut, Wisconsin, Minnesota, Kansas, Ohio and Michigan had refused to give the negro the right to vote within their own bounds, and this plank was evidence of the unwillingness of the party to make a direct issue of universal negro suffrage The platform pronounced in favour of payment of the public debt, not only according to the letter but the spirit of the laws under which it was contracted The significance of this lay in its challenge to the Democratic agitation on the currency question

It was this question which gave the tone to the proceedings of the Democracy at their convention in July 1868. The situation can best be presented by a brief review of the financial history just preceding the convention Together with the discussion over political reconstruction in the South, Congress and the Administration had been obliged to deal with the reconstruction of debt, taxation and currency in the nation at the close of four years of expensive war The problems of funding, readjustment of taxation, and resumption of specie payments proved to be so complicated with the industrial growth of the nation that they led to issues destined to exert a long-continued influence

Finance.—The various war tariffs, passed primarily for the sake of increased revenue, had been shaped for protection under the influence of the manufacturing interests, and they had been framed also with reference to the need of compensating the heavy internal taxes which were imposed upon the manufacturers. When the war ended, public sentiment demanded relief from these heavy burdens, especially from the irksome internal taxes The rapidly growing grain-raising districts of the Middle West exhibited a lively discontent with the protective tariff, but this did not prevent the passage in 1867 of the Wool and Woollens Act, which discriminated in favour of the woollen manufacturers and raised the *ad valorem* duty on wool In spite of several large reductions of internal revenue, the national debt was being rapidly extinguished

The currency question, however, furnished the economic issue which was most debated One set of interests aimed at rapidly reducing the volume of the currency by retiring the legal tender notes, or "greenbacks" The secretary of the Treasury, Hugh McCulloch, pressed this policy to the foreground, and desired authority to issue bonds to retire these notes Another set of interests demanded the retention of the greenbacks, supporting their views by arguments varying according to the degree of radicalism of the speakers The more moderate, like Senator John Sherman, of Ohio, who reflected the views of parts of the West, argued that the recuperation of the nation and the rapid increase of business would absorb the existing currency, while gold would cease to go abroad Thus, by the increasing credit of the Government, specie payment would be automatically resumed The most extreme, so far from contracting the currency by retiring the greenbacks, wished to increase this form of money, while diminishing the circulation of the notes of the national banks. The discussion tended to produce a sectional issue with the West against the East, and a social issue with bondholders

and the creditor class in general arrayed against the less well-to-do. Congress agreed with Secretary McCulloch, and in the Funding Act of 1866 not only provided for converting short-time securities into long-term bonds, but also for retiring $10,000,000 of greenbacks in six months and thereafter not more than $4,000,000 monthly. But the agricultural depression of 1866 produced a reaction. Loud demands were made that bonds should be paid in greenbacks instead of coin and the national bank-notes suppressed In 1868, on the eve of the presidential campaign, Congress, alarmed by the extent of these popular demands, suspended the process of contraction after $40,000,000 in greenbacks had been retired. Ohio was the storm centre of the agitation. The "Ohio idea" that greenbacks should become the accepted currency of the country was championed by George H. Pendleton, of that State, and his friends now brought him forward for the Democratic nomination for President on this issue In the national convention of that party they succeeded in incorporating into the platform their demands that there should be one currency for the Government and the people, the bondholder and the producer, and that where the obligations of the Government did not expressly provide for payment in coin, they should be paid in lawful money (*i e*, greenbacks) of the United States

But another wing of the Democratic Party desired to make prominent the issue against the reconstruction measures of the Republicans. This wing added to the platform and declaration that these acts were unconstitutional and void, and the demand that the Southern States should be restored to their former rights and given control over their own elective franchise.

Democrats Nominate Seymour.—Although the followers of Pendleton had shaped the financial plank of the platform, they could not nominate their leader The opposition was at first divided between the various candidates New York, which feared the effect upon the conservative financial interests of the East if Pendleton were nominated, attempted to break the deadlock by proposing an Ohio man, Chief Justice Chase But eager as Chase was for the Presidency he had flatly refused to abandon the views which he held in favour of negro suffrage Ohio was, therefore, able to retaliate by stampeding the convention in favour of Horatio Seymour, of New York As the war governor of his State he had been a consistent critic of the extremes to which the Federal Administration had carried its interpretation of the war power. For vice-president the convention nominated Francis P Blair, jun, of Missouri

Grant Elected.—But the popularity of Grant in the North, together with the Republican strength in the States of the South which had been reconstructed under negro suffrage, gave an easy victory to the Republicans in the election of 1868 Seymour carried only Delaware New Jersey, New York and Oregon, of the North, and Maryland, Kentucky, Georgia and Louisiana of the South Tennessee, and five of the former Confederate States, upon which negro suffrage had been imposed (North Carolina, South Carolina, Florida, Alabama and Arkansas) voted for Grant. Virginia, Mississippi and Texas had not yet been restored

Fifteenth Amendment.—This decisive victory and the knowledge that it had been won by the advantage of the negro vote in the restored States led the Republican leaders to ignore their recent platform declaration in regard to negro suffrage. Shortly after Congress assembled propositions were made to place the freedman's right to vote beyond the power of the States to change To do this by constitutional enactment it was necessary to make the provision universal, and Congress, therefore, submitted for ratification the 15th amendment declaring that "the right of citizens of the United States to vote shall not be denied or abridged by the United States or by any state on account of race, color or previous condition of servitude." Congress was given power to enforce the amendment by appropriate legislation By March 30, 1870, the amendment had been ratified; but it is doubtful whether this could have been accomplished by legislatures chosen on the issue As it was, the States of Virginia, Mississippi, Texas and Georgia were required to ratify it as a condition of their readmittance to representation in Congress, and the three former States, having been permitted to vote separately on the obnoxious provisions of their Constitutions in regard to the disfranchisement of former Confederates, rejected those clauses, adopted the 15th amendment and were restored in 1870. Georgia, after a new experience of military rule, likewise ratified the amendment, and her representatives were likewise admitted to Congress.

As soon as the 15th amendment was proclaimed in effect, and the military Governments of the South were superseded, the dominant party proceeded to enact measures of enforcement These seemed especially necessary in view of the fact that, partly by intimidation of the coloured vote, Louisiana (1868) and Tennessee (1869) broke away from the Republican column; while in the election of 1870 Tennessee, North Carolina, Georgia, Virginia and Alabama went Democratic The enforcement legislation of 1870 provided penalties for violating the 14th and 15th amendments and re-enacted the Civil Rights Act of 1866. In the years 1871 and 1872 acts were passed providing for effective Federal supervision of Congressional elections, and the "Ku-Klux Acts" (1871 and 1872) still further increased the power of the Federal courts to enforce the amendments and authorized the President to suspend the writ of *habeas corpus* and use military force to suppress public disorders But these stern measures were accompanied by some efforts to restore harmony, such as the repeal of the "iron-clad oath" for ex-Confederates, in 1871, and the passage of the General Amnesty Act of 1872. The North was becoming restive under the long-continued use of the Federal military arm within State borders in time of peace

Reconstruction Governments.—In any case the cost of rehabilitating the public works and providing education and the political and judicial institutions which should apply equally to the hitherto non-political class of the blacks, would have been a heavy one But the legislatures, especially of Louisiana, South Carolina, Tennessee, Arkansas and Alabama, plunged into an extravagance made possible by the fact that the legislatures contained but few representatives who paid considerable taxes In 1872 it was estimated that the public debts of the 11 reconstructed States amounted to nearly $132,000,000, two-thirds of which was composed of guarantees to corporations Legislative expenses were grotesquely extravagant, the coloured members in some States engaging in a saturnalia of corrupt expenditure. This alienated from the so-called Radical Party the support of Southern whites, because they resented the concessions of the carpet-bag leaders to the negro vote, because they suffered from the burden of taxation, and above all because race friction increased

By 1872 a coalition had been formed under the name of Conservatives But the control of electoral machinery in the strongly centralized State executives chosen by negro votes, and coercion by the Federal authority, still upheld Republican rule in various Southern States Virginia and North Carolina were practically bankrupt, the capitals of Louisiana, Arkansas and Alabama, where rival State officers claimed possession, were occupied by Federal troops, and many of the Governments were so corrupt that only the contemporaneous rottenness in New York City and in certain branches of the Federal Government afford a parallel

It was a time of lax public morals after war, which was ill suited to the difficult experiment of transferring political power to a race recently enslaved Only the strong arm of the Federal authority sufficed to prevent the whites of the South from overthrowing a condition of things which it was impossible under American political ideas permanently to maintain

Southern Changes.—An important economic reorganization was in progress in the South White districts were recovering from the war and were becoming the productive cotton areas by the use of fertilizers and by the more intelligent white labour. Cities were rising, and the mines and manufactures of the southern Appalachians were developing In the black belt, or region of denser negro settlement the blacks became tenant farmers, or workers on shares The effective and just direction of negro labour was a difficult problem and was aggravated by the political agitation which intensified race friction It became evident that there was a negro problem as well as a slavery question, and that the North was unable to solve it.

Foreign Relations.—In the meantime important foreign relations had been dealt with by Secretary William H Seward, under Johnson, and by Secretary Hamilton Fish, under Grant. Not only were many treaties of commerce and extradition, including one with China, negotiated by Seward, but he also brought about a solution of more important diplomatic problems The relations of the United States with France and England had been strained in the course of the war Not only had Napoleon III. been inclined to recognize the Confederacy, but he had also taken advantage of the war to throw into Mexico a French army in support of the Emperor Maximilian The temptation to use force while American military prestige was high appealed even to Gen. Grant; but Seward by firm and cautious diplomatic pressure induced France to withdraw her troops in 1867, and the power of Maximilian collapsed Russia's friendly attitude throughout the war was signalized by her offer to sell Alaska to the United States in 1867. Seward promptly accepted it and the treaty was ratified by the Senate and the purchase money ($7,200,000) was voted by the reluctant House, which saw little in the acquisition to commend it

"Alabama" Claims.—With England, affairs were even more threatening than with France Confederate cruisers (notably the "Alabama"), built in England and permitted by the negligence of the British Government to go to sea, had nearly swept the American merchant marine from the ocean Unsettled questions of boundary and the fisheries aggravated the ill feeling, and England's refusal in 1865 to arbitrate made a serious situation Prolonged negotiations followed a change of attitude of England with regard to arbitration, and in 1870 President Grant recommended to Congress that the United States should pay the claims for damages of the Confederate cruisers, and thus assume them against England. However, in 1871, the Treaty of Washington was negotiated under Secretary Fish, by the terms of which England expressed regret for the escape of the cruisers and provided for arbitration of the fisheries, the north-western boundary, and the "Alabama" claims The case of the United States was victorious, the tribunal awarding damages against Great Britain to the amount of $15,500,000 Two months later the German emperor gave to the United States the disputed north-west boundary, including the San Juan island in Puget sound

In the West Indies also important questions were presented Seward had negotiated a treaty of purchase of the Danish West Indies, but the Senate refused to ratify it, nor did Grant's attempt to acquire Santo Domingo meet with a different fate at the hands of that body (1870). In Cuba another insurrection was in progress. Secretary Fish "pigeon-holed" a proclamation of President Grant recognizing the Cubans as belligerents, and secured a policy of neutrality which endured even the shock of the "Virginius affair" in 1873, when 50 of the men of the filibustering steamer flying the American flag were shot by the Spanish authorities It was shown that the vessel had no right to the flag. Negotiations for an isthmian canal resulted only in a treaty with Nicaragua in 1868 giving to the United States a right of way across the isthmus and providing for a Government survey of the Panama route.

It was in the field of domestic concerns, in economic and social development, that the most significant tendencies appeared. The old issues were already diminishing in importance before the other aspect of reconstruction which came from the revived expansion of the nation toward the West and the new forms taken by the development of American industrial society.

Finance.—The Republican Party, following the traditions of the Whigs, was especially responsive to the demands of the creditor class, who demanded legislation to conserve their interests Its victory in 1868 was signalized by the passage in the spring of the following year of an act pledging the faith of the United States to pay in coin or its equivalent all the obligations of the United States, except in cases where the law authorizing the issue had expressly provided otherwise. In 1870 and 1871 refunding acts were passed, providing for the issue of bonds to the total amount of $1,800,000,000, one billion of which was to run for 30 years at 4%. This abandonment of the doctrine of early convertibility was made in order to render the bonds acceptable to capitalists, but in fact they soon went to a premium of over 25%.

While the legislature was thus scrupulous of the credit of the nation and responsive to the views of capital, the Supreme Court was engaged in deciding the question of whether the legal tender notes (greenbacks) were constitutional Successive decisions in 1868 determined that they were not legal in certain cases In these decisions the judges had divided, four to three Within a year the court was changed by the appointment of one new judge to fill a vacancy, and the addition of another in accordance with a law enlarging the court In 1871 the former decision was reversed and the constitutionality of the Legal Tender Acts sustained on loose-construction reasoning In 1884 the court went to the extent of affirming the right of Congress to pass legal tender acts in time of peace In 1871 and 1872 Secretary George S Boutwell illustrated the power of the Administration to change the volume of the currency, by issuing in all over $6,000,000 of legal tender notes; and, following the practice of his predecessors, he sold gold from the Treasury to check speculations in that part of the currency

Economic Changes.—Speculation and the rapid growth of great fortunes were characteristic of the period The war itself had furnished means for acquiring sudden riches; the reorganization of taxation, currency and banking increased the opportunities; and the opening of new fields of speculative enterprise in the oil fields of Pennsylvania and Ohio and the gold and silver mines of the mountains of the Far West tended in the same direction An enormous development of manufactures resulted from the diminished commerce and increased demand for manufactured goods, the protection afforded by the tariff, the stimulus due to rising prices, and the consumption of the rapidly growing West It was officially reported in 1869 that "within five years more cotton spindles had been put in motion, more iron furnaces erected, more iron smelted, more bars rolled, more steel made, more coal and copper mined, more lumber sawn and hewn, more houses and shops constructed, more manufactories of different kinds started, and more petroleum collected, refined and exported, than during any equal period in the history of the country"

Pacific Railways.—Between the Civil War and 1872, the extension of the nation's activity to the industrial conquest of the great West, as well as the economic reorganization of the East, had a profound effect upon the development of the United States Between 1862 and 1872 grants were made to the Union Pacific and Central Pacific companies, and to other connecting corporations, for railways from the Missouri to the Pacific, amounting to nearly 33,000,000ac, and in the same period large loans of funds were made by the general Government for this enterprise Construction advanced rapidly after 1866, and by 1869 an all-rail connection had been established on the line of the Union Pacific and Central Pacific railways between the East and San Francisco Various grants were made in these years to other roads, both trans-continental and Middle Western Between 1850 and 1871 Congress granted about 155,000,000ac for railway construction, but not all these grants were perfected It is estimated that some $500,000,000 were invested in the construction of Western railways between 1868 and the panic of 1873, and about 30,000m. of railway had been added.

The effects of this extraordinary extension of railway transportation were immediately apparent In the Far West the railway lines rapidly made possible the extinction of the bison herds This opened the way for the great extension of the cattle country, following the retreat of the Indians Upon the plains Indians the effect was revolutionary Their domain had been penetrated by the railways at the same time that their means of subsistence had been withdrawn During the Civil War most of these Western tribes had engaged in hostilities against the Federal Government By the Peace Commission Act of July 20, 1867, commissioners, including Gen. William T. Sherman, were sent to negotiate treaties As a result the tribes of the Indian Territory were so concentrated as to permit the transfer of other Western tribes to the same region, while the Sioux of the northern plains were given a reservation embracing the western portions of the Dakotas. Discontent with these treaties resulted, however, in hostilities following 1867 Between the close of the war and 1880 some $22,000,000

were expended in Indian wars, although the act of 1871 inaugurated the change of policy whereby the Indians were no longer dealt with by treaty, but were regarded as wards of the nation, to be concentrated on reservations and fed at the expense of the nation under the supervision of Indian agents.

Mining.—Part of these Indian difficulties were due to the opening up of new mining areas in the Rocky Mountains, some of them within the Indians' choicest hunting-grounds At the beginning of the Civil War a preliminary mining boom struck Colorado; the rich Comstock lode was opened in Nevada, Arizona was the scene of mining rushes; the Idaho mines were entered; and the Montana ores were discovered, so that in the period of the Civil War itself the Territories of Nevada, Idaho and Montana had been organized The discovery of gold in the Black Hills in 1874 continued the same movement In 1860 the nation produced $156 000 worth of silver, in 1861 over $2 000,000 and in 1873 nearly $36,000,000 Capital in mines and quarries of the United States was over $65,000,000 in 1860, over $245,000,000 in 1870, and nearly $1,500,000,000 in 1880

The Middle West.—This revolution in the life of the great plains and the Rocky Mountains, opening the way to agriculture and to cattle raising, and preparing for the exploitation of the precious metals of that great area, was contemporaneous with the important development of the farming regions of the Middle West Even during the Civil War the agricultural development of the northern half of the Mississippi valley had continued This was aided by the demand for food products to supply the armies and was made possible by the extension of railways, the taking up of the prairie lands through the operation of the homestead law of 1862, the marketing of the railway land grants, and the increased use of agricultural machinery in those years Between 1860 and 1870 the population of the North Central group of States increased over 42%, and in the next decade by 34%, a total addition to the population in those two decades of 8,000 000 Between 1870 and 1880 about 200,000sq m were added to the farm lands of the United States, an area almost equal in extent to that of France In the same decade the North Central States increased their improved farms from near 78,500,000ac to over 136,800,000 acres The production of Indian corn about doubled between 1860 and 1880, and that of wheat and oats more than doubled. The addition came chiefly from the Middle West

Railway Scandals.—The pressing need of increased transportation facilities had led, as we have seen, to lavish land grants and to subsidies by nation, States and municipalities to the railways The railways themselves tempted by these opportunities, had extended their lines in some cases beyond the immediate needs of the regions Extravagances in construction and operation, aggravated by "construction rings" of railway officials and by rolling stock companies who received extravagant prices by favouritism, brought about a condition where the roads were no longer able to meet the demands of their stockholders for returns on the investment without imposing rates that the Western farmer deemed extortionate In the competitive development of these roads and in the struggle of business corporations and localities with each other, the roads also discriminated between persons and places. This condition chiefly accounted for the political unrest which manifested itself in the West in the so-called "Granger" movements of the '70s

"Granger" Movement.—The farmers felt the pressure of the unsettled currency, taxes were very heavy, the protective tariff seemed to them to bear unduly upon the producers of crops which exceeded the home consumption and had to seek the foreign markets The price of Indian corn, wheat and cotton in the early '70s tended to fall as production rose, so that the gold value of the total crop was not greatly increased during the decade after the war, in spite of increase of production Dissatisfaction with their share in the prosperity of the country, and especially with the charges of middlemen and transportation companies, discontent with the backwardness of rural social conditions, and a desire for larger political influence, all aided in fostering the growth of organizations designed to promote the farmers' interests. The most influential of these organizations was the Patrons of Husbandry, which was founded in 1867 and spread chiefly after 1872 by local clubs or "granges," especially in the West and South

The height of the movement was reached in the autumn of 1874 It threatened the disruption of the old political parties in most of the Middle Western States By holding the balance of power the Grangers secured legislation in many of these States, fixed maximum railway rates, and provided for regulation through commissions In the reaction after the panic of 1873 (when nearly a fifth of the railway mileage of the United States had passed into the hands of receivers) many of the "Granger laws" were repealed, the regulation was rendered nominal and the railways more than regained their political power, yet the agitation had established the important principle, sanctioned by decisions of the Supreme Court, that the railways were common carriers subject fully to public regulation so far as it was not confiscatory The movement for regulation of interstate commerce by congressional legislation was begun at this time under the leadership of congressmen from the Granger States. Later efforts were more wisely considered and more effective; but the rural democracy showed its opposition to the increasing political influence of capital, to special privileges and to the attempts of corporations to avoid public control periodically thereafter

Tweed Ring.—The presidential election of 1872 took place in the midst of this Western upheaval At the same time in the South the reform Republicans and Democrats were uniting under the name of "Conservatives" against the carpet-bag rule, and control was passing into their hands A reform movement was active against the evident corruption in national and municipal administrations, for Grant's trust in his appointees was grossly violated The Tweed ring was systematically looting New York city, and prior to Tweed's indictment in 1871 it was acquiring large power in State legislation. Civil service reformers, men of moderate views with respect to reconstruction many war Democrats who had adhered to the Union Party, and tariff reformers began to break away

Grant Re-elected.—The Liberal-Republican movement started in Missouri, and a national convention was called to meet at Cincinnati on May 1, 1872 Their platform attacked the corruption of civil service by the Administration, supported the results of the war as embodied in the last three amendments and demanded amnesty and local civil government for the South It opposed further land grants to railways, but denounced repudiation and demanded specie payments in terms which excluded from its support the advocates of inflation of the currency This effort to combine the opponents of Grant's Administration was wrecked by the nomination of Horace Greeley, a strong protectionist, who did not command the confidence of the masses of the disaffected Although endorsed by the Democrats, Greeley was defeated by Grant, who ran on the record of the Republican Party, which now dropped the word Union from its name Greeley died before the electoral count, the Democrats won only the States of Maryland, Kentucky, Missouri, Tennessee, Georgia and Texas, the votes of Louisiana and Arkansas being thrown out

Panic of 1873.—The enormous cost of the war, the excessive railway building, over-trading, and inflated credit and fluctuating currency, the sinking of capital in opening new farming lands and in readjusting manufactures to new conditions brought their results in the panic of 1873, precipitated by the failure (Sept. 18) of Jay Cooke, the financier of the Northern Pacific railway For over five years the nation underwent a drastic purgation, railway building almost ceased, and so late as 1877 over 18% of the railway mileage of the nation was in the hands of receivers. The iron industry was prostrated, and mercantile failures for four years amounted to $775,000,000 At the close of the period there was a replacement of partnerships and individual businesses by corporations, but in the interval political unrest was in the foreground

Crédit Mobilier.—The charges that congressmen had been bribed by stock in the Crédit Mobilier, a construction company controlled by Union Pacific stockholders, led to a congressional investigation which damaged the reputations of prominent Republicans, including Vice President Schuyler Colfax, but the same Congress which investigated this scandal voted itself retroactive

increases of salary, and this "back-pay grab" created popular indignation Evidences of fraud and corruption in revenue collection under the "moiety system," and the general demoralization of the civil service continued. The demand for relief from the stringency of the crisis of 1873 expressed itself in the so-called Inflation Bill (passed April 1874) providing a maximum of $400,000,000 for greenback issues This was vetoed by Grant, but he later signed a bill accepting as a maximum the existing greenback circulation of $382,000,000 This compromise was satisfactory neither to contractionists nor greenbackers.

Republicans Lose Congress.—The "tidal wave" in the congressional elections of 1874 was the result of these conditions. It marked a political revolution The House of Representatives, which exhibited a two-thirds Republican majority in 1872, showed an opposition majority of about 70, and the Senate was soon to be close Such Republican strongholds as Pennsylvania, Ohio and Massachusetts went over to the Democrats in the State elections, while in the grain-raising States of the Middle West the Grangers were holding the balance of power, and in the South the Republican Radicals remained in force in few States and only by the use of Federal troops President Grant in his message of Dec 1874 acknowledged that public opinion was opposed to this use of force, but declared that without it negro suffrage would be worse than a mockery Thus by the year 1874 the era of triumphant Republicanism and reconstruction was closing The leaders perceiving power about to pass from them rapidly enacted a series of party measures before the meeting of the newly elected Congress Under the leadership of Senator John Sherman an act was passed (Jan 14, 1875) providing for resumption of specie payments on Jan 1, 1879, gradually contracting greenbacks to $300 000,000 and compensating this by expanding the circulation of the national banks

In the field of the tariff a similar policy was followed. The act of 1870 had somewhat reduced duties on tea, coffee, sugar and iron, but under Western pressure in 1872 the Republican Congress had consented to a 10% reduction on most classes of goods in order to save the general system of protection. On the eve of their relinquishment of full power the Republicans (March 3, 1875) repealed the Tariff Act of 1872, increased the duties on molasses and sugar and increased the revenue tax on tobacco and spirits. Thus the tariff was restored to the war basis, before the incoming Democratic House could block the advance Similarly on March 1 Congress passed a Civil Rights Act, milder than the measure for which Sumner had fought so long, guaranteeing equal rights to the negroes in hotels, public conveyances, and places of amusement and forbidding the exclusion of them from juries An effort to pass a new force bill levelled against the intimidation of negro voters failed By these measures the Republicans placed the important features of their policy where they could be overturned only by a Democratic capture of Presidency and Senate

Supreme Court Decisions.—In the midst of these changes the Supreme Court handed down decisions undoing important portions of the reconstruction system by restraining the tendency of the nation to encroach on the sphere of the State; and restricting the scope of the recent constitutional amendments On April 14, 1873, in the Slaughter House cases, the courts held that the amendments were primarily restrictions upon the States for the protection of the freedom of the coloured man, rather than extensions of the power of the Federal Government under the definition of United States citizenship, and that general fundamental civil rights remained under State protection In the case of the United States v Reese, decided March 27, 1876, the court declared parts of the act of 1870 (which provided for the use of Federal force to protect the negro in his right to vote) unconstitutional, on the ground that they did not specify that the denial of suffrage must be on the sole ground of race or colour A reasonable pre-requisite, such as a poll-tax, for voting was permissible The South later took advantage of this decision to restrain negro suffrage indirectly In United States v Cruikshank (1876) the court held that the amendments to the Constitution left it still the duty of the State, rather than of the United States, to protect its citizens, even when whites had mobbed the negroes In 1883 the court declared the conspiracy clause of the Ku-Klux Act unconstitutional and restricted the application of the law to acts of a State through its officers and not to private citizens. In the same year it declared the Civil Rights Act of 1875 invalid.

In 1875 President Grant refused the appeal of the "carpet-bagger" Gov Adelbert Ames of Mississippi to be supported by troops, whereupon Ames resigned his office into the hands of the Conservatives The Mississippi plan of general intimidation of negroes to keep them from the polls was followed in Louisiana, South Carolina and Florida which alone remained Republican Thus steadily the radical reconstruction policy and Republican control of the South were being reversed It was made clear that negro suffrage could be enforced upon the South only by military rule which could no longer command Northern sympathy or the sanction of the Federal court. Northern interest increasingly turned to other issues, and especially to discontent over administrative corruption

Corruption.—The spoils system had triumphed over the advocates of civil service reform to such an extent that Grant abandoned the competitive system in 1875 on the ground that Congress did not support him in the policy. Enormous frauds in the collection of the internal revenue by the whisky ring with the connivance of Federal officials were revealed in 1875, and at about the same time, secretary of War William W. Belknap resigned to avoid impeachment for corruption in the conduct of Indian affairs The enforced resignation in 1876 of secretary of the Treasury Benjamin H Bristow, after he had successfully exposed the whisky ring, and of postmaster-general Marshall Jewell, who had resisted the spoils system in his department, tended to discredit the Administration. Blaine, the leader of the Republicans in the House of Representatives, fell under suspicion on account of his earlier relations with the Little Rock and Fort Smith and Northern Pacific railways, which left it doubtful, in spite of his aggressive defence, whether he had not used his influence as Speaker in previous Congresses to secure pecuniary advantages from land grant railways

Campaign of 1876.—Thus the campaign of 1876 approached, with the Republicans divided into (1) steadfast supporters of the Grant Administration, (2) a discontented reform wing (which favoured ex-Secretary Bristow), and (3) an intermediate group which followed Blaine. This statesman made a bold stroke to shift the fighting which the Democrats planned to make against the scandals of the Administration, to the old-time war issues. By proposing to exclude Jefferson Davis from amnesty, he goaded Southern congressmen into indiscreet utterances which fanned anew the fires of sectional animosity. A compromise candidate was selected in the person of Gov Rutherford B. Hayes, of Ohio, who had vigorously opposed the greenback movement in his State, and whose life and character, though little known to the general public, made him acceptable to the reform leaders of the party. The Democrats, demanding reform, economy, a revenue tariff and the repeal of the resumption clause of the act of 1875, chose the reform governor of New York, Samuel J. Tilden, as their candidate. The Independent National, or Greenback, Party, which was to develop rapidly in the next two years, nominated Peter Cooper, a New York philanthropist, and demanded the repeal of the Resumption Act, and the enactment of a law providing a paper currency

Hayes Elected.—The election proved to be a very close contest. Tilden, according to the count of both parties, had a plurality of over 250,000 votes, and at first the leading Republican journals conceded his election He had carried New York, Indiana, New Jersey and Connecticut and, by the Democratic count, the solid South. But the Republican headquarters claimed the election of Hayes by one electoral vote, based on the belief that the States of South Carolina, Florida and Louisiana had gone Republican Since these States were in the midst of the transition from negro to white Government, and elections were notorious for fraudulent practices, a serious question was raised, first as to the proper authority to count the electoral vote, and second, how far it was permissible to go behind the returns of the State authorities to ascertain the validity of the canvass of the votes in the

State. The political capacity and moderation of the nation were severely tested; but in the end a characteristic American solution was found by the creation of an electoral commission in which five associate justices of the Supreme Court were joined with an equal number of representatives from each of the two houses of Congress The result was that this commission refused to "go behind the returns," and Hayes was declared elected by one vote To prevent the threatened danger of a filibuster by Democrats of the House of Representatives against the completion of the count until after legal date for the inauguration of the President, Hayes's friends agreed with leading Democrats that he would withdraw the Federal troops from Louisiana.

Thus a new era began under a moderate and reforming Republican President, a close Republican Senate and a Democratic House of Representatives The Southern question was not settled, but other issues of an economic and social nature increasingly forced themselves to the front. During the dozen years that followed Hayes's inauguration neither party held complete possession of both the executive and the two houses of Congress. His own moderate character, the conditions of his election and the check imposed during the first two years by a Democratic House of Representatives (and during the second two years by an opposition in both houses) made the period of Hayes's Administration a transition from the era of reconstruction to the era of dominant economic and reform agitation

When he withdrew the troops which sustained the Republican Governments in Louisiana and South Carolina, those States returned to the rule of the white Democrats. In the Congress elected in 1878 the former slave States chose 101 Democrats to the House of Representatives and only four Republicans. Leading Republicans like Blaine protested vigorously against the policy, declaring that the men who saved the Union should govern it; and on the other hand the Democrats in Congress added "riders" to appropriation bills designed to starve the Administration into complete cessation of the use of troops and Federal deputy marshals at Southern elections Due to this policy extra sessions had to be summoned in 1877 and 1879 to provide supplies for the Government Hayes assisted his party by vetoing these coercive attempts of the Democrats and it was not until later that Federal attempts to supervise Southern elections entirely ceased

Civil Service Reform.—As his early policy toward the South had dissatisfied many of the leaders of his party, his opposition to the spoils system alienated others In 1877 a Civil Service Reform Association was formed in New York and extended to other States In June 1877 President Hayes issued an executive order against the participation of Federal officers in political management, and he furnished evidence of his sincerity by removing Alonzo B Cornell, the naval officer of New York, who was also chairman of both State and national Republican committees, and Chester A Arthur, collector of the port of New York As both were friends of Senator Roscoe Conkling of that State, the leader of the Grant men, this was a bold challenge The "Stalwarts" answered it by securing the nomination of Cornell as governor of New York and Arthur as vice-president of the United States.

Finances.—The monetary question rose to primary importance at this time Hayes himself had campaigned in Ohio successfully against the greenback movement, and he chose as his secretary of the Treasury, John Sherman, whose long service as chairman of the finance committee had made him familiar with conditions and influential with moderate men. The *per capita* circulation of the nation had fallen from $20 57 in 1865 to $15 58 in 1877 and was still declining. The remarkable increase in the production of silver, as the new mining regions were opened, was accompanied by a fall in its ratio to gold from 15 to one in 1860 to 17 to one in 1877. Congress had, in 1873, passed an act dropping the standard silver dollar from the list of coins; but though the significance of this omission of a coin not widely circulated passed almost unnoticed at the moment, the demonetization of silver was afterward stigmatized as a conspiracy, "the crime of 1873" As the date (Jan. 1, 1879) for the redemption of the greenbacks in specie approached, demands were renewed for the replacement of national bank-notes by greenbacks, for the postponement, or abandonment of resumption, for the free coinage of silver, and for the use of silver as well as gold in payment of bonds redeemable in "coin." Sectional grouping of debtor against creditor regions, rather than party alignment, showed itself in the votes, for each party had its "soft money" as well as "hard money" followers.

A monetary commission, appointed in 1876, reported in 1877, but without agreement or real influence upon the country The president took strong ground against free coinage and against the payment of bonds in silver; but the House of Representatives passed the measure, known as the Bland bill, for the free coinage of silver, by a vote of 163 to 34. In the Senate this was amended and as it finally passed both houses it was known as the Bland-Allison Act after the two leaders, the Democratic representative from Missouri and the Republican senator from Iowa. This compromise was carried over the veto of President Hayes and became a law Feb 28, 1878. In the vote of Feb. 15, all but one of the senators from New England, New York and New Jersey opposed it, while the States west of the Alleghenies furnished only four opposing votes. The law restored the legal tender character of the silver dollar and authorized the secretary of the Treasury to buy silver bullion at the market price, to an amount of not less than $2,000,000 nor more than $4,000,000 per month, and to coin the bullion into silver dollars.

Hardly had the Bland-Allison compromise been effected on the silver issue when an act was passed (May 31, 1878) forbidding the further retirement of greenbacks, which remained at $346,681,000 Substantially the same sectional alignment was followed in the vote on this bill as in the silver votes Not satisfied with this legislation, nearly 1,000,000 voters cast their ballots for Greenback Party candidates at the congressional elections in the autumn of 1878 The preparations of Secretary Sherman had been so carefully made, and the turning tide of trade brought coin so freely to the United States, that before the date of resumption of specie payments a gold reserve had been accumulated to the amount of $133,000,000 in excess of matured liabilities and the greenbacks rose to par before the date of redemption.

Election of 1880.—In the campaign of 1880, Hayes and Tilden both declined to stand for renomination Thus the issue of the "fraud of 1876," which the Democratic platform called the paramount issue, was subordinated Nor was it possible for the Republicans to force the tariff question into a commanding position, for although the Democratic platform declared for a tariff for revenue only, a considerable wing of that party led by Samuel J. Randall, of Pennsylvania, favoured protection. Gen. Winfield S. Hancock, a distinguished soldier in the Civil War, whose nomination for the Presidency by the Democrats was designed to allay Northern distrust, refused to make the tariff a national issue. The recent adjustment of the monetary question and return of prosperity relegated the discussion of the currency also to a subordinate place.

The Republicans, after a heated convention in which the followers of Grant, Blaine and Sherman, fought each other to a deadlock, selected Gen. James A Garfield of Ohio, who was political manager for Sherman in the convention This was a blow to the Grant, or "Stalwart" wing, which was, however, partly placated by the nomination of Arthur for the vice-presidency. Garfield's popular plurality was only a little over 7,000 out of a total vote of over 9,000,000; but his electoral vote was 214 to Hancock's 155. The area of the former slave States marked the boundaries between the Republican and the Democratic States, except that Hancock also carried New Jersey, Nevada and California The Republicans won the elections for the House of Representatives which would meet in 1881, and the Senate was at first nearly evenly divided, two independents holding the balance. In the ensuing four years party lines were badly broken, factions made bitter war upon each other, and the independent reformers or "Mugwumps" grew in numbers The selection of Blaine as secretary of State committed Garfield to the anti-Grant wing, and the breach was widened by his appointment of the collector of the port of New York against the protests of Roscoe Conkling and Thomas C. Platt, the "Stalwart" senators from New York They resigned, then sought re-election in order to vindicate the right of senatorial recommendation; but were defeated.

Garfield Assassinated.—In the midst of this excitement the President was assassinated by a disappointed office-seeker of unsound mind Vice-President Arthur, who succeeded Garfield in Sept. 1881, by his tact and moderation won the admiration of former opponents; but the bad crops in 1881 and the dissatisfaction with boss rule among independent voters caused a Democratic victory in the congressional campaign of 1882.

Legislative Acts.—Garfield's assassination had given new impetus to the movement against the spoils system, a National Civil Service Reform League had been organized in 1881, President Arthur presented the question in his message of December of that year, and in 1882 George H. Pendleton, a Democratic senator from Ohio, urged the subject upon the attention of Congress. Stimulated by the elections of 1882 Congress passed an act (Jan 16, 1883) authorizing the President to appoint a commission to classify certain of the Federal employees, and providing for appointment and promotion within this classified list by competitive examination. Congressional recommendations for these offices were not to be received, and political assessments for campaign purposes were forbidden This was an effective beginning in the purification of the civil service; but the evil of assessment of employees was succeeded by the evil of soliciting campaign contributions from corporations interested in legislation. The extension of the competitive list proceeded gradually through succeeding Administrations The Edmunds Anti-Polygamy Act (1882) was levelled at the Mormons and the Chinese Exclusion Act was passed at the demand of labour, after a long agitation in 1882, the way having been prepared by the Treaty of Peking in 1880 Bills to this effect had been vetoed by Hayes and Arthur as violative of international agreement, but the desire of the politicians to win the California vote, and the compromise by which the exclusion was limited to ten years finally carried the measure, and the Supreme Court (1889) held it constitutional.

Surplus Revenues.—From 1879 to 1890 the Treasury showed a surplus of revenue over expenditure This furnishes the explanation of much of the legislation of that period It led to extravagant appropriations, such as the Arrears of Pensions Act of 1879, and the River and Harbor Act of 1882 providing for the expenditure of more than $18,000,000 which was passed over the veto of Arthur Appropriation bills were merely constructed in various committees of Congress under a system of bargaining between interests and sections with primary reference to the political fortunes of the congressmen

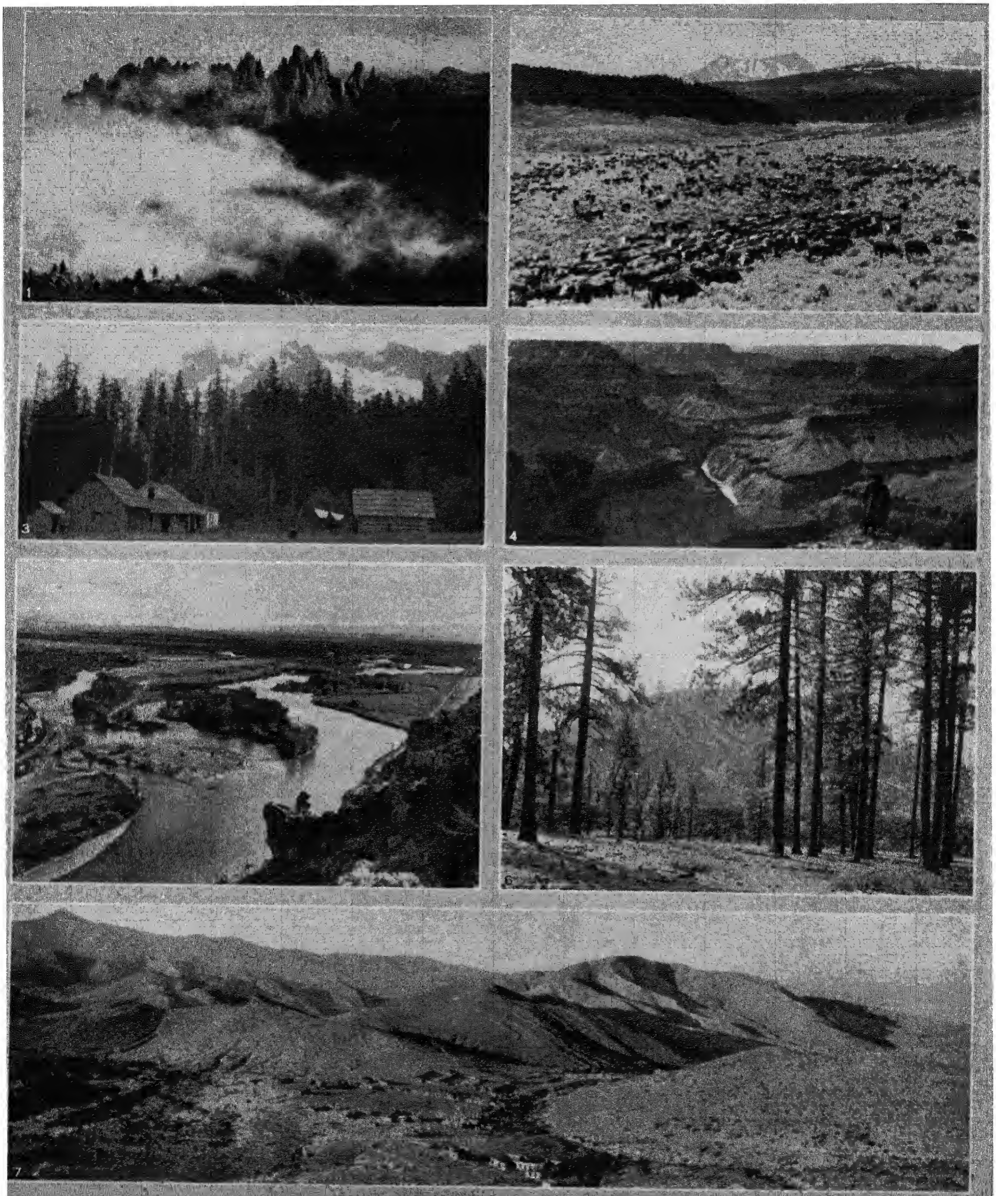
The surplus also strengthened the demand for a reduction of the tariff A tariff commission, composed of men friendly to protection, appointed in 1882, proposed an average reduction of 20 to 25% Nevertheless, in the act as passed in 1883 duties were increased in general on those protected articles which continued to be imported in large volume, especially on certain woollen goods and about two-thirds of the imported cotton goods, and on iron ore and some steel products, while they were lowered on finer grades of wool and cheaper grades of woollen and cotton fabrics, etc It was unsatisfactory to large portions of both parties and did not materially lower the revenue; but the act of 1883 made extensive reductions in internal taxes As the Senate had just fallen into the hands of the Republicans, and the House would not become Democratic until the new Congress met, this protective law gave the Republicans the advantage of position Moreover, the Democrats were themselves divided, 19 Representatives voting with the Republicans on the act of 1883. In the next Congress (1884), when the leaders made an attempt to rally the Democrats to show their position by passing a bill for a horizontal reduction of 20% in general, 41 Democrats voted against the bill and prevented its passage through the House.

Election of 1884.—Thus the campaign of 1884 found both parties still lacking unity of policy although it seemed possible that the tariff might become the touchstone of the contest. The Republicans challenged the independents by nominating Blaine, whose record was objectionable to many reformers, and who had been chiefly identified with the reconstruction politics. The Democrats, taking advantage of the situation, nominated Grover Cleveland of New York. He had won approval by his reform administration as mayor of Buffalo and as governor of New York during the past two years, when he had shown an independence of party "bosses" and had convinced the public of his sincerity and strength of character He represented conceptions and interests which had grown up since the war, and which appealed to a new generation of voters. The platform emphasized the idea that "new issues are born of time and progress," and made the leading question that of reform and change in Administration, lest the continued rule of one party should corrupt the government. On the question of tariff the Democrats took a conservative attitude, emphasizing their desire to promote healthy growth, rather than to injure any domestic industries, and recognizing that capital had been invested and manufactures developed in reliance upon the protective system. Subject to these limitations, they demanded correction of abuses. The Greenbackers nominated Gen Benjamin F Butler of Massachusetts, recently chosen governor of that State on the Democratic ticket, but he polled only 175,000 votes John P St. John, the candidate of those who would prohibit the liquor traffic, secured 150,000 votes, an unprecedented gain

Cleveland President.—The campaign abounded in bitter personalities, and the popular vote was close, Cleveland's plurality being only 23,000. The great State of New York, with electoral votes enough to have turned the scale, was carried by the Democrats by only a few more than 1,000 votes out of a total of over 1,000,000 Cleveland's electoral majority was 37. The election was nevertheless recognized as making an epoch For the first time since victory came to Lincoln and the Republicans on the eve of the Civil War, nearly a quarter of a century earlier, the country had entrusted power to the Democrats, although over two-thirds of their electoral vote came from the former slave States. New York, Connecticut, New Jersey and Indiana constituted their Northern territory Perhaps the most significant thing about the result was the evidence that in the North political and sectional habits and prejudices were giving way among a sufficient number of independent voters, responsive to strong personal leadership on reform issues, to turn the political scale. The transition from war issues which began in 1872, and became marked in 1876, was completed by the election of Cleveland in 1884

During the first half of his term President Cleveland had the opposition of a strongly Republican Senate In the second half the Senate remained Republican by a majority of two, and the House continued Democratic. His civil service policy naturally met severe criticism not only from his party foes, but also from the spoils men among his Democratic followers, who desired a clean sweep of Republican office-holders, and from those of his independent supporters who looked to him to establish the service on a strictly non-partisan basis The outcome of the first two years of his Administration was that, of the entire body of Federal office-holders, two-thirds were changed and the obnoxious Tenure of Office Act was repealed, thus leaving the President the right of removal without presenting his reasons. Nevertheless there was a gain, for the criticism by the Republicans placed them on record against the former spoils system; Cleveland somewhat checked the political activity of officeholders; and before leaving the Presidency he transferred the railway mail service to the classified list requiring competitive examination

The transition of executive power for the time to the Democratic Party, however much it impressed the imaginations of the public, as the end of an era, was not so significant as the national growth and expansion in the decade between 1880 and 1890 whereby forces were set loose which determined the characteristics of the succeeding period Between these years the nation grew from about 50,000,000 to over 62,000,000. The Middle West, or North Central group of States, gained nearly 5,000,000 and the Western division over 1,250,000. West of the Alleghenies altogether more than 8,000,000 souls had been added, while the old Eastern States gained but 4,000,000. In 1890 the North Central division alone had achieved a population nearly 5,000,000 greater than that of the North Atlantic, while the trans-Allegheny region surpassed the whole East by about 10,000,000, and the numbers of its representatives in House and Senate placed the political destiny of the nation in its hands.



VARIED SCENERY IN WESTERN UNITED STATES

6. Volcanic cone and lava wall near Bend, Oregon
7. View of the desert country around Ft. Bowie, Arizona

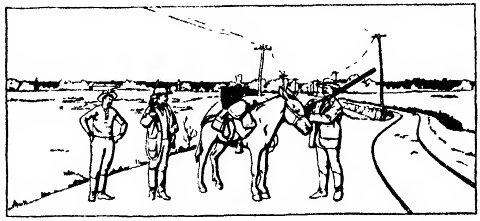
The West.—One of the most important reasons for the wholesale taking up of Western resources in these and the following years was the burst of railway building subsequent to the interruption of the panic of 1873 The eager pioneers pushed into western Kansas and Nebraska as they had into the northern Ohio valley a half-century before Nebraska grew from a population of 123,000 in 1870 to nearly 500,000 in 1880 and to over 1,000,000 in 1890 From about 333,300 in 1870, Kansas' rose to almost 1,000,000 in 1880, and to nearly 1,500,000 in 1890 The railway had "boomed" the Golden West and a cycle of abundant rains seemed to justify the belief that the "Great American Desert" was a myth Thus settlers borrowed money to secure farms beyond the region of safe annual rainfall under the agricultural methods of traditional pioneering Swift disappointment overtook them after 1886, when droughts and grasshoppers ruined the crops and turned back the tide of Middle Western colonists until the western parts of these States were almost depopulated, Kansas alone losing one-seventh of its population, nor did prosperity return for a decade

As the column of settlement along the Ohio valley had extended its flanks into the old North-west between the Ohio and the Great Lakes, and into the old South-west of the lower Mississippi after the war of 1812, so the later pioneers by railway trains began to take possession of the remoter and vaster North-west and South-west The "granger roads," centring in Chicago, thrust their lines out to develop wheat farms in interior Iowa, Minnesota and the Dakotas, where the virgin soil of the prairie farms brought returns that transferred the wheat belt to this new land of promise, and by competition forced the older wheat areas to develop varied agriculture The introduction into the Minneapolis mills of the recently invented steel-roller system of making flour not only built up a great flour industry there but created a demand for the hard wheat suited to the North-western prairies The pine forests of Michigan, Wisconsin and Minnesota were exploited in the same era

A more impressive movement was in progress as additional trans-continental railways were extended from the frontier to the Pacific In 1870 for 1,000m west of Duluth, at the head of Lake Superior, along the line of the projected Northern Pacific railway there were no cities or little towns Relying upon its land grant and upon the undeveloped resources of the vast tributary region, the railway, after halting for a few years subsequent to the panic of 1873 at Bismarck on the Missouri rushed its construction to Seattle and was opened in 1883 The Great Northern, a product of the vision and sound judgment of James J Hill, started from St Paul without a land grant and reached Puget sound in 1893 Thus a new industrial zone had been brought into existence Colorado had become a State in 1876, in 1889 North Dakota South Dakota, Washington and Montana were admitted as States and the next year Idaho and Wyoming were added The Western political forces, especially the friends of silver, were thus given the balance of power in the Senate

As a new North-west was opened by the completion of the Canadian Pacific (1883), the Northern Pacific (1883) and the Great Northern (1893), so the new South-west was entered by the completion of the Southern Pacific from New Orleans across Texas, New Mexico, Arizona and southern California to San Francisco by 1883. In 1883 also the lines which became the Atchison, Topeka and Santa Fe, extending from the lower Missouri valley, with St Louis and Kansas City as important terminals, through south-eastern Colorado, northern Arizona and New Mexico, reached the same goal The Denver and Rio Grande opened new mining areas between Denver and Ogden

Not only additional mines were reached by these lines, but a great cattle country, recently the habitat of the bison and the Indian, was opened. All the large cities commanding the approaches to this country developed packing industries, but Chicago especially profited. South-eastern Texas was the original home of these cattle ranches, but the driving of herds to supply the miners of the Rocky Mountains revealed the fact that the whole bison country was capable of supporting range cattle, and the practice grew of driving the stock to the feeding ground of the north and returning The height of the movement along the cattle trail, which in its largest extent ran through the public lands of the great plains from Texas to the Dakotas and Montana, was reached in 1884 In that period cattlemen fought over the possession of the range, controlled vast tracts by seizing the approaches to the water supplies under perversion of the land



BY COURTESY OF AMERICAN EXPRESS

"ON THE NORTH LINE." THE LAND RUSH TO OKLAHOMA IN 1889
Since 1834 the land comprising the present state of Oklahoma had been in the possession of Indian tribes. In 1889 the Federal government purchased a title to a large tract and a proclamation was issued that at noon on April 22nd, this land would be opened to homestead settlement. More than 20,000 people were on the border at the appointed hour

laws, fenced in the public domain, either defiantly or by leases from land grant roads, and called out proclamations of Presidents from Hayes to Cleveland The steady advance of the farmer, and protective measures against the spread of the cattle disease known as Texas fever, gradually prevented the continuance of the trail, and ultimately broke down the system of great ranches About 1870 shipment of live-stock from Chicago had become significant, and within a decade the refrigerator car revolutionized the packing industry by making possible the shipment of dressed beef not only to the markets of the Eastern United States but even to Europe The value of slaughtering and packing industries in the United States increased from less than \$30,000,000 in 1870, to \$564,000,000 in 1890

Another important revolution in American economic life was effected by the opening of new iron mines, the growth of the steel and coal industry and the rise of an extraordinary internal commerce along the whole length of the Great Lakes By 1890 the output of pig-iron in the United States surpassed that of Great Britain, having doubled since 1880 The full meaning of the revolution is seen in the fact that by 1907 the United States produced more pig-iron and steel than Great Britain, Germany and France combined As a result of the growth of the wheat, lumber and iron-ore production of the North-west, the traffic along the 1,000m of the Great Lakes grew (chiefly after 1890) by leaps, and changed from wooden sailing-vessels to steel ships driven by steam The traffic through the Sault Ste Marie canal came greatly to exceed that through the Suez canal

The New South.—The South shared in these industrial transformations Not only did white labour produce an increasing proportion of the cotton crop, but cheap white labour came from the uplands to cotton mills situated at the water-powers. This, with the abundant supply of raw material, enabled the South to develop cotton manufacture between 1880 and 1890 on a scale that threatened New England's dominance The southern Appalachians began to yield their treasures of coal and iron, northern Alabama became one of the great centres of the iron industry and the South produced nearly 400,000 tons of pig-iron in 1880 and 2,500,000 20 years later By 1890 the production of coal, iron-ore and pig-iron in this section was as great as that of the United States in 1870 The value of the products of manufacture in the South rose from \$338,000,000 in 1880 to \$1,184,000,000 in 1900 The exploitation of the long leaf pine forests also attracted Northern capital Fruit and truck gardening grew rapidly, and the South began to exhibit traits of industrial development familiar in the North and West. The negro problem continued to hold the South as a whole to the Democratic party

Industrial Changes.—The opportunities opened to capital by these forces of growth in the West and South, as well as the

general influence of an age of machine production, led to transformations in the East which brought new difficulties for political solution The East began to exhibit characteristics of other long-settled countries where increasing density of population and highly developed industry are accompanied by labour troubles To capital the opening resources of the West, and the general national prosperity after 1879, offered such inducements that large scale production by corporations became the order of the day The forces which had exhibited themselves in increased manufacture and railway development between the Civil War and the panic of 1873 now found expression in a general concentration of industries into fewer plants with vastly greater capital and output, in the combination of partnerships into corporations, and of corporations into agreements and trusts to avoid competition and to secure the needed capital and economies for dealing with the new problems of industrial magnitude. Western farming competition led to the actual abandonment of much inferior land in New England and to agricultural disadvantages in the Middle States As agriculture became less attractive and as industrial demands grew, the urban population of the East increased at the expense of the rural The numbers of cities of the United States with more than 8,000 people nearly doubled between 1880 and 1890; by 1900, the urban population constituted a third of the total, this phenomenon was especially marked in the North Atlantic division, where, by 1900, over half the population was in cities of more than 8,000 inhabitants

In similar fashion concentration of industry in large establishments was in progress In 1880 nearly 2,000 mills were engaged in the woollen industry; in 1890 not many more than 1,300. Even more marked was the change in iron and steel, where large-scale production and concentration of mills began to revolutionize this fundamental industry, and other lines of production showed the same tendency The anthracite mines of Pennsylvania fell into the possession of seven coal-carrying railways which became closely allied in interest. In most of the important industries the tendency of large organizations to subject or drive out the small undertakings became significant Already the railways to avoid "cut-throat competition" had begun to consolidate, to form rate agreements and to "pool" their earnings

Interstate Commerce Act.—The Cullom bill as enacted into the interstate commerce law of Feb. 4, 1887, was framed to prevent unjust discriminations by the railroads between persons, places and commodities, the tendency of which was to foster monopoly. The law forbade discriminations and pooling, made a higher charge for a short haul than for a long haul over the same road illegal, required publicity of rates, and provided for a commission to investigate and fine offenders But the decisions of the commission were reviewable by the Federal courts and the offender could be coerced, if he refused to obey the commission, only by judicial proceedings The commission was empowered to provide uniform accounting and to exact annual reports The principle settled by the law was an important one, and marked the growing reliance of the former individualistic nation upon Federal regulation But the difficulties by no means disappeared; the Federal judiciary refusing to accept the findings of the commission on questions of fact, retried the cases, and the Supreme Court overruled the commission on fundamental questions, and narrowed the scope of the act by interpretation.

Social Unrest.—Labour exhibited the tendency to combination shown by capital. The Knights of Labor, founded in 1869, on the basis of "the individual masses" instead of the trades unions, and professing the principle that "the injury of one is the concern of all," grew from a membership of about 100,000 in 1885 to 730,000 in 1886. The number of strikes in 1886 was over twice as many as in any previous year. In one of the strikes on the Gould railway system 6,000m of railway were held up. In New York, Henry George, author of books proposing the single tax on land, ran for mayor of the city and received 68,000 out of 219,000 votes At the same time socialistic doctrines spread, even among Western farmers. But sympathetic strikes, anarchistic outbreaks, and drastic plans for social change did not appeal to the people as a whole The Knights of Labor began to split, and the unions, organized as the American Federation of Labor, began to take their place with a less radical membership. President Cleveland broke with precedents in 1886 by sending in the first message on labour, in which he advocated, without success, a labour commission to settle controversies A national bureau of labour to collect statistics had been established in 1884; State legislation increasingly provided for arbitration of labour disputes, and regulation of factories and child labour.

Early in 1885 a law had been enacted forbidding the importation of labour under contract, and in 1888 the Chinese Exclusion Act was continued. Immigration was exceptionally large in the decade from 1880 to 1890, amounting to about 5,250,000 as compared with 2,800,000 for the previous decade But a large number of these new-comers settled on the newly opened lands of the Middle West By 1890 the persons of German parentage in the Middle West numbered over 4,000,000 Minnesota held 373,000 persons of Scandinavian parentage The Irish constituted the largest element among the English-speaking immigrants The population of foreign parentage amounted to one-third of the whole population of the United States in 1890.

In the midst of this national development and turmoil President Cleveland struggled to unite his party on a definite issue The silver question continued to divide each party, the continued fall of silver leading to renewed agitation for free coinage The surplus led to extravagant appropriation bills, such as special pension bills, which Cleveland vetoed altogether, thereby incurring criticism by veterans of the Civil War, and river and harbour improvement measures, particularly the act of 1886, to which the President gave reluctant assent, and the bill of 1887, to which he gave a "pocket veto" by refusing his signature. But the retention of the surplus in the Treasury would create a monetary stringency, its deposit in banks aroused opposition, and its use to buy bonds was unpopular with the Democrats

The Tariff.—Cleveland boldly met the issue and gave purpose to his party by his annual message of Dec 1887, which he entirely devoted to an exposition of the situation arising from the surplus, and to a demand for a revision of the tariff in order to reduce revenue He did not profess free trade doctrines "It is a condition which confronts us, not a theory," he declared The election of 1886 had reduced the Democratic majority in the House, but the President was able to induce his party to pass the Mills bill (1888) through that body as a concrete presentation of policy The bill put many important raw materials (including wool) on the free list, substituted *ad valorem* for specific duties to a large extent, and generally reduced the protective duties It was believed that the measure would remit over $50,500,000 of duties, nearly $20,000,000 of which would result from additions to the free list. The Republican Senate also found party unity on the tariff issue and its committee on finance, under the leadership of Senator Nelson W Aldrich of Rhode Island, drafted a counter proposal. They would reduce revenue by repealing the taxes on tobacco, and the taxes on spirits used in the arts and for mechanical purposes, and by revising the tariff so as to check imports of articles produced at home

Harrison Elected.—On the tariff issue the two parties contested the election of 1888, the Republicans denouncing the Mills bill and the Democrats supporting it Blaine having withdrawn from the contest, and John Sherman having secured but little more than half the votes necessary to nominate, the Republicans picked from a multitude of candidates Gen Benjamin Harrison of Indiana, grandson of President William Henry Harrison, to run against Mr Cleveland The popular vote was exceedingly close, but Harrison had an electoral majority of 65, having carried all of the States except the solid South, Connecticut and New Jersey The increasing use of money to influence the election, and particularly the association of great business interests with such political "bosses" as Matthew S Quay of Pennsylvania and Thomas C Platt of New York, were features of the campaign. The congressional elections ensured to the Republicans the undisputed control of all branches of the Government when the 51st Congress should convene, and it was generally agreed that the party had a mandate to sustain the protective tariff.

Lacking a large majority in either house the Republicans were exposed not only to the danger of free silver defections in the Senate, but also to "filibustering" by the Democratic minority in the House as the means of blocking the victorious party's programme. These obstructive tactics were made possible chiefly by the use of privileged motions and roll calls to delay business, and the refusal to respond on the roll call for a vote, thus preventing a quorum. Speaker Thomas B Reed of Maine, a virile and keen-witted leader, greatly strengthened the power of the Speaker, as well as expediting the business of the House, by ruling that the Constitution required a present, not a voting, quorum; and in spite of disorderly protests he "counted a quorum" of those actually present By securing rules sanctioning this action and empowering the Speaker to refuse to entertain dilatory motions, that officer became the effective agent for carrying on the business of the party majority As his power through the committee on rules, which he appointed, grew, he came, in the course of time, also to dominate the action of the House, refusing to recognize members except for motions which he approved This efficiency of action was secured at a loss to the House as a representative and debating body, responsive to minority proposals

Sherman Anti-Trust Act.—But the discipline of party caucus and House rules enabled the Republican leaders to put through with rapidity a number of important laws One of these was the measure known as the Sherman Anti-Trust Act of July 2, 1890, which declared combinations affecting commerce between the several States, or with foreign nations, illegal and punishable by fine or imprisonment or both This act, the full power of which was not exhibited until later, was a response to the growing unrest of the nation as other corporations emulated the success of the Standard Oil Trust (formed in 1882) The members of a trust combined in an organization managed by boards of trustees whose certificates the former owners accepted instead of their shares of stock in the component companies Competition was thus eliminated within the combination and the greatly increased capital and economies enabled it not only to deal with the increasing magnitude of business operation, but also to master the smaller concerns which opposed it State legislation had proved unable to check the process, partly because the trust was an interstate affair By putting into operation its power to regulate interstate commerce, Congress responded to the popular demand for Federal restraint of these great combinations which threatened the old American ideals of individualism and freedom of competition The trusts, although embarrassed, soon showed their ability to find other devices to maintain their unified control Nor was the act used, in this period, to prevent the railways from agreements and combinations which in large measure neutralized the anti-pooling clause of the Interstate Commerce Act of 1887

Silver Purchases.—Another important law was the so-called Sherman Silver Purchase Act of July 14, 1890 By 1889 the ratio of silver to gold had fallen to one to 22 In the 12 years of the Bland-Allison Act of 1878 over 378,000,000 silver dollars had been coined from bullion purchased at the market price This bullion value was falling: it was $.89 in 1877 and $.72 in 1889 The production of gold in the United States in 1878 was about 2,500,000 fine ounces, and of silver about 35,000,000; in 1890 the gold production was 1,588,000 and the silver 54,500,000. The Silver Purchase Act authorized the secretary of the Treasury to purchase each month 4,500,000 oz of silver at its market price and to pay for it in treasury notes redeemable at his discretion, in silver or gold

McKinley Tariff.—The customs duties upon which the fighting of the campaign of 1888 had turned was promptly taken up, and in the McKinley Tariff Act of Oct 1, 1890 the Republicans embodied their conceptions of protection to American industry Some of the main features of this law were the addition of agricultural products to the protected articles; the extension of the free list, particularly the inclusion therein of raw sugar, which had been bringing in a revenue of $50,000,000 annually; the granting of compensating bounties to sugar planters to an amount of about $10,000,000 a year; and the raising of duties to the prohibitory point on many articles of general consumption which could be produced at home Blaine, then secretary of State, had just been active in promoting closer relations with South America wherein he hoped for an extension of American trade and he severely criticized the bill as it passed the House, because the free list opened wide the doors of American trade, particularly to sugar-producing countries, without first exacting compensating advantages for our products in those markets To meet this criticism a provision was finally added authorizing the President to impose discriminating duties where it was necessary to obtain the advantages of reciprocity.

This tariff, which passed on the eve of the congressional elections of 1890, was immediately followed by such increases in prices and the cost of living that it was potent in bringing about the political revolution, or "land slide," which swept the Republicans from power in the House of Representatives. The Republicans returned but 88 members as compared with nearly twice that number in the Congress which passed the McKinley bill. Looked at broadly, the movement was a rural uprising, strongest in the South and Middle West, the old Granger areas, against forces which seemed to them to threaten their ideals of American democracy. But the movement was recruited by the silver-mining states and discontented labour interests

Farm products had not proportionately shared the general increase in prosperity. This convinced large portions of the agricultural West that the currency system had too narrow a basis in gold, which was appreciating in value. Much of the Middle Western agricultural development had been made on borrowed Eastern capital, and it seemed to the farmer that the principal of his mortgage was in effect increasing with the rise in the price of gold, at the same time that his crops brought a smaller net profit He did not give due attention to the effect of greatly increased production, as the new wheat lands were opened on such a grand scale; but he was keenly sensitive to increased freight rates and to the influence of Eastern capitalists, banks, bondholders, trusts and railways upon Federal and State legislatures and judiciary. After the evidence of the power of this tide of Western discontent in the elections of 1890, those portions of it which were ripest for revolt combined in 1892 as the People's Party or Populists, soon to prove an important political factor

The Republicans meanwhile had been actively reducing the surplus In 1892 the excess of revenue over expenditures was $10,000,000; in 1893 only $2,000,000 This was effected not only by the Tariff Act but by such measures as the Dependent Pension Act of 1890 (resulting in a list of pensioners of the Civil War which cost the nation $68,000,000 by 1893, over half of these pensioners having been added during Harrison's Administration), the rapid construction of the new Navy, raising the United States from 12th to fifth in the list of naval powers; the repayment of the direct war tax to the States (1891) to the amount of $51,000,000, and other appropriations such as those provided by river and harbour bills. The Democrats stigmatized this Congress as a "billion dollar Congress" from its expenditures, to which Speaker Reed replied that the United States was a billion dollar nation In fact the Democrats when they regained power were not able greatly to diminish the cost of government

Homestead Strike.—The Democratic House in the 52nd Congress repressed obstructive Republican tactics by methods like those adopted by Speaker Reed, and contented itself with passing a series of bills through that body proposing reductions of the tariff in special schedules, including free wool and a reduction of the duty on woollens, free raw material for the cotton planters of the South, free binding twine for the farmers of the North and a reduced duty on tin plate for the fruit raisers Of course these bills failed in the Republican Senate A bloody strike on the eve of the election of 1892 in the great steel works at Homestead, Pa., where armed guards engaged by the company fired upon the mob which sought higher wages, was not without its adverse effect upon public sentiment in regard to the Republican tariff for the protection of labour

During the campaign of 1892 the Democrats rejected a conservative tariff plank, denounced the McKinley tariff in violent language, and denied the constitutional power to impose tariff

duties except for the purpose of revenue only. But Cleveland, who was renominated in spite of vigorous opposition from leading politicians of his own State, toned down the platform utterances on the tariff in his letter of acceptance In their declarations upon the currency the Democrats furnished a common standing ground for the different factions by attacking the Silver Purchase Act of 1890 as a cowardly makeshift.

Cleveland Re-elected.—The People's Party, in its national convention at Omaha (July 1892), drew a gloomy picture of Government corrupted in all of its branches, business prostrated, farms covered with mortgages, labour oppressed, lands concentrating in the hands of capitalists Demanding the restoration of government to the "plain people," they proposed an expansion of its powers, to afford an adequate volume of currency and to check the tendency to "breed tramps and millionaires" Among their positive proposals were the free and unlimited coinage of silver at the legal ratio of 16 to one, the expansion of a national currency issued directly to the people; the establishment of postal savings banks, Government ownership of the railways, telegraph and telephone, restoration to the Government of the lands held by railways and other corporations in excess of their needs, and a graduated income tax Combining with the Democratic Party in various States beyond the Mississippi, and with Republicans in some of the Southern States, they won large masses of voters in the West, and exerted an influence upon public opinion in that section beyond what was indicated in the returns, although Gen James B Weaver of Iowa, their candidate for the Presidency, received over 1,000,000 popular votes and 22 votes in the electoral college The Republicans renominated President Harrison, though he lacked an enthusiastic personal following. They supported the McKinley Tariff Act in spite of the wave of opposition shown in the elections of 1890 But, fearing party divisions, they, like the Democrats, made an ambiguous declaration on the currency The result of the election of 1892 was to return the Democrats under Cleveland to power by a plurality of over 380,000 and an electoral plurality of 132 Congress in both branches was to be Democratic in 1893, and the way was open for the first time in a generation for that party to carry out a policy unchecked by any legislative or executive branch of Government

Panic of 1893.—But before Cleveland was fairly started in his second Administration the disastrous panic of 1893 swept the nation, nor did prosperity return during the four years that followed The panic is not, directly at least, to be traced to the silver purchases, but was the result of various causes, including the agricultural depression, farm mortgages, reckless railway financing and unsound banking in the United States. The panic began in the spring with the failure of the Reading railway and the collapse of the National Cordage Company, one of the numerous examples of reckless trust financiering into which large banks had also been drawn Clearing-house certificates were resorted to by the New York banks in June, followed in August by partial suspension of specie payments Currency remained at a premium for a month; deposits in national banks shrank enormously; national bank loans contracted more than 14·7%; failures were common, 22,000m of railways were under receiverships, and construction almost ceased

The panic of 1893 was in many ways a turning-point in American history It focused attention upon monetary questions, prostrated the silver-mining States, embittered the already discontented farming regions of the West, produced an industrial chaos out of which the stronger economic interests emerged with increased power by the absorption of embarrassed companies, and was accompanied by renewed labour troubles Most noteworthy of these was the Pullman Car Company strike near Chicago in 1894, which led to sympathetic strikes by the American Railway Union, extending over 27 States and Territories from Cincinnati to San Francisco. Mobs of the worst classes of Chicago burned and looted cars The refusal of Gov John P Altgeld of Illinois to call out the militia, and interference with the United States mails, led President Cleveland to order Federal troops to the scene, on the constitutional ground that they were necessary to prevent interference with interstate commerce and the postal service and to enforce the processes of the Federal courts. The courts issued a sweeping injunction requiring that the members of the American Railway Union or other persons desist from interference with the business of the railways concerned. The president of the striking organization, Eugene V. Debs, was imprisoned for contempt of court and conspiracy

Silver Issue.—The most immediate political effect of the panic was upon the silver issue Soon after the outbreak of the financial crisis, the gold reserve, which protected the greenbacks and the Treasury notes issued under the Silver Purchase Act, shrank ominously, while foreigners returned their American securities instead of sending gold To sell bonds in order to replenish the gold reserve, and to repeal the Silver Purchase Act without substituting free coinage, would aggravate Western discontent and turn away the promise of recruits to the Democratic Party from the Populists of the prairie and silver-mining States; to carry out the Democratic platform by a tariff for revenue only while mills were shutting down would be hazardous in the East. The fruits of victory were turning to ashes; but Cleveland summoned a special session of Congress for August, while the panic was acute, and asked his party to repeal the Silver Purchase Act without accompanying the repeal with provisions for silver Not until the last of Oct 1893 was repeal carried, by a vote in which the friends of repeal in the House were about equally divided between Democrats and Republicans, and nearly two-thirds of its opponents Democrats.

By this time the surplus had disappeared and the gold reserve was drawn upon for ordinary expenses Early in 1894 the Administration, failing to secure legislation from Congress to authorize the sale of gold bonds on favourable terms to protect the reserve, sold under the Resumption Act of 1875 $50,000,000 5% bonds, redeemable in ten years Part of this very gold, however, was withdrawn from the reserve by the presentation of legal tender notes for redemption, and the "endless chain" continued this operation to the verge of extinguishing the reserve, so that another loan of $50,000,000 in 1894 was followed in 1895 by a dramatic meeting between Cleveland and some of his cabinet with the Wall street banker, J Pierpont Morgan, who agreed on behalf of his syndicate to sell the Government $65,166,000 of gold for $62,315,000 of bonds, equivalent to 4% bonds for 30 years at a price of 104 In return the syndicate agreed to use its influence to protect the withdrawals of gold from the Treasury These securities were over-subscribed when offered to the public at 112½. President Cleveland had protected the Treasury and sustained the parity of gold and silver, but at the cost of disrupting his party Again, in the beginning of 1896, the Treasury was forced to sell bonds, but this time it dealt directly with the public and easily placed $100,000,000 in bonds at about 111, affording a rate of interest about equal to 3·4%

Tariff Reform.—Before the political harvest of the monetary issue was reaped, the Democrats had also found party ties too weak to bear the strain of an effective redemption of the party pledges on the tariff The Wilson bill prepared as the administrative measure was reported late in 1893, while the panic was still exerting a baneful influence Its leading features were the substitution of *ad valorem* for specific duties in general, the extension of the free list to include such materials of manufacture as iron ore, wool, coal, sugar and lumber, and the reduction of many prohibitory rates The loss in revenue was partly provided for by an income tax, significant of the new forces affecting American society, and an increase in the duty on distilled liquors. Although the bill passed the House by an overwhelming majority, it met the opposition in the Senate of the representatives, Democratic as well as Republican, of those States whose interests were adversely affected Led by Senators Arthur P. Gorman, of Maryland; Calvin S Brice, of Ohio; and David B. Hill, of New York, the bill was transformed by an alliance between Democratic and Republican senators, on the plea that it would otherwise result in a deficit of $100,000,000 Coal, iron ore and sugar were withdrawn from the free raw materials and specific duties replaced *ad valorem* in many cases, while many other individual schedules

were amended in the direction of protection The House, given the alternative of allowing the McKinley Act to remain or to accept the Senate's bill, yielded, and the Wilson-Gorman Tariff Act became a law without the President's signature, Aug 27, 1894. Even the income tax was soon (1895) held by the Supreme Court to be unconstitutional

Venezuela Message.—Toward the close of his administration Cleveland's brusque message on the Venezuelan boundary question aroused such excitement and so rallied the general public (though not the more conservative) that the war spirit, shown soon afterwards against Spain, might have been a potent factor in the election of 1896 had not England exhibited exceptional moderation and self-restraint in her attitude The silver question, therefore, became the important issue The Republicans nominated McKinley and declared for the gold standard in opposition to free coinage, losing thereby an influential following in the silver-mining and prairie states, but gaining the support of multitudes of business men among the Democrats in the East and Middle West

William J. Bryan.—The Democratic convention marked a revolution in the party The old school leaders were deposed by decisive majorities, and a radical platform was constructed which made "the free and unlimited coinage of both silver and gold at the present legal ratio of 16 to one, without waiting for the aid or consent of any other nation," the paramount issue Objecting also to the decision against the income tax, and to "government by injunction as a new and highly dangerous form of oppression," they incurred the charge of hostility to the Federal judiciary. William J Bryan made a brilliant speech in behalf of free coinage, and so voiced the passion and thought of the captivated convention that he was nominated by it for the Presidency over the veteran free-silver leader, Richard P Bland of Missouri The Cleveland men, or "gold Democrats," broke with their party after it became committed to free silver, and holding a convention of their own, nominated Gen John McA Palmer, of Illinois, for the Presidency on a platform which extolled Cleveland, attacked free coinage and favoured the gold standard Its main influence was to permit many Cleveland men to vote against Bryan without renouncing the name of Democrats On the other hand the Populist convention also nominated Bryan on a platform more radical than that of the Democrats

The contest was marked by great excitement as Bryan travelled across the country addressing great audiences The endangered business interests found an efficient manager in Marcus A Hanna of Ohio, McKinley's adviser, and expended large sums in a campaign of education In the event, the older States of the Middle West, holding the balance between the manufacturing and capitalistic East and the prairie and mining States of the West, gave their decision against free silver But class appeals and class voting were a marked feature of the campaign, the regions of agricultural depression and farm mortgages favouring Bryan, and those of urban life favouring McKinley Labour was not convinced that its interests lay in expanding the currency, and Mr. Hanna had conducted McKinley's campaign successfully on the plea that he was the advance agent of prosperity under the gold standard and a restoration of confidence McKinley carried all the Northern States east of the Missouri, and North Dakota, Oregon and California of the Farther West, as well as Maryland, Delaware, West Virginia and Kentucky His plurality over Bryan in the popular vote was more than 600,000, and his electoral majority 95 All the departments of Government were transferred by the election to the Republicans

Dingley Tariff.—Having secured power, the Administration called a special session of Congress, and enacted the Dingley protective tariff (July 24, 1897), under which the deficit in the Treasury was turned into a surplus. The act raised duties to their highest point, and as the protective schedules included some important articles produced by trusts which had a practical monopoly, such as sugar and petroleum, this was seized upon by the Democrats to stigmatize the tariff as the "mother of trusts" Many articles which had been placed on the free list in the Tariff Act of 1894, including lumber and wool were made dutiable

Gold Standard.—The Republicans also wrote their triumph into the Gold Standard Act of March 4, 1900, which ensured the maintenance of this standard by reserving $150,000,000 of gold coin and bullion to redeem the United States notes and the Treasury notes of 1890, and by authorizing the sale of bonds when necessary to maintain the reserve National banks were authorized in the smaller towns (3,000 or less) with a capital of $25,000, half of that formerly required, and increased circulation was further provided for by permitting the national banks to issue notes on United States bonds up to their par value

Economic Changes.—The economic policy of the Republicans was facilitated by the prosperity which set in about 1898 The downfall of silver-mining turned the prospectors to seek new gold-fields, and they found them, especially in Alaska, and contemporaneously the chemists discovered cheaper and more efficient methods of extracting the gold from low-grade ores Within five years after the crisis of 1893 the gold production of the United States nearly doubled The United States coined $437,500,000 in gold in the five-year period 1897–1902, while the average for five-year periods since 1873 had been only $224 000,000 Thus gold instead of silver began to inundate the market and to diminish the demand for expansion of the currency Agriculture, prostrated in the years immediately preceding and following the panic of 1893, turned to the scientific study of its problems, developed dry farming, rotation and variety of crops, introduced forage crops like alfalfa, fed its Indian corn to cattle and hogs, and thus converted it into a profitable and condensed form for shipment Range cattle were brought to the corn belt and fattened, while packing industries moved closer to these western centres of supply Dairy-farming replaced the unprofitable attempts of older sections of the Middle West and the East to compete with the wheat-fields of the Farther West Truck and fruit farming increased in the South, and the canning industry added utility to the fruits and vegetables of the West Following the trend of combination the farmers formed growers' associations and studied the demand of the market to guide their sales The mortgaged farms were gradually freed from debt. The wheat crop increased from less than 400,-000,000bu valued at $213,000,000 in 1893 to 675,000,000bu valued at $392 000,000 in 1898 Prosperity and contentment replaced agitation in the West, and the Republican Party gained the advantage of these changed conditions

In the South also there was greater contentment as the new industries of iron, textiles and forestry grew, and as the cotton crops increased Unrest was diminished by the new State Constitutions, which after 1890 disqualified negro voters by educational and tax requirements so contrived as not to disfranchise the poor whites

In the decade which followed the crisis of 1893 a new industrial structure was made out of the chaos of the panic. "High financing" was undertaken on a scale hitherto unknown Combinations absorbed their weaker rivals; Standard Oil especially gained large interests in New York banks and in the iron mines and transportation lines about the Great Lakes, while it extended its power over new fields of oil in the South-west. In general, a small group of powerful financial interests acquired holdings in other lines of business, and by absorptions and "community of interest" exerted great influence upon the whole business world The group of financiers, headed by J Pierpont Morgan, came to dominate various Southern transportation lines and the anthracite coal roads and mines, and extended their influence to the Northern Pacific railway, while a new genius in railway financing, Edward H Harriman, began an avowed plan of controlling the entire railway system of the nation Backed by an important banking syndicate he rescued the Union Pacific from bankruptcy, and with its profits as a working basis he started in to acquire connecting and competing lines Labour also shared in the general prosperity after 1898 Relative real wages increased, even allowing for the higher cost of living, and the length of the working day in general decreased except in special industries

General Prosperity.—By 1900 the continental United States had a population of 76,000,000; an aggregate real and personal wealth of $88,500,000,000; a per capita public debt of $14 52, and per capita money circulation of $26 94 against $21 41 in 1896 In 1901 bank clearings amounted to nearly $115,000,000,000 against

$45,000,000,000 in 1894. Imports of merchandise had fallen in this period, while exports rose from about $847,000,000 in 1893 to $1,394,000,000 in 1900. Of these exports foodstuffs and food animals, crude and partly manufactured, aggregated nearly 40% of the total. The production of pig-iron, which was about 7,000,000 long tons in 1893, was nearly twice that in 1900. This economic prosperity and these far-reaching processes of social change by which the remaining natural resources of the nation were rapidly appropriated, went on contemporaneously with the extension of the activity of the nation overseas The first rough conquest of the wilderness accomplished, the long period of internal colonization drawing to a close, the United States turned to consider its position as a world power

To understand this position it is necessary to return to an earlier period and briefly survey the foreign relations since the close of the reconstruction era. The most significant and persistent influence came from the growing interest of the United States in the Pacific, as its population and economic power extended to that ocean. The problem of an overflow of Chinese migration to the Pacific coast, and the jeopardizing of the American standard of labour by this flood, had been settled by various treaties and laws since 1880 The question of the relation of the United States to an interoceanic canal was not so easily settled. In 1878 Colombia granted a concession to a French company, promoted by Ferdinand de Lesseps, the engineer of the Suez canal, to dig a tide-level canal through the Isthmus of Panama President Hayes voiced the antagonism of the United States to this project of European capital in his message of 1880 in which he declared that such a canal should be under the control of this nation, and that it would be "virtually a part of the coast-line of the United States" Although an American company was organized to construct a canal under a concession from Nicaragua in 1884, no real progress was made, and the French company, defeated by engineering and sanitary difficulties, failed at the close of 1888.

Pan-American Congress.—Meantime, for a few months, Blaine, as secretary of State under President Garfield, began a vigorous foreign policy with especial reference to the Pacific He attempted to get the consent of England to abrogate the Clayton-Bulwer Treaty of 1850, which contemplated the construction of an isthmian canal by private enterprise under joint control and neutralization of the United States and Great Britain, together with such other Powers as should join them In South America he actively pressed the influence of the United States to settle the war between Chile and Peru. Again, in the years from 1889 to 1892, Blaine held the portfolio of State, and attempted to increase the influence of his country in Spanish America by the Pan-American congress of 1890, which proposed a great international railway system and bank, commercial reciprocity and arbitration, without immediate results Indeed, the bad feeling aroused by his earlier policy toward Chile found expression in 1891 in a mob at Valparaiso, when some of the men from the United States ship "Baltimore" on shore leave were killed and wounded. An apology averted the war which President Harrison threatened. Blaine also asserted, against Canada particularly, the right of the United States to the seals of the Bering Sea, but in 1893 arbitrators decided against the claim

Foreign Affairs.—As the Navy grew and American policy increasingly turned to the Pacific, the need of coaling stations and positions advantageous to its sea power was appreciated By a tripartite treaty in 1889 the Samoan islands were placed under the joint control of the United States, England and Germany, and, a decade later, they were divided among these powers, Tutuila and the harbour of Pago-Pago falling to the United States. The Hawaiian islands, which had been brought under the influence of civilization by American missionaries, were connected by commercial ties with the United States. Upon the attempt of the ruler to overturn the constitution, the American party, aided by the moral support of the United States, which landed marines, revolted, set up a republic, and asked annexation to the Union. A treaty, negotiated under President Harrison to this end, was withdrawn by President Cleveland, after investigation, on the ground that the part of the United States in the revolution was improper. He attempted, without success, to restore the original state of affairs, and on July 7, 1898, the islands were annexed.

President Cleveland's conservatism in this and other matters of foreign policy had not prepared the people for the sudden exhibition of firmness in foreign policy with which he startled the nation in his message of Dec. 1895 upon the question of the boundary of Venezuela. That nation and England had a long-standing dispute over the line which separated British Guiana from Venezuela Great Britain declined to arbitrate, at the suggestion of the United States, and gave an interpretation to the Monroe Doctrine which the Administration declined to accept. President Cleveland thereupon brusquely announced to Congress his belief that Great Britain's attitude was in effect an attempt to control Venezuela, and proposed that a commission on the part of the United States should report upon the disputed boundary, and support Venezuela in the possession of what should be ascertained to be her rightful territory Secretary of State Richard Olney declared: "To-day the United States is practically sovereign on this continent, and its fiat is law upon the subjects to which it confines its interposition" Great Britain tactfully accepted arbitration, however, and in the end (1899) was awarded most of the territory regarding which she had been unwilling to arbitrate.

Spanish-American War.—The growing activity of the United States in foreign relations next manifested itself against Spain. Cuba in its commanding position with reference to the Gulf of Mexico and the approaches to the proposed isthmian canal, as well as in its commercial relations, and its menace as a breeding spot for yellow fever, had long been regarded by the United States as an important factor in her foreign policy. Between 1868 and 1878 a harsh war had been in progress between the island and the mother country, and American intervention was imminent But Spain promised reforms and peace followed; again in 1895 revolt broke out, accompanied by severe repressive measures, involving grave commercial injury to the United States

By the Treaty of Paris, signed Dec 10. 1898, Spain lost the remaining fragments of her ancient American empire She relinquished Cuba, which the United States continued temporarily to occupy without holding the sovereignty pending the orderly establishment of an independent Government for the island. Porto Rico, Guam and the Philippines were ceded outright to the United States, which agreed to pay $20,000,000 to Spain, and to satisfy the claims of its citizens against that power By the treaty Congress was to determine the civil rights and political status of the native inhabitants of the ceded territory.

As a result of the Spanish-American War, the United States found itself in a position of increased importance and prestige among the nations of the world Especially in the Pacific, it was immediately involved in the diplomatic situation created by the efforts of European States to divide China into spheres of influence or of actual possession. The interests of the United States in the trade with China, as well as her new position in the Philippines, inclined her to oppose this policy, and secretary of State John Hay showed himself one of the great American diplomats in his treatment of this difficult problem In order to preserve Chinese entity and the "open door" for trade, he drew replies from the nations concerned, the result of which was to compel them to avow and moderate their intentions

The acquisition of Porto Rico and the acceptance of responsibilities in Cuba gave new importance to the isthmian canal and increased the relative weight of the United States in regard to its control The popular excitement with which the voyage of the "Oregon" was followed, as it took its way 14,000m. around South America to participate in the destruction of the Spanish fleet in the battle of Santiago, showed the American people the need of such communication between the Atlantic and Pacific coasts.

The Philippines.—But the immediate political issues were concerned with problems of the relation of the newly won lands to the United States Government. Bryan had persuaded his party to join in ratifying the Treaty of Paris, expecting to determine the status of the islands later. But attention soon turned to the insurrection which broke out (Feb. 4, 1899) in the Philippines under Aguinaldo, after it became probable that the Administra-

tion intended to retain these islands, not under a weak protectorate, but as a possession to be ruled and "assimilated" It was not until the spring of 1902 that this insurrection was completely put down, and in the interval the question of the destiny of the islands and the harshness of the measures of repression aroused political debate. The Democrats and many Republicans charged the Administration with a policy of imperialism.

Porto Rico.—The same issue was involved, in its constitutional and economic aspects, in the treatment of Porto Rico and Cuba. While the insurrection continued in the Philippines the government there was legally a military one, although exercised in part through civil officers and commissions. But in the case of Porto Rico the question was whether the "Constitution follows the flag," that is, whether it extended of its own force without an act of Congress to acquired territory, and covered the inhabitants with all the rights of citizens of the United States, as an integral part of the American people.

The Foraker Act of 1900 imposed a special tariff for two years upon Porto Rico, the proceeds to go to that island's own Treasury. The act further asserted the principle that the inhabitants of the new possessions were not incorporated into the United States or entitled to all the privileges of citizens of the United States under the Constitution, by declaring that statutory acts of the United States locally inapplicable should not be in force in Porto Rico The Supreme Court sustained this act in 1901, holding that Porto Rico was not so strictly a part of the United States that separate customs tariffs could not be imposed upon the territory. The Foraker Act also provided a government for the island In Cuba the United States remained in authority until May 20, 1902 Details of the arrangements whereby the United States secured the substantial advantages of a protectorate without destroying the independence of Cuba, will be found by the reader in the article on CUBA

Re-election of McKinley.—Meantime, in the election of 1900, the Democrats renominated Bryan on a platform which opposed the Republican Administration's acts in relation to the newly acquired territory and declared that "imperialism" was the paramount issue The platform reaffirmed its silver doctrine of the previous campaign and denounced the tariff as a breeder of trusts The Republicans renominated McKinley and endorsed his Administration. McKinley received an electoral majority of 137 and a popular plurality of 849,790. Before his second term was fairly begun he was shot by an anarchist while attending the Pan-American exposition at Buffalo, and died on Sept 14, 1901. His wisdom in choosing able cabinet officers, his sympathetic tact in dealing with men and with sections, as well as the victories of the Spanish-American War, had brought him popularity even among his political opponents. But McKinley, like Cleveland, lacked the imagination to perceive and the desire to voice the aspirations and demands that had been gathering force for many years for legislation and executive action that should deal with the problem of effective regulation of the economic forces that were transforming American society. This gave his opportunity to Theodore Roosevelt, who as vice president now succeeded to office.

Roosevelt President.—It was in foreign relations, which Secretary Hay continued to conduct, that continuity with McKinley's Administration was most evident. But even here a bolder spirit, a readiness to break new paths and to take short cuts was shown by the new President. Venezuela had long delayed the payment of claims of citizens of various nations. In 1901, the President, having been informed by Germany of its intention to collect the claims of its citizens by force, but without acquisition of territory, announced that the United States would not guarantee any State against punishment if it misconducted itself, provided that the punishment did not take the form of acquisition of territory. As a result, a blockade of Venezuela was undertaken by the joint action of Germany, England and Italy at the close of 1902. The diplomatic intervention of the United States early the next year resulted in Venezuela's agreement to pay the claims in part and to set aside a portion of her customs receipts to this end But since the blockading powers demanded preferential treatment, the United States secured a reference of the question to The Hague court, which decided that this demand was justified. Santo Domingo offered a similar problem, having a debt incurred by revolutionary governments, beyond its power to pay, and being threatened with forcible intervention by European States President Roosevelt, in 1904, declared that in case of wrongdoing or impotency requiring intervention in the western hemisphere the United States might be forced "to the exercise of an international police power." In 1905 Santo Domingo and the United States signed a protocol under which the United States Government was empowered to take possession of the custom-house, conduct the finances and settle the domestic and foreign debts of Santo Domingo In spite of the refusal of the Senate to assent to this protocol, President Roosevelt put the arrangement unofficially into effect, until, in 1907, the Senate consented to a treaty authorizing it with some modifications.

In the Far East the Boxer insurrection in China had been followed by the combined military expedition of the powers to the relief of Peking (in which the United States shared), and the exaction of a huge indemnity, of which the United States relinquished nearly half of its share, as in excess of the actual losses. The United States protested against Russian demands upon China, and actively participated in the negotiations which resulted in Russia's agreement to evacuate Manchuria The delays of that power and her policy toward China having led Japan to declare war, Secretary Hay's diplomacy was influential in limiting the zone of hostilities, and the good offices of President Roosevelt brought about the conference between the two powers at Portsmouth, N H, which terminated hostilities in 1905 The dispute over the boundary between Alaska and Canada was narrowed by diplomatic discussion, and the remaining questions, involving the control of important ports at the head of the great inlets which offered access to the gold-fields, were settled by arbitration in 1903 favourably to the American contentions

The isthmian canal also received a settlement in this Administration by a process which was thoroughly characteristic of the resolution of President Roosevelt. *See* PANAMA CANAL.

The Philippines.—In the Philippines early in 1901 municipal and provincial governments were provided for, and the President had been for a brief time granted full power to govern the archipelago He appointed Judge Taft civil governor, and limited the power of the military governor to regions where insurrection continued. On July 1, 1902, congressional authority was substituted for that of the President, but Taft remained governor The provisions of the Constitution guaranteeing life, liberty and property were in general extended specifically to the dependency, and a legislative assembly was promised, the lower house elective, and the upper house to consist of the Philippine commission By negotiations with Rome Gov Taft secured for the Philippines the "friars' lands" which had been a source of friction. On Oct. 16, 1907, the first Philippine assembly was convened in the presence of Taft, then secretary of war.

The tariff question complicated American relations with both the Philippines and Cuba Beet sugar and tobacco interests feared the competition of these products, and opposed freedom of trade between the United States and the new territories The Philippine tariff of 1902 made a reduction of only 25% from the Dingley tariff in the case of the products of those islands, instead of the 75% urged by Taft; but the duties were to go to the Philippines In the case of Cuba a more heated controversy arose over the tariff—Roosevelt strongly urged a substantial reduction in justice to Cuba at several regular and special sessions of Congress, but not until the close of 1903 was a treaty in operation which, under the principle of reciprocity, admitted some products of the United States to Cuba at reduced rates, and allowed Cuban products a reduction of 20% from the Dingley tariff

The Trusts.—The dominant historical tendencies of the beginning of the 20th century in the United States, however, were characterized by huge combinations of capital and labour, the rapid passing of natural resources into private possession, and the exploitation of these resources on the principle of individualism by aggregations of capital which prevented effective competition by ordinary individuals. Pioneer conceptions of individual in-

dustrial achievement free from governmental restraint were adopted by huge monopolies, and the result was a demand for social control of these dangerous forces.

After the Sherman Anti-Trust Act of 1890 the combinations found in the favourable laws of States like New Jersey opportunity to incorporate under the device of the "holding company," which was supposed to be within the law A "promotion mania" set in in 1901 The steel industry, after a threatened war between the Standard Oil and Carnegie groups, was united by Pierpont Morgan into the United States Steel Corporation with stocks and bonds aggregating $1,400,000,000 This was only one of the many combinations embracing public utilities of all kinds. Where open consolidation was not effected, secret agreements, as in the case of the meat packers, effectively regulated the market In the field of railway transportation, Harriman used the bonds of the Union Pacific to acquire the Southern Pacific with the Central Pacific, and by 1906 he was dictator of one-third of the total mileage of the United States Meanwhile the Great Northern and the Northern Pacific had been brought into friendly working arrangements under James J. Hill, and tried to secure the Burlington railway A fierce contest followed between the Hill, Morgan and Harriman forces, resulting in a compromise by which the Northern Securities Company, a holding company for the joint interests of the contestants, was created It was admitted by the counsel for this company that the machinery provided in this organization would permit the consolidation of all the railways of the country in the hands of three or four individuals By using notes of one railway company, based on its treasury securities, one could acquire a controlling interest in others, and by watering the capital stock, recover the cost of the undertaking, while the public paid the added rates to supply dividends on the watered stock

Following a similar tendency the great Wall street banking-houses were dominated by the large financial groups in the interest of speculative undertakings, the directors of banks loaning to themselves, as directors of industrial combinations, the funds which flowed into New York from all the banks of the interior By a similar process the great insurance and trust companies of New York became feeders to the same operations Thus a community of control over the fundamental economic interests of the nation was lodged in a few hands

Such was the situation in domestic affairs which confronted Roosevelt when he became President In his first message he foreshadowed his determination to grapple with these problems In 1903 he instructed the attorney-general to bring suit to dissolve the Northern Securities Company as a combination in restraint of trade, and in 1904 the Supreme Court held the merger illegal But the effect was to increase the tendency to change from incomplete combination of financial interests to consolidated corporations owning the property, and to lead the Government, on the other hand, to seek to regulate these vast business interests by legislation The Elkins law, passed in 1903, increased the power of the interstate commerce commission to prosecute offenders, especially those who violated the anti-rebating clauses In the same year the creation of the Federal bureau of corporations provided for increased publicity in the affairs of these organizations

Combinations of Labour.—Labour was combining in its turn Not only did local unions in most of the trades increase in number and power, but workers in separate industries over large areas were combined for collective bargaining and a national organization, the American Federation of Labor, had a membership by 1905 of approximately 2,000,000. Labour legislation by the States increased under these influences, and political leaders became increasingly aware of the power of the labour vote, while employers began to form counter organizations to check the growth of the movement In 1902 Pennsylvania members of the United Mine Workers of America struck. Inasmuch as their employers were the owners of the anthracite coal monopoly under the control of an allied group of coal-carrying railways, the contest was one of far-reaching importance, and soon brought about a coal famine felt throughout the nation So threatening was the situation that President Roosevelt called a conference of the contestants, and induced them to submit their difficulties to an arbitration commission which, by its report, in the spring of 1903, awarded to the miners shorter hours and an increase of wages.

Steadily the United States enlarged its economic functions In 1903 Congress created a department of Commerce and Labor and made the secretary a member of the cabinet. The reports of this department gave publicity to investigations of the perplexing industrial conditions. The department of Agriculture enlarged its staff and its activity, investigating different plants and animals, ascertaining means of checking insect pests, advising upon the suitability of soils to crops, seeking new and better seeds, and circulating general information. The contemporaneous development of agricultural education in the various Western and Southern States whose agricultural colleges had been subsidized by land grants and appropriations by the Federal Government, and the experimental farms conducted by railways, all worked to the same end. The nation began also to awake to the need of protecting its remaining forests, which were rapidly falling into the hands of corporations by perversion of homestead and other land laws President Cleveland had withdrawn large forest tracts, and in 1898 Gifford Pinchot was made head of a division of forestry in the department of Agriculture In 1901 the work was organized under a separate bureau, and four years later the national forests were placed under his management

Reclamation.—The increasing demand for lands for agriculture led also, under Roosevelt, to the real beginning of national irrigation actively in the vast arid area of the Far West The reclamation service was created by the act of June 17, 1902, which set aside the proceeds of the sale of public lands in 13 States and three Territories as a fund for irrigation works The Government itself reserved timber and coal tracts, water powers and other requisites for construction, and sold the irrigated lands to actual settlers in small farms, while retaining title to the reservoirs and the works. The income from the reclamation fund between 1901 and 1910 aggregated over $60,000,000. By the use of suitable crops and dry farming agricultural occupation was extended into formerly desert lands

Election of 1904.—In the election of 1904 the popularity of President Roosevelt, after his strenuous activity in challenging some of the strongest tendencies in American life, was put to the test His political management exhibited the fact that he was trained in the school of the New York politician as well as in the reformer's camp, and he was easily nominated by the Republicans on a platform which endorsed his Administration, and made no promise of tariff changes The Democrats turned to the Conservative wing, omitted any reference to silver or the income tax, and nominated Judge Alton B Parker, of New York The issue of imperialism had been largely eliminated by the current of events and the anti-trust issue was professed by both parties. In the outcome Roosevelt won by the unprecedented popular plurality of over 2,500,000, and an electoral majority of 196

The State elections of the same period showed that a wave of reform and of revolt against former political forces was rising In five States which Roosevelt carried by his popularity the machine Republican candidates for governor were defeated by reforming Democratic candidates, and in cities like Chicago and Philadelphia the issues of reform and radicalism won unexpected though temporary success. Roosevelt had "stolen the thunder" of the parties of social unrest, including the old populistic areas of the Middle West and the labour element of the cities, and also retained control of the Republican party machinery.

Roosevelt's Second Administration.—In his second Administration President Roosevelt pressed his policies so hard and with such increasing radicalism that he lost control of the regular organization in Congress before the end of his term. In the House Speaker Joseph G. Cannon, of Illinois, exhibited the full power of his office in concentrating party policies in the hands of the few regular leaders, while in the Senate a directing group of New England men who had served for a long time, chiefly senators Nelson W Aldrich and Eugene Hale, showed a similar mastery. Against this control a significant revolt, illustrative of revived discontent in the Middle West, was made by the Republican senator Robert M. La Follette, of Wisconsin, who had won his fight in that State

against the faction friendly to the railways, and had secured primary elections, railway rate regulation on the basis of expert valuation of the physical property of the railways, and a system of taxation which rested more heavily upon public utilities In pressing similar policies upon Congress he became isolated from the party leaders, but forced them to go on record by roll calls

In New York a legislative investigation of the insurance companies disclosed such connections with the high financing of Wall street as to create widespread distrust and to lead to reform legislation The attorney who conducted the investigation, Charles Evans Hughes, had shown such ability that he was chosen governor of New York in 1906 His administration was marked by independence of the party machine and a progressive policy Foreign relations were conducted during the second administration of Roosevelt by Secretary Elihu Root from 1905 He fostered friendly relations with the other American nations, allaying their concern lest ambitious designs of their larger neighbour might endanger their independence In Cuba a signal illustration of the good faith of the United States was exhibited when an insurrection in the summer of 1906 left the republic substantially without a government Taft, then secretary of War, was sent, under the treaty provisions for intervention, to organize a provisional Government. During his few days' service as governor-general he set in motion the machinery for restoring order But Roosevelt had plainly stated that if the insurrectionary habit became confirmed in Cuba she could not expect to retain continued independence

Japanese Immigration.—Attention was again fixed upon the Pacific coast, not only by the earthquake and conflagration which in 1906 destroyed the business parts and much of the residence section of San Francisco, but also by municipal regulations there against the presence of Japanese in the public schools The incident seemed to threaten grave consequences, which were averted by the popularity of Roosevelt both in California and in Japan In the Immigration Act of Feb 20, 1907, the problem of exclusion of Japanese labour, which underlay the difficulty, was partly solved by preventing the entrance to the continental United States by way of neighbouring countries of persons holding passports issued by a foreign Government for going to other countries or dependencies of the United States

As a demonstration of the naval power of the United States in Pacific waters, the President sent the American fleet on a cruise around the world, in the course of which they were received in a friendly spirit by Japan The Navy was increased to keep pace with the growth of that of other nations, both in numbers and size of vessels, in this period, but not to the extent demanded by the Administration Already a more efficient organization of both Army and Navy had been effected While the nation prepared for war, it also engaged prominently in the successive international peace congresses between 1899 and 1907, aiming consistently to increase the use of arbitration

Railway Regulation.—The tendencies of the Government to deal with social improvement were exemplified by the laws of 1906 providing for pure food and meat inspection The Railway Rate Regulation Act of 1906 strengthened previous interstate acts by including pipe lines (except for gas and water) under the jurisdiction of the interstate commerce commission, and extending the meaning of "common carrier" to include express and sleeping-car companies. Published rate schedules were required, not to be changed without 30 days' notice, and more stringent provisions were made to prevent rebating The act provided for review by the Federal courts, and did not permit the commission to investigate an increase of rates until the rates went into operation, nor did it provide for a valuation of the railways as a basis of rate-making which the commission had desired. Later acts partly met the demands of railway employees by increasing the liability of common carriers and by providing for shorter hours.

Panic of 1907.—Although Roosevelt had made concessions to the railways in the formation of the act of 1906, his utterances showed a tendency alarming to the large business interests and the holders of corporation securities generally. The unsettled business conditions were reflected in the stock market, and began to produce a reaction against the activity of Government in this direction. The panic of 1907 started with the downfall of an attempted combination of a chain of banks, copper interests and other enterprises, and was followed by the collapse of the Knickerbocker Trust Company in New York (Oct. 21, 1907). The country was generally prosperous, though much of the banking funds was tied up in New York city at this juncture Clearing-house certificates were resorted to; by Nov 1 partial suspension was general throughout the nation; and banking facilities were more completely interrupted than at any time since the Civil War The Government greatly increased its deposits, and offered Panama 2% bonds to the amount of $50,000,000, and 3% certificates for $100,000,000, with the object of providing the national banks a basis for additional note issues But these were taken only to a small amount, as they proved useful for their moral effect chiefly An enormous addition to the money supply was made in the course of the panic, both by governmental activity, gold imports and national bank-notes The crisis was brought to a close before the end of 1907 by the vigour of the Government and the activity of the large financial interests under the lead of J P Morgan, who finally entered the field to stop the decline, at the same time that his associates in the Steel Trust acquired possession of their last remaining rival of importance, the Tennessee Coal and Iron Co

The reaction after the panic, and the loss of influence resulting from his announcement that he would not permit his renomination for the campaign of 1908, left Roosevelt unable to exercise the compelling power which he had displayed in previous years Congress under the control of the Conservatives refused him legislation which he asked, but before he left the Presidency he raised a new issue to national importance in his calling of a congress of State governors and experts to consider the need of the conservation of natural resources. This congress met in May 1908 and endorsed the proposal for vigorous attention by State and nation to the question

Election of 1908.—In the campaign of 1908 he succeeded, against the opposition of both the extreme Conservative and the Radical wings, in procuring the nomination of Secretary Taft by the Republicans on a platform endorsing the Roosevelt policies, promising a revision of the tariff at a special session, on the basis of such protection as would equal the difference between the cost of production at home and abroad, together with a reasonable profit to American industries, and providing for maximum and minimum rates to be used in furthering American commerce and preventing discriminations by other nations A postal bank was promised, a more effective regulation of the railways, and a modification of the Sherman Anti-Trust Act The Democrats again selected William J Bryan as their candidate; demanded the enforcement of criminal law against "trust magnates" and such additional legislation as would prevent private monopoly; opposed the use of injunctions in cases where they would issue if no industrial dispute was involved, impugned the Republicans' good faith in tariff revision, promising for themselves a substantial reduction of duties; favoured an income tax and a guarantee fund by national banks to pay depositors of insolvent banks, or a postal savings bank, if the guaranteed bank could not be secured, demanded election of United States senators by direct vote of the people, legislation to prevent contributions by corporations to campaign funds, and a more efficient regulation of railways

Taft President.—The Republicans won a sweeping victory, Taft's popular plurality reaching about 1,270,000 and his electoral majority 159 But it had been won by some ambiguity of utterance with respect to tariff and railway regulation. The result was made manifest early in the new Administration, when party contentions over the direction of revision of the tariff, the thoroughness of the regulation of railways and corporations, and the question of where the postal bank fund should be placed, resulted in a movement of "insurgency" among the Republicans of the Middle West The insurgents termed themselves "Progressive Republicans," and did not hesitate to join forces with the Democrats in order to shape legislation to their wishes Progressives and Democrats united in overturning the control of Speaker J G. Cannon in the House of Representatives by modifying the rules,

and a group of senators, chiefly from the Middle-western States, destroyed the control of the regular leaders in the Upper House. President Taft's influence over the revolting wing was further weakened by the charges made against his secretary of the Interior, Richard A. Ballinger, on behalf of Gifford Pinchot, the chief forester, who accused the Administration of obstructing Mr. Roosevelt's "conservation" policy

Pinchot was indeed removed from office, but the "conservation" issue was raised to primary importance by the return of Roosevelt from his African trip His influence was revealed even while he was enjoying the hospitality of European countries. On his return, there was a widely extended desire to know his judgment of the Administration's policy, but he maintained silence until the close of the summer of 1910, when in a series of public utterances in the West he ranged himself, on the whole, with the progressive wing and announced a "new nationalism" which should enlarge the power of the Federal Government and drive the "special interests" out of politics. The "insurgents" achieved remarkable victories in the Middle West, California, New Hampshire and New York in the fall conventions and primary elections, retiring various leaders of the regular wing of the Republicans. Senators Aldrich and Hale, former regular leaders in the Senate, had already announced their purpose to resign The result of the autumn elections was a pronounced victory for the Democratic Party

Social Questions.—At the close of the first decade of the 20th century the United States was actively engaged in settling its social and economic questions, with a tendency toward radicalism in its dealings with the great industrial forces of the nation The "sweat shops" and slums of the great cities were filled with new material for American society to assimilate To the sisterhood of States had been added Oklahoma (1907), and in 1910 Congress empowered New Mexico and Arizona to form Constitutions preparatory to statehood, thus extinguishing the last Territories, except the insular dependencies and Alaska Already the food supply showed signs of not keeping pace with the growth of population, while the supply of gold flowed in with undiminished volume High prices became a factor in the political situation Between 1890 and 1900, in the continental United States, farms were added in area equal to that of France and Italy combined Even the addition of improved farm land in that decade surpassed the whole area of France or of the German Empire in Europe But intensive cultivation and agricultural returns hardly kept pace with the growth in population or the extension of farms (F J.T.)

BIBLIOGRAPHY.—*Sources:* The debates of Congress in *The Congressional Record* become very bulky in this period The Senate and House documents and reports of the various departments and bureaus are indexed in B P Poore, *Descriptive Catalogue of Government Publications of the United States, 1775–1881* (1885); J G Ames, *Comprehensive Index of Publications of the United States Government, 1881–1893* (1894) and *Catalogue of Public Documents of Congress and of all Departments of Government of the United States, 1893–sqq.* (under supervision of the Supt of Docs) The *Messages and Papers of the Presidents* (J D Richardson, editor) is useful up to 1899. *See* also W L. Fleming, *Documentary History of Reconstruction* (1906); *The Diary of Gideon Wells* (1911); Carl Schurtz, *Reminiscences* (1907); J Sherman, *Recollections of Forty Years* (1895), G. Cleveland, *Presidential Problems* (1904); J. R. Commons, *Documentary History of American Industrial Society* (10 vols, 1911); R M LaFollette, *Autobiography* (1913); T. F Poole's *Index to Periodical Literature* (1822 *sqq*) The period is unusually rich in biographical material which will be found by consulting the bibliographies attached to biographical sketches in this edition of the Encyclopædia Britannica

FROM 1910 TO 1926

The American Nation.—In 1910 the total population of the continental United States was 92,000,000 Of these, only 50,000,000 were native whites of native parentage; 13,000,000 were foreign-born, and 19,000,000 others were of foreign-born or mixed parentage. The negroes and Indians together numbered about 10,000,000. Everybody in the United States except the American Indian is an immigrant from some other country or a descendant of an immigrant. The main race groups are: (1) the descendants of the colonists, who were mainly Anglo-Saxons, with some Germans and Scotch-Irish and small elements of other races; (2), descendants of the Europeans who came over in great numbers from 1820 to 1870, (3), the large number of recent immigrants and their children

In the opening years of the present century the country was not yet aroused to the dangers arising from this mixture of unassimilated races. Few voices were raised against admitting not only western Europeans, whose languages and customs were much like those of the United States, but men and women from east and south-east Europe and from western Asia. The only bar to immigration based on race was the prohibition, since 1888, of Chinese immigration and the practical exclusion of Japanese labourers by a "gentlemen's agreement" with the Japanese Government (1907). The undigested load was becoming heavy.

Defects in Government.—The units of American society were held together by a strong, if complicated, democratic government, well fitted to rule a diverse population. The political forms were familiar to every schoolboy: (*a*) A group (in 1910)

of 46 States, each with its own government rigidly confined by the traditional principle of "checks and balances" into three departments, legislative, executive, judicial; (*b*) a widely distributed franchise almost equivalent to universal suffrage for adult males; (*c*) a belief that the courts were the highest authority, not only as to questions of personal rights and duties, but as to the validity of the laws and acts of the other two departments; (*d*) local government of city and town, township and county. This combination of governments was expensive and not highly skilled, but was supported by the conviction of a large part of the population that it was the "best government on earth."

In the organization and conditions of business there could be traced some startling contradictions between the word liberty and the fact. Nominally all kinds of business not prohibited by law were open to all comers in free and honourable competition In reality, by 1908, a considerable number of both employers and employees were engaged in a combat outside the laws, constant and conscienceless. It was hard for individuals and firms to compete with corporations, and hard for small corporations to compete with large ones The railways were among the most conspicuous of the large corporations, and they, too, tended to combine into larger and more powerful units. The States could not deal adequately with these powerful bodies because most of the railways and many of the other corporations operated from State to State, and could not be controlled at either end by anything short of federal power

Political organizations were on nearly the same basis as business companies they also grew bigger and more powerful and gathered into fewer groups Nominally, parties are simply associations of voters for common ends. Actually, they are armies acting under commanding leaders who in many cases hold no offices. The evils of this "invisible government," as Elihu Root called it, were apparent The political philosophy of Americans was based on the belief that mankind was steadily growing better. Hence a tendency to rely upon laws and political devices for correcting the ills of popular government What was most needed was the leadership of bold and far-seeing men.

Finances and the Tariff (1908–13).—Every growing unit in the country was harassed by questions of taxation and expenditure The U.S. Government also sought new resources, and found them in the income-tax. This was made possible on July 13, 1909, by the 16th amendment to the Constitution, which came into effect on Feb. 25, 1913. Another new resource of the Federal Government was a tax upon corporations levied on net income (Aug. 5, 1909). The important question of reorganizing the national banking system, so as to furnish a strong national institution, was debated from 1908 to 1912, and was the subject of an elaborate report by a national monetary commission; but no action was taken at that time The net Federal debt was $1,000,000,000, or only about $11 per head of the population.

A financial resource over which Congress had sole authority was the tariff Under strong pressure from members of the party to carry out the promises of the Republican convention of 1908, President Taft, a few days after his inauguration, summoned Congress to meet in special session, for a "revision" of the tariff. As usual there was a long controversy, which resulted (Aug. 5, 1909) in the Payne-Aldrich Tariff The act created a permanent court of customs appeals, with power to determine finally all questions as to the value of imports, together with a tariff board, expected to make investigations and recommend specific measures which Congress might adopt. As to rates, the Act was not very different from its predecessor, except for a decided increase of duties on cotton and silk manufactures There was a loud outcry that the "revision" intended by the party platform was a revision downward and not upward. Nevertheless President Taft signed the bill, and in a speech at Winona, Sept. 17, 1909, surprised the country by declaring that it was the "best tariff bill that the Republican Party has ever passed"

Political Reform (1908–13).—When Roosevelt left the presidency in 1909 the position of President was at the highest point of authority that it had ever known. Most presidents have found their principal legislative influence in the veto; Roosevelt had followed the McKinley method of emphasising his wishes in personal discussion with members of Congress He did more. he revived the Jacksonian method of announcing a legislative plan, and if congressmen hung back, of appealing over their heads to the country at large A similar policy was adopted by President Taft, who had many of the qualities of leadership He was large, happy, genial, fond of his many friends, a cheerful, balanced man He had served as first civil governor of the Philippines and as secretary of War in the cabinet of Roosevelt, who practically designated him as his successor. Nevertheless, as an avowed inheritor of Roosevelt's policies, he drew upon himself the opposition of Roosevelt's enemies while it soon became apparent that he was not relying upon Roosevelt's friends

At this time "the primary" method of selecting candidates was spreading rapidly through the Union Candidates for each party were selected by the ballots of the people, thus undermining the convention system From nominations for local officers the new method had spread, by 1911, to State officers in numerous States; and after 1910 it began to be applied to the choice of delegates to the national party conventions An unforeseen effect was that the official ballots were made upon the basis of party nominations, with an opportunity for independent voting. The primary thus became a part of the system of public elections, and therefore the party system was engrafted on public law, as a part of the Government

The distrust of conventions and controlled elections extended to the numerous and powerful bosses in city and State Legislatures. Three new devices were set at work to curb them and to interest the electors in public measures. The first of these, the "referendum" (*q v*), was by 1909 spreading rapidly through the Western States, as a means of checking legislative action contrary to public sentiment The referendum system furnished a mechanism, usually imbedded in State constitutions, by which on the demand of a sufficient number of voters, a statute could be held back from effect until submitted to a vote of the electors What was to be done if the Legislature refused to enact a statute demanded by the people? The "initiative" (*q v*) was invoked, by which a designated number of voters could unite on a measure, which must then be submitted to the electors for their suffrages

A third branch of this system of appeal to the people was the "recall" (*q v.*), under which a public officer already chosen by popular vote (and in a few cases those who were appointed in some other way) could be subjected to an election; and, should the majority decide against him, be thereby removed from office. In 1911–12 the question came up in connection with the proposed constitution of the new State of Arizona, which included a provision for the recall of judges Because of this provision President Taft vetoed the Act of Admission The State withdrew the clause, was duly admitted in 1912, and thereupon proceeded to reinsert the recall In practice, recalls have proved to be few, and recalls of judges very few A still wider application of the principle of the responsibility of functionaries to the voters was the "recall of judicial decisions," which was advocated by Roosevelt in 1912, but proved to be more than the country desired

United States Senators, till then chosen by State Legislatures, were next made subject to popular choice Urged by public sentiment, Congress submitted (June 12, 1912) the 17th Amendment, which was duly ratified and added to the Constitution (May 31, 1913) Under this, all elections to the Senate were to be made by direct popular vote Another evidence of a rising feeling of responsibility in Congress was a statute (Aug 7, 1911) requiring candidates for the House and Senate to submit statements of the money raised and expended in their behalf and limiting the amount which they themselves might spend One purpose of both these measures was to make it difficult for men to purchase their way into the Senate On July 13, 1912, Senator Lorimer, of Illinois, was practically expelled from the U S. Senate for buying votes in the Legislature

Another slow reform was in the ballot system Most cities, towns and States were loaded down with long lists of the officers

to be chosen The result was an agitation for the reform commonly known as the "short ballot," by reducing the number of elective officers and increasing the officers to be appointed by the few elective officials. Working difficulties were found in many of these reforms. It was hard to keep the public keyed up to the necessary pitch of thought and attention at every election; but it was evident that the American people intended to free themselves from the shackles of "invisible government."

Social Questions (1908–12).—The spirit of discontent extended to many questions outside of politics. Throughout the Taft administration there was an increasing pressure for "equal suffrage" —that is, woman suffrage—which, introduced in the Territory of Wyoming in 1869, had gradually spread among the Far-western States, and then begun working its way eastward. Again, both state and national governments were compelled to deal with the question of alcoholic beverages. From the earliest times there had been restriction on liquor selling and liquor sellers By 1909 in almost all States there was some form of general legal restriction—prohibition, local option, high licence or a State dispensary system. The question became national, because the liquor trade transported its wares from one State to another; and that brought it within the Interstate Commerce clause of the Constitution and the Interstate Commerce Act Eventually by the original Package Act of 1890, Congress adopted the policy of prohibiting shipments of liquor into prohibition States. Pure food laws in force before 1909 were supplemented by the Drug Label Act of 1912, which greatly aided in preventing the adulteration of drugs.

Many questions arose out of immigration The laws in 1909 forbade the entry of labourers under a contract to work in the United States, of convicts, diseased persons and the insane; but the execution of the laws was slack. The first statute looking toward decided control of immigration was that of Feb 1907, which increased the grounds of exclusion, and at the same time provided a plan to help the immigrants in finding work It also created an immigration commission, which in 1910 made a report in 41 volumes, strongly recommending the sifting of immigrants by testing their ability to read and write some language Meanwhile, in the decade 1901–10 the number of immigrants rose to an average of 1,000,000 a year. Since, however, the record showed that from 300,000 to 500,000 annually returned to their old homes, the actual rate of increase of population by immigration was no more than about ½% annually.

Labour Questions.—No legal obstacle stood in the way of the right to organize, first, by local trade unions, then by nation-wide unions for single trades, and finally by national unions combining many trades. To this was slowly added by the unions the principle of the "right to labour," which means both that it is the duty of the community to see that the worker has a job and that at least the skilled workers have a kind of title in their employment, so that it is contrary to good morals for a "scab" to take the place of a striker.

The legal position of labour unions in these controversies was brought out by suits of national importance against unions. In the test case of Gompers v Buck's Stove and Range Co, the charge was that the federation, by posting the company in its publications as "unfair to labour," was boycotting, and thus infringing legal rights Gompers, president of the American Federation of Labor, was convicted for contempt of court on the ground that he had refused to obey a court order to abandon the boycott In 1908 a suit was decided against a union of the hatters of Danbury (Conn), who had attempted to boycott the products of a local hat manufacturer with a verdict of $74,000 damages.

Another phase of the labour situation was the spread of employers' liability laws through various States, and the passing of an Act of Congress (April 22, 1908) for the protection of the employees of interstate railways. In June 1912 Congress added to its previous enactment of an eight-hour maximum regular day for public employees, by providing that all contract work for the Federal Government must also be on the eight-hour basis As most labourers were voters they brought powerful influences to bear on State Legislatures and on Congress in favour of labour On the other hand, the courts, particularly those of the States, were slow to recognize the changes in industrial conditions.

In addition, the courts began to use a system of labour injunctions: workmen, labour unions and their members were ordered to abstain from committing acts which if committed would presumably violate a law and would thus lead to a prosecution, in which the question of guilt could be settled by a jury Instead, the courts by injunction would decide on the responsibility and affix a penalty not specifically laid down in any statute.

Trusts and Transportation 1887–1912.—During the 20 years ending with 1910 it became clear that the most difficult question before the United States Government was the regulation of the vast aggregates of capital, commonly called trusts (*q.v*), which combined into corporations, aimed at the control of particular lines of business, and also of the railways. The efforts of Congress to adjust the question were registered in two lines of restrictive statutes, headed by the Interstate Commerce Act of 1887 and the Sherman Anti-Trust Act of 1890 Upon these was built a structure of decisions by the United States Supreme Court To carry out and partly to avoid these decisions, the Mann-Elkins Act of June 18, 1910, widely extended the Interstate Commerce Acts by including telephones, telegraphs, express and sleeping-car companies, and setting up a Commerce court which was to render decisions on transportation questions. Federal control of railways on the whole worked well. The commission was a striking example of disregard of the principle of separation of powers, inasmuch as it was a rule-making body, an executive body, and a court which interpreted its own rules, subject as to some questions of appeal to the Federal courts

The great problem of the trusts was much farther from a solution than that of the railways, because the large corporations were linked together through the holding and manipulation of stocks by capitalists and banks, and through the so-called "interlocking of interests" The only effective way of dealing with large corporations whose activities extended from State to State was to bring suit against them for monopolizing or conspiring to monopolize in their lines of trade It was considered a triumph when (May 9, 1911) the United States Supreme Court rendered decisions against two of the most powerful trusts—the Standard Oil Company and the American Tobacco Company The court held that the anti-trust legislation must be interpreted by the "standard of reason"—namely, that a combination was not unlawful or against the public interest unless it actually caused a restraint of trade and commerce among the Federal States or with foreign nations Having thus set up a "rule of reason" which Congress had refused to enact, and having created an example of judicial legislation, the court proceeded in both the pending cases to hold that the companies were guilty of attempts to monopolize their lines of trade. As to penalties, the court contented itself with ordering the offenders to disintegrate. The general danger of vast aggregations of capital was ignored.

Foreign Affairs.—The fields of the diplomacy of the United States for the last 100 years have been American, Pacific, and in a much smaller degree European In the Second Hague Conference of 1907 the United States delegates urged international arbitration; and in accordance with the general principles put forth at that conference, Elihu Root as secretary of State secured 25 arbitration treaties with as many countries (1908). The United States and Great Britain arranged (Jan 27, 1909) to refer to The Hague tribunal their long-standing dispute on the Newfoundland fisheries. The result was a decision acceptable to both sides (Sept. 7, 1910). In 1911 the Republican majority under President Taft's leadership initiated a policy of commercial reciprocity with Canada. An agreement was made with the Canadian Government by which each side should by legislation reduce or abolish duties on certain raw products and manufactures. With great difficulty the necessary bill was pushed through Congress (July 1911); but two months later the Canadian electors refused to support the reciprocity agreement, and the plan broke down

Latin America.—Notwithstanding the position of the United States as the responsible holder of the Philippine Islands, and hence an Asiatic Power, the tradition of isolation continued to

be a strong force in the public mind Nevertheless no formidable public protest was made to a policy of special American intervention in Mexico, the Caribbean and the Isthmus region. The arrangements of 1902 made Cuba practically a dependency, subject in the last resort to decisions from the White House President Taft continued the occupation of the Dominican Republic; consent of the Senate under a treaty to that effect having been obtained by Roosevelt in 1907. In 1911 Mr Taft secured a convention by which Nicaragua gave exclusive canal privileges to the United States

The Panama canal was now approaching completion and the little Republic of Panama, which it bisected, though nominally an independent State, was in fact under American control. An Act of Congress (Aug. 24, 1912) laid tolls on shipping, from which American ships engaged in coastwise trade were to be relieved The British Government lodged a protest on the ground that by its treaty with the United States the canal was to be opened on equal terms to the ships of "all nations", President Taft, however, stood by the act, and the question was passed on to the next administration.

Still more serious were the relations with Mexico, where, in 1910, a revolution headed by Madero, assailed the long established government of Porfirio Diaz and drove him after a few months out of the country. Mexico was thrown into confusion, and President Taft found it necessary to place troops on the border In 1912 he proclaimed an embargo on the export of arms or military supplies to Mexico Meanwhile the concessions and property of Americans in Mexico were threatened or destroyed The Americans who had interests in Mexico began a steady pressure for intervention by the United States.

Pacific Relations 1908–12.—Across the Pacific, clouds rose on the diplomatic horizon. The commercial treaties with Japan allowed a reciprocal freedom of residence and trade to the nationals of the two countries The immigration of Japanese was very distasteful to the people of California, who undertook to restrict Japanese children to separate schools Behind this difficulty was the rising power of the Japanese and their national spirit, greatly enhanced by their victory over the Russians in 1905. In 1908 Roosevelt sent round the world a powerful naval fleet, which visited Japan and was received with elaborate courtesy by a welcoming Japanese squadron exactly equal in number, ship for ship In the Root-Takahira reciprocal note of Dec. 1, 1908 (which was never submitted to the Senate), the United States practically admitted Japan's special interest in Asiatic affairs The question of Japanese immigration was settled for the time being by a renewal of the commercial treaty (July 24, 1911). It continued the previous "gentlemen's agreement," according to which, though claiming a right of immigration into the United States, the Japanese Government pledged itself not to issue passports to labourers

Politics 1909–12.—In the action of Congress on many of the important issues above discussed no party lines were drawn, though such measures as the tariff and new taxes were distinctly Republican On the tariff, some members from Middle-western States, particularly Minnesota, voted against the Payne-Aldrich measure of 1909 Another disturbance was due to resentment against the Speaker of the House, Joseph Cannon of Illinois, who through the union of various powers virtually had a veto on any measure or proceeding which he did not like Cannon kept too tight a hand; hence (March 19, 1910) a group of Republican "insurgents" joined hands with the Democrats to reduce his prerogatives till Cannon became simply a partisan moderator.

A new issue upon which both parties were divided was covered by the general term "conservation" Although most of the arable land had passed out of its possession, the Federal Government was still the possessor of great tracts of forest, of mineral lands and of water power. Congress in 1902 provided for a system of irrigation, the cost to be advanced by the Government and repaid in instalments by the users of the water President Roosevelt became interested in stopping the waste of timber and minerals, in preserving part of the gifts of nature for future generations, and in retaining public ownership of the utilities of the country, particularly the forests and streams In 1910 new statutes provided for a fresh classification of land and for the reservation of coal by the Government

Roosevelt and Wilson.—By 1910 it became clear that the Republican Party was weakening, and that President Taft's popularity and influence were lessening The State and congressional elections of 1910 were unfavourable to the Republicans The insurgents, who soon came to be called Progressives, gained most of the Republican districts in the west, and the Democrats gained about 50 seats in Congress. This result transferred to the Democrats the control of the House, while in the Senate they secured 41 of the 92 members.

A group of dissatisfied Republicans gathered about Senator La Follette of Wisconsin as a leader and presumptive candidate for President Meanwhile State Legislatures were passing primary laws which included the election of delegates to national nominating conventions This made it easier to break through the old line organizations, as La Follette had done in his own State Taft's friends and supporters naturally expected that the President would be renominated

All these calculations were disturbed by the greatest personality in the country, Theodore Roosevelt. A few weeks after leaving the White House (1909) he started on an expedition to Central Africa, and was, on his way back, received in Europe as the ex-President of the most important of republics and as a commanding personage He returned to the United States (June 18, 1910) to find political conditions little to his liking Most of his friends had disappeared from the Administration; his policies seemed to him to have been slighted Taft did not satisfy the ex-President, and the two drifted apart On Aug 31, 1910, at Osawatomie, Kan, Roosevelt set forth a programme which he called "the New Nationalism," favouring publicity of the accounts and proceedings of trusts, a tariff commission, a graduated income-tax, an adequate Army and Navy, conservation, protection of labour, and the direct primary with the recall of elective officers For the time being Roosevelt made no direct movement toward standing for the Presidency Meanwhile several of the Western States, particularly California under the guidance of Governor Hiram Johnson, accepted a radical programme of political and social reform. A formal breach with Taft and the open candidature of Roosevelt seemed inevitable The crisis came when (Feb 12, 1912) President Taft in a speech alluded to the Progressives (evidently having Roosevelt in mind) as "Extremists—not Progressives; they are political emotionaries, or neurotics" This was taken as a challenge, and a few days later Roosevelt openly declared himself a candidate

The Election of 1912.—As the convention held in Chicago approached, the lines of battle were developed. Behind Taft were Barnes of New York, Penrose of Pennsylvania, Crane of Massachusetts, and other "stand-pat" leaders Among those in favour of Roosevelt were James R Garfield of Ohio, Pinchot of Pennsylvania and a strong body of Republican governors Roosevelt himself went to Chicago, and threw his immense energy and enthusiasm into the campaign The convention was a scene of unusual excitement

The critical decision was made in the preliminary meetings of the national committee, which was strongly "stand-pat"; for that committee had to decide upon the right of claimants to be inscribed in the preliminary roll of delegates Every contest except one was settled in favour of the Taft claimants The shifting of 30 delegates from one side to the other would have brought about a "stampede" to Roosevelt, but they were not to be had Roosevelt advised his delegates to take no further part in the proceedings. At the final roll-call, June 22, there were 561 votes for Taft, 58 scattering and 107 for Roosevelt, besides 344 Roosevelt men not voting In the last issue, therefore, Taft had a majority of 50 votes out of 1,070 In the minds of Roosevelt and most of his followers the nomination was a violation of the principles of popular government Roosevelt openly advised a bolt This was duly accomplished by a formal Progressive Convention It met in Chicago in August and nominated Roosevelt for president and Hiram Johnson for vice-president

Meanwhile the Democratic Convention met at Baltimore with William J. Bryan in a position to dictate the choice. The apparently sure candidate was Champ Clark of Missouri, Speaker of the House of Representatives But under the rules of the Democratic Convention requiring a two-thirds majority, he was finally defeated by Woodrow Wilson, Governor of New Jersey. The platforms of the two old parties were of the usual type The Republicans declared for protective duties The Democrats stood by their platform of a tariff for revenue only, additional regulation of the railways and presidential preference primaries The Progressive platform was a general programme of political reform and "an enlarged measure of social and industrial justice"

Woodrow Wilson's Victory.—Not platforms, however, but men, appealed to the voters All three candidates took the field From the first it was clear that the real fight was between Roosevelt and Wilson. The Progressives were well organized, and their convention and campaign included many women The final question was whether Roosevelt could draw to himself a sufficient number of Democrats to reduce the Democratic vote below the winning point The result in Nov showed that the Democrats in the main stood by their party candidates. The total popular Democratic vote, 6,286,214, was only about 120,000 less than in 1908. The total Taft and Roosevelt vote combined was almost exactly the same as that of the Republicans in 1900 Roosevelt polled 4,126,020 popular votes to 3,483,922 for Taft; but he carried only six States, with 88 electoral votes, against 2 States with 8 votes for Taft, and 40 States with 435 votes for Wilson

Woodrow Wilson.—On March 4, 1913, Wilson was inaugurated as President. Born in Staunton, Va, in 1856, of Scotch Presbyterian ancestry, he graduated from Princeton in 1879, essayed the practice of law, then was a professor in several colleges. From 1902 to 1910 he was president of Princeton university. He was an easy and attractive speaker, and had a remarkable literary style (*See* WILSON, WOODROW) As Governor of New Jersey during 1911 and 1912 he had opportunity to show his skill as a party leader and his interest in reform In 1912 he was taken up by Bryan, who saw in him an exponent of the political principles for which Bryan had stood and a President who could meet the Progressives on their own ground.

In making up his cabinet it was only reasonable that Bryan should enter it. He was made secretary of State, an office for which he had little adaptation. To a new cabinet office recently created by Congress, the secretaryship of the Department of Labor, Wilson appointed W B Wilson, a strict labour organization man. Lindley M Garrison, secretary of War, and Franklin K Lane, secretary of the Interior, were strong men. Albert S Burleson, postmaster-general, and Josephus Daniels, secretary of the Navy, had insufficient training for their duties David F. Houston, of Missouri, was made secretary of Agriculture, William G McAdoo, secretary of the Treasury and James C McReynolds, Attorney-General. Most of the members of the cabinet were men who could be trusted to follow the President's lead One remarkable statesman not included in this list was Col E. M House of Texas, who for six years was the President's most trusted counsellor and political friend without holding any political office. In the minor civil service Wilson carried out his principles by enlarging the classified list of posts which could be entered only by competitive examinations.

A genial man, who could be a delightful companion, full of experience and of Scotch Presbyterian humour, President Wilson had a powerful mind, an amazing skill of expression and an intense belief in the power of ideals to arouse and inspire a people. He thought he had no need of conferences, of feeling the public pulse, of mixing with members of Congress and party leaders, of personally greeting the average voter.

Finance and Tariff, 1913.—The election of 1912 carried with it a safe Democratic majority in the Senate and a two-to-one majority in the House. On April 8, 1913, the President created a surprise by appearing in person to address the two Houses of Congress jointly at the opening of a special session, instead of sending a written message. This practice he followed throughout his administration, with great effect He felt himself not only chief magistrate of the nation, but head of the Democratic Party, and practically the premier of the Government from which ought to proceed plans for important legislation.

A special session was called particularly to frame a tariff act. Representative Underwood, chairman of the Committee of Ways and Means, gave to the new measure his name and experience The purpose of the statute was to enlarge the free list of raw materials, foodstuffs and some manufactures, to make a moderate reduction of the protective duties, and to correct some of the things which made the Payne-Aldrich Act unpopular. Included in the statute was an income-tax, at last made possible by the adoption of the 16th amendment (Feb. 25, 1913), which was expected to supply any revenue which might be lost by the reduction of duties. A tariff commission was created to make researches into the workings of the Act and to find out what was the actual difference between the cost of labour in the United States and in foreign countries (Oct. 3, 1913).

The powerful influence of the President was again exerted to secure a systematic banking system, with the result that (Dec 23, 1913) the Owen-Glass Federal Reserve Bank Act was added to the statutes. The principle was to create a national institution, which was to be divided into 12 regional banks, in each of which was a body of directors, besides the central organisation in Washington. In these 12 subdivisions clustered such banks, whether national or State-chartered, as chose to accept. The new institution was also to issue a new form of paper money. The system from the start was recognized as a large national asset At the same time a Rural Credits Act was passed (July 17, 1916), which created a special group of banks to lend money to farmers on the security of their farms Both systems worked efficiently.

Transportation, 1914–16.—Under a statute of March 1, 1913, the Interstate commerce commission was authorized to enter on an elaborate valuation of the railway property throughout the country as the basis of a judgment as to what was a reasonable profit The Panama canal was now approaching completion This was the first great agency of transportation owned and managed by the United States Government President Wilson used to the utmost his personal influence for a bill to repeal discrimination in favour of American-owned vessels, of which the British Government had complained; it became an act, June 15, 1914. On Aug 15 the first steamer passed through the canal from sea to sea and in a few months the canal was paying its own way A new question of transportation was arising through the rapid development of motor vehicles At first a plaything, then a luxury, by 1908 they were spreading throughout the land The attention of the whole country was called to the absolute necessity of good roads In 1916 Congress passed an act appropriating approximately $85,000,000 to be paid in about five years to such States as would contribute equal sums for good roads From this beginning the movement spread rapidly throughout the whole country.

The Trusts, 1914.—A few hours before the end of President Taft's term a congressional committee reported against the "great and rapidly growing concentration of the money control and credit in the hands of a few men" In June 1914, in a suit involving the International Harvester Company, the United States Supreme Court upheld state anti-trust laws. The ring of law and justice seemed to be drawing closer round the great offenders. Yet these offenders still flourished, and huge corporations, such as the U S Steel Corp, paid dividends on thousands of millions in stocks and bonds. President Wilson urged successfully a radical amendment of the Sherman Act (Oct. 15, 1914) against discriminating freight agreements, interlocking directorates, and holding corporations.

Another branch of the same attack on the money power was the Federal Trade Commission, created Sept. 26, 1914, which was an attempt to find means of dealing with corporations engaged in interstate commerce other than banks and common carriers In the same direction went the "blue sky laws" passed in this period by many States, to break up the practice of floating the stock of companies which had no property more substantial than the atmosphere.

Labour, 1913–17.—The example of capital, in rolling itself into

masses too great to be controlled by ordinary means, was followed by labour. The American Federation of Labor was a loosely woven council of representatives from the great trade organizations. It did not undertake to call strikes, though it was likely to support them, and it had great effect in bringing about combined and simultaneous demands for the various items in the labour programme. The leaders fixed upon an eight-hour day as the basic working time The next item was the minimum wage, which made its way slowly and was not altogether acceptable to labour. Another demand was that American citizens should have preference over aliens in employment. Labour in general was unfriendly to child labour and was, therefore, interested in a Federal statute of Sept 1, 1916, to prevent the transport of products made by child labour under specified conditions

As the labour unions gained in numbers and strength they used their energies in favour of the "closed shop," a system under which union men refused to work in any establishment where men not members of the union were also employed. From this idea rapidly developed the system of sympathetic strikes, in which members of one union back up another union by refusing to handle, use or transport products of non-union labour Hence boycotts, and perhaps ruin for employers who had no difficulty or quarrel with their own workmen Never in the history of the United States were there so many and so violent strikes as from 1913 to 1917. The I.W W organized long and tumultuous strikes among the silk weavers of Paterson, N J, and the textile workers of Lawrence, Mass In the trying years of 1916–17 violent strikes were directed not only against non-striking workmen, but against the public peace. In July 1917, at Bisbee, Ariz., the tables were turned A kind of vigilance committee seized and carried out of town, with orders not to return, about 1,200 striking miners and their friends. No jury would convict those responsible for this illegal action The most serious of all these labour struggles was the threatened strike in 1916 of the large and very powerful unions of railway employees President Wilson intervened and practically compelled Congress to pass (Sept. 3, 1916) the Adamson Act by which a basic eight-hour day was secured with *pro rata* for overtime. The Supreme Court upheld this statute, which went to the farthest verge of the Federal Government's authority over labour matters.

Social Movements, 1913–17.—These struggles between the railways and the courts, between the trusts and Congress, between labour and State governments, between strikers and the President of the United States, are part of American history because they were vital to the welfare of the country. The farmers everywhere were aroused, for they looked on railways as hostile to their interests, by overcharging for carrying their products; and they resented the trusts, which they believed raised prices. The anti-liquor forces steadily developed strength. They urged out-and-out prohibition and secured it in more than half the States. At the end of 1917 war prohibition was enacted by the Federal Government and also prohibition in the District of Columbia On Dec. 19, 1917, a two-thirds majority was secured in Congress for a prohibition constitutional amendment—the 18th amendment—which was at once submitted to the States. Woman suffrage also advanced steadily Congress submitted a woman suffrage amendment in 1919. Thus changes that had been 50 years on the way finally were brought about by the force of public opinion. A change was also visible in the attitude of the country toward immigration which Congress was determined to reduce by an intelligence qualification. A new bill (Feb. 5, 1917) was passed over Wilson's veto. Besides a literacy test it raised the head-tax to $8 and excluded oriental labourers coming from certain geographical areas, which did not include Japan but did apply to Hindus and Malays

Educational Progress, 1909–21.—The decade following 1909 was marked by a new sense of the possibility of general education, and the need for a more direct, searching and practical type of education The country was accustomed to a system of graded public school, offering the "common school education," and leading up to a few endowed and private schools, and to thousands of public high schools, which were expected to prepare the small proportion of young men and women who went on to institutions of higher education Secondary education was subdivided into literary, commercial and industrial schools The institutions of higher learning set up new professional departments, including the intensive study of education and separate schools of science, engineering, agriculture and other specialties. Private enterprise created a great number of so-called business colleges, and a few very efficient trade schools

Nevertheless there was general complaint that the schools did not relate themselves to the life of the community A National Society for the Promotion of Industrial Education became the focus of a movement to organize what now became generally known throughout the country as vocational education. A national commission was appointed by President Wilson, in 1914, to consider the whole subject. The resulting Smith-Hughes Act (Feb 22, 1917) created a Federal Board for Vocational Education which framed an elaborate plan for instruction in the four vocational fields of agriculture, commerce, industry and home-making. The Act promised to appropriate Federal funds rising to about $7,000,000 in 1925, to be paid to such States as would match these funds dollar for dollar.

Private enterprise accompanied this movement by building up advanced engineering and trade schools of a high type, such as the Carnegie Institute at Pittsburgh, by improving the private commercial schools and by establishing advanced schools of business training in colleges Some of the great manufacturers, especially of the automobiles, set up schools within their own works

When the United States plunged into the World War in 1917, the Government established a variety of vocational schools to train men for the numerous specialties of military service It made use of the shops and other vocational facilities of the existing schools and colleges Great sums were raised by special "drives" among the alumni and friends of the endowed institutions, and the State universities were allotted hitherto unheard-of grants. The strictly vocational schools were admitted into fellowship with the other institutions.

Wilson's Foreign Policy.—Woodrow Wilson was naturally a man of peace, and so emphatically was Secretary Bryan. They set themselves to aid the cause of general peace by arbitration treaties. Secretary Bryan prepared a definite project for treaties by which the nations concerned should, in case of difficulties, pledge themselves to submit their grievances and claims to a special examining commission and to abstain from war or preparations for war until the commission should have had time to report The presumption was that a sensible nation would submit to the judgment of an impartial tribunal There was little difficulty in concluding more than 30 treaties upon this basis in the course of a year, but none was put into effect. The truth is that the American people, as a whole little accustomed to international questions, had no definite foreign policy.

Philippines and Caribbeans.—The Government of the Philippine Islands was altered by setting up the first Filipino Assembly in 1907 In response to the pleading of President Taft, Congress in 1909 grudgingly included them within the customs boundary of the United States Under President Wilson, Gov.-Gen Cameron Forbes was withdrawn and Burton Harrison was appointed his successor, to carry out a policy of liberalization and preparation for independence. The Filipinos were allowed to hold a majority of the seats in the commission, which became a kind of administrative Upper House Filipinos were substituted for Americans in many of the civil offices. The people were thus given a definite opportunity to govern themselves. The Jones bill, enacted Aug. 29, 1916, greatly enlarged the power of the popular part of the Government, and the commission ceased to exist. The act promised that the Filipinos should be given their independence when their ability to govern themselves should be demonstrated.

At the other end of the American sphere of influence, Cuba, while nominally independent, remained a protectorate of the United States On March 2, 1917, the Porto Ricans were for the first time made American citizens and received a popular government of two elected Houses. President Wilson continued the

administration of the Dominican republic which dated back to Roosevelt. He also took military control of Haiti in 1914, and followed it by a controlling treaty which was ratified by the Senate (Feb 28, 1916) He carried even farther Taft's policy in Nicaragua by a treaty (ratified Feb. 18, 1916) which converted that country into a virtual protectorate. Another area came under control of the United States by a treaty for the annexation of the Danish West Indies proclaimed in 1917. These islands were duly organized under the title Virgin Islands of the United States. Little opposition was made to this creation of a virtual empire, including dependent provinces

Latin America and the Orient, 1913–17.—The peaceful policy of the United States towards its neighbours was severely tested by disturbances in Mexico In 1913, Madero, president of that turbulent republic, was murdered, presumably by order of Huerta, an insurgent officer, who thereupon declared himself the head of the State. The almost invariable policy of the United States had been to recognize any *de facto* head of a Latin-American Government without inquiring into the source of his title But on this occasion President Wilson adopted what he called a policy of "watchful waiting" He steadily refused to recognize Huerta, against rival revolutionists In April 1914 a trifling dispute arose at Tampico as to a salute of the American flag, and Wilson, apparently yielding to strong public sentiment, ordered the navy to attack and capture Vera Cruz, of which the United States remained in possession for some months. The real object was to discredit Huerta, who was compelled to flee the country When in 1915 the brigand Villa raided the town of Columbus, N M, the President ordered a military expedition under General Pershing to advance into the interior of Mexico. It remained about eight months, without capturing Villa or accomplishing any other definite result The three friendly nations of South America—Argentina, Brazil and Chile, commonly known as the "A B C Powers"—offered a kind of mediation At their suggestion Carranza was recognized as president by the United States Disorder continued, and in May 1920 Carranza was overthrown and killed by the troops of Obregon For a time thereafter Mexico emerged from the state of revolution

This long controversy was highly disturbing to the desired close relations with Latin America in general In spite of four Pan-American congresses and several scientific congresses, in spite of visits of Roosevelt and of Root and Knox as secretaries of State to South America, there could be no harmony if the United States were to continue "administering" small and defenceless Latin American nations and waging undeclared wars with Mexico. Nevertheless, President Wilson in a speech at Mobile (Oct. 27, 1913) declared that the United States had no designs on the territory or independence of its Latin-American neighbours. Colombia, too, had a grievance arising out of the loss of the isthmus when the Panama canal zone was annexed in 1904. A treaty negotiated by Bryan to pay to Colombia $25,000,000 as a kind of reparation was ratified by the Republican administration in 1921

In regard to the Far East, Wilson had little opportunity to develop a policy. He began by disavowing the plans made under the advice of President Taft for a loan by American bankers to China He argued with the people of California because they insisted on passing a statute restricting alien ownership of lands by Japanese residents. The World War soon united the United States and Japan in a common cause, and on Nov. 2, 1917, the Lansing-Ishii note, on the same plan as the Root-Takahira note of 1908, set forth that the United States recognized Japan's "special interests in China."

Neutrality.—The United States in 1914 expected to remain indefinitely at peace, as was shown by lack of anything that could be considered national military preparation in the terms of modern warfare When on Aug 4, 1914, President Wilson issued a proclamation of neutrality as between the two groups of European nations just engaging in a gigantic struggle, the authorized military establishment was about 107,000 men, of whom some 87,000 were enrolled The United States had not one military aeroplane of approved type; had only four modern heavy field guns and no transport for them; had not a trench bomb or a mine-thrower; nor considerable supplies of any weapons or equipment except 800,000 excellent rifles; nor any officers experienced in the kind of warfare used in recent wars; nor any instruction camps for officers or men. The navy included a fleet of battleships recently built, but weak in small and swift vessels and particularly in submarines. The militia proved to be of little service, though Secretary Bryan publicly declared that the nation needed no preparation, for it "could raise a million men between sunrise and sunset."

Neither the foreign policy nor the diplomatic organization of the United States was fitted for such a crisis. The traditional Monroe Doctrine was expected to keep the nation out of dangerous controversies with the other American States. The counterpart principle of isolation forbade the United States to take any part in European crises or wars As a neutral it stood by the principle of "freedom of the seas," by which was meant in particular the right to carry on commerce with all belligerents in case of war, subject to the limitations of the then acknowledged international law as to contraband and blockade. Soon after the beginning of the World War relief was organized on a large scale for the Belgian people, most of whose country was overrun and held by the Germans This system soon included French refugees, the unhappy peoples of Serbia and Asia Minor and other combatant or non-combatant sufferers, besides the sick and wounded of the contending armies

Difficulties with the Belligerents, 1914–17.—The United States was compelled at once to take into account the relation between the War and American industries, commerce and finance Heavy loans were placed in the United States by Great Britain, France and Russia As fast as the money was borrowed it was spent in the United States for the purchase of food, clothing, animals and especially munitions President Wilson issued a proclamation (Aug. 18, 1914) advising that the people remain neutral "not only in act but in word and in thought" Such neutrality was impossible In the first weeks of the War, German commerce was driven from the seas The command of the sea by the Allies very nearly cut off trade of any kind between the United States and Germany and Austria, while commerce continued in ever-increasing volume with England and France. This disparity led to protests on the part of the German Government, and also to lawless acts perpetrated or directed by agents despatched by the German Government for the purpose of paralysing the munition factories Violent antipathies were caused by the German methods of carrying on war, and particularly the treatment of the occupied areas of Belgium and France. The American population included hundreds of thousands of citizens of the belligerent countries, many of whom attempted to return to their homes in order to serve in the army The road for such recruits was blocked for the Germans and their allies, but open to the Allies. For the first time in half a century the United States found within its own borders a sharp division on questions of foreign policy.

On the other hand, the war trade brought immense profits The favourable balance of trade rose from $690,000,000 in 1913 to $1,770,000,000 in 1915 and $3,000,000,000 in 1916. This prodigious debit was balanced by about $3,000,000,000 sent to the United States in securities and gold, besides $2,000,000,000 in foreign War bonds. Under these circumstances genuine neutrality was out of the question. A decided preponderance of sympathy developed toward the western Allies, who were profitable customers, were in close and almost undisturbed intercourse with the United States and were considered to be fighting against a ruthless, arrogant and dangerous autocracy.

International Controversies, 1914–17.—The internal tension of the United States was tightened by the insistence of Germany on the right to use new weapons, tactics and practices of war, without the traditional limitations of international law, without mercy to non-combatants, on the basis of "a law of necessity." No able-bodied German man or woman was really a non-combatant; the Germans insisted that they must regard all civilian enemies as combatants. There was no way to stop them without using similar new methods of warfare

Great Britain, which in the London Maritime Conference of 1908–09 had shown some disposition to enlarge the privileges of neutral commerce, now seized American ships and shipments, and arbitrarily extended the list of contraband, until (Dec. 26, 1914) a despatch signed by Secretary Bryan, but expressing the conclusions of President Wilson, made a protest. In the course of 1915 the British Government began to apply the American principle of "continuous voyage" as applied by the United States during the Civil War to cover shipments to neutral ports in cases where those shipments were likely ultimately to reach Germany; and also where they might replace products of the neutral countries that could thus be spared for Germany, or if the neutral countries declined to make a hard and fast agreement not to reship

In 1916 the British were practically blockading neutral European ports and capturing vessels, American and other, wherever they liked. The Central Powers set up a new war practice of using submarines as commerce destroyers The American Government protested. A crisis came through the sinking by a submarine of the British passenger liner "Lusitania" (May 7, 1915), with the loss of 113 American lives That sinking was a deliberate act of the Germans to test the temper of the United States. Apparently they were greatly surprised when the people of the United States rose in resentment. President Wilson, who had earlier insisted on "strict accountability," insisted on a sharp protest Mr Bryan thought milder measures sufficient, and on that issue resigned the secretaryship of State (June 8, 1915), being succeeded by Robert M Lansing. The correspondence went on until October when Germany at last informed the American Government that merchant ships would not be sunk without warning and an opportunity to save non-combatant lives Meanwhile, throughout 1915 and 1916, systematic violations of the neutrality laws of the United States by Germans and Austrians caused the dismissal of the Austrian ambassador to the United States and of the two most obnoxious members of the German ambassador's staff

"Preparedness."—By the end of 1915 it became clear that with or without their own desire, the people of the United States might find themselves involved in the War. President Wilson desired peace A day or two after the sinking of the "Lusitania" he spoke of there being such a thing as "a nation that was too proud to fight" In his message of Dec 1915 he urged national defence and the protection of American shipping Long before this time the World War had brought about a violent change in the economic conditions of the country The great demand for foodstuffs raised the price of grain and other farm products The high cost of living became a political issue. The munition factories offered unheard-of wages and drew hundreds of thousands into improvised towns. The World War caused a great change in immigration Hundreds of thousands of men left the United States for Europe, while the net immigration fell from 1,200,000 in 1914 to 300,000 in 1916.

The Election of 1916.—In the midst of this turmoil and confusion of business came the preliminaries of the presidential election of 1916 President Wilson carefully abstained from taking sides between the Allies and the Central Powers, but the aggressive submarine policy of Germany provoked a much sharper tone than did the aggressions by the English. He felt the need of caution, particularly because a growing group of men, among them Roosevelt, were coming to the conclusion that eventually the United States would have to join in the World War

The Republican nominating convention met in Chicago, June 7. A strong effort was made by friends of Roosevelt to capture the Republican Convention, but the "stand-pat" Republicans had control of the party machinery The Progressives—who in Nov. 1914 had cast 1,800,000 votes for congressional and State candidates—also met in convention in Chicago Their purpose was to compel the Republicans to nominate Roosevelt as the only means of healing the breach. That effort failed: the Republicans nominated Justice Hughes of the Supreme Court, who had been a reform governor of New York State. The days of the Progressive Party were numbered.

In the Democratic Convention (June 14) there was practically no opposition to Wilson and his running-mate T. R Marshall. The platfrom in many respects was similar to that of the Republicans Both favoured woman suffrage, the conservation of national resources and national enforcement of child-labour laws; both reaffirmed the Monroe Doctrine. But the Democrats upheld tariff for revenue only, they endorsed the promise of ultimate independence to the Filipinos; they commended the establishment of a Federal trade commission, and they approved a merchant marine owned and operated by the Federal Government In the campaign Roosevelt publicly supported Hughes, though it was well known that he felt no enthusiasm for him. The only "slogan" that caught the public ear was favourable to Wilson. "He kept us out of war" Wilson received about 9,000,000 popular votes against 8,500,000 for Hughes, and was chosen by a very close vote in the electoral college.

President Wilson stood in a very strong position in the United States and in the world He had been re-elected His policy was approved He felt that he had the nation politically united behind him He soon began to take a firmer tone against the Allied system of neutral blockade. He hoped that the one great neutral nation might bring about peace On Dec. 18, 1916, he sent a communication to the warring Powers suggesting that they come to an understanding of each other's demands. On Jan 22, 1917, in an address to the Senate on foreign affairs the President described the replies he had received to the identic note of Dec 18.

> The Central Powers united in a reply which stated merely that they were ready to meet their antagonists in conference to discuss terms of peace The Entente Powers have replied much more definitely, and have stated, in general terms indeed, but with sufficient definiteness to imply details, the arrangements, guarantees and acts of reparation which they deem to be indispensable conditions of a satisfactory settlement

He went on to speak of an "organized common peace," and of a "peace without victory"; he outlined the principle of self-determination, declaring that "Governments derive all their just powers from the consent of the governed," and that "no right anywhere exists to hand people about from potentate to potentate as if they were property" The practical German answer was a brief note communicated by Ambassador Bernstorff to Secretary Lansing (Jan 31, 1917), withdrawing the pledge given in Oct. 1915 and renewed in May 1916 that merchant ships would not be sunk without preliminary warning and announcing that the Germans would shortly resume unrestricted submarine warfare High military authority in Germany believed that Americans would never sacrifice the large profits of export trade and incur the huge expenses of war merely for the sake of a question of neutral maritime rights.

Immediate steps were taken to make the American Navy ready for war For a time the President dallied with a plan of arming merchant ships One result of the controversy was the adoption by the Senate (March 8) of a mild and cumbrous method of cutting short debate by closure. During Feb. and March 1917 a few American vessels were torpedoed by German submarines. On Feb 8 the Government published an intercepted German despatch to the Mexican Government asking it to join in the World War, promising it the "former Mexican provinces," long incorporated in the United States The participation of the United States in the War was now inevitable A formal declaration of a state of war was signed by the President (April 6) after a House vote of 373 to 50 and a Senate vote of 82 to 6, which stated that war had already been begun by Germany Relations with Austria and Turkey were at once broken off, but the declaration of war with Austria was delayed until Dec. 7 and no declaration was ever made against Turkey or Bulgaria

The breach with Germany was a spontaneous national action representing a national belief that the United States could no longer live in peace with such a nation as Germany had become. As President Wilson put it the War was to make the world "safe for democracy" Moreover, there was widespread sympathy with the three western Powers, France, Belgium and Great Britain, which were closest to the United States in their political principles and system of government Wrath was aroused by the German treatment of the people of Belgium and other conquered

countries In some minds there existed a genuine and well grounded fear of a future attack upon the United States by Germany if the resistance of the Allies should be destroyed. Amid all the motives for the War, the one thing was that the American people recognized Germany as an enemy, and the enemies of Germany as natural friends and partners in the great enterprise of subduing "the Hun."

War Measures.—Passionate national spirit, patriotism and urgent reasons for war were all useless unless the United States could enrol, train, equip, convey and continuously supply an immense army The American Navy, though the vessels were good and the crews skilled and well commanded, was in no position to give direct aid in the process of destroying the German army. What was most needed was to raise and convey to the fighting front a large force of American troops.

Soon after the declaration of war by the United States, missions from the various Allied countries were sent to America. The British Mission, headed by Arthur (now Lord) Balfour, British Foreign Secretary, reached Halifax April 20 and proceeded to Washington. The French Mission, headed by René Viviani, the former Premier, and including Marshal Joffre, landed April 24. Other missions came from Italy, Belgium, Russia, Rumania and Japan The United States was able at once to help the western Allies in their pressing financial difficulties Taxes were low and little felt, money abounded Under Acts of Congress beginning Oct. 17, 1917, the Allies received essential credits, which amounted eventually to $9,500,000,000

These enormous payments were made possible by the Liberty Loans In June 1917, 4,000 000 people joined in offering $3,000,000,000 to the Government, and at the end of the World War the interest-bearing debt had increased from $972,469,290 on Dec 31, 1916, to $25,234,496,274, on June 30, 1919 These loans were supplemented by the War Revenue Act (Oct 17, 1917) and later statutes, which laid a variety of new taxes, increased the income-tax heavily, and combined with it an excess-profits tax to bring into the Treasury unreasonable profits likely to be made in the war industries

All traditional limitations on raising an army were discarded On May 18 the Selective Service Act was passed which provided for the enlistment of 1,000,000 men by "selective draft" When called up, the men had to be clothed, housed, fed and drilled Thousands of officers were necessary, and training camps, both for men and officers, were established on a vast scale In May 1917 a few American destroyers reached England On June 9, Gen J J Pershing, who had been selected as commander-in-chief, arrived in England On June 26 a small detachment of United States troops reached Europe. New branches of military service were established, among them the Chemical Warfare Service which provided materials for lethal gases and for gas-masks and other means of resisting the enemy attacks. Congress, on July 24, appropriated $640,000,000 for aviation By August about 700,000 men were enrolled in the army and 230,000 in the navy

Control of Industry and Transportation.—The establishment of huge war industries put a great strain on the industry and transportation of the United States On Aug 10, 1917, a Food Control Act gave the President powers never before conferred with regard to food and fuel. Herbert C. Hoover, of California, who had distinguished himself in the management of the Red Cross in Europe, was made Food Administrator with large powers Before the World War ended he had established "meatless" and "wheatless" days; the price of grain was fixed; eventually the farmers were assured $2 20 a bushel for their wheat crops H. A. Garfield, Fuel Administrator, carried through drastic measures for stimulating the production of fuel, regulating shipments and distributing supplies. On March 21, 1918, the Federal Control Act placed the management of all the railways in the country in the hands of the Government during the World War, and for a period after its close. W. G McAdoo, Secretary of the Treasury, was made director-general of the railways; later Walker D. Hines, an experienced railway man, succeeded him One of the most serious needs of the times was a merchant fleet adequate to carry across the Atlantic the army and its supplies The Government undertook the great task of improvising such a fleet, and vast construction was authorized in both steel and wood.

War Activities at Home.—At once after the declaration of War the American people through official and unofficial channels gave support by civilian service and money contribution. Among the multifarious public agencies was a Committee on Public Information, of which George Creel, journalist, was chairman, which kept up a lively system of publicity aided by the National Board for Historical Service A Censorship Board censored all communications—mail, cable, radio—passing between the United States and foreign countries. As early as Aug. 29, 1916, a Council of National Defence was created by Act of Congress Under it were created numerous special organizations. The Council of National Defence appointed a women's committee to co-ordinate the patriotic work of the women throughout the country. The Advisory Commission of the Council of National Defence created a committee on transportation and communication. A Railroad War Board undertook to secure unity of operation among all the railways, to subordinate private interests and to eliminate competition Important coastwise steamship lines were added to this system In 1918 the Government assumed control of telegraph, telephone, marine cable systems and radios. Many scientists were engaged in research throughout the country under the National Research Council Commerce also was regulated.

By the Espionage Act of June 15, 1917, the President was empowered to control exports, and he created a Bureau of Export Licenses and a Trade Board A list was prepared of firms throughout the world with whom Americans should not trade The Government formally took charge of all foreign trade Feb. 15, 1918, and seized all German ships interned in United States ports.

Samuel Gompers, president of the American Federation of Labor, co-operated in organizing a Committee on Labor, and a Mediation commission was appointed A National War Labor Board (April 9, 1918) acted throughout the country as a kind of "supreme court" to settle labour disputes For the recruiting of essential labour and directing it into necessary industries a U S. Employment Service was created

Several private war agencies were established Chief among these were the American National Red Cross, which was to be found wherever there was fighting, sickness, suffering or starvation, the Y M C A ; Y W C A.; Knights of Columbus (Catholic); Salvation Army; Jewish Welfare Board, American Library Association and War Camp Community Service.

Enemies in the United States.—While the people of the United States were practically a unit in favour of a vigorous prosecution of the World War, a few, chiefly foreign-born or sons of foreign-born, were opposed to the World War or more often to the nations in concert with which the United States was fighting Ever since 1914 the country had been irritated and aroused by a series of illegal, violent and often murderous acts which were traced to German and Austrian agents Such were determined efforts to blow up the international bridge at Vanceboro, Me., and the locks of the Welland Canal, Ont Bopp, German consul-general at San Francisco, was convicted and imprisoned for aiding German vessels in the Pacific in defiance of neutrality laws. Rintelen (after the war specially rewarded by the German Government) was sent to the Federal Prison at Atlanta for aiding in placing bombs on outgoing vessels with intent to destroy them.

The Navy.—Beginning with patrol work on the American coast as soon as war was declared, the activities of the United States Navy extended to co-operation with the British and French in the hunting down of submarines and the protection of convoys and in the laying of the North Sea mine barrage, extending from the Orkneys to Norway. The American Navy had some part in blockading the Austrian coast of the Adriatic, and it participated in maintaining that Allied command of the sea which in the end was fatal to Germany. By a remarkable convoy system over 2,000,000 troops were carried safely 3,000m overseas to France In this work the utmost secrecy was necessary. In June 1917 a few cruisers and transports were provided and the first troops sent across. At intervals vessels assembled and sailed on definite routes under the protection of destroyers According to the report

of the secretary of the Navy (1920), 911,047, or nearly half of the American troops, were carried on United States Navy transports; the rest chiefly by the British. Not one east-bound American transport was torpedoed by the German submarines; and only three ships were sunk on their return voyage. Three small fighting ships were destroyed by the enemy.

During the campaign of 1918 efforts were made to extend the possible field of enlistment by the passage of the Man Power Act of Aug. 27. All men between 18 and 45 were required to register with a view to service if needed, and 11,000,000 were registered By a statute of Oct. 6, 1917, provision was made for a system of military and naval insurance available for all men in the service. (A. B. H.)

The American Expeditionary Force.—When Gen. John J. Pershing, commander-in-chief of the American Expeditionary Force, departed for Europe on May 28, 1917, America's military defensive forces comprised a regular army of approximately 80,000 and a National Guard of less than 150,000. While the regular army was well officered and trained as regimental units, the National Guard was not adequately organized nor sufficiently trained. Industry was not prepared for its part and no authority for raising national armies had been enacted. Consequently, the nation found itself faced with the problems involved in providing man power and organizing, financing, equipping and transporting overseas an enormous army and organizing a theatre of operations—all before Germany could strike decisively on the western front. With her small unprepared forces as a nucleus, the United States called into army service 4,000,000 men, sent overseas 2,086,000 in 19 months, averaging in the summer of 1918 about 10,000 men per day. The first contingent comprised the regular army 1st Division and some special troops which landed in France at the end of June 1917. The peak of the troop shipment was reached in the summer of 1918, when over 300,000 men landed in one month. Over 50% of the American forces were carried in Allied ships. In addition some 7,500,000 tons of supplies were shipped from America to France, practically all in American ships. The tasks involved in these problems were both intricate and gigantic.

Upon America's entry into the World War, German hopes of final victory cannot be said to have been extravagant. The Allies were embarrassed financially and through lack of supplies Losses had been tremendous and resources in man power were so low that there was little prospect of materially increasing their armed strength even in the face of the probable concentration on the western front of practically the whole German military strength in the spring of 1918. A review of the conditions then existing made so apparent the early necessity for a supreme effort that Gen. Pershing cabled Washington on July 6, 1917: "Plans should contemplate sending over at least 1,000,000 men by next May." Upon completion of his study on July 11, 1917, he reported. "Plans for the future should be based . . . on at least 3,000,000 men." By the middle of Oct 1917, Gen. Pershing had completed his basic plans for the operation of the U S. army in Europe These included the training of the combat army, the organization of supply in Europe, a priority for shipment from America of troops and supplies, and a project for the army's strategical and tactical employment.

The American mission was offensive. The plans were based on striking where a definite military decision could be gained. While the Allied armies had endeavoured to maintain the offensive, the British, in order to guard the Channel ports, were committed to operations in Flanders and the French to the front protecting Paris. Both lacked troops to operate elsewhere on a large scale. A deep advance east of Metz, or the capture of the Briey region, by threatening the invasion of rich German territory in the Moselle valley and the Saar basin, and curtailing her supply of coal or iron, would have a decisive effect in forcing a withdrawal of German troops from northern France. The military and economic situation of the enemy and the Allies indicated Lorraine as the field promising most fruitful results and in Sept. 1917 it was selected by Gen. Pershing as the area for the decisive operations of the American army. These plans contemplated a reduction of the St. Mihiel salient followed by a decisive blow based either on Verdun or on Nancy. The organization of the immense American supply service accorded with this strategical conception. The complexity of trench life had enormously increased the tonnage of supplies required by troops. Not only was it a question of providing food but enormous quantities of munitions and material. Upon the railroads of France fell the burden of meeting the heavy demands of the 3,500,000 Allied combatants. If the American army was to have an independent and flexible system it could not use the lines behind the British-Belgium front nor those in the rear of the French front covering Paris, for these were needed for the British and French forces respectively. The problem confronting the American Expeditionary Forces was then to superimpose its rail communications on those of France where there would be the least possible disturbance to the existing arteries of supply. These controlling factors lead to the organization of base ports along the south-west coast of France and the utilization of French railways passing mainly south of Paris

For all practical purposes the American Expeditionary Forces were based on the American continent. Three thousand miles of ocean to cross with a growing submarine menace, an uncertain quantity of ship tonnage available and a land line of communications in France 400 m long, presented almost insurmountable difficulties. The system developed in France included American construction of 83 new ship berths, about 1,500 m. of new railway with shops and round houses, 4,000 km of telegraph and telephone lines with the operation of a 215,500 km system; 1,500 locomotives and 20,000 freight-cars were brought over and American engineers repaired 2 000 French locomotives and 58,000 French freight-cars Daily tonnage at ports increased from 17 000 in July to 45,000 in Nov. 1918 Commanded by Maj -gen. James G Harbord, this great supply system engaged over 650,000 personnel by Nov. 11, 1918.

The problems indicated were complicated by those necessarily involved in the association of the American commander with Allied Governments and commanders. The outstanding problems related to the persistent Allied proposals for the amalgamation of the Americans in the British and French ranks This Gen. Pershing consistently and successfully opposed; he favoured unity of American command, adherence to the American doctrine of open warfare training and the primary value of the rifle and bayonet.

In meeting the crises caused by the German offensives in the spring and summer of 1918, American troops (combat and service) were frequently employed with decisive results under Allied command The 1st Division's successful Cantigny operation near Montdidier, in May, demonstrated American fighting qualities The 2nd and 3rd Divisions in June, blocked the German advance on Paris by holding the line about Château Thierry. The 3rd and 42nd Divisions held a vital part of the line against the German attack of July 15. The successful Allied counter-offensive of July 18 was based on the decisive blow delivered south of Soissons by the 1st and 2nd American Divisions with the 1st French Moroccan Division between them. Thus the American arms were in time to assist in crushing the last offensive of the enemy and to commit him entirely to the defensive.

After these divisions cut the main German communications in the Marne salient, the 3rd, 4th, 26th, 28th, 32nd, 42nd and 77th American Divisions joined the French in driving the enemy out of the salient and across the Vesle river. At the same time some divisions were holding sectors in the Vosges and others were training as reserves behind the British and even participating in British operations Some 20,000 aviation specialists were working in England and over 11,000 motor mechanics were helping the French in addition to several thousand engineers, medical, hospital and other specialists.

The successful counter-offensive of July 18 against the Marne salient showed that the emergency which justified the dispersion of American divisions had passed. By July 24 Marshal Foch accepted Gen. Pershing's proposal for the organization and operation of an independent American combat army and the execution of the American plan of the previous September. Accordingly,

early in the morning of Sept. 12 the American I Army, 550,000 strong, supported by 110,000 French troops, attacked the St. Mihiel salient and within a few hours had attained its objectives. Following out a pre-arranged plan the Americans were immediately transferred to the Meuse-Argonne zone where they began operations on Sept. 26. In the fighting which followed the Americans (24 American and 7 French Divisions) drove the Germans from their strongly fortified positions and captured the heights commanding Sedan; only the Armistice saved the German V. Army from complete destruction. The Germans had employed one-fourth of their divisional strength (62 divisions) to meet the attack. (For full particulars of these two battles *see* ST MIHIEL, BATTLE OF; MEUSE-ARGONNE OPERATION.)

During these purely American battles, other American troops and services continued to operate under Allied command, such as the troops of two divisions who assisted the British to break the Hindenburg line at Le Cateau in Sept 30–Oct 1, the two divisions with the IV. French Army capturing Mont Blanc and advancing towards the Aisne in early October; two divisions with the VI. French Army in Flanders in late October and early November driving the enemy across the Escaut and the Scheldt rivers. In addition, a regiment of infantry with auxiliaries assisted the Italians on the Piave in the fall of 1918 and another regiment and auxiliaries joined the Allies in the Russian Archangel Expedition of 1918–19

The Armistice.—The campaign of 1918 was the final effort of the Germans No one can say that the American Army in the field was the chief element that insured victory, but there is not a doubt that the triumphant success in raising and transporting incessantly troops, provisions and supplies was to the German mind convincing and disheartening evidence that the Government and the people of the United States, with all their power and potentiality, would stand by the Allies indefinitely On Nov. 11, 1918, by the Armistice in which the American armies shared, the Germans admitted their defeat and at once began to evacuate the occupied regions and also portions of their own national territory.

In accordance with the terms of the Armistice, the Allies were to occupy all German territory west of the Rhine The zone assigned the American command was the bridge-head of Coblenz and the district of Trèves This territory was occupied by the American army with its reserves held between the Moselle-Meuse rivers and the Luxembourg frontier. The advance toward German territory began on Nov. 17, 1918, and passing through Luxembourg crossed the German line on Dec. 1.

Shortly after the signing of the Armistice, the American commander formulated plans for the early return of the American forces to America. Re-arrangement of base port and rail facilities, securing additional ships and the demands of the Allies for considerable American forces to remain in France, necessarily presented important considerations Beginning, however, in December, a continuous flow of returning troops was maintained and by May 19, 1919, all combat divisions, except five still in the Army of Occupation, were scheduled to sail by July. The remaining troops, less a permanent force of one regiment of infantry and certain auxiliaries, were released in Aug. 1919. (J. J. P.)

Rehabilitation in America, 1919.—The task of *post bellum* economic adjustment was long and costly. At the end of the War the Federal Government by means of War statutes was controlling the food supply and its distribution, manufactures, the coal supply and shipments, railways, telegraphs and telephones, foreign commerce and shipping. It took over the property of aliens through an Alien Property Custodian. It settled conditions of interstate labour and of labour in other fields For foreign commerce there was still a Shipping Board, an Emergency Fleet Corporation, a War Trade Board and a War Finance Board Two million American soldiers were overseas and wanted to come home as soon as possible. The United States spent on the World War about $35,500,000,000, including $9,500,000,000 lent to the Allies. Expenditures after peace came continued on a scale far beyond any previous experience of the country

In the course of six months after the Armistice, about two-thirds of the troops were brought back, leaving behind them enormous stores, large parts of which were sold at heavy discounts to European Governments General Pershing, the only U S military man of high rank whose achievements caught the public eye, received the reward of the permanent rank of general In Sept 1919 the American Legion, incorporated by Act of Congress, was formed to look after the interests of the ex-soldiers By 1920 the only American troops left in Europe were an Army of Occupation on the Rhine.

The Election of 1918.—The Armistice came a few days after the State and Congressional elections of the autumn of 1918 The War was a national war Enlistments, whether volunteer or by draft, had no relation to politics Nobody paid any attention to the party affiliations of officers or men or civilian administrators and aids Nevertheless, on Oct 24, a few days before the elections, President Wilson issued a circular letter urging the voters to return a Democratic majority to the Senate and the House, because, if the Republicans were successful, it would be considered an imputation upon the President. The warning was in vain the result of the election made the new House decidedly Republican and the Senate Republican by two votes It was apparent, therefore, that the Administration in making the necessary adjustments after the World War must take into account the preponderant opposition in both Houses of Congress

Throughout the year 1918 the influence of Theodore Roosevelt was manifestly growing As the months passed it became clear that he would probably be nominated by the Republican Convention of 1920 and in all probability would be elected President But he died suddenly, Jan 6, 1919, leaving behind him a long roll of achievements and a place among the greatest of American statesmen and world figures.

The Peace Conference.—In Dec 1918 President Wilson decided that he would attend the necessary Peace Conference in person, and designated as peace commissioners with himself four others—Secretary Lansing, Col Edward M. House of Texas (his most intimate friend and political adviser), Gen. Tasker Bliss of the army, and Harry White, formerly minister to France. These commissioners were not confirmed by the Senate; only one of them was a Republican, and not one was a member of either the Senate or the House. To Republicans it seemed that the President meant it to be a Democratic peace as well as a Democratic war.

In the Peace Conference of 1919 President Wilson, as representative of the richest and most powerful nation in the world, was one of the representatives of the four Great Powers—Great Britain, France, Italy and the United States—who engineered the treaty. He had, and used, the opportunity to draw up a League and Covenant which was a crystallization of long-debated suggestions for a world confederation of States. President Wilson was so interested in the project for the League of Nations that when he found the French were not ready to adopt such a plan without some guarantee of protection, he signed a treaty of

alliance between the United States, France and Great Britain, pledging the United States to join in war in case of invasion of France by Germany.

American Action on the Treaty, 1919.—No one familiar with the temper of Congress and of the American people should have supposed that such a treaty would be ratified President Wilson returned home for a short stay (Feb. 24–March 4) defending the general terms of the treaty and the Covenant of the League of Nations. On his return to Paris, he reversed decisions made in his absence by Col. House; and thereafter the close co-operation between the two able men diminished. On June 28, 1919, Wilson and his four commissioners signed for the United States the formal Treaty of Versailles, including the Covenant of the League of Nations, which was so interwoven into the text of the treaty that it was impossible to ratify one without the other. The treaty had many powerful supporters among all parties, particularly ex-President Taft, the League of Free Nations Association and the League to Enforce Peace The Senate was divided into strongly opposed groups Most of the Democrats, under the lead of Senator Hitchcock, followed the President in favouring the treaty with the Covenant as it stood. A group of Republicans, headed by Senator Lodge of Massachusetts, favoured "amendments" to the treaty and "reservations" to the league, which would have maimed but not killed the two projects Another group desired reservations that would practically destroy both A small but implacable junto, headed by Borah of Idaho and Johnson of California, were against both the treaty and the Covenant in any form or with any reservations.

The contest ostensibly centred about Art. X of the Covenant, under which the members of the League undertook "to respect and preserve as against external aggression the territorial integrity and existing political independence of all members of the League" The implacable group expressed fear lest the United States be drawn into foreign wars and insisted that "no American soldiers or sailors must be sent to fight in other lands at the bidding of the League of Nations" The President, on the other hand, regarded Art X as the heart of the whole treaty. He declined at the critical moment to accept either amendments or reservations, except certain minor alterations. After strenuous debate and by a test vote, Nov 19, 1919, the Senate refused to ratify the Peace Treaty with reservations—the vote being 55 to 39 in favour, but not the necessary two-thirds. Thus after five months' discussion the treaty was rejected, and the United States was left in the situation of technically remaining at war with Germany and Austria though all hostilities had ceased a year before

President Wilson believed, until the last moment, that he could force ratification of the treaty by his logic and influence On Sept. 26, 1919, while on a speaking tour through the country in favour of the treaty, he was struck down by paralysis, when he rallied sufficiently to think of public business he continued to hope that he would recover. His advisers and closest friends joined in an attempt to minimize the extent of the President's illness, though for months he was unable to see even members of his cabinet

On March 4, 1921, Woodrow Wilson accompanied President-elect Harding to the Capitol as the last act of his official life. He had been president for eight years, during six of which he was the undisputed leader of his party and of the nation Up to the fall of 1919 he carried all his points. He was responsible for a group of important revenue, banking and labour laws. He had a great hold on the affections and opinions of millions of his fellow citizens, and maintained the country's dignity in war and peace The people stood behind him in entering the World War. He supported measures for organizing and transporting millions of American soldiers. For a time in Paris he was the foremost man in the world, and he succeeded in inducing foreign statesmen to accept a League of Nations. At the height of his career he suddenly lost the prestige gained as War president of the whole country, was no longer accepted by his party, and ceased to be the one man who could appeal from Congress to the people. Before illness disabled him, he had already lost his hold upon the minds of the majority of his fellow countrymen. He lived in Washington in retirement, physically unable to take part in public affairs and died Feb. 3, 1924.

Presidential Election of 1920.—The peace revealed underlying elements of dissatisfaction. The soldiers received in many States a money bonus varying in amount, and demanded a similar bonus from Congress The general public complained bitterly against the high cost of living, while many corporations continued to make War profits in time of peace. A multitude saw their incomes and expectations reduced by the fall in the purchasing power of the dollar. As the presidential election came near, the Democratic Party was paralysed by internal dissensions over the Peace Treaty and by lack of the trusted leadership of the President; it had no fixed policy in foreign relations or reconstruction, and no commanding figure to put forward for the presidency.

The Republicans were rent by personal rivalries. The supporters of Gen Leonard Wood, Gov. Lowden of Illinois and Herbert C. Hoover of California struggled against each other for the nomination The Convention at Chicago (June 9, 1920) passed them all by, and gave the nomination to Senator Warren G. Harding of Ohio He was backed by a strong group of stand-patters to whom, however, he seems to have made no pledges as to policy or appointments Calvin Coolidge, Governor of Massachusetts, was put on the ticket as vice-president The Democratic convention held at San Francisco was confronted with similar difficulties. The nomination went to Gov Cox of Ohio, a man little known in national affairs, with Franklin D. Roosevelt, a cousin of the former president, as candidate for the vice-presidency. In the campaign for the first time women were eligible to vote in every State. The election was a complete triumph for the Republicans, who elected Harding by a popular majority of about seven millions, and an electoral majority of 404 against 127 for Cox, besides securing solid majorities in both Houses of Congress.

The presidency was thus transferred to a man little experienced in national politics, whose task it was to take over the discordant elements and build out of them a coherent policy. President Harding began his administration under favouring auspices, although several members of his cabinet had been chosen in the face of strong opposition from various quarters. The new President early showed tact and ability in leading his party in favour of constructive action. Within four months an epoch-making bill providing for a Federal budget system was passed under his pressure (June 9, 1921). He displayed keen interest in all attempts to restore business to a sound basis and urged prompt action in the assistance of the railways. By nature conservative, he laboured to bring the country back to a state of "normalcy."

Harding's foreign policy was set on remaining outside the League of Nations, while coming to amicable understandings on all relations with foreign nations Hence special treaties of peace negotiated with Germany, Austria and Hungary were ratified by the U S Senate Oct 18, 1921 Of world-wide importance was his call for a conference at Washington of the different Powers bordering on and interested in the Pacific Ocean, to discuss both questions of the Pacific and the limitation of armaments. The conference assembled Nov 12, 1921, and closed Feb. 6, 1922. The nine participants were the United States, Great Britain, France, Italy, Holland, Belgium, Portugal, China and Japan Important agreements were signed: to limit construction of capital warships; against improper use of submarines; against gas warfare; for maintenance of the status of Pacific insular possessions; and other questions involving relations with Japan and China (*see* WASHINGTON CONFERENCE)

Before Harding came to the Presidency, two constitutional amendments had crystallized some of the results of the World War. The various prohibition measures passed by Congress on the ground that the use of liquor impeded the success of the World War were powerful aids to the general arguments against liquor.

The active World War patriotism and service of women, together with the votes they already enjoyed, caused Congress (June 7, 1919), to submit the 19th constitutional amendment, annulling all sex restrictions on suffrage It was warmly supported by the former Progressives and by President Wilson, received the ratification of the 36th State, Aug. 24, 1920, and went into force Aug. 26

Conditions of the United States 1921–26.—A study of the political, social, economic and international history of the United

States must take account of the extraordinary national elation following the World War. The War produced a profound and permanent effect upon the national mind It was the beginning of an enlargement of national life in every direction From a World War out of which Great Britain and the British Dominions and France obtained the administration of immense areas of territory under mandates subsequently confirmed by the League of Nations the United States claimed not a single square yard, but the nation felt free to enlarge its influence in the Caribbean and the Pacific Hence the maintenance and enlargement of a policy of paramount interest in the three normally independent countries—Cuba, Haiti and the Dominican republic, and a strengthening of the control over the states of Panama, Honduras and Nicaragua

To carry out great national policies, the United States could call upon a population expanding from year to year beyond any experience of mankind The total continental population rose from 92,000,000 in 1910 to 106,000,000 in 1920 and (estimated) to 117,000,000 in 1926. Net immigration of 818,000 in 1910 sank to 19,000 in the World War year 1918, but rose in 1924 to 663,000 The wealth of the country, estimated at 187 thousand million dollars in 1912 was counted at 321 thousand millions in 1922, and still swelled in volume. Against these figures, what were such burdens as a national debt of 25 thousand million dollars, bearing a thousand million of annual interest, besides six thousand millions of state and municipal debts? Manufacturing, transportation, mining, distribution and financial business were all prosperous.

Political Survey, 1921–26.—Political rancour and party spirit somewhat diminished President Harding was a man of personal charm, and he drew into his cabinet in March 1921, several strong men Secretary of State Hughes had been a Justice of the U.S. Supreme Court and candidate for the presidency in 1916 Secretary of the Treasury Mellon was a rich and successful banker and financier who had never before appeared in public life, but who proved most successful as secretary Herbert C Hoover, Secretary of Commerce, was brought in on account of his extraordinary gift of business organization Henry C Wallace, Secretary of Agriculture, was the editor of a great agricultural newspaper James J Davis, Secretary of Labor, was a Welsh immigrant who had grown up in a steel mill The other members of the Cabinet were: Will H Hays, Postmaster-General; Edwin Denby, Secretary of the Navy; John W. Weeks, Secretary of War; A B Fall, Secretary of the Interior; and Henry M Daugherty, Attorney-General.

President Harding steered the ship of State easily, though without the commanding influence of a Roosevelt or a Wilson He stood steadfastly against a high scale of expenditure As a Middle-western man he was especially interested in the depressed state of agriculture His foreign policy was strong and successful His career was broken by a very brief illness, from which he died in San Francisco, Aug 2, 1923. After his death facts regarding himself and certain members of his cabinet came to light which were far from creditable

Vice-President Coolidge, formerly Governor of Massachusetts, a quiet unostentatious man, set up a new régime in the White House. He proved to be a man of strong character, who consulted those whom he trusted, and then made up his own mind and stood by his decisions His plain common-sense mode of life, his good temper, his patience with the two Houses of Congress, were combined with a keen judgment in public affairs Coolidge for the time being continued Harding's cabinet, but later changes were made, so that at the end of five years, Secretary of the Treasury Mellon, Secretary of Commerce Hoover and Secretary of Labor Davis were the only men left of Harding's first cabinet

Investigations of Officials.—The growth in wealth and enterprise reacted upon the Government where even the President's cabinet was disturbed and dismembered by a painful series of accusations and investigations For some years the Government had conserved certain oil-bearing areas of public land as a supply of oil fuel for the navy On April 7, 1922, jurisdiction over this matter was transferred from the Navy Department to the Interior Department by an order of President Harding, the purpose of which the President apparently did not understand. Under this supposed authority Secretary of the Interior Fall leased to the Sinclair interest a large tract in the Teapot Dome district in Wyoming, and also leased one of the California reserves to Doheny, another oil magnate. For reasons never publicly stated, Doheny turned over to Fall $100,000 in cash. These published facts led in 1924 to an investigation by a Senate committee under the chairmanship of Senator Walsh of Montana. Secretary of the Navy Denby's part, though no corrupt relation appeared, so aroused public opinion that he had to resign He was replaced by Judge Curtis D Wilbur of California. Meanwhile Attorney-General Daugherty was shown to be in close relation with shady characters, a special committee of the Senate under Senator Wheeler unearthed unexplainable transactions Daugherty refused to allow the files of his office to be examined by the Senate committee; whereupon President Coolidge demanded his resignation (March 28, 1924) An attempt was made by Republicans to turn the tables by prosecuting Senator Walsh and his colleague Senator Wheeler on trivial and technical charges, but the courts dismissed the proceedings Criminal proceedings were instituted against Fall, Doheny and Daugherty, but every possible legal technicality was invoked by the defence so that several years after the trouble began proceedings were still pending President Coolidge took rather a neutral attitude in these proceedings, which he considered to be outside the scope of the executive power Daugherty was succeeded as Attorney-General by Harlan F Stone of New York, then Stone was placed on the Supreme Court bench and John G Sargent of Vermont became Attorney-General

Politics and Elections.—In the congressional elections of 1922 the Republicans retained small working majorities in both House and Senate There was, however, a return of earlier conditions in the appearance of a small group of radical Republicans, with Robert La Follette of Wisconsin as leader, who were able sometimes to hold the balance of power between the regular Republicans and Democrats President Coolidge's conduct during his eight months in office seemed to justify the confidence of his party, and when the Republican convention met in Cleveland there was no rival candidate On the first ballot the vote was: Coolidge 1,065, La Follette 34, and Hiram Johnson 10. The vice-presidency offered difficulties In the end the choice fell upon Charles G Dawes, known to the American public through his association with the Commission of 1923, which had devised the scheme for the payment of reparations by Germany The Democratic convention, held in New York, was the longest and fiercest in 60 years The vote was divided between McAdoo former Secretary of the Treasury, and "Al" Smith, a Roman Catholic, who had won a national reputation as Governor of New York

The convention balloted 103 times; but neither candidate could secure the necessary two-thirds The convention finally nominated John W Davis of West Virginia, former ambassador to Great Britain, with Charles Bryan (brother of William J Bryan) as vice-presidential candidate The campaign was quiet, and the result was that in the election (Nov 1924) Coolidge received 15,725,016 votes, as against 8,386,503 for Davis and 4,822,856 for La Follette, who gathered up many discontented Republicans and the considerable vote usually cast for Socialist and other minor candidates La Follette, however, had only the 13 electoral votes of his own state as against 136 for Davis and 382 for Coolidge It was a substantial Republican victory, accompanied by a Republican majority over all of 59 in the House and 16 in the Senate Vice-President Dawes on taking his seat in the Senate for the first time (March 4, 1925) seized the occasion to suggest that the procedure of that body needed reform; and that its first duty was to pass an efficient rule of closure

The Coolidge Administration.—Throughout both his terms of presidential service Coolidge addressed himself to a policy of economy. He stood by the budget bill which President Harding had secured from an unwilling Congress and continued the appointment of Gen Herbert M Lord as chief budget officer. This reform meant simply that Congress would not begin to act on the main appropriation bills until a budget based upon the ascertained needs of all the various departments had been drawn up, totalled

and submitted by the budget officials.

In 1913 the United States adopted an income-tax, made possible by the going into effect of the 17th amendment of the Constitution. During the World War the tax was raised to high rates, intended in part to transfer some of the immense War profits to the public treasury. Thenceforward that income was the largest factor in the national revenue, and was vigorously collected from individuals and corporations. The policy of the Government was to break down the high scale of War expenditure, to dispense with superfluous employees and so to come back to the public needs in time of peace. Several Acts of Congress, begun in 1921, reduced the rate of income-tax. The result was that the amount paid in income-taxes which was $2,600,763,000 in 1919 and $3,956,936,000 in 1920, came down to $1,691,090,000 in 1923 but rose to $1,761,659,049 in 1925. By the Act of Feb. 26, 1926, the rates were still further lowered but without any decrease in the total paid to the government; and the provision in the statute of 1924 under which the amounts paid by individuals or corporations were open to the public, was repealed

The Underwood tariff of 1913, passed by the Democrats and somewhat altered in 1916 and 1921, was repealed by a Republican majority after the inauguration of President Harding; and an emergency Act was passed (May 27, 1921). Soon afterwards the Republicans framed a new bill, the Fordney-McCumber tariff, signed by President Harding Sept. 21, 1922. It included a provision, never before a part of a United States statute, under which the President was to have power (informed by a Tariff commission) to alter rates of duty if necessary to "equalize the differences in cost of production in the United States over similar articles produced elsewhere." The receipts from duties on imports, which were $334,000,000 in 1910 and $324,000,000 in 1920, rose to $549,000,000 in 1925. The public debt, which for many years previous to 1917 stood at about a thousand million dollars was $26,594,268,000 soon after the close of the World War (Aug 31, 1919); but on June 30, 1926, had been reduced to $19,643,183,000, partly by selling the surplus War material and chiefly by payments made out of surplus.

Industry and Commerce.—However much the wealth of the country increased, it was not equally diffused; and large areas of the country were far from prosperous. The rural credits banks (*see* FEDERAL FARM LOAN SYSTEM), established under Wilson, furnished needed capital, and the farmers from 1917 to 1919 had a guaranteed government price of $2 20 per bushel for wheat When that protection was taken off after the World War, a group of members of Congress in both House and Senate, commonly called the Agricultural Bloc, demanded special consideration for the agriculturists Their prices had tumbled, and agricultural land values, inflated during the World War, fell back to or below antebellum prices. The cost of living and hiring farm labourers had been nearly doubled Discontent was reflected in the large popular vote for La Follette in 1924. Various propositions were made by farmers' associations and sympathetic members of Congress that the Federal Government permanently guarantee a price for the principal staples The South was also affected by this movement because the inroads of the boll weevil for a time greatly reduced the output In some degree the conditions of 1885–95 were reproduced; only it was no longer East against West, so much as the farmers of all sections against the group of manufacturers and distributors wherever established

Organized capital in banking, in manufactures, and in trade, was rolling up in this period notwithstanding the Sherman Act, the Mann Elkins Act and other measures against combinations In spite of Federal suits and Supreme Court decisions substantially upholding Federal control, combinations and consolidations of capital went on steadily. The railways, which had been sustained during the World War by the Government, were returned to their owners in 1920. For several years, notwithstanding a great increase in passenger and freight rates during the World War, they were unable to make what they thought a fair profit. Under the Esch-Cummins Act of 1920 they were allowed to retain a profit of 5½% earnings, plus one-half of one per cent to make provision for improvements chargeable to capital accounts, all excess over 6% to be evenly divided with the Government. Meanwhile the administrative commissions which had been so powerful lost prestige. The Tariff commission was weak and disregarded. The Labor Board was unable to enforce its decisions The Interstate Commerce commission and the Federal Trade commission suffered in prestige and influence from internal strains and quarrels. The special Shipping commission, created during the World War to build up a national merchant fleet, was left with a large number of vessels for which profitable business could not be found The Supreme Court decisions, under which great corporations like the Standard Oil Company and the American Tobacco Company were regulated, left them more prosperous than ever. The hold of the great banks and the smaller banks and bankers on the finances of the country was unshaken. Deposits in national and state chartered banking institutions in 1925 aggregated over 40 thousand million dollars

Social Questions.—Many phases of social life went through a similar exaggeration and transition. During the World War the United States offered extraordinary wages in order to activate the pursuits necessary to keep up the Army. This led to a general raising of the scale of wages of skilled workers, some increase for the unskilled and considerable increase in the earnings of domestic and agricultural workers. The Labor Unions made it their business to see that no systematic reduction of wages should succeed Fuel was especially important. The whole anthracite supply comes from a small region in Pennsylvania. In 1923 and again in 1925 came serious strikes of the miners' unions. The last one endured 170 days, and was settled only with great difficulty by a return to previous conditions.

Prohibition.—The most serious social question and most difficult governmental problem of this time was national prohibition (*see* PROHIBITION). In 1918 more than 30 States had laws on their statute books for the restriction of the liquor traffic and 28 States prohibited it outright During the World War, Congress prohibited the sale of liquor to soldiers, and then to the general public A prohibition (Eighteenth) amendment to the Federal Constitution was easily put through Congress, was ratified by a vote of 46 State Legislatures out of 48, and became a part of the Constitution Jan 16, 1919. On Oct. 28, 1919, the Volstead Act for enforcing the amendment was passed by Congress over the veto of President Wilson It forbade the sale or transportation of "intoxicating liquor" which was defined as any liquor which contains one-half of one per cent of alcohol. To administer this act required a large force of officials distributed over the country. The amendment contained a clause under which the States were to have "concurrent jurisdiction," which appeared to mean that State laws might continue in force and be carried out by State courts at the same time with the Federal system From the very beginning there was an organized system of evasion of the laws A regular system of "bootlegging," illegal sale and transportation sprang up. It was informally countered by "high-jackers"—that is bandits who seized bootleggers' supplies and carried them off by force, knowing that they were not likely to be followed by legal proceedings. An organized marine bootlegging trade placed a line of foreign sailing craft and steamers just outside the three-mile limit of the United States, whence they supplied the markets of the adjoining coasts.

The United States entered into treaties by which Great Britain and other nations agreed that vessels carrying their flags might be captured within that distance from the United States coast which can be traversed in one hour by the vessel suspected of endeavouring to commit an offence This might possibly be as much as 30 nautical miles Within the United States large numbers of otherwise law-abiding persons bought and sold or gave away bootleg liquor, and the difficulties of executing the law are shown by the figures of national enforcement In one fiscal year (1924–25) 20,000,000 gal of distilled and fermented liquors were seized; 77,000 persons were arrested; 50,000 criminal cases were entered against bootleggers; 35,000 pleas of guilty were entered and 38,000 convictions were obtained A national law regulating the traffic in habit-forming drugs was enacted May 26, 1922

National Defence.—The Armies were returned and disbanded

as fast as possible; but a demand was made at once by soldiers and officers for some immediate acknowledgment of their sufferings and services The Government attempted to head off this movement, first by an elaborate system of life insurance during the World War with the privilege of continuing afterward, then by money bonuses, passed by a number of the States. The Federal Government instituted an elaborate rehabilitation system for training wounded or otherwise injured men in some pursuit in which they could earn their own living The Government also provided hospitals and care for sick and disabled soldiers. Provision was made for special privileges of alloting government land in favour of ex-soldiers On Sept 20, 1922, a bonus bill was defeated by President Harding's veto On March 18, 1924, a Federal bonus was enacted by a large majority vote in Congress but it was vetoed by President Coolidge It was passed over his veto, May 17–19, by both houses of Congress.

Notwithstanding the experience of the United States in 1917, when it declared a war without any mobile Army, strong pressure was put on Congress to reduce the regular Army By an Act of Feb 12, 1925, the force of the regular Army was set at 125,000 enlisted men and 7,953 enlisted men of the Philippine Scouts. Most of the veterans were interested in the American Legion, the most widely distributed society of service men; and that body had considerable influence in the legislation for ex-soldiers.

International Relations.—The foreign affairs of the United States are always much affected by changes in party and in personnel. President Coolidge, accepting the resignation of Charles E Hughes from the Department of State, appointed as his successor (Feb 1925) Frank B Kellogg, previously a Senator and Ambassador to Great Britain To the powerful chairmanship of the committee on foreign relations, after the death of Henry Cabot Lodge of Massachusetts, who had been head of the opposition to the ratification of the League and Covenant, succeeded William E Borah of Idaho (Dec. 1924), the famous freelance of the Senate A great improvement in the conduct of foreign relations was introduced by the Rogers Act, which took effect July 1, 1924, under which the consular and diplomatic services were merged and the policy of training young men with the prospect of life-long service was entered upon

The general policy of the United States towards other nations was much affected first of all by changes in international trade caused by the disruption of the World War, then by the refusal of the Senate in 1919 to approve the Versailles Treaty and further by a strong popular opposition to any formal relation with the League of Nations. A treaty with Germany (July 2, 1921) formally restored peace, provided for commerce and arranged for an adjustment of claims Similar treaties were made shortly afterwards with Austria and Hungary The Lausanne treaty with Turkey, signed on July 24, 1923, was defeated in the Senate on Jan. 18, 1927

Immigration.—An important question, partly social and partly international, was that of immigration, which went through a new phase because of the rush of people from other parts of the world as soon as the war conditions were cleared up Complaint was made that in the previous two decades the greater part of the immigrants came from southern and eastern Europe, and was made up of persons who were not by tradition and inheritance of the same type as most of the previous immigrants Several changes were made in 1918 and at other dates so as to reduce the number of undesirables, and by the Act of 1924, a permanent quota system was enacted, based on 2% of the number of nationals of that country shown to be in the United States by the census of 1890. This made a total of about 165,000 permissible each year from all countries, besides about 150,000 transient visitors. Unrestricted immigration from Canada and Mexico and some other sources brought the total immigration in 1924 and 1925 up to about 300,000, out of which should be taken about 100,000 emigrants, leaving a total permanent addition of about 200,000 annually.

Reparations.—The United States was no party to the provisions of the Versailles Treaty providing for German reparations, particularly to France, and the payment of an indemnity by Germany However, an American force of occupation was left in the Rhine belt, the costs of which amounted to about $200,000,000 and were to be paid by Germany. In 1921 Germany did not pay the stipulated sums to the Allies and therefore the French occupied the Ruhr valley. The United States suggested a commission, which, headed by Charles G Dawes (later Vice-President of the U. S), succeeded in working out a scheme (1924) that was acceptable to France, Great Britain and Belgium, for a method of payment secured by a lien on German railways and factories Financially the importance of the Dawes plan to the United States was that it cleared the way for considerable investments of private capital in German municipal and corporate securities

General Foreign Relations.—Among the incidents of foreign relations after the World War was the recognition of various new countries created by the Treaty of Versailles. Poland, Latvia, Lithuania, Estonia, Finland, Czechoslovakia, Yugoslavia, Hungary and the enlarged Rumania In 1924 the United States received Prof Timothy A Smiddy as minister from the Irish Free State. The British Government consented to the appointment of a direct Canadian representative at Washington, and in 1924 a diplomatic agreement was made between the United States and Canada as regards halibut fishing, for which, however, the United States insisted upon a formal approval by the British Government This was granted in due course

The last American troops were withdrawn from Germany in 1923 Meanwhile a joint commission on German claims was far advanced in its task A troublesome difficulty was that a treaty with Prussia, entered into in 1828 and assumed in 1871 by the German empire, entitled German citizens in case of war to nine months to dispose of their property in the United States and leave the country. Instead, all discernible property of Germans, and particularly of German corporations, was seized at the beginning of the World War and placed in the hands of a Custodian of Enemy Property Valuable German patents were turned over, for a very small payment, to American manufacturing chemists It was not until March 10, 1928, that President Coolidge signed a bill appropriating $50,000,000 to cover the value of the property seized

Allies' Debts.—A very serious and difficult issue was that of the sums lent by the United States to foreign governments during the World War, aggregating nine and a half thousand million dollars Without those enormous advances the Allies would have broken down economically before an American Army could have been placed in Europe Nearly all the allied European countries shared in these advances For several years interest accumulated, until, at the end of 1922, the total principal was ten thousand million dollars and the accumulated interest one and a half thousand millions more. This enormous sum was funded in United States Government bonds placed at about four per cent interest, mostly in American hands, upon the same footing as other obligations of the Government. The interest was paid by the United States Treasury In 1923 the first important adjustment of the debt was made by an agreement with England (Feb 28, 1923) The whole amount of the principal and interest then due was funded at $4,000,000,000 to be paid in annual instalments beginning with 23 millions a year and increasing, until in the 62nd year the debt and accruing interest would be extinguished Similar settlements were made with Finland and other small nations. The obligations of Armenia and Russia were practically written off

Negotiations followed with other countries and a settlement was made with Italy (Nov. 1925), ratified (April 1926), to pay $5,000,000 a year for five years, and thereafter rising payments for 57 years The principal was reduced from a nominal value of two thousand million dollars to a present value at 5% of £430,000,000 the low rate of interest on long-deferred payments being thus equivalent to a reduction of about one-half the debt

In April 1926, following an unsuccessful visit of a French debt commission to the United States in Sept. 1925, the Berenger-Mellon settlement was finally arrived at with France

The total amount of the French indebtedness to be refunded, after a cash payment to adjust the sum to round figures, was de-

clared to be $4,025,000,000, and the repayment of this amount with interest was to be spread over 62 years as in the other World War debt settlements. The total sum to be received by the United States under this agreement amounted to $6,847,674,104, being an increase of approximately $627,000,000 over the previous French offer made by M Caillaux in 1925. The French Chamber, however, has not ratified the Berenger-Mellon agreement

Comparing the French settlement with those of Great Britain and Italy, the figures worked out as follows Great Britain's agreement discounted represented slightly over 80% of her total obligation, France's approximately 50% and that of Italy 26% The House of Representatives voted approval June 2, but ratification by the Senate was deferred pending the action of the French legislature The various agreements made to the end of April 1926 left only $295,000,000 unfunded World War debts to the United States, including $193,000,000 owing by Russia In nearly all cases the period of payment is so long and the interest so low that the settlements involve payment at the value of from one-quarter to over three-quarters of the original advances by the United States

Latin America.—With Latin America the United States in the main enjoyed peaceful relations The long-standing question over the Isle of Pines was adjusted by a treaty (March 13, 1925), under which the title of Cuba was acknowledged At the request of Chile and Peru, President Harding agreed in 1922 to arbitrate the obstinate dispute over the ownership of the Tacna-Arica region. After Harding's death President Coolidge took up the task and rendered his decision (March 4, 1925) to the effect that the delayed plebiscite of the inhabitants should now be taken; and General Pershing was made the head of a commission to preside over this process Chile objected, and nothing was done (*See* TACNA-ARICA) With Mexico relations became strained by a dispute over the application of the new Mexican constitution of 1917 under which aliens were forbidden to hold lands or concessions Mexicans claimed that this was in accord with the practice of several States in the United States. In 1925 Secretary Kellogg protested against the attitude of Mexico as unfriendly and declared that the Government of Mexico was on trial before the world In March 1926 a financial understanding was reached The United States was also concerned in the outbreak of anti-foreign feeling in China and her representatives took part in a conference at Peking in Oct 1925 upon questions relating to the withdrawal of the foreign limitation on the laying of tariffs by the Chinese Government

The League of Nations.—After the refusal of the United States to ratify the Treaty of Versailles or to take part in the League of Nations, no official relations with the League were established However, large numbers of American citizens were interested in the work of the League and some of them were appointed to advisory committees in which, however, they did not represent the American Government. Eventually the United States consented to appoint official delegates or "observers" to commissions on the Opium Traffic and other matters, instituted by the League and operating in its headquarters in Geneva. The United States became a party to treaties with regard to the white-slave trade and other matters, drawn up by the League, but to take effect for only such countries as might ratify them Gradually even the warm friends of the League accepted the conviction that it was useless for the time to urge participation in the League by the United States

The World Court.—Down to 1914 the International Court of The Hague, founded in 1899 and strengthened in 1907, was in being and rendered occasional decisions It was, however, entirely ignored by the contending parties in the six wars that broke out from 1900 to 1914 and after the World War it remained ineffective. Elihu Root, who had a share in framing the court, came forward in 1920 as the leader of an unofficial group of experts in international affairs, to propose a new world court with wide powers and jurisdiction. An advisory committee of jurists sat at The Hague and drew up a plan for a Permanent Court of International Justice. The League of Nations modified the project but established the Court (Dec. 1920) and chose the judges (Sept. 1921) (*See* PERMANENT COURT OF INTERNATIONAL JUSTICE) The United States had no official relation with the Court; but the force of American public sentiment for a World League concentrated on a proposition for qualified entrance of the United States into the World Court

This was warmly urged by President Harding and later by President Coolidge. Senator Borah, Senator Hiram Johnson of California and others strongly opposed. The progress of the movement was checked by a proposal, originally drawn by a group headed by Professor J T Shotwell of Columbia University and the Carnegie Endowment, who desired to enlarge the jurisdiction of the World Court and give it a compulsory character. The League of Nations modified this proposal into the so-called Geneva Protocol, which was unanimously approved by the Assembly of the League of Nations (Sept 1924), and sent for ratifications by the nations of the world Strong opposition was made in the United States on the plea that the Court was to decide whether a controversy was justiciable, and could assert jurisdiction over all nations and also arbitrate regarding nations, even if not members of the League of Nations Great Britain declined to accept the compulsory jurisdiction and the whole plan fell to the ground. (A. B H.)

SINCE 1926

Adherence to the World Court Defeated.—The refusal of Great Britain to accept the Geneva Protocol left the original statute constituting the World Court intact and pressure upon the U S Senate to vote for U S participation in the court was renewed President Coolidge and Secretary Kellogg also urged it On Jan 27, 1926, the Senate, by a majority of 76 to 17, voted the adhesion of the United States with five reservations, the most important of which provided that the statute of the Court should not be amended without the consent of the United States and that the Court should not "without the consent of the United States entertain any request for an advisory opinion touching any dispute or question in which the United States has or claims an interest " When the representatives of the powers signatory to the statute of the court, in a meeting at Geneva, in September 1926, refused to grant the United States the favoured position which the Senate reservations demanded, the prospects of joining the Court grew dim In his Armistice Day address at Kansas City (Nov 11, 1926), dedicating the $2 000,000 Liberty Memorial to the heroes of the World War, President Coolidge declared that he should not ask the Senate to modify its position, and that unless its reservations were accepted by the other interested nations he saw "no prospect of this country adhering to the Court "

President Coolidge and Congress.—A few days before the President's Armistice Day address the midterm Congressional elections were held. The Democrats captured seven of the contested seats in the Senate, exactly wiping out the Republican majority in the 69th Congress, and gained thirteen seats in the House, making the complexion of the 70th Congress (1927–29) 237 Republicans, 195 Democrats, 3 Independents in the House, and 48 Republicans, 47 Democrats, 1 Farmer-Labourite in the Senate The election foreshadowed embarrassment for the administration in its last two years. Not only was President Coolidge rebuffed by the defeat of his personal friend and adviser Senator Wm M. Butler of Massachusetts, chairman of the Republican National Committee, by his Democratic opponent David I Walsh, in spite of a letter from the President to the voters of Massachusetts, urging the election of Butler, but the elimination of the Republican margin in the Senate made it necessary for that body to conciliate the "insurgent" members who had supported La Follette in 1924 and had been punished therefor by being dropped from important committee assignments in the 69th Congress The Republican progressives, like La Follette (the younger), Blaine, Frazier and Nye, were now restored to good and regular standing, and exacted from floor-leader Curtis as the price of their support of the party the promise that "certain legislation of paramount interest to the people" (farm relief, investigation of American policy in Latin America, a bill to regulate the issuance

of injunctions) should be brought to a vote during the first session of the 70th Congress. On these questions, as on several others of major importance, such as the details of tax reduction, the disposition of Mussel shoals, the naval programme, the Mississippi flood control, the method of prohibition enforcement, President Coolidge found himself at odds with Congress. He did not, however, attempt to drive Congress, as Roosevelt and Wilson had done, nor did he treat it with sarcastic indignation, like Cleveland. With characteristic patience he held to his policies, vetoing 16 bills and resolutions in the first session of the 70th Congress (Dec. 5, 1927–May 29, 1929), and insisting in his messages and speeches on the blessings of obedience to law and of rigid economy for the preservation of America's prosperity and favoured position among the nations of the world

National Finances.—The era of prosperity which set in at about the time of Mr Coolidge's accession to the presidency continued unabated during his entire administration. Except in a few "spots," such as the bituminous coal, the textile, and some agricultural industries, production mounted steadily, consumption kept pace, labour was well employed and content. The national wealth, which had stood at about $7,000,000,000 in 1850, $25,000,000,000 in 1870, $65,000,000,000 in 1890 and $350,000,000,000 in 1920, was approaching the $450,000,000,000 mark by 1929 The annual income had reached $90,000,000,000 and annual savings were more than $17,000,000,000. The United States was investing about $2,000,000,000 of surplus wealth abroad and diminishing the national debt by nearly $1,000,000,000 each year. The abundant receipts of the Treasury (more than half from income taxes), combined with the careful co-operation of the committees of the administrative departments under President Coolidge and Director of the Budget Lord, resulted in substantial surpluses at the end of every fiscal year On Feb. 26, 1926 the President signed a bill for a tax reduction of $388,000,000 (which he thought was too much), by which the normal rates on incomes were reduced from 2% to 1½% on the first $4,000, from 4% to 3% on the next $4,000, and from 6% to 5% on the excess of $8,000. The exemptions were raised from $1,000 to $1,500 for a single person and from $2,500 to $3,500 for a married couple. In spite of the cut in taxes the surplus continued to come in, and on May 29, 1928 the President signed the third tax reduction bill of his administration (relieving corporations and certain industries, but leaving the personal schedules unchanged), involving a cut of about $220,000,000. The refunding of the second and third Liberty loans in 1928 effected a saving to the Government of $75,000,000 a year in interest charges. As President Coolidge's term drew toward a close, however, the prospect for further tax reduction vanished, and there was even some apprehension that the Treasury might be confronted for the first time in the administration with a deficit instead of a surplus. This was due to certain extraordinary demands on the Government, such as the appropriation of $75,000,000 for the refund of taxes illegally collected, of $50,000,000 for the settlement of claims arising out of taking over alien property during the World War, of nearly $50,000,000 for a public buildings program, and of some $20,000,000 for initiating work on the vast $315,000,000 programme for Federal engineering work on the lower Mississippi river, to avert a repetition of the terrible floods that had occurred in the spring of 1927, breaking the levees and deluging millions of acres of farm lands in Missouri, Arkansas, Tennessee, Mississippi and Louisiana, drowning hundreds of persons and making hundreds of thousands homeless The commission for the settlement of the debts of foreign countries to the United States incurred in the World War was dissolved on Feb. 9, 1927, after having negotiated settlements with thirteen countries for the eventual payment of principal and interest amounting to $11,522,354,000. The Government later arranged with Greece for the funding of her debt to the United States of $15,000,000 Austria was granted a moratorium on her debt of $12,000,000 until 1943. The Mellon-Berenger agreement for the settlement of the French debt to the United States over a period of 62 years has not (June, 1929) been ratified by the Chambers at Paris.

National Defence.—Since the fortunate position of the United States brings immunity from fear of attacks by strong and hostile neighbours, the country follows the traditional policy of a small and well-equipped army supplemented by State militia. The regular army of about 132,000 men means only 1·1 soldiers to every thousand of population and every $3,250,000 of national wealth, as against 12·5 soldiers to every thousand of the population and every $135,000 of the national wealth of France. Reduction of land armaments is not a problem in which the United States is directly interested. But the Government has worked diligently in the last few years for the reduction of naval armaments To supplement the work of the Washington Conference of 1921–22, which limited the tonnage of battleships and aircraft carriers, President Coolidge, on Feb 10, 1927, sent an identic note to Great Britain, France, Italy and Japan, asking these nations to empower their delegates to the forthcoming Preparation Conference on Disarmament at Geneva to negotiate treaties with the United States for the limitation of the construction of cruisers, submarines and destroyers. France and Italy, however, declined the invitation outright, and Great Britain hedged her acceptance with such conditions as meant, in the President's words, "not a limitation but an extension of war fleets." Moreover, details were published of a naval agreement between England and France in 1928, which seemed to be aimed against the cruiser strength of the United States. Disappointed by the failure of his proposed conference, President Coolidge came out more positively for a "policy of adequate defence," using rather strong phrases in praise of the American army and navy and air force in his Armistice Day address (Nov 11, 1928) at Washington under the auspices of the American Legion. A five-year building programme had been approved by Secretary of the Navy Wilbur in the summer of 1926, calling for 71 new vessels (cruisers, submarines, destroyers and carriers) to cost nearly $800,000,000 Cutting this programme to 15 cruisers and one aeroplane carrier, the House, on March 17, 1928, passed a bill for the construction of the 16 vessels in three years at a cost of $274,000,000. The cruiser bill was put over to the short session of the Senate, where it met sharp opposition, especially as it was pending at the same time as the ratification of the Kellogg Pact for the renunciation of war as an instrument of national policy. However, the bill was passed on Feb. 5, 1929 by a vote of 68 to 12, and was signed by the President, although he was opposed to the time limit requiring that five of the cruisers be laid down in each of the years 1929, 1930, 1931. On Feb 28, 1929 Congress agreed to a $12,370,000 addition to the Naval Appropriation for the new vessels, $200,000 to be available at once for starting the 1929 group of five, and $200,000 to be available on July 1, 1929 for beginning the 1930 group The marvellous progress of aviation in the last few years has played a great part in the field of national defence as well as in the carrying of passengers, goods and mail. Bombing, scout, pursuit and combat planes, aircraft carriers and rigid airships have been important parts of army and navy equipment. Some critics have urged the creation of a unified cabinet department of national defence, with under-secretaries of army, navy and air. In 1925 the army and navy departments spent $12,769,689 and $14,743,348 respectively for aviation. President Coolidge in his final statement on the budget (Dec 5, 1928) declared that by the end of 1931 the navy would have a "well balanced fleet of 1,000 aeroplanes" and that a year later the number of army planes would reach 1,800. The total sum contemplated for national aviation projects in 1930 is over $140,000,000, including about $18,000,000 for air mail contracts, $6,400,000 for the Department of Commerce's activities, and $582,000 for the Department of Agriculture (forest patrol, weather observation and fighting the boll weevil).

Railroads and Shipping.—In the stress of the World War these two major agencies of transportation had been taken over by the Government. The railroads were restored to their owners on March 1, 1920, by the Esch-Cummins Transportation Act, which besides providing for substantial Government loans to the railroads and a six months' guarantee against deficit, created a Railroad Board of nine members, to which disputes on wages and hours had to be submitted, required the roads to pay to the

Government one-half of their earnings above 6% of their valuation, and ordered the Interstate Commerce Commission to make regional railroad consolidations to the end that the stronger roads might bear the infirmities of the weak But the Transportation Act was more honoured in the breach than in the observance The Commission did not effect a single compulsory consolidation, and in 1927 it was relieved from this duty by the Parker bill and allowed to approve or deny applications for consolidation from the railroads themselves. Most such requests have been denied as prejudicial to the stockholders or the public. Labour was dissatisfied with the decisions of the compulsory Labour Board, and it was not until the Watson-Parker bill of May 20, 1926 had set up in its place a voluntary Board of Mediation that the first successful mediation of a railroad wage dispute in 20 years was effected (Feb 5, 1927). A large number of wage increases, generally averaging 7½% were secured by the railroad workers under the new Mediation Board in the years 1927 and 1928. The physical valuation of the railroads by the Interstate Commerce Commission, as a basis for rate fixing, which had been authorized in 1913 and interrupted by the War, was virtually completed by the summer of 1928. The Commission's valuation of the property of the roads was to serve as the basis of the "recapture" clause of the act of 1920, by which one-half of the earnings in excess of 6% should go to the Government This provision promises endless litigation The validity of the Commission's method of valuation was presented to the Supreme Court of the United States in the case of the St Louis and O'Fallon railroad, called "the greatest law-suit in history" because of the immense sums involved in the right of the government to recapture excess earnings This railroad's earnings in excess of 6% of the Commission's valuation had been ordered paid to the Government The court, with Justices Holmes, Brandeis, and Stone dissenting, rejected the Commission's valuation on the ground that no weight had been given to "reproduction" cost (49 Sup Cl. Rep. 384) But, since no criteria were laid down as to how much weight was to be given to this factor, the decision could not be said to be decisive In no year since 1920 have the railroads even of the first class earned so much as 6% on their own property valuation in which cost of reproduction figures largely

At the close of the World War the United States Shipping Board had on its hands a large number of merchant ships seized from Germany or constructed by the Emergency Fleet Corporation since 1917 Many of the smaller cargo ships the Board sold as junk, but it maintained the larger vessels in the passenger and freight service, operating them at a loss of millions a year The arrangement was confessedly provisional, and the Board was continually inviting bids for the merchant fleet from private operators In 1923 five ships of the "President" class were purchased by the Dollar Line. By the Jones-White act of May 1928, Congress reluctantly appropriated $250,000,000 for the maintenance of the fleet and loans for the construction of new vessels On Jan 16, 1929 the Shipping Board received a bid from the P W Chapman Company of New York, which it accepted a few weeks later by a vote of six to one The Chapman company is to pay $16,082,000 for the "Leviathan," the "George Washington," the "America," the "Republic," the "President Harding," the "President Roosevelt," and the five ships of the American Merchant Line, and promises to build, with the aid of a Government loan, two new vessels "superior in type and size to the 'Leviathan' " Thus the Government may go out of the shipping business with the assurance that the flag of the American merchant marine will be upheld in world trade

Efforts at Farm Relief.—In the midst of general prosperity the farmers complained that they were poorer The value of their capital investment had shrunk from $79,000,000,000 to $59,000,000,000 in the five-year period 1922–27, and the return on this capital was less than 3% While over-production kept the prices of their products down, State and local taxes and the cost of farm implements and machinery were rising. The farmers asked the Government to come to their relief (as it helped the manufacturers by the tariff and labour by the restriction of immigration) by purchasing their surplus product of wheat, corn, cotton, hogs and tobacco and selling it abroad for what it would bring in the world market, assessing the loss and the cost of the operation on the industries benefited (the "equalization fee"). The McNary-Haugen bills embodying these demands were kept before Congress during the last three years of the Coolidge administration. The first bill failed of passage in the late spring of 1926, but in Feb 1927 a McNary-Haugen bill went through both houses President Coolidge vetoed it because it put the Government into the farming business, though he was willing to help the farmers help themselves by generous contributions to co-operative marketing projects and by aid from the Department of Agriculture The veto was accompanied by an opinion from Attorney-General Sargent condemning certain features of the bill as unconstitutional. Nothing daunted, the advocates of farm relief came forward with a third McNary-Haugen bill, which passed Congress by increased majorities in the spring of 1928, only to meet with a second veto from the President (May 23) The Senate failed by the margin of 50 votes to 31 to pass the bill over the veto. On the first day of the short session of the 70th Congress (Dec 4, 1928) the fourth McNary-Haugen bill was introduced, this time without the equalization fee No action was taken on it during the session, but President Hoover called an extra session of the 71st Congress to meet on April 15 to deal with farm relief and the revision of the tariff President Coolidge's vetoes of the farm relief bills roused opposition in the west and led to predictions that the farming sections of the country would not support an administration candidate for the presidency in the campaign of 1928. But Mr Hoover carried every one of the agricultural States.

Latin-American Relations.—The controversy with Mexico over her legislation to put into effect the provisions of Article 27 of the Constitution of 1917, regulating alien exploitation of mineral and agricultural lands, was further embittered by the appeal made to the Catholics of that country against President Calles' measures against the foreign clergy of the Roman Catholic Church in Mexico, and by the report that the Mexican Bolshevists were encouraging the rebels in Nicaragua in their resistance to the American marines So serious was the situation at the beginning of 1927 that the United States Senate by a unanimous vote asked President Coolidge to submit the controversy with Mexico to arbitration The President ignored the request, but in the autumn he sent Dwight M Morrow, of the firm of J P Morgan & Co as ambassador to Mexico Mr. Morrow's friendly and tactful diplomacy resulted in an early agreement with President Calles, and the amicable relations of the two countries were greatly strengthened when Col Charles A Lindbergh, after a non-stop flight from Washington, arrived at Mexico City (Dec. 14, 1927) as an American "ambassador of good-will" President Coolidge, in spite of criticism in Congress and in the Liberal press of the country, held to his policy of maintaining some 5,000 marines in Nicaragua to quell the revolt against Díaz and to protect American lives and property The Sacasa and Díaz forces agreed to lay down their arms when President Coolidge sent Col Henry L Stimson to Nicaragua with an ultimatum in April 1927, but the rebel leader Sandino continued a guerrilla warfare in which more than 20 American marines were killed and 50 wounded When Sandino was overcome, both parties agreed to a fair election which was held under the supervision of American troops (Dec 4, 1928) and resulted in the victory of the Liberal candidate, Moncada The Sixth Pan-American Congress was opened by President Coolidge in person, at Havana, Cuba, on Jan 16, 1928 Charles E. Hughes headed the American delegation, and skilfully steered the conference away from the embarrassing political questions raised by the United States intervention in Nicaragua A supplementary Pan-American Conference on Arbitration and Conciliation met at Washington on Dec. 10, 1928, which not only negotiated a score of arbitration treaties between the Latin-American nations, but was influential in keeping Bolivia and Paraguay from going to war over disputed territory in the heart of South America President Coolidge in an address at George Washington university, on Feb 22, 1929, declared that our relations with Central and South America were then better than they had been at any time in the past 25 years.

The Briand-Kellogg Peace Pact.—On the tenth anniversary of the entrance of the United States into the World War (April 6, 1927), the French Foreign Minister, Aristide Briand, proposed that the United States and France should agree to a treaty renouncing war as an instrument of national policy, and agreeing to settle disputes of whatever origin or nature by pacific means. Rather tardily Secretary of State Kellogg replied, suggesting that the treaty be extended to other nations. On Aug. 27, 1928, the representatives of 15 nations met at Paris and signed the Briand-Kellogg Pact. Secretary Kellogg represented the United States at Paris, making a visit to the Irish Free State after he had left Paris On Jan. 15, 1929, the Senate ratified the pact.

The Election of 1928.—President Coolidge and Charles E Hughes, the two most conspicuous leaders of the Republican party, having announced that they would not run for the presidency in 1928, the field was left open for Secretary of Commerce Herbert C. Hoover, who was easily nominated over his senatorial rivals (Curtis of Kansas, Watson of Indiana, Goff of West Virginia, Norris of Nebraska), receiving 837 out of the 1,084 votes cast in the first ballot, at the nominating convention at Kansas City, June 12–15, 1928. The delegates to the Democratic nominating convention at Houston, Texas, on June 26–29, cast 849⅔ votes out of 1,100 for Alfred E. Smith, then serving his fourth term as governor of New York Senators Charles Curtis of Kansas and Jos T Robinson of Arkansas were named as the respective vice-presidential candidates Each of the four nominations was made on the first ballot cast The platform of the Republican party promised farm relief and a careful revision of the tariff, defended the Coolidge policy in Nicaragua, and adopted a prohibition plank written by Senator Borah, pledging the administration to a "vigorous enforcement" of the 18th Amendment. The Democratic platform contained a scathing denunciation of the "sordid corruption and unabashed rascality" of Republican rule, which had left "agriculture prostrate, industry depressed, and workmen without employment," and pledged action instead of broken promises for the relief of the farmer. Governor Smith telegraphed to Chairman Robinson of the Convention endorsing the platform in general, but adding that it was his duty as the chosen leader of the party to say that he advocated "fundamental changes in the present provisions for national prohibition." Mr. Hoover made only a few campaign speeches, and in them he confined himself to generalities. Governor Smith, on the other hand, toured the country and discussed definite policies which he proposed to adopt if he were elected On election day, Nov. 6, 1928, Mr. Hoover carried 40 of the 48 States, including four (Virginia, North Carolina, Florida and Texas) which had been solidly Democratic since the days of reconstruction The electoral vote was 444 for Hoover to 87 for Smith But the popular vote of 21,429,109 to 15,005,497 indicated no such crushing defeat for the Democratic candidate. He had, indeed, proved a stronger candidate with the people than either Cox in 1920 or Davis in 1924. The Socialist candidate, Norman Thomas of New York, polled 267,835 votes; the Radical Workers' (Communist) party candidate, Wm. Z. Foster, 48,228, the Social-Labour candidate, Reynolds, 21,181; and the Prohibitionist candidate, Varney, 20,101. Mr. Hoover's invasion of the "Solid South" was attributed by the Democrats to the prejudice in that section against Governor Smith as a "wet" and a Roman Catholic, while the Republicans affected to see in it the swing of the South towards tariff-protected industry and the recognition of Mr Hoover's wide experience as an executive. Soon after the election Hoover sailed from San Diego, California, on the battleship "Maryland," for a good-will tour to the countries of Central and South America He visited Honduras, Nicaragua, Costa Rica, Ecuador, Peru, Chile, Argentina, Uruguay and Brazil, sailing for home on the "Utah," Dec. 21, 1928. The tour afforded the president-elect the occasion not only to pay his respects to the statesmen of the sister republics to the South, but also to get some acquaintance at first hand with a region in which United States investments of capital had increased from $1,500,000,000 in 1913 to over $5,000,000,000 in 1928, and with which the annual trade had passed the $1,000,000,000 mark. While the "lame duck" session of the 70th Congress was drawing to a close, with the enactment of the Jones bill for a marked increase in penalties (maximum of $10,000 fine and 5 years' imprisonment, instead of $2,000 fine and 6 months' imprisonment) for the violation of the prohibition law, Mr. Hoover was studying the problems which would confront him after March 4, receiving hundreds of political visitors at his home in Washington or on his vacation in Florida, and wrestling with the task of selecting his cabinet On March 2 the names of the cabinet officers were given to the public. Secretary of the Treasury Mellon and Secretary of Labor Davis of the Coolidge cabinet were retained in office. The eight new appointees (none from the States of the South which Hoover had carried) were Col. H. L. Stimson, governor-general of the Philippines, for Secretary of State; James W. Good of Iowa, Secretary of War; William De W. Mitchell of Minnesota (a conservative Democrat), Attorney-General; Charles Francis Adams of Massachusetts, Secretary of the Navy; Walter F. Brown of Ohio, Postmaster General; Ray L. Wilbur of California, Secretary of the Interior; Arthur M Hyde of Missouri, Secretary of Agriculture; and Robert P. Lamont of Illinois, Secretary of Commerce

Beginning of Hoover Administration.—On March 4, Mr Hoover took the oath of office administered by Chief Justice Taft, and read his inaugural address, while a vast crowd stood patiently in the cold, drizzling rain before the east front of the Capitol He pledged the administration to a vigorous enforcement of law, to co-operation with the agencies of public health, education, agriculture and business, and to continued efforts for the promotion of world peace. He announced that he would shortly call the 71st Congress (Senate 55 R, 39 D., 1 F. L; House 269 R., 165 D., 1 F. L.) in extra session to consider the problems of farm relief and the tariff He closed with a glowing confession of his faith in the American people

The special session opened on Apr. 16. A farm relief bill, embodying the creation of a Federal Farm Board and a $500,000,000 revolving fund to be used at the board's discretion in the aid of agriculture, quickly passed the House The Senate drew up its own bill, like that of the House in all essentials except that it contained a plan for debentures on farm exports This met with opposition from President Hoover, but the bill was passed by a vote of 47 to 44. A deadlock between the houses followed which was not broken until June 13 when the President secured a vote in the House on the debenture plan alone in which the plan was defeated 250 to 113 The Senate then allowed the House bill, as slightly modified in conference, to pass, and it was signed on June 15 The tariff also provided difficulties. Instead of "limited revision," as the President had requested in his message to Congress the Smoot-Hawley bill which was introduced into the House on May 7 proposed changes in every schedule except tobacco and revision of about one-fourth of the rates, mostly upward. The smooth-running House organization passed it in spite of protests from the Democrats and insurgent Republicans. The issue was met squarely in the Senate when Senator Borah introduced a resolution which would limit changes in the schedule to agricultural and related products. The resolution was defeated 38 to 39 on June 18. The next day the Senate voted a recess until Aug. 19, and the House until Sept. 23. Both bodies, meantime, had passed a bill providing for reapportionment of the House of Representatives immediately following the 1930 census. (D. S. Mu.)

UNITED STATES COAST GUARD, THE: see Coast Guard.

UNITED STATES NAVAL ACADEMY, an institution of higher learning conducted by the U S. Navy Department and located at Annapolis, Md., for the purpose of preparing young men to enter the lowest commissioned ranks of the Navy. It is the principal source of officers It was founded as the Naval School in 1845 by the Hon George Bancroft, historian, educator and secretary of the navy, to improve the then unsatisfactory methods of instructing midshipmen (*q v*). At first the course was five years, of which only the first and last were spent at the school. It was reorganized in 1850–51 as the U.S. Naval Academy, with a course of study of four consecutive years. A summer practice cruise replaced the omitted sea service, and gave better opportunities for intensive training During the Civil War the academy was moved to Newport, R I, but was brought back to Annapolis in 1865 In the following years great improvements were effected in the organization and curriculum. During the Civil, Spanish-American and World Wars, the course was shortened to provide more officers for the fleets During the World War large classes of reserve officers were also trained.

Under the superintendent, the academy is organized into the following departments. the executive department, headed by the commandant of midshipmen, who is charged with interior discipline, drills and tactical instruction; and the academic departments. The superintendent, commandant of midshipmen, and the heads of the academic departments constitute the academic board, which determines policies. There are also medical and supply departments, station ships, a hospital, a rifle range and a post-

graduate school

Considering that the Naval Academy does not attempt to produce specialists in any one subject, the course is equal to those of the best colleges and technical schools. Candidates are appointed upon nomination by the president from the United States at large, and from the several States and Territories upon nomination by the senators, representatives and delegates in Congress Also 100 each year from the Navy and Marine Corps and 25 from the Naval and Marine Corps Reserve by competitive examination; and 40 by competitive examination from among the sons of officers, soldiers, sailors and marines who died as a result of the World War The entrance examinations are designed to admit competent graduates of first-class secondary schools. The physical requirements are rigid A fourth-classman or "plebe" enters in June or July, between 16 and 20 years of age, and spends the summer in drills designed to fit him for his new environment. Each succeeding summer he spends on a three months' practice cruise, usually on a battleship The academic year runs from October to June The course covers higher mathematics, physics, chemistry, engineering, naval construction, electricity, seamanship, communications, military and international law, elementary strategy and tactics, military tactics, aeronautics, ordnance and gunnery, navigation, English, naval history, modern history, French or Spanish, hygiene and physical training Theoretical and practical instruction are combined to the fullest extent.

In the early part of the century, the academy was almost completely rebuilt. The grounds, comprising 224 ac, present a most pleasing appearance, with imposing buildings in granite, reinforced concrete, white brick and terra cotta, in the French Renaissance style, after the designs of Ernest Flagg. There are 125 major buildings, including officers' quarters, the estimated value of which is (1928) about $28,000,000 In 1928 there were 1,790 midshipmen In 1912 the Postgraduate School was established Selected officers are sent there from sea for a year or more of advanced work in engineering subjects, to provide experts in design, repair, construction and operation of material. They are then usually given a year's work at certain universities and technical schools In 1927 a "general line course" was established, consisting of a year's work at the Postgraduate School in professional subjects, followed by a year at the Naval War College, Newport, R I

See Benjamin, *The United States Naval Academy;* Earle, *Life at the U S Naval Academy*, Soley, *Historical Sketch of the United States Naval Academy*, Naval Academy Registers, and *Regulations Governing the Admission of Candidates into the U.S Naval Academy*, published by the Bureau of Navigation, Navy Department (S S. R.)

UNITED STATES OF EUROPE, THE. After the end of the World War, there was a widespread feeling among men of all nations that the old formula of the balance of power, unstable and precarious as it had always been, was obsolete and must be replaced by an organized system for the preservation of peace, based on permanent institutions It was for this reason that the League of Nations was created It is however gradually becoming clear that owing to its necessarily world-wide character, the League includes nations too different in race and civilization to be bound closely together by common institutions; and moreover, since it recognizes the principle of the sovereignty of States, the only method at its disposal is arbitration, which only too often cannot be enforced by any kind of sanction.

Conception of Closer Union.—The nations of Europe on the other hand are all similar in race and culture, and it would be possible to conceive of a closer union between them, the aim of which would be not to settle their disputes, but rather to prevent their arising Since quarrels between the countries of Europe are the greatest menace to world peace, this would make the task of the world-wide League at Geneva much easier of accomplishment. At the time of the Locarno agreement the Assembly of the League recognized that regional agreements between neighbouring States were legitimate; and there thus arose the idea of a European Union developing within the framework of the League of Nations.

Geographical Limits.—The European Union was first conceived on political lines, as a federation of States, each of which would retain full political, administrative and fiscal autonomy. Above the local Governments there would however be a parliament, with either one or two chambers, to deal with relations between the countries forming part of the Union, and a central executive authority which would have at its disposal the forces necessary to protect the group against attack from without. This is the system which has been adopted, with differences of detail, by the Swiss cantons, Germany, the American people and the British dominions. The example of the United States shows that the system is capable of maintaining peace among hundreds of millions of men inhabiting a whole continent. It is simple and easily grasped, and it has the advantage of being based on precedent It is therefore accepted almost without discussion by many men whose training is exclusively political.

Differences of opinion begin to appear when an attempt is made to fix the limits of the new Federation. Some would include the whole of traditional Europe from the Urals to Gibraltar. including the British Isles. This is the view taken by the *Fédération pour la Coopération européenne.* Others would exclude Soviet Russia, because the political and social principles on which that country is constituted are absolutely opposed to those of other countries; at the same time they consider that Great Britain could not be included because it is bound up with a vast oversea empire which cannot be incorporated in a European Federation and from which Great Britain would not separate itself. This is the position of *Paneuropa* According to this theory the European Union would consist simply of the European peninsula from the Baltic to the Strait of Gibraltar and the mouth of the Danube, with the addition of Scandinavia.

Economic Aspects.—Whatever be the solution adopted, it is evident that there is an economic as well as a political problem to be considered It is impossible to conceive of a Federation whose members engage in tariff wars with one another All existing Federations have established free circulation of goods, capital and persons between the States of which they are composed. Economic unity has always preceded or immediately followed both the formation of great nations and the federation of small States Some have therefore thought that action should first of all be taken in the economic sphere. This is the object of the *Union Douanière européenne* What countries could however be included in such a customs union? Not Soviet Russia, which will not abandon the State monopoly of foreign trade. It would also be difficult to include Great Britain, on account of the preferential tariffs accorded to the dominions. The only possibility would thus be a peninsular customs union reaching from Poland and Rumania to Spain, and from Scandinavia to Greece. Such a customs union would imply a unified currency, with a federation of the banks of issue, the disappearance of undertakings which are artificially kept in existence by protectionism, and consequently a great regrouping of industries, with specialization according to the districts naturally best suited to each, modernization of plant, and agreements for the distribution of markets in the form of cartels, or financial amalgamations in the form of trusts. This would of course be an exceedingly complicated matter to bring about, but unless it were accomplished, any attempt at political federation would be doomed to collapse as rapidly as the Frankfurt Parliament at the time of the 1848 Revolution.

The suppression of customs duties within the Federation, combined with the rationalization of industry, would clearly result in a general lowering of selling prices, an increase in the purchasing power of the population, and greatly enhanced activity for European industry.

Another question however arises—what would be the relations of the European customs union with other groups of countries? Some believe that it would at once take steps to exclude British and American manufactured products from the continental market, and would endeavour, by means of dumping if necessary, to eliminate its rivals on the principal markets of the world Others on the contrary, including some circles in Great Britain and the United States, consider that it would be easier for Anglo-Saxon industry to conclude tariff agreements with a single customs union than with 24 different States, and that its trade would

rapidly develop on the extensive and newly opened markets of continental Europe, where the purchasing power of the population would have suddenly increased. However this may be, all are agreed that the economic unity of the continent is a necessary preliminary to political union.

Let it be assumed that both problems have been solved. The United States of Europe would then form a great block of 300 million white men, placed between:—Soviet Russia, with 92 million Slavs and 54 million of other races; the British empire, with 67 million whites (plus 413 million natives). The United States of America, with 105 million whites and a coloured population of 13 million

The United States of Europe would far outstrip the others in the size and homogeneity of its population, industrial equipment and military strength. Might it not be tempted to establish its hegemony? The preservation of peace between the four great groups would have to be entrusted to the League of Nations. It may well be asked, however, whether the task of the League would not be rendered much more difficult instead of easier.

Centralization and Decentralization.—The whole of the conception described above rests on one postulate: that it is necessary to adjust the political and economic mechanism of the various countries by widening them to the dimensions of Europe Some however doubt whether this is really the best way of ensuring peace They point out that as elementary education and democracy extend their influence among the population, there is an increasing tendency towards the formation of close ethnic groups This is particularly striking in Central and Eastern Europe, but even the oldest established centralized States of the West are not entirely exempt from regionalist or autonomist movements Simultaneously there is a contrary movement; the enormous development of means of communication, and the constantly accelerated pace of trade, tend to form increasingly large economic units This results in one of two things; either an attempt is made to reduce the economic mechanism to the dimensions of the ethnic group (autarchy), thus paralyzing its material development, or else different ethnic groups are included within the customs frontiers of a great State, and this is liable to result in the oppression of minorities. In either case the causes of dispute between adjoining Powers are multiplied, and the lack of unity in Europe is accentuated The Federalists consider that it would be better to let each of the two mechanisms develop on its own lines. The United States of Europe would thus be the outcome of a twofold movement: political decentralization and economic centralization.

The Two Europes.—If the matter is regarded from the technical point of view, it will be seen that there are in reality two Europes of widely different structure Suppose a line to be drawn through Stockholm, Dantzig, Cracow, Budapest, Florence, Barcelona and Bilbao, let it continue round France, pass between England and Ireland, and continue through Glasgow and Bergen back to Stockholm. Within the circle thus formed are concentrated nearly all the coal mines, the great factories for the production of machinery and manufactured goods, and the great financial markets. Even agriculture within the circle is highly industrialized, and is carried on with machinery, tractors and chemical fertilisers There is a close network of roads and railways, and all the undertakings are highly specialized and produce goods for commerce. Outside the circle there lives an almost exclusively agricultural population: the peasant cultivates his land by human labour with the assistance of a few beasts of burden, he produces little, trades still less, and lives under an economic system of a family character. The first of the two Europes is the Europe of mechanical power, the second the Europe of animal power. The latter has a population of about 230 million souls, living scattered in the country districts (32 persons per sq km.), and cultivating land with a low yield; it cannot feed the annual surplus of the population, and the social equilibrium is only maintained by emigration The former on the other hand has a dense population of about 210 million (92 persons per sq.km.), most of whom are concentrated in the towns. In spite of intensive cultivation, the land cannot provide enough food for the population, and it is necessary to import ever-increasing quantities of foodstuffs as well as th necessary raw materials; in order to pay for these, larger an larger quantities of manufactured goods must be sold to othe countries Thus one of the two Europes exports human beings and the other goods.

During the last century millions of emigrants, most of then coming from the agricultural districts of Europe, crossed th ocean, in order to find in the various countries with a temperat climate (Canada, the United States, Argentina, Uruguay, Chile South Africa, Australia and New Zealand) land which they coul cultivate or on which they could raise stock just as they did i their native country Industrial Europe supplied them, on credit with agricultural machinery, railways, textiles and so on, for whicl they paid with cereals, meat, fruit, wool, etc. Thus there cam into being a third Europe, the offspring of the two others; agricul tural like the second, but equipped like the first, and having to-da a population of 140 millions.

In addition, about 20 million whites have settled in exoti countries (tropical districts, countries inhabited by semi-nomadi Mohammedans, Asiatic countries inhabited by sedentary tillers o the soil) in order to obtain from them certain foodstuffs and ra materials which are not produced by temperate countries, such a cotton, rubber, ground-nut, tea and coffee. In exchange, they sel to the natives such of the products of European industry as thei habits of life permit them to utilize, such as textiles, alcoholi liquors and arms; for the rest, they endeavour to compel them t work or to buy goods by various measures, fiscal and other.

The total exports of the various countries of industrial Europ (not including the goods exchanged among themselves) amounte in 1925 to a value of about 7,400 million dollars They wer distributed as follows:

	Millions of dollars	Percentage of whole
To agricultural Europe	2,033	27·5
To Europe overseas	2,845	38·4
To exotic countries	2,519	34·0
	7,397	99·9

It will be seen from these figures that the Europe of anima power absorbs little more than one-quarter of the surplus pro duction of the Europe of mechanical power, and naturally i supplies it with little more than one-quarter of the foodstuff and raw materials needed by the excess of its urban populatior This shows how utopian it is to imagine that Europe can be self supporting to-day As a matter of fact, the economic and socia equilibrium of industrial Europe depends on oversea countries fo nearly three-quarters of its trade Until recently this has been n disadvantage Now, however, trade currents are beginning t change their direction. Before the World War, it was to the Unite States that most of the emigrants, goods and capital of the Ol World made their way Now however the United States is no only closing its doors to emigration from agricultural Europe an raising customs barriers against imports from industrial Europe but is in its turn exporting an increasing quantity of raw materials foodstuffs, manufactured goods and capital. In face of this nev competition, Great Britain has not succeeded without difficulty i maintaining its exports at their pre-war level (value as in 1913)

Continental industry has not yet suffered greatly from thi state of affairs, because the depreciation of the various Europea currencies has enabled it to sell its goods at less than America and British prices Now however that the currencies of the variou European countries have been stabilized, their costs of produc tion, reckoned in gold value, have begun to come up to those o their competitors, and the premium on export is thus tending t disappear. In spite of what has been done for the rationalizatio of industry, Europe must expect to lose more and more of it oversea markets Compensation cannot be looked for in th exotic countries, for Japan, China and India are becoming increas ingly industrialized; and the coloured races are showing a tendenc to revolt against excessively one-sided exploitation of their re sources Thus only one outlet remains for the industry of th

continent; the development of Eastern and Southern Europe, which has been too much neglected. At the present time the 230 million inhabitants of agricultural Europe absorb 2,033 million dollars' worth of the products of industrial Europe, or on an average rather less than 9 dollars' worth per head per year. The 140 million inhabitants of Europe overseas absorb 2,845 million dollars' worth, or over 20 dollars' worth per head per year. Yet these men, whether they live in Canada, the United States, Argentina or Australia, are similar to the men of agricultural Europe, and cultivate similar land in a similar climate The only difference is that for half a century industrial Europe has been supplying them on credit with plant and transport facilities to a value of milliards of dollars; these have been amply repaid in the form of foodstuffs and raw materials.

Let us suppose that by the same means the purchasing power of the agricultural population of Europe had been raised to the level of that of the oversea populations. In that case the exports of industrial Europe to agricultural Europe would have amounted to 20 times 230 million, or 4,600 million dollars, instead of 2,000 million as at present, thus giving an increase of 2,600 million dollars This would represent an increase of 35% as compared with the total present exports of industrial Europe to all parts of the world, which amount to 7,400 million dollars This would not merely solve the unemployment problem both in Great Britain and on the continent, but would also settle the agrarian question which is at the present time so acute throughout Eastern and Southern Europe. The two parts of the continent would then be on the same level technically, and Europe would thus recover its material and moral unity

Conclusion.—Three conditions appear to be necessary if this is to be attained:

(1) The stream of gold which for the last three generations has flowed from the money markets of the Old World to oversea countries must turn back from America to Europe. This process has already begun; but it would be better if instead of lending their capital to industries which lack customers, New York and London would lend it to agricultural countries, which would then be able to give industrial undertakings the orders which they need

(2) Credit however presupposes confidence, and capital is not risked in countries which are at any time likely to go to war with one another. It is therefore necessary that the Kellogg pact should become a reality; this is an indispensable condition for the necessary supply of credit

(3) In order that the spirit of peace may penetrate more profoundly into the masses of the population, they must learn to think less in terms of the nation and more in terms of Europe.

The latter object may be greatly promoted by the idea of the United States of Europe. Imperfect though it may be, it provides the masses with a readily comprehensible idea of what a united Europe might be; it may thus act on the popular mind as an idea capable of being translated into action In this sense it may be a sort of myth; but the myth may become a reality provided that it is accompanied by a practical economic policy Such a policy would necessitate the financial collaboration of Great Britain and the United States, and thus there could be no opposition between them and the European union. (F Del.)

UNITED STATES RUBBER COMPANY was formed in 1892 through the merging of nine companies manufacturing rubber boots, shoes and clothing Later, many other companies were acquired. In 1929, with more than 50 factories in the United States and Canada, the United States Rubber Company is producing rubber articles of every description, and has distribution points throughout the world

Among the company's most important assets are its great rubber plantations in Sumatra and Malaya. The annual production is more than 30,000,000 pounds. The development of super-yielding trees by means of bud grafting has been successfully accomplished The research laboratories of the United States Rubber Company are concerned with the study of new manufacturing processes and have made important contributions such as the flat-band method of tire building; the use of latex in the treatment of cord fabric for tires, and in the manufacture of inner tubes for tires. The sales of the United States Rubber Company approximate $200,000,000 per annum. (E. C. Bu.)

UNITED STATES SHIPPING BOARD, a board created by an act of Congress approved Sept. 7, 1916, entitled:—

An act to establish a United States Shipping Board for the purpose of encouraging, developing and creating a naval auxiliary and naval reserve and a merchant marine to meet the requirements of the commerce of the United States with its territories and possessions and with foreign countries; to regulate carriers by water engaged in foreign and interstate commerce of the United States; and for other purposes.

Under the act the board was authorized to form a shipping corporation with a capital stock not exceeding $50,000,000, of which a majority was to be held by the United States, for the purchase, construction, equipment, lease, charter and operation of merchant vessels in the commerce of the United States. The act provided that the $50,000,000 to be placed at the disposal of the board would be raised through the sale of Panama Canal bonds. The shipping corporation provided for in the act was incorporated under the name of the Emergency Fleet Corporation, but in 1927 Congress changed the name to the U.S. Shipping Board Merchant Fleet Corporation.

In the spring of 1917, when the United States entered the war, there were in the country 37 steel ship-yards with 162 ways and 24 wooden ship-yards with 72 ways, capable of launching vessels of 3,500 dead-weight tons At the signing of the Armistice in 1918, there were in all 223 ship-yards, steel and wood, with a total of 1,099 ways. At the close of the war the Shipping Board controlled a total fleet of 1,196 vessels of 6,540,205 dead-weight tons. These vessels were acquired by: (1) New ships built by the Shipping Board. (2) American ships requisitioned on "time" and "bare boat" charters. (3) Seized German ships. (4) Commandeered Dutch ships (5) Chartered neutral ships

The Shipping Board is an independent department of the executive branch of the Government. The powers given the board under the act to regulate the operation of common carriers by water make its powers not unlike those of the Interstate Commerce Commission However, it is expressly provided in the act that the board has not concurrent jurisdiction with the Interstate Commerce Commission in matters within the latter's power.

Following the directions of Congress, contained in the Merchant Marine Act of 1916, as amended in 1920, the Shipping Board has gradually disposed of its vessels to American citizens Some vessels were disposed of with the obligation that the vessel would be used in a definite service and trade The sale of some vessels carried with it the obligation to undertake alterations, betterments and reconditioning under approved plans and specifications.

UNITED STATES STEEL CORPORATION, an American holding company, was incorporated under the laws of the State of New Jersey, on Feb. 25, 1901 Its principal manufacturing subsidiary companies are Carnegie Steel Company, Clairton Steel Company, Union Steel Company, Illinois Steel Company, Illinois Steel Warehouse Company, Minnesota Steel Company, American Steel and Wire Company, American Sheet and Tin Plate Company, National Tube Company, The Lorain Steel Company, American Bridge Company, Canadian Bridge Company, Limited, Tennessee Coal, Iron and Railroad Company, Federal Shipbuilding and Dry Dock Company, Universal Portland Cement Company and Cyclone Fence Company. Its export subsidiary is the United States Steel Products Company which sells about 15% of the corporation's total production for export. The subsidiary manufacturing companies operate 133 works with 109 blast furnaces, 32 Bessemer converters, 335 open hearth and electric steel furnaces, with finishing mills for all steel products.

The corporation owns through other subsidiaries extensive iron ore, coal and coke and limestone properties. Its subsidiary railroal companies own or lease 1,132 main line tracks, with 443 m. of second tracks, 332 m. operated under trackage rights, 618 m. of industrial tracks and 1,369 m. of yard tracks and sidings Its marine equipment includes 34 steamers for overseas trade and 72 steamers on the Great Lakes. Its ingot capacity is about 24,000,000 gross tons annually or about 40% of the total ingot capacity of the United States. For 1927 the average number of

employees was 231,549 with a total pay roll of $430,727,095. The total sales for 1927 had a value of $870,235,942, representing about 13,000,000 tons of finished products.

Capital stock of the corporation consisted (1928) of 7,116,235 shares of common and 3,602,811 shares of preferred, with a par value of $1,071,904,600. Undivided surplus as of Dec 31, 1927, was $363,044,913 62 and the number of stockholders was 151,596.

UNITED SYNAGOGUE, one of the six chief organizations of London Jews. These are, in order of seniority (1) the Spanish and Portuguese Jews' congregation, founded in 1657· principal synagogue, Bevis Marks, Aldgate (built 1699–1701); three constituent synagogues The post of *Haham* has not been filled since Dr. M. Gaster resigned in 1917 after 37 years' tenure. President of the Elders, Sir Francis Montefiore, Bart. (2) West London synagogue of British Jews (Reform), founded in 1841 mainly by members of the preceding synagogues, 34 Upper Berkeley street, W.I Minister Emeritus, Rev M Joseph; minister, Rev V. C. Simmons, B A.; Chairman of Council, P S Waley. (3) The United synagogue, founded by Act of Parliament in 1870 by a union of the Duke's place and other Ashkenazic synagogues and consisting of 18 constituent, two district and 13 associated synagogues. the chief Rabbi is Dr J H Hertz (*q v*) and the president is Lionel de Rothschild, O B E (4) The Federation of Synagogues (38 constituents). (5) The Adas Yisroel (Rabbi V. Schonfeld), 124, Green lanes, N 16. (6) The Liberal Jewish synagogue, established 1910, 28 St. John's Wood road, N W 8 Rabbi I. I Mattuck and Rev. M L Perlzweig. President, Dr C. G Montefiore Besides these six organizations there are many independent synagogues The United synagogue is confined in its direct spiritual, educational and charitable work to London, but it exercises considerable influence over the Jews of the empire by reason of the high respect felt towards its Chief Rabbi (*See* pp. 18. *sqq*. of H P Stokes, *Studies in Angl. Jew. Hist.* 1913)

BIBLIOGRAPHY—Details of the United Synagogue and other bodies, metropolitan, provincial and colonial, will be found in the current issue of the *Jewish Year Book*

The United Synagogue of America is a federation of Jewish congregations, sisterhoods and young people's organizations, in the United States, Canada and Cuba It was founded in 1913 by the late Prof Solomon Schechter, for the purpose of advancing the cause of Judaism in America and the maintenance of Jewish tradition in its historical continuity It was incorporated on April 24, 1916 The United Synagogue of America does not endorse innovations introduced by any of its constituent bodies, yet embraces all elements essentially loyal to traditional Judaism. In 1918, the Women's League was organized with the object of advancing traditional Judaism by furthering Jewish education among women, by creating and fostering Jewish sentiment in the home, by promoting the observance of Jewish dietary laws and home ceremonials, Sabbath and Festivals, and by generally strengthening the religious institutions of the home and the community In 1921, the Young People's League was established for the purpose of enlisting the activity of the Jewish youth in the advancement of traditional Judaism by extending their knowledge of Judaism, deepening their devotion to its precepts and establishing closer relations between them and the Synagogue; to foster a knowledge of Hebrew and to encourage an active interest in the Zionist cause.

UNITS, DIMENSIONS OF (including the principles of DYNAMIC SIMILARITY.) In the article on PHYSICAL UNITS it is shown how certain units, or standards, of physical quantities have been chosen, enabling other amounts to be specified as multiples of the respective standards. It is further described how, in accordance with the lines along which physical science has developed, it has been found to be necessary to select three only as fundamental, namely, the standards of mass, length and time; other physical quantities are not independent but can be expressed in terms of these three by an application of the laws of mechanics. For example, a velocity is a length divided by a time, an acceleration is a velocity divided by a time, a force is a mass multiplied by an acceleration, and so on. The particular way in which the fundamental quantities enter into the specification of the secondary or derived quantities can be indicated by a type of algebra based upon the definition of the quantity in question. The most explicit representation is obtained by including the name of the unit as well as the numerical magnitude. Thus when a length of x feet is traversed in t seconds the velocity is $\frac{x}{t}\frac{\text{feet}}{\text{sec}}$ and not merely $\frac{x}{t}$, the area of a rectangle is $[x \text{ feet}]\times[y \text{ feet}]=xy \text{ feet}^2$ where x and y are the numerical lengths of the two sides and the symbol (feet^2) merely indicates the number of lengths (expressed in feet) that are multiplied together in calculating the area In the same way if we write the velocity $\frac{x}{t}$ feet sec^{-1} we are again indicating, by usual algebraic symbols, the operation that is carried out in calculating the velocity Metaphysical arguments as to what the possible meaning of a *reciprocal* second may be are completely out of place. The fundamental quantities of mass, length and time are denoted by M, L, T and the indices for the respective quantities are indicated in square brackets, thus $[M]^{n_1}$, $[L]^{n_2}$, $[T]^{n_3}$, that is to say the first term indicates that the numerical values of n_1 masses were multiplied together, the second, that n_2 lengths were multiplied and the third that n_3 times were multiplied. Such equations indicate what are called the dimensions of the quantity to which they refer.

Principle of Homogeneity.—The basic fact which makes a knowledge of the dimensions important is that we can add, subtract or equate together only things of like kind We can add any number lengths, for example, or of times, or of velocities, but to add the numerical values of a length and a time, or a length and a volume, is a meaningless act so far as rational physics is concerned. This can be stated, as a positive general principle in the following words:—

In any physical equation every term must have the same dimensions

It is perhaps unfortunate that the same word—*dimensions*—is used in popular conversation for size (as when we speak of a hall of large dimensions), if we do not use it in this sense in connection with scientific problems no harm is done

Every term may consist of one or more factors or elements; there is nothing constraining the separate elements to have the same dimensions Thus, by definition

$$[v]=[LT^{-1}]$$
$$\text{and } [\text{acceleration}]=[a]=[LT^{-2}]$$

Further, when a is constant, space $=\frac{1}{2}at^2$ or $[L]=[LT^{-2}\cdot T^2]=[L]$. Thus both sides have the same dimensions, though on the right the term is built up of elements having various dimensions

$$\begin{aligned}\text{Again work done} &= Fs=\text{force}\times\text{distance},\\ \text{kinetic energy} &= \tfrac{1}{2}mv^2.\\ \text{Thus [work done]} &= [M\cdot LT^{-2}\,L]=[ML^2T^{-2}]\\ [\text{energy}] &= [M\cdot LT^{-1}\cdot LT^{-1}]=[ML^2T^{-2}]\end{aligned}$$

Hence work done and energy have the same dimensions. This could have been foreseen because energy is defined as that which diminishes, when work is done, by an amount *equal* to the work so done

The greater part of this article will be concerned with applications of this principle of homogeneity

Change-ratios.—A second application is concerned with the change of the numerical value of a quantity when the unit is changed. This arises from the fact that we are not yet content with having only one unit for each kind of quantity. Thus in ordinary life, money is measured in pounds, shillings, pence, francs, marks, dollars, kopecs, pesetas, etc. These do not even preserve invariable relations to one another. Keeping to the British system, if we estimate the value of an estate in shillings the numerical value is 20 times its value expressed in pounds sterling since the shilling is $\frac{1}{20}$ of a pound; or, in general, the numerical value of a physical quantity varies inversely as the

value of the unit in terms of which it is expressed. This is true also for derived units. The method of applying the idea of dimensions is best seen from an example which will be set out in full·—

To find the number of dynes in 10 lb. weight.

Let x be the desired number then

$$x \text{ dynes} = x\,\frac{\text{g.}\times\text{cm.}}{\text{sec}^2} = 10\,\frac{\text{lb}\times 32{\cdot}2\text{ ft}}{\text{sec}^2}$$
$$= 10\,\frac{453{\cdot}6\text{ g}\times 32{\cdot}2\times 30{\cdot}48\text{ cm}}{\text{sec.}^2}$$
$$= 10\times 445170\,\frac{\text{g.}\times\text{cm}}{\text{sec}^2}$$
$$\therefore\quad x = 4451700.$$

Here a lb. weight is taken as the force which gives an acceleration $g\left(\equiv 32{\cdot}2\,\frac{\text{ft}}{\text{sec}^2} = 32{\cdot}2\times 30{\cdot}48\,\frac{\text{cm}}{\text{sec}^2}\right)$ to a mass of one pound ($\equiv 453{\cdot}6$ grammes). These substitutions are introduced on the right, the names of the units are then identical on both sides; finally the numerical coefficients are reduced to one which gives the value of x. The above formal method serves to effect the change of units in any case whatever

The need for homogeneity in regard to the dimensions of the terms of an equation may be based upon the fact that the course of a phenomenon cannot be supposed to vary with a change of the units employed. Now if one term involves a mass to the second power and we increase the unit of mass ten times the numerical value of the term changes in the ratio 1/100; if another term involved the mass to the first power, it would change in the ratio 1/10, thus the relative values of the terms would alter and this would imply that the phenomenon represented by their sum would follow a different mode of change. Phenomena of nature, however, proceed quite independently of our mode of analysis.

Applications.—The chief application of the method of dimensions arises, however, owing to the possibility it provides of effecting a partial solution of problems in physics. It does not provide a complete answer in any case; there is always a constant, or even a function, left undetermined by it. The method is best explained by means of examples.

Simple pendulum—One of the simplest is the problem of the time period of a simple pendulum. The first step is to decide on the various properties that can possibly take part in the determination of the value of the time period. For simplification, we suppose the motion to be frictionless. The quantities that determine the period are the force due to gravitation *i e.* the weight of the *bob*, W, the mass M, and the length L of the suspending cord The amplitude of the swing, A, may be important but for small oscillations it may be ignored. The dimensional equation is therefore $[T]=[M^x]\,[W^y]\,[L^z]$ where the indices must be chosen so that the principle of homogeneity is satisfied; that is the sum of the indices for any one fundamental quantity must be the same on both sides of the equation. Each element must now be expressed in terms of the fundamental units; this gives the equation

$$[T]=[M^x]\,[(MLT^{-2})^y]\,[L^z].$$

Hence considering time $1 = -2y$
considering length $0 = y + z$
considering mass $0 = x + y.$

These three equations give for the three unknowns,

$$y = -\tfrac{1}{2},\qquad z = +\tfrac{1}{2} = x$$
$$\therefore\quad [T] = [(MW^{-1}L)^{\frac{1}{2}}].$$

Hence we conclude that

$$\text{Time period} = \text{constant}\left(\frac{ML}{W}\right)^{\frac{1}{2}}.$$

The constant is left entirely undetermined by the method so that the solution of the problem is not complete. Newton completed the solution by experiment and found that the time period was independent of the weight of the bob. Hence he was able to conclude that *the weight of a body must be proportional to its mass;* the proportionality is g, the acceleration due to gravity, so that finally $T = \text{constant}\sqrt{\frac{L}{g}}$. A complete solution obtained by applying the laws of motion proves that the constant is 2π for small oscillations, while for a large angular amplitude, α, it is equal to the numerical series $2\pi\left(1+\frac{\sin^2\alpha}{4}+\text{etc}\right)$ It should be observed that α is the ratio of two lengths and is therefore of zero dimensions. We could have inferred that it could only depend upon the ratio of the lengths of the arc and of the pendulum and not upon their absolute magnitudes because the "constant" must be of zero dimensions.

The dependence of the time-period upon the *square-root* of the determining length is characteristic of cases in which forces proportional to the *volume* are the sole motive power. "As examples coming under this head may be mentioned the common pendulum, sea-waves whose velocity varies as the square-root of the *wave-length*, and the whole theory of the comparison of ships and their models by which Froude predicted the behaviour of ships from experiments made on models of small dimensions." (Rayleigh, *Theory of Sound*, Art 381, 2nd edition.) We return to this more general problem later.

Dynamic Similarity.—In geometry, plane figures are said to be similar when a single length is sufficient to specify for each its distinction from the rest Thus, for equilateral triangles it is sufficient to specify for each the length of one side, and for circles, the radius. For example, the areas of circles are given by πr^2, those of equilateral triangles are given by $\sqrt{3}\,r^2/4$. In each case the area is proportional to the square of the length x but the factors of proportionality are different when the figures are different The constancy of the numerical factor is, therefore, a characteristic of similar figures.

Now, in the problem of the pendulum we can write, in general, allowing for the effect of the arc of swing

$$T\sqrt{\frac{g}{L}} = \text{a function of (arc/length).}$$

If, however, we restrict attention to those cases only for which the ratio arc/length is constant we can consider them as constituting a family (analogous to the family of similar triangles). All members of such a family are said to be *dynamically* similar and for these the right hand and therefore the left side also, is a constant. The similarity consists in the circumstance that different members of the family are distinguished from one another by the *single* quantity L. Take two pendulums in the same locality (g=const.) and having the same value of arc/length, then $T^2 \propto L$. If we observe one pendulum at intervals of time T_1 and find it is always passing through its central position at each observation; and then take a second pendulum of twice the length (and twice the maximum arc of swing) then the intervals of time must be four times as great in order that the observations shall take place at passages through its central position.

For the experimental determination of the constant, on the right, use may be made of either shorter or longer pendulums according to convenience. This is the principle underlying the use of models in dynamical problems, to which Lord Rayleigh referred.

Planetary Motion.—As a more complicated case, which brings out the weakness as well as the power of the method we may consider planetary motion under the influence of universal gravitation. Putting F for the attraction between the sun and planet the law of gravitation gives $F=\gamma\,\frac{PS}{L^2}$ where P and S are the masses of planet and sun respectively, L the distance apart and γ the gravitation constant; and consequently

$$[\gamma]=\left[\frac{FL^2}{PS}\right]=\left[\frac{L^3}{T^2M}\right].$$

The eccentricity of the orbit is a pure number and does not contribute to the dimensional equation; therefore we may assume $[T]=[R^x\gamma^z S^u P^v]$, where R is the radius of the orbit. From this it follows that

$$0=x+3z$$
$$0=-z+u+v$$
$$1=-2z$$

so that $z=-\frac{1}{2},\quad x=\frac{3}{2},\quad u+v=-\frac{1}{2}$

and therefore $[T^2]=[R^3\gamma^{-1}S^{-1}(P/S)^n]$.

There is nothing here enabling one to specify how the time period depends upon the eccentricities of the orbits. However, provided we restrict attention to a group of cases for which the eccentricity is the same, we have

$$T^2=\frac{R^3}{\gamma S}\left(\frac{P}{S}\right)^n\times\text{constant}$$

There is however a subsidiary principle which should be attended to concerning the choice of the equations which determine the dimensions of the "physical elements" upon which the character of the phenomenon depends For example, in finding the dimensions of γ from the law of gravitation $F=\gamma\frac{PS}{L^2}$ since $F=P\times$acceleration it is seen that P enters *in the same way* on both sides and it can be cancelled, in other words, we can define γ in terms of the acceleration instead of in terms of the force. If this is done, the mass P does not come into the equations at all and therefore n *must* be zero This subsidiary principle may be stated thus: the dimensions of any one of the physical elements of the equation must be defined by the simplest mechanical equation by which its definition is possible.

The factor $(P/S)^n$ therefore disappears from the equation The other factor can be compared with that determined by applying the laws of mechanics in the simple case of circular orbits The centripetal force on the planet is $P\omega^2R$ where ω is the angular velocity and this must equal $\gamma PS/R^2$ whence $\omega^2=\gamma S/R^3$. Since $\omega=2\pi/T$ this is of the same form as that obtained by considering the dimensions

It may be added that if we had assumed a force (or acceleration) proportional to the inverse k^{th} power of the distance the index of R would be $k+1$ instead of 3.

Indeterminateness.—In the examples given not more than three indices are required to be determined. In most cases, however, the number is greater than three. It is obvious that there are only three dimensional equations depending respectively on the indices of mass, length and time Hence any additional indices must remain undetermined. A complete mechanical treatment of the problem (if possible) would show that all these values are definite and would determine them. Since however the real utility of the method of dimensions is in connection with those problems, which, owing to the complexity of the mathematical relations cannot be solved in detail, it follows that for the determination of all but three of the unknown quantities it is necessary to have recourse to experiment. The possibility of solving the equation even for only three variables is however an immense advantage since it reduces the range of experiments necessary for the determination of the rest.

Motion of Fluids.—Casual examination of the flow of liquids in pipes, such as can be made by watching the motion of solid particles carried down with the stream, is sufficient to show that it is different in character for sufficiently slow and for sufficiently high rates of flow. Careful investigation demonstrates that for a circular pipe of definite diameter there is a particular outflow at (or very near) which the change occurs. The change is detected by varying the pressure-head and finding at each stage the corresponding outflow; for low heads the two quantities are proportional to one another; at very high velocities the head varies more nearly as the square of the outflow. The difference is traceable to the formation of eddies when the speed is great enough. The problem of eddying flow has not yet been solved by means of mechanical theory and this is exactly the type of problem which it is useful to investigate as far as possible by means of the method of dimensions. The data upon which the velocity of outflow depends are (i.) the diameter D of the tube which is assumed in the first place to be cylindrical, (ii.) the density ρ of the fluid; (iii.) the viscosity, μ; (iv.) the resistance per unit area R. The temperature will be regarded as fixed, in any case it only enters in a secondary way owing to the above quantities depending upon it. The dimensions of D and ρ are [L] and $[ML^{-3}]$; while for μ, which is defined as a force per unit area per unit gradient of velocity the dimensions are $[ML^{-1}T^{-1}]$, and for R, they are $[ML^{-1}T^{-2}]$. The dimensional equation is

$$[LT^{-1}]=[L^x(ML^{-3})^y(ML^{-1}T^{-1})^z(ML^{-1}T^{-2})^u].$$

Equating dimensions, we have,

from lengths, $1=x-3y-z-u$

from times, $-1=-z-2u$

from masses, $0=y+z+u$

whence $x=2u-1$, $y=u-1$, $z=1-2u$ and u is undetermined.

Hence $$[v]=\left[\frac{\mu}{D\rho}\right]\left[\frac{RD^2\rho}{\mu^2}\right]^u.$$

Since the value of u is undetermined it is clear that *any* value will be consistent with dimensional requirements. Not only is this so but a series of terms of powers of $RD^2\rho/\mu^2$ will also be consistent. Instead of assuming a single power a more general solution is obtained by writing the last factor as an unknown function of the term in brackets, or finally

A. $$\frac{vD\rho}{\mu}=f_1\left(\frac{RD^2\rho}{\mu^2}\right)\quad\text{where}\quad f_1\left(\frac{RD^2\rho}{\mu^2}\right)$$

stands for such a function. It is important to observe that both sides of the equation have zero dimensions—they are purely numerical quantities (such a pure number was named by James Thomson a *numeric*). The equation therefore asserts that the numeric on the left is some function of that on the right It can be written in various ways for since $\frac{RD^2\rho}{\mu^2}=\frac{RD}{\mu v}\cdot\frac{vD\rho}{\mu}$, and so on, we can assert that

B. $$\frac{vD\rho}{\mu}=f_2\left(\frac{RD}{\mu v}\right)=f_3\left(\frac{R}{\rho v^2}\right)$$

where f_2 and f_3 indicate different functions. Each of the terms in brackets is a numeric.

These equations represent the most general conclusions that can be drawn, in this problem, from the method of dimensions. Since each side is a pure number its value is an absolute constant, *i.e.*, it is independent of the particular system of units in terms of which the values of v, D, ρ, μ, etc., are expressed. (Although of course if mixed systems are employed the value will be different; for example if v is in feet per second, D must not be in inches without a suitable change being made in the "constant." Such mixed units will not be further referred to though they are frequently employed). This forms the basis of the use of a model. The expression $vD\rho/\mu$ can be determined experimentally by means of a single experiment and must be constant for dynamical similarity *if it be assumed that the above specification of the problem is complete.* It is useful to enquire at this stage in which particulars it may be incomplete. It has already been restricted to *cylindrical* tubes A truly cylindrical tube is an ideal one; real tubes depart from the ideal in possessing irregularities of surface. The degree of roughness may be specified by the maximum deviations, d, from a perfectly smooth surface, in which case the ratio d/D is another numerical factor on which $vD\rho/\mu$ will depend; a function of it requires to be introduced on the right, and the single experiment will only determine the numerical value of $vD\rho/\mu$ for those cases in which the roughness bears a constant proportion to the diameter. Similar remarks require to be made if the tubes are smooth

but not cylindrical. If they are elliptical in section a function of the eccentricity will be concerned; this will, however, be a mere number; hence, provided, the eccentricity is the same in the group of cases considered, the "constant" will not be affected. Further, the question of the possible influence of the elastic properties of the fluid must in any case be raised; in practice it is found that they are of no importance until velocities comparable with the velocity of sound in the fluid are set up. These questions are raised here in order to indicate that some degree of caution is necessary; but since, in any case, the results arrived at are intended to be checked by suitable experiments no irreparable harm is done if some important variable is at first left out of account

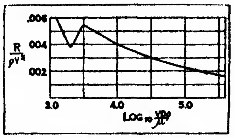

FIG 1—DIAGRAM FOR THE FLOW OF FLUID THROUGH PIPES, SHOWING HOW BEHAVIOUR IS DETERMINED

The outcome of the foregoing discussion is that dynamical similarity will exist between all cases for which $vD\rho/\mu$ is a constant; the characteristic constant will be different for each characteristic feature of the flow that may be examined.

Further elucidation is obtained if we examine the various experimental results which have been obtained for various velocities, diameters and *fluids*. These include fluids as diverse as air and water. If $vD\rho/\mu$ be plotted horizontally on a single diagram against $R/\rho v^2$ vertically, for all cases a *single curve* is obtained, the ordinates decreasing at first, then rapidly increasing for a short range of values of the abscissae and then gradually falling continuously. The diagram can be compressed into less space if $\log vD\rho/\mu$ is plotted horizontally instead of the quantity itself (fig. 1). Any single point on the curve represents a whole group of cases which are dynamically similar. The most characteristic case is the position of the almost discontinuous middle region where a sudden change in the law of flow is indicated. This region is, in fact, that in which the flow changes from linear to turbulent. This change occurs in each case for a certain velocity V_c; but this *critical velocity* depends upon the other data for the same point on the diagram, it occurs, in fact, for a definite value of $V_c D\rho/\mu$, the same for the whole group. Doubling the viscosity alone, doubles the critical velocity; using the same fluid (*i e.*, μ/ρ = const.) and doubling the diameter of the tube *halves* the critical velocity and so on The value of this critical constant is called the *Reynolds number* after Osborne Reynolds who first examined the problem both theoretically and experimentally. It is, from what has been said, a pure number independent of the system of units employed; its value is a little over 2,000. Any lack of perfect definiteness can be attributed to fortuitous circumstances such as different roughnesses of the tube, accidental tremors, etc. It is evident from the experimental curve that these accidents play only a very subordinate part. In passing along the curve the change of $R/\rho v^2$ (which is also a numeric), in the critical region is from ·0038 to ·0054 or thereabouts (Stanton and Pannell *Phil. Trans. Roy. Soc.* A vol. 214, p. 109, [1914]). Professor C. H. Lees from an examination of this diagram has concluded that the resistance per unit area, R, can be represented by the following formulae in the region of turbulent flow; for water at 15° C, $R=0{\cdot}0191v^{1{\cdot}65}/D^{0{\cdot}35}+0{\cdot}0009v^2$, and for air at 15° C and 76 cm. pressure, $R=0{\cdot}0000468v^{1{\cdot}65}/D^{0{\cdot}35}+0{\cdot}00000110v^2$ where C.G.S. units are employed. These formulae show that the unknown function can be represented sufficiently well by two terms, one of which is practically independent of the diameter of the tube. The velocity referred to is the mean velocity for the whole cross-section of the tube. The formulae are considered to be valid for at least a range of diameters from 0·3 to 12 cm. (*Roy. Soc. Proc.* A. Vol. 91, p. 60, 1914). If a single term be used instead of two the best index of v is not far from 1·75.

It was by no means certain that a single curve would represent the facts for tubes of various diameters because the principle of dynamical similarity requires that the eddies when present should have diameters proportional to those of the tubes and this is not known to be the case. Our knowledge concerning the curve must, in this repect, rest on experimental results.

Flow Past Obstacles.—From the dimensional point of view the flow past fixed obstacles is dealt with in the same way as that through pipes. The diameter, D, of the obstacle takes the place of the diameter of the pipe and further we naturally deal with the total force, F, which the obstacle experiences from the fluid instead of a force per unit area. The final result obtained as before is

$$\frac{vD\rho}{\mu} = f_1\left(\frac{F}{\rho v^2 D^2}\right) = f_2\left(\frac{F\rho}{\mu^2}\right).$$

Since the practical problem is usually to find the force corresponding to a given velocity we may conveniently write $\frac{F\rho}{\mu^2} = f_3\left(\frac{vD\rho}{\mu}\right)$. The velocity referred to here is the relative velocity of the fluid at a great distance from the obstacle (*i e.*, what may be called the undisturbed velocity) to that of this obstacle (which we have supposed fixed). The same equation also represents the case of a body moving with velocity v through a fluid which is stationary at a great distance and in which the body is completely immersed. No factor dependent on the shape is introduced, therefore for similarity between the several members of a group they must all have the same shape. The formula shows that for this family $F\rho/\mu^2$ will have a constant value provided $vD\rho/\mu$ remains constant. The corresponding values of these terms can be determined by experiments on small-scale models and once determined should be applicable to all cases having the same geometrical shape. All the results for different media and different sizes and the different forces that correspond can be plotted as a curve with ordinates $F\rho/\mu^2$ and abscissae either $vD\rho/\mu$ or its logarithm (or any other convenient function of it). Any one point on such a diagram gives a group of cases which are dynamically similar to one another.

For sufficiently slow speeds the force and speed are proportional to each other, hence $F = \text{constant} \times \frac{\mu^2}{\rho}\frac{D\rho}{\mu}v = \text{const.} \times \mu Dv$ which is Stokes' Law. For a sphere, experiment and dynamical theory indicate that the constant is 3π. The motion is non-turbulent. For very rapid motion F is found to vary more nearly as the square of the velocity and the equation for it must then approach the form

$$F = const.\ \frac{\mu^2}{\rho}\left(\frac{vD\rho}{\mu}\right)^2 = const. \times D^2\rho v^2$$

which is independent of the viscosity. To illustrate the use of these results in connection with small-scale models consider cases in which it is required to find the force in air of a machine of linear dimension D_a by means of measurements in water with a model of linear dimensions D_w. The data required are:

Ratio of viscosities of air and water 1/60 approx.
Ratio of densities of air and water 0·0013 approx.
Ratio of μ/ρ of air and water 10 approx.
Ratio of μ^2/ρ of air and water 0·6 approx.

Hence going back to the general equation the condition for dynamic similarity is that $\frac{v_a}{v_w} = 10\frac{D_w}{D_a}$ and F_a/F_w is then 0·6. The object gained by driving the model in water is to diminish the speed necessary to about one-tenth the very high speed that would be required in air. The numbers given are only approximate since both μ and ρ vary with temperature. A rise of 25 degrees C diminishes the viscosity of water to one-half so that particular attention must be paid to its temperature during the experiments.

If however the model is used in the same medium as the main apparatus—for example in air for all aeroplane work—it is usually impossible to work with velocities that satisfy the principle of similitude. It is necessary then to make experiments with as large a variation of velocity as possible and to *extrapolate* the curve of F plotted against vD, the values of μ and

ρ being now constants; or, what is more usual, to take the left side of the equation in the alternative form already given, $F/(\rho v^2D^2)$, and to plot $F/(v^2D^2)$ against vD (at high speeds F varies nearly as v^2 and the extrapolation is safer if this choice of ordinate is made). A useful guide in design is thereby provided which is subsequently tested out on the full scale machine.

Plates.—Difficulties arise in many cases Experiments on square plates placed in a stream of fluid do not accord with the deductions from the above equations and have given rise to a great deal of discussion. In applying the deductions it must, of course, be borne in mind that it is only the group of plates whose thickness varies in the same proportion as the other lengths that are comparable. According to the formula a reduction in D should carry with it the same effect as an increase in μ/ρ whereas the opposite effect has been observed The only possible conclusion is that phenomena arise which are not contemplated in the dimensional specification. Appeal has been made by Bairstow and Booth to the compressibility of air in front of the plate but examination shows that this does not provide a large enough effect at the usual velocities concerned. They show, however, that all the reliable results can be represented by a formula of the type $F=a(vD)^2+b(vD)^3$ for values of vD from 1 to 350 (foot-second units). This would fit in with the requirements for different fluids provided $a\propto(\rho/\mu)^2$ and $b\propto(\rho/\mu)^3$; but this does not seem as yet to have been proved. Stanton (*Proc. Inst. Civil. Eng.* 171) has brought forward evidence that a negative pressure on the leeward side of the plate is responsible for the complication.

Influence of Boundary.—When the fluid is bounded by a tube and the obstacle is on its axis the mean velocity at which turbulence begins is changed For example, it has been found experimentally by Hisamitu Nisi, *Phil Mag.* XLVI. 754 (1923) (using in succession two tubes of square section of 2·6 and 2·0 cm. lengths of sides and containing, in any single experiment, a cylinder at right angles to the length of tube or a small sphere), that the velocity of air at which turbulence begins in the tube can be expressed very closely by the formula

$$v_c=\frac{\mu}{\rho D}\left\{A_1+A_2\left(\frac{D}{\Delta}\right)^n\right\}$$

where Δ is the diameter of the tube, $n=\frac{1}{2}$, $A_1=8{\cdot}15$, $A_2=68{\cdot}2$ for spheres, and $A_1=2{\cdot}65$, $A_2=48{\cdot}2$ for cylinders. The form of the equation was chosen to suit dimensional requirements but for the index n resort had to be made to experiment.

Floating Bodies.—In the case of a floating body gravity is a determining factor. Since gD/v^2 is a non-dimensional term we can allow for it most generally by writing

$$F/D^2v^2\rho=f\left(\frac{vD\rho}{\mu},\frac{gD}{v^2}\right).$$

Dynamical similarity requires that the right hand side should be a constant and this requires that $vD\rho/\mu=$ const. and $gD/v^2=$ const. If both the small and the large scale body are intended to float in water, μ, ρ and g are all constants; therefore we require that $vD=$ const. and $D/v^2=$ const. simultaneously; but this is impossible. No similitude can exist therefore between bodies of different sizes. Viscosity however, only plays a small part, owing to the force varying nearly as the square of the velocity. The right hand side must, to this approximation, be independent of μ and therefore of $vD\rho/\mu$ and we need only consider the term D/v^2 which must be the same both for model and original and therefore so must F/D. That is to say the forces are directly as the linear dimensions when the velocities are as the square roots of the linear dimensions. The assumption throughout is, as usual, that the bodies compared are geometrically similar.

Oscillations.—The oscillations of a simple pendulum were taken as the introductory example. In that case the force was proportional to the volume of the moving body. A tuning fork presents a case where the force is proportional to an area, viz., the area of cross section of the prongs. According to what law will the time-period of geometrically similar tuning-forks depend? The elements of the dimensional equation are, the density, ρ, Young's modulus, Y, Poisson's ratio, P and a length L. Poisson's ratio is a mere number and may at first be left out of account. Hence putting $[T]=[Y^x\rho^yL^z]$ and recalling that Y has the dimensions of a force per unit area it is found that $x=-\frac{1}{2}=-y$ and $z=1$; $\therefore$ Time-period $=$ constant $L\sqrt{(\rho/Y)}$ Since with any selected material, ρ and Y and P are constant the time period is proportional to the characteristic length. Strictly for complete similarity the amplitude should be varied in the same proportion in order that this conclusion may apply. The time period however is so nearly independent of the amplitude that we may disregard this restriction

"If the tuning forks are not similar to one another, the problem is more complicated and can only be solved by reference to the mechanical equations." (Rayleigh.)

Miscellaneous Vibrations.—The following results can also easily be obtained by this method, the controlling elements are in each case specified. The velocity of propagation of periodic waves controlled by gravity on the surface of deep water is as the square root of the wave-length. $V_1=f(g,\lambda)$.

For short ripples, which are governed principally by surface tension, σ, the velocity is proportional to the inverse square-root of the wave length. $V_2=f(\sigma,\rho,\lambda)$. Waves of intermediate wave length are controlled both by gravity and by surface tension so that we should expect the velocity to be a function of V_1 and V_2. Mechanical theory gives $V^2=\dfrac{g\lambda}{2\pi}+\dfrac{2\pi\sigma}{\rho\lambda}$.

The time period of a Helmholtz resonator is directly as the linear dimension.

The frequency of vibration of a globe of liquid vibrating in any of its modes under its own gravitation, is independent of the diameter and directly as the square root of the density The frequency of vibration of a drop of liquid, vibrating under "capillary" force is directly as the square root of the surface tension and inversely as the square root of the density and as the $\frac{3}{2}$ power of the diameter.

Weight of Drops.—In the article on SURFACE TENSION the weight, W, of drops from tubes of various diameters is discussed. If the diameter of the delivery tube is D, surface tension σ, the acceleration due to gravity, g, and if these data determine W completely, Rayleigh has shown that $W/(\sigma D)=f\{\sigma/(g\rho D^2)\}$. Experiment shows that for wide changes in the variables on the right the term on the left is nearly a constant but has a minimum value Approximately, therefore, we expect the weight for a given liquid to be proportional to the diameter of the tube. The deviation from strict dynamic similarity is no doubt due to omitted quantities which have some control over the situation. The most important one is viscosity and since $\mu^2/(\rho\sigma D)$ is a non-dimensional quantity the solution is made more general by writing

$$\frac{W}{\sigma D}=f\left\{\frac{\sigma}{g\rho D^2},\frac{\mu^2}{\rho\sigma D}\right\}$$

This can also be written

$$\frac{W}{\sigma D}=f\left\{\frac{\rho\sigma^3}{g\mu^4},\frac{\sigma^2\rho^2}{\mu^4}D^2\right\}$$

where the first term on the right depends only upon the nature of the fluid while the second involves D^2 Experiments are lacking by which algebraic laws based upon this dimensional examination can be tested. The terms on the right seem to have comparatively little influence for the size of an oil drop from a given tube is much the same as that of a water drop although the viscosity is nearly 100 times as great and enters as the second power. This is what might be expected if the rate of formation of the drop is sufficiently slow.

This problem is a very instructive one. If we take Rayleigh's formula as the standard it might be expected that $\sigma/(g\rho D^2)$ must be constant for the cases to be dynamically similar, whereas wide variation of this term has scarcely any influence. There is, however, a variety of possible independent variables Since $W/(\sigma D)$ is a numeric so also is $[\sigma/(g\rho D^2)][W/(\sigma D)]$.

Now, assuming the diameters of the drops to be proportional to the diameters of the tubes, W varies as $g\rho D^3$; whence this new "variable" is an absolute constant. This is nearly the case in practice. We may now attribute the departure from precise similarity to the diameters of the drops and tubes not being strictly proportional to one another. Let D_2 be the characteristic linear dimension of the *drops*. If their weight be expressed in terms of D_2 the above substitution gives finally $W/(\sigma D) = f(D_2/D)$. The approximate constancy of each side of this equation is now easier to understand. It must be added that large and small drops are not *geometrically* similar before falling; this fact also needs to be taken into account.

Temperature.—In all the cases that have been considered, up to this point, temperature has only entered in a secondary way. For example, the density, ρ, *depends* upon the temperature, but if we write $\rho = \rho_0(1 - at)$ the term at must be a mere numeric and provided that we know the law of variation the value ρ can be calculated from the standard value ρ_0 and the temperature does not further concern us. The same remark applies to other variables such as σ and μ. But there are many cases in which the question cannot be dealt with so simply and we are obliged to ask what are the dimensions of temperature. At first sight it appears to be a new fundamental quantity; and it can be so treated in many problems, so that we then expect it to turn up to the same power on both sides of the equation. In other cases we must seek to find a relation by which it can be expressed in mechanical units.

Now absolute temperature is defined in terms of the laws of ideal gases for which the characteristic equation is $pv = K\theta$ where v is the molecular volume and K is a universal constant. By suitably altering the size of a degree the factor K might be made unity and then it would be clear that θ would represent energy for pv has the dimensions of energy. Mechanical theory identifies it with the kinetic energy of the molecular motion.

Viscosity and Temperature.—Let the problem be to examine how viscosity will depend upon molecular motion when molecules repel each other with a force varying inversely as the pth power of their distance apart. Let $R = \text{force} \times L$ where R is the force at unit distance, let the data for the molecules be $m = \text{mass}$, $v = \text{mean velocity of agitation}$, $N = \text{number per unit volume}$; and let it be supposed that the viscosity μ varies as $m^x v^y N^z R^n$. In the usual way it is found that

$$[\mu] = mvN^{\frac{1}{3}}\{N^{(p-1)/3}m^{-1}v^{-2}R\}^n.$$

The values of n and p are both indeterminate by the present method and, as usual, resort must be made to experiment Now v is proportional to the square root of the kinetic energy $\frac{1}{2}mv^2$; and μ has also been considered by experimentalists to vary in the same way If this were the case n would equal zero; and further, since μ is found to be independent of the density except for low pressures, $2 + np = 0$ and $\therefore\ p = \infty$. This would correspond to an infinite power for the repulsive force, that is, the molecules would behave as rigid bodies. However, it is found that μ varies more nearly according to the 2/3 or even higher powers of the temperature Putting the power of θ as κ and solving for p the following values are obtained

κ	2/3	3/4	1
p	13	9	5

The last case is the one which Maxwell gave as illustrating gas theory. These calculations assume that a single power law n is sufficient. As in other cases all we can infer in general is that

$$\mu = mvN^{\frac{1}{3}}f\{N^{(p-1)/3}m^{-1}v^{-2}R\}$$

and mechanical theory as developed by Sutherland and afterwards more rigorously by S. Chapman shows that the equation

$$\mu\left(1 + \frac{S}{\theta}\right) \propto \theta^{\frac{1}{2}}$$

is the form to be expected. Here S (known as Sutherland's constant) is of the dimensions of θ and is in fact nearly equal to the critical temperature of the gas. The index 1/2 indicates as before that the molecules are behaving as rigid spheres.

Thermal Conduction.—Further examples are to be found in connection with thermal conduction. Heat itself can be expressed either as energy or, in a secondary way, as the number of degrees change of temperature it can produce in a given mass of water. Conductivity, k, is defined by the equation $\text{Heat} = ka\frac{d\theta}{dr} \times \text{time}$. To free the equation from dimensional difficulties it would be better to write $K\theta$ instead of θ where K is the gas constant, and define k/K as the thermal conductivity, because as we have seen $K\theta$ has the dimensions of energy On the other hand if Heat is measured as (mass of water $\times$ degrees rise of temperature) the temperature enters on both sides of the equation and, as far as dimensions go, it can be cancelled

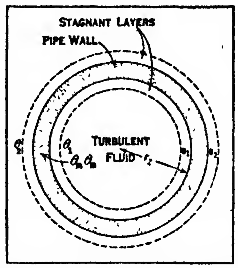

FIG 2 —CROSS SECTION THROUGH A CIRCULAR PIPE, SHOWING SURFACES COVERED BY THIN LAYERS

The chief problems involving dimensions concern the transfer of heat through pipe walls between the fluids on the inside and outside The actual transfer in the case of metal pipes is controlled mainly by the presence of a stagnant layer of fluid on each side In the body of each fluid it is transferred from point to point (except for the case of very slow motion) mainly by turbulent convection, but in the stagnant layers it is by conduction through media which usually are bad conductors. In describing his work on steam condensers Joule adopted a new term at the suggestion of Lord Kelvin (1859)—the coefficient of heat transmission, C—which he defined as the amount of heat flowing per unit area of the pipe surface in unit time per unit difference of temperature between the fluids, *i e*, $H = CA(\theta_2 - \theta_1) \times \text{time}$ where H is positive if $\theta_2 > \theta_1$. If θ_m is the temperature of the metal pipe (it is practically constant *across* the section) Fig 2 we can write

$$H = C_1A_1(\theta_m - \theta_1)t = C_2A_2(\theta_2 - \theta_m)t$$

where C_1 and C_2 are coefficients of transmission of heat across the two stagnant layers. Whence $\frac{1}{CA} = \frac{1}{C_1A_1} + \frac{1}{C_2A_2}$. In this way we can calculate the effective over-all coefficient from the coefficients for the separate films. If r_1 is the inside radius of the pipe and e_1 the thickness of the film $\theta_m - \theta_1 = \frac{H}{2\pi k_1}\log\frac{r_1}{r_1 - e_1}$ where H is the heat transmitted per unit length of the pipe, or, approximately, $\theta_m - \theta_1 = \frac{H}{2\pi}\frac{e_1}{r_1k_1}$ so that $C_1 = \frac{k_1}{e_1}$; similarly for the outside film $C_2 = k_2/e_2$. If the pipe wall is thin it is possible usually to write $A = A_1 = A_2$ so that

$$\frac{1}{C} = \frac{1}{C_1} + \frac{1}{C_2}.$$

So much by way of introduction. The real problem is to find C_1 (or C_2), and the essential part of it is to find e_1 or e_2 It can be shown from the equations already given that the resistance per unit area of the pipe wall can be expressed as $\frac{\mu^2}{D^2\rho}\left\{\frac{vD\rho}{\mu}\right\}^n$; but in the non-eddying film it must be equal to $\mu\frac{dv}{dl} = \mu\frac{v}{e}$ where e is the effective thickness of the film;

$$\therefore\quad [e]^{-1} = \left[\frac{\mu^2}{D^2\rho}\right]\left[\frac{vD\rho}{\mu}\right]^n\left[\frac{1}{\mu v}\right]$$

$$= \text{constant}\left(\frac{v\rho}{\mu}\right)^{n-1}D^{n-2}.$$

The coefficient of transmission C_1 is this quantity multiplied by k_1. In usual practice n can be taken as 1·75 hence

$$C_1, \propto k_1 \left(\frac{v\rho}{\mu}\right)^{\frac{3}{4}} \cdot \frac{1}{D^{\frac{1}{4}}}.$$

The value of C_2 is determined in a similar way and thence the over-all coefficient is obtained except for numerical constants. To find the constants recourse must be made to a few experiments with various values of the variables. To show the importance of a knowledge of C in technical practice the following figures, calculated from the formula are given. They are based partly upon the thermal measurements of Stanton at the National Physical Laboratory but mainly upon those by H. Greenwood made for the Ministry of Munitions in 1918. The values are the over-all coefficients (C) in British Cent. Units per sq.ft. per deg. C per hour, v_1 and v_2 are the velocities in feet/min. inside and outside a pipe of 1 inch diameter at 20° C carrying water on both sides.

v_2 \ v_1	100	200	300	400	500
100	160	185	224	240	251
200	185	220	277	302	318
300	224	277	375	421	454
400	240	302	421	480	523
500	251	318	454	523	570

For a six inch pipe the values range from 97 to 352. Reference should be made to No 9 of the *Technical Reports* published for the Ministry of Munitions (London, H.M.S. Stationery Office) for further information and for charts enabling the coefficient to be calculated easily for various temperatures, diameters, viscosities and for gases as well as liquids.

To prevent unjustifiable use of the formula and table it must be added that the values are for *turbulent* flow in *clean* pipes. A layer of incrustation only .02 inch thick may reduce the values to one half. In many actual interchangers where the velocity is very small and the motion only fortuitously turbulent (if at all) the value falls as low as 2 and is rarely more than 15.

The idea that the passage of heat from solids to liquids moving past them is governed by the same principles as apply, in virtue of viscosity, to the passage of *momentum*, was originated by Osborne Reynolds though with some misgivings and has been further developed by others. Lord Rayleigh has shown, however, that the analogy is not complete owing to the existence of a pressure-gradient term in the momentum problem which has no counterpart in the thermal problem. (*Advisory Comm. for Aeronautics*, T. 941, 1917) In the same place, considering the flow of heat between two planes, distance D apart, with fluid flowing in the space between the planes he derives the equation for the heat flow $H = \frac{K\theta}{D} f\left[\frac{Dv\rho}{\mu}, \frac{C\mu}{k\rho}\right]$. Where C is the specific heat per unit volume. For a given fluid the last term is a constant and may be omitted and dynamic similarity is attained when vD is constant so that a complete determination of the function can be made by varying *either* v or D. It is best to vary v not D; variation of the latter would require the roughness of the surfaces to vary in the same proportion.

Turn again to the theoretic side To take C as proportional to k does away temporarily with the necessity of answering the question as to the dimensions of temperature. Nevertheless the question calls for an answer. If temperature can be identified with the energy of agitation its specification involves a velocity. If it be so expressed in the equation for the transfer of heat a different set of dimensions is obtained: this uncertainty as to dimensions throws doubt on the method. This point has been discussed by Lord Rayleigh and others (see *Nature*, 1915) but without it being cleared up satisfactorily. The real cause of the difference seems to be that when temperature is recognized as involving molecular velocity there are two velocities entering into the problem—the velocity of molecular agitation and the velocity of the stream of fluid. In order to obtain true dynamical similarity both these velocities must be varied *in the same proportion;* in other words the temperature must be *varied* as the square of the stream velocity. The solution given above corresponds to the case of *constant* temperature: that is the stream velocity changes without any change in the velocity of agitation. To pass from one case to another is like passing from similar tuning forks to those that are not similar (*see* above).

Electric and Magnetic Quantities.—A similar indeterminateness arises when electric and magnetic phenomena are considered. In an electric charge we meet with a kind of thing which can be connected with mechanical data in more than one way. On the electrostatic system it is defined in terms of the force between two charges (q) in vacuum by means of Coulomb's law $F=qq^1/d^2$ and the dimensions are those of $\sqrt{Fd^2}$. The fact that the measurements must be made in vacuum indicates that for other media the force would be different and the ratio found is $1/K$ where K is called the dielectric constant. Since we know nothing about the real nature of electricity, and provided we knew nothing further about other electric phenomena, it would be quite sound to treat K as a numerical constant and to take the dimensions of q as $\sqrt{Fd^2}$ or $\mathrm{M}^{\frac{1}{2}}\mathrm{L}^{\frac{3}{2}}\mathrm{T}^{-1}$. These dimensions would strictly be those of $q/\sqrt{K_0}$ where K_0 represents a property of vacuum. If we chose to call this quantity electricity there is nothing to prevent us and this is virtually what we do on the electrostatic system.

But electricity can be measured in other ways. Magnetic forces between poles are measured in units depending on an inverse square law of force, $F=\mathrm{MM}'/(\mu d^2)$ where μ again depends on the medium. If we take μ as having no dimensions the dimensions of M are $\sqrt{Fd^2}$. In addition electric currents are measured in terms of the force on unit pole when flowing in a circuit of unit radius; and a current has the dimensions of an electric charge divided by a time. It is clear that from such data a second unit of charge is definable and its dimensions are $\mathrm{M}^{\frac{1}{2}}\,\mathrm{L}^{\frac{1}{2}}$, it is called the electromagnetic unit of charge. In this case indeterminateness arises since μ for vacuum may be a mere number or may represent another property of vacuum. What we measure as a pole of strength M may perhaps be definable as M_0/μ_0 where M_0 is a more fundamental physical quantity independent of the medium.

It follows from this summary that it is not merely a question of choosing two units of different sizes (like an inch and a metre for lengths) but of choosing two units which fail to satisfy the law of dimensional homogeneity. Homogeneity can be brought about by regarding K_0 and μ_0 (both for vacua) as not being mere numbers but as having such dimensions that $\mu^{-\frac{1}{2}}\mathrm{M}^{\frac{1}{2}}\,\mathrm{L}^{\frac{1}{2}}$ is homogeneous with $K^{\frac{1}{2}}\mathrm{M}^{\frac{1}{2}}\mathrm{L}^{\frac{3}{2}}\mathrm{T}^{-1}$. This requires that $[\mu K \mathrm{L}^2\mathrm{T}^{-2}]$ = a numeric or in other words, that μK has the dimensions of the reciprocal of the square of a velocity. This velocity has been shown to be that with which electric waves are propagated in the medium (*see* ELECTRIC WAVES); its value for vacuum is equal to the ratio of an electromagnetic unit of charge to an electrostatic unit, that is (as nearly as is known) 3×10^{10} cm./sec

In this article we are not concerned with the details of electric measurements but with applications of the law of dimensional homogeneity. On the two systems of units we treat either K or else μ as a numeric. Their real dimensions we do not know; those of their product alone are known. We know neither the properties of the medium which the symbols represent nor (in consequence) the physical nature of an electric charge or of a magnetic pole. The situation from the point of view of dimensions can be best illustrated by an example.

Suppose that in the flow of liquids through tubes we had found that its character depended upon the liquid not owing to difference of density alone but that another factor was necessary which varied from liquid to liquid, *e.g.*, the viscosity which we assume we have not learned how to express in terms of mechanical data and which we treat as a numeric Dimensionally we write

$$[v] = f\left[\frac{\mu}{\mu_0}\right]\cdot[D^x\rho^y R^z]$$

the symbols having the same meanings as before. This yields the equation

$$\left[\frac{v\rho^{\frac{1}{2}}}{R^{\frac{1}{2}}}\right] = f[\mu/\mu_0] = \text{a numeric}$$

Dynamic similarity will exist if the right hand is a constant Hence the critical velocity, *for such cases*, can be given as v_c = constant $R_c^{\frac{1}{2}}/\rho^{\frac{1}{2}}$ where R_c will be the critical value of the resistance. Further than this it would not be possible to go, except to declare that the value of the constant must in general be a function of μ/μ_0. The value obtained for v_c is, however, consistent with that obtained by recognizing the dimensions of μ. For previously it was obtained that

$$\frac{vD\rho}{\mu} = f\left(\frac{RD^2\rho}{\mu^2}\right)$$

or

$$\frac{vD\rho}{\mu} = f\left(\frac{R}{v^2\rho}\right)$$

When μ is constant the critical velocity is therefore given *either* by $v_cD\rho$ = const. or $R/(v_c^2\rho)$ = const. The latter is the result arrived at by ignoring the dimensions of μ The *general* theorem just given enables one, however, to go further and discuss the cases where μ is a variable.

In very much the same way, limited applications of the law of homogeneity can be made in electromagnetic problems. For example, the time required for a current to fall to $\frac{1}{e}$ of its value in a linear, conducting, electric circuit is directly as the self-inductance and inversely as the resistance, *both* being measured in electromagnetic units (or *both* in electrostatic units).

The time-constant of circumferential, electric currents in an infinitely long conducting cylinder is as the square of the diameter.

The amplitude of a periodic current (frequency constant = p) in a circuit of resistance R and self-inductance L must be given by $C_{max} = \frac{E}{R}f\left(\frac{Lp}{R}\right)$ where E is the maximum electromotive force.

Although many valuable hints may be obtained in this way the chief problem in electricity is the logic of the method in which certain quantities have their dimensions suppressed. If the time comes when electric charges, magnetic poles etc. are analyzed into more fundamental entities a greater logical simplicity will be obtained. But when that time comes it is possible, or even probable, that the notion of mass will also have been further analyzed.

General.—Let z_1, z_2, z_3, etc. be any terms of zero dimensions each consisting of powers and products of physical elements (such as length, velocity, force, viscosity, electric charge, etc.) some of which may be ratios of like elements (such as a ratio of two masses or of two lengths). Let Q be any term, completely defined by them so that Q$=f(z_1, z_2, z_3$, etc). From the principle of dimensional homogeneity it follows that Q, which may consist of powers and products of physical elements, must also be of zero dimensions.

If z_1, z_2, z_3, etc. are all constant during any phenomenon, any systems satisfying the equation are said to be *dynamically similar*. For such systems Q is necessarily a constant.

In practice it is usually sufficient to retain only two or three of the z-terms it being assumed that the more "remote" causes of an event have so little influence that they can be ignored or treated as constant. Thus, in considering the motion of the earth round the sun we may at first ignore the influence of the other planets, and the possible influence of magnetic forces. These secondary effects may subsequently be treated as *perturbations.* Again, in considering the flow of liquids in pipes, any possible electrification has not been considered. One of the most important considerations in the design of an experimental investigation is the exclusion of such extraneous effects in order thereby to reduce the number of the z-terms that need to be taken into account.

Any or all of the z-terms may be changed by multiplying by powers of Q or of each other for they will still remain terms of zero dimensions. In this way they may be selected so as best to suit particular problems. For example, any one of them may so be changed that its elements depend upon the intrinsic properties of the medium under examination (density, viscosity, etc) and not at all on induced properties (such as velocity or acceleration) If this is so, the particular z-term will be a constant so long as the same medium is dealt with and thereby drops out of the list automatically.

If the retained terms are Q, z_1, z_2 and their experimental values are plotted as the x y z co-ordinates of points in space any one such point represents all the members of a group of cases which are dynamically similar to one another. The behaviour of any one member of the group can be determined by measurements made on any other member of the same group If the curve through the points is *nearly* parallel to one of the planes of co-ordinates say x y it shows that the third co-ordinate, z, is nearly constant. Hence, for approximate purposes it may be treated as a constant and if it be a z-term it can be ignored.

History.—The subject of dynamic similarity was originated by Newton (*Principia*, Lib. ii prop 32) The explicit formulation of the idea of the dimensions or the exponents of dimensions of physical quantities was first made by Fourier, *Theorie de la chaleur*, 1822, ch ii sec 9, where he insists upon the necessity for homogeneity in the dimensions of all the terms of an equation. Both the logical statement of the principles and the practical applications have advanced very rapidly during the last 20 years.

BIBLIOGRAPHY —Much use has been made of the above principles by Lord Rayleigh (*Collected papers*), by A H Gibson in *The mechanical properties of fluids* (Blackie, 1923) The fullest treatment of the logic of the process is by E. Buckingham (*Physical Review*, 1914); applications are given in article, *Dynamic Similarity*, by H Levy, in the *Dictionary of Applied Physics* [Macmillan (1922)] and by Karman, *Zeitschr. f. angew. Math u. Mech* Band 1, p. 233 (1921) and in the publications of the Aerodynamic Institute at Aachen, also in the reports of the Advisory Committee for Aeronautics (London).

(A W. Po)

UNIVERSAL, in logic, means that which our thought conceives to be common to several instances which are thus considered to be of the same kind, whether as instances of the same quality or relation or as members of the same class Universals in this sense can not be apprehended in sense-perception, only in thought, that is by means of ideas or concepts Hence the tendency sometimes to identify "universals" with "ideas" (or "Ideas" with a capital), as in Plato, for instance, without however confusing them with mental processes as such. The predicate of a judgment or proposition is always a universal term, except perhaps in the unimportant cases in which the proposition simply refers singular terms to the same subject Hence universals are sometimes called predicates, and the five predicables (*q v*) are known as *the* universals or the highest universals

See B. Bosanquet, *Logic* (1911), *The Principle of Individuality and Value* (1912), *Implication and Linear Inference* (1920), F H. Bradley, *Principles of Logic* (1922).

UNIVERSALIST CHURCH, a religious body organized in the United States, and represented chiefly by parishes and churches in that country and Canada. A distinction should be noted between Universalism and the Universalist denomination Universalism—the belief that the whole human race will be "saved"—was a doctrine of some of the greatest of the Church fathers, notably Clement of Alexandria and Origen, and is now held by many in other communions The Universalist denomination arose in the United States in the latter part of the 18th century.

History.—The origin of this Church is commonly associated with the landing and preaching of Rev. John Murray at Good Luck, N.J., in September 1770. Murray, a disciple of James Relly (1720–1778), a Calvinistic Universalist of London, was seeking refuge in the new world from sorrow and trouble. Per-

suaded that he should be an apostle of this new faith, he became an itinerant minister in Massachusetts, New York, New Jersey, Pennsylvania and settled in Gloucester, Mass. (1774). His Universalism was a protest against the doctrine of endless punishment

Under the leadership of Hosea Ballou (1771–1852), the most influential and honoured minister of the sect for half a century, Universalists became largely Unitarian and also broke with the Calvinism of Murray. The first period of the denomination's history was largely controversial. Religious and sectarian feeling pro and contra Universalism was intense After 1820, ministers and churches began to multiply, and newspapers were established.

Doctrine.—The fundamental tenet of Universalism may be said to be the illimitable love and goodness of God, assuring triumph over evil in human society as a whole and in the life of every individual The historic symbol of the denomination is the Winchester Profession, adopted at the meeting of the General Convention—then a spontaneous yearly gathering of Universalists, without ecclesiastical authority—in Winchester, N.H, in Sept. 1803. It consists of three brief articles

Article I —We believe that the Holy Scriptures of the Old and New Testaments contain revelation of the character of God and of the duty, interest and final destination of mankind.

Article II —We believe that there is one God, whose Nature is Love, revealed in one Lord Jesus Christ, by one Holy Spirit of Grace, who will finally restore the whole family of mankind to holiness and happiness

Article III —We believe that holiness and true happiness are inseparably connected, and that believers ought to be careful to maintain order and practise good works, for these things are good and profitable unto men

At a session of the General Convention in Boston in 1899 a brief statement of essential principles was adopted as follows

1. The Universal Fatherhood of God, 2 The Spiritual Authority and leadership of His Son, Jesus Christ, 3 The Trustworthiness of the Bible as containing a revelation from God; 4. The certainty of just retribution for sin, 5 The final harmony of all souls with God

Polity.—Universalist parishes govern themselves but acknowledge (theoretically) the authority of the Universalist General Convention, constituted of its officers, a board of trustees of 11 members, active ordained clergymen, two lay delegates (one a woman) from each parish and officers of the several State conventions, which are subordinate to the General Convention

Statistics.—According to the Universalist Year Book (1927) the denomination had 623 churches, 553 ordained ministers and 55,000–60,000 church members

UNIVERSAL LANGUAGE. The term international language is generally used to denote a second, or auxiliary, language for international use. The concept has been a constant one, as we are reminded by the story of the curse of Babel; but the ancient and modern solutions have a crucial point of differentiation. Formerly the universal language was the language of the conqueror, and that concept has been urged in modern times in support of French, as the traditional language of diplomacy, and of English, as that of commerce. The modern world, however, tends to favor the adoption of some new linguistic medium, because it has been found that such a medium is easy to use and because it is inoffensive to national pride

Greek, Latin and Arabic have had, at various times, the status of international languages. French occupied a similar position, particularly in the 18th and early 19th centuries, in diplomacy, social life and literature; it is still the usual international language of Europe and the Levant. English, however, has come to share the prestige of French in diplomacy, while in the Orient the normal international language is English, often in the debased forms known as *Pidgin* (*q v.*), or "business" English. Italian was used as the basis for a similar international commercial language in the Mediterranean countries during the Crusades, and has persisted in common use under the designation *lingua franca.* The international language of high local prestige has been a constant phenomenon along linguistic frontiers the Chinook of the Columbia river valley and the "pidgin" Malay of Polynesia are examples in point

Of some 200 schemes for the creation of a suitable language on scientific principles the vast majority are projects only They may be roughly divided into (a) *a priori* (philosophical, arbitrary) and (b) *a posteriori* (based on one or more existing languages)

Most early schemes were of the *a priori* type alluded to by Roget in his *Thesaurus* Solresol, based on the seven notes of the scale (1817), Lingualumina (1875), Blaia Zimondal (1884), Cabe aban (1887), Zahlensprache (1901) are more recent examples Such schemes are based on a classification of ideas translated into words bearing no relation to any other language Obviously they depend on the caprice of the inventor, though usable as codes, they impose a great strain on the memory One such scheme still advocated is Ro, invented in 1904 by the Rev P. Foster It has some vocabularies, a monthly sheet *Roia,* and as literature the first chapter of St John

It is, however, now generally agreed that the international language must be *a posteriori* It should be international, easy for all, neutral, euphonious, phonetic, flexible, unambiguous, logical, regular, adaptable, and must be tested by long-continued practical use on a large scale.

Esperanto.—Initiated in 1887 by Dr L L Zamenhof, Esperanto is claimed to possess all these characteristics It is neutral and international in its elements, logical and regular in construction, and euphonious The grammar can be grasped in half an hour, every rule is without exception, the spelling is phonetic and the dictionary small Nevertheless, it has literary power, beauty, precision, flexibility and power of growth There are some 4,000 Esperanto books, original and translated, including the Bible, the literature is rapidly growing, 100 magazines appearing regularly The League of Nations has published a favourable memorandum (compiled from Government reports) on the teaching of Esperanto in the schools of the world. The Paris Chamber of Commerce and the London County Council teach Esperanto in their commercial schools, the London Chamber of Commerce examines in Esperanto In 1925 the International Telegraphic Union officially recognized Esperanto as a "clear language." The British Association in 1919 appointed a committee, which in 1924 definitely recommended Esperanto as its choice. In May 1927 the Union Internationale de Radiophonie recommended broadcasting stations to use Esperanto, and in December 1927, 44 stations were giving regular Esperanto transmissions Twenty annual International Esperanto Congresses have already been held, attended by from 1,000 to 4,000 members from all parts of the world On a foundation they regard as sound they are rearing a superstructure of technical vocabularies with the co-operation of expert committees The majority of universal language partisans, and nearly all the literature, are Esperantist, but there are considerable differences in pronunciation in different countries

Ido.—In 1907 Couturat and de Beaufront produced a modification of Esperanto which they named simplified Esperanto. Owing to Esperantist protests, the "linguo internaciona" was renamed Ido (an Esperanto word meaning offspring) Ido is said to be Esperanto rendered more scientific and natural; it abolishes accented letters, correlatives, the compulsory accusative, the agreement of the adjective with the noun.

Over 50 schemes have appeared for "reformed" Esperanto, "reformed" Ido or some compromise; none of these projects, however, has had any success Prof. R de Saussure, believing that some minor features of Esperanto handicap propaganda, proposed to eliminate them while preserving the essential qualities of the language From 1907 onwards a stream of experimental projects and literature has issued from his language laboratory—Antido I, Antido II, Lingvo Kosmopolita, Esperantido and finally Nov-Esperanto (1925) His attitude of scientific detachment and re-

search, however, has been insufficiently appreciated

The first international language to be used in fact was the once famous Volapuk This was invented in 1880 by an Austrian priest, the Rev F Schleyer It was founded, as to 40%, on English, but the roots were so distorted in accordance with arbitrary rules that they were almost unrecognizable, and the language was further encumbered by an almost Greek profusion of terminations and variations The collapse of Volapuk, which in 1889 claimed a million adherents and had held three successful congresses, was ensured by the refusal of Bishop Schleyer to permit any modification The central Volapuk academy, Kadem Bevuretik Volapuka, directed by Dr W Rosenberger (d. 1918), nevertheless continued its researches into the best possible form of an international language. In 1898 it issued a vastly improved language which it called Idiom Neutral and changed its own name to *Akademi de Lingu Internasional.* From that time, both within and without the academy, research has not ceased, nor has the stream of proposed languages Latinesce (by Henderson), Nov-Latin (by Rosa), Monario (by Lavagnini), Occidental (by de Wahl), Europan (by Weisbart), Optez (by S Bond), Romanal (by Michaux), deserve particular mention

The greatest advance has perhaps been made by Prof G. Peano, since 1908 director of the academy, now the Academia pro Interlingua. Peano's Interlingua arises out of an address written by him in 1903; he began in good classical Latin and pointed out that certain features—*e g*, conjugation, gender, irregularity of verbs, agreement of adjectives—were no longer necessary. As he proved each point he removed the offending practice from his own text and the address, which began in Ciceronian Latin, finished in "Latino sine flexione," a tongue now known as Interlingua, which consists of the living Latin roots in all European languages, with the modern rules of the order of words, and without grammar

See L Couturat and L Leau, *Histoire de la langue universelle* (1903), W J Clark, *International Language, Past, Present and Future* (1912); G. Peano, *Vocabulario Commune* (1915), A. L Guérard, *Short History of the International Language Movement* (1922); Otto Jespersen, *An International Language* (1928)

UNIVERSE OF DISCOURSE, in logic, is the limited sphere of reference within which an assertion is intended to hold good. Hence the alternative name, "limited universe" The expression "universe of discourse" was first introduced by A. De Morgan, who states his meaning as follows. "For the most part the objects of thought which enter into a proposition are supposed to be taken, not from the whole universe of possible objects, but from some more definite collection of them Thus when we say 'All animals require air' . . . we should understand that we are speaking of things on this earth. the planets, etc. . . . not being included" (*Formal Logic,* ch iv.) Boole and Jevons used the term in the same sense, namely, for a part of the real world Subsequently the notion was extended so as to include also merely imaginary spheres of reference—the world of illusions, supernatural worlds, worlds of sheer madness and vagary, etc (*see* W. James, *Principles of Psychology*, vol. ii., ch. xxi). In logic the question is of some importance in connection with the problem of the existential import of propositions, especially of categorical propositions. *See* A. Wolf, *The Existential Import of Categorical Predication: Studies in Logic* (1905).

UNIVERSITIES. The mediaeval Latin term *universitas* was originally employed to denote any community or corporation. When used in its modern sense of a body devoted to learning and education, it required the addition of other words, such as *magistrorum et scholarum* In the course of time, probably towards the latter part of the 14th century, the term began to be used by itself, with the exclusive meaning of a lawfully recognized community of teachers and scholars But the more ancient and customary designation of such communities in mediaeval times (regarded as places of instruction) was *studium* (and subsequently *studium generale*), a term implying a centre of instruction for all.

A university often had a vigorous virtual existence long before it obtained that legal recognition which entitled it, technically, to take rank as a *studium generale.*

The university appears to have started as a scholastic gild—a spontaneous combination, that is to say, of teachers or scholars, or of both combined, and formed, probably, on the analogy of the trades gilds, and the gilds of aliens in foreign cities, which, in the course of the 13th and 14th centuries, sprang up in most of the great European centres. The design, in the first instance, was little more than that of securing mutual protection. And so the university, composed as it was to a great extent of students from foreign countries, was a combination formed for the protection of its members from the extortion of the townsmen and the other annoyances incident in mediaeval times to residence in a foreign State

Meaning of "Studium Generale."—In the north of Europe licences to teach were granted by the chancellor scholasticus, or some other officer of a cathedral church; in the south it is probable that the guilds of masters (when these came to be formed) were at first free to grant their own licences, without any ecclesiastical or other supervision Gradually, however, towards the end of the 12th century, a few great schools claimed, from the excellence of their teaching, to be of more than merely local importance Practically, a doctor of Paris or Bologna would be allowed to teach anywhere; and those great schools began to be known as *studia generalia, i e*, places resorted to by scholars from all parts Eventually the term came to have a more definite and technical signification The emperor Frederick II set the example of attempting to confer, by an authoritative bull, upon his new school at Naples the prestige which the earlier *studia* had acquired by reputation and general consent In 1229 Gregory IX did the same for Toulouse, and in 1233 added to its original privileges a bull by which anyone who had been admitted to the doctorate or mastership in that university should have the right to teach anywhere without further examination. Other *studia generalia* were subsequently founded by papal or imperial bulls, and in 1292 even the oldest universities, Paris and Bologna, found it desirable to obtain similar bulls from Nicolas IV From this time the notion began to prevail among the jurists that the essence of the *studium generale* was the privilege of conferring the *ius ubicunque docendi*, and that no new *studium* could acquire that position without a papal or imperial bull There were, however a few *studia generalia* (*e g*, Oxford), whose position was too well established to be seriously questioned, although they had never obtained such a bull; these were held to be *studia generalia ex consuetudine.* A few Spanish universities founded by royal charter were held to be *studia generalia respectu regni*

ITALIAN UNIVERSITIES IN THE MIDDLE AGES

Rise of University of Salerno.—The origins of the first European university—that of Salerno in Italy, which became known as a school of medicine as early as the 9th century—are uncertain. The most authoritative researches point to the conclusion that the medical system of Salerno was originally an outcome of the Graeco-Roman tradition of the Old Roman world, and the Arabic medicine was not introduced till the highest fame of the Civitas Hippocratica was passing away. It *may* have been influenced by the late survival of the Greek language in southern Italy, though this cannot be proved. In the first half of the 9th century the emperor at Constantinople sent to the Caliph Mamoun at Baghdad a considerable collection of Greek manuscripts, which seems to have given the earliest impulse to the study of the Hellenic pagan literature by the Saracens. The original texts were translated into Arabic by Syrian Christians, and these versions were, in turn, rendered into Latin for the use of teachers in the West. Of the existence of such versions we have evidence, according to Jourdain, long prior to the time when Constantine the African (d. 1087) began to deliver his lectures on the science at Salerno. Under his teaching the fame of Salerno as a medical school became diffused all over Europe; it was distinguished also by its catholic spirit, and, at a time when Jews were the object of religious persecution throughout Europe, members of this nationality were to be found both as teachers and learners at Salerno. In 1231 it was constituted by the emperor Frederick II. the only school of medicine in the kingdom of Naples.

Bologna.—The great revival of legal studies which took place at Bologna about the year 1000 had also been preceded by a corresponding activity elsewhere—at Pavia by a famous school of Lombard law, and at Ravenna by a yet more important school of Roman law. And in Bologna itself we have evidence that the Digest was known and studied before the time of Irnerius (1100–30), a certain Pepo being named as lecturing on the text about the year 1076. The secular character of this new study, and its close connection with the claims and prerogatives of the Western emperor, aroused papal suspicion, and for a time Bologna and its civilians were regarded by the Church with distrust. But in the year 1151 the appearance of the *Decretum* of Gratian, largely compiled from spurious documents, invested the studies of the canonist with fresh importance; and numerous decrees of past and almost forgotten pontiffs now claimed to take their stand side by side with the enactments contained in the *Corpus Iuris Civilis*. They constituted, in fact, the main basis of those new pretensions asserted by the papacy in the course of the 12th and 13th centuries. It was necessary, accordingly, that the *Decretum* should be known and studied beyond the walls of the monastery or the episcopal palace. Such a centre of instruction was in Bologna, which became recognized as the chief school of civil and canon law. But the statement, that university degrees were instituted there as early as the pontificate of Eugenius III (1145–53), rests on no good authority. The students found their first real protector in the emperor Frederick Barbarossa. Finding that their grievances were real, especially against the landlords in whose houses they were domiciled, he granted the foreign students substantial protection by conferring on them certain special immunities and privileges (Nov. 1158). These privileges were embodied in the celebrated *Authentica, Habita,* in the *Corpus Iuris Civilis* of the empire (bk iv. tit. 13), and were eventually extended to all the other universities of Italy.

Nevertheless Bologna did not possess a university so early as 1158. Its first university was not constituted until the close of the 12th century. The "universities" at Bologna, were, as Denifle has shown, really student guilds These were originally only two in number, the *Ultramontani* and the *Citramontani,* and arose out of the absolute necessity, under which residents in a foreign city found themselves, of obtaining by combination that protection and those rights which they could not claim as citizens Originally, they did not include the native student element, and were composed exclusively of students in law. Denifle thinks that the "universities" at Bologna were at one time certainly more than four in number, and we know that the Italian students alone were subdivided into two—the Tuscans and the Lombards. In the centres formed by secession from the parent body a like subdivision took place. At Vercelli there were four *universitates,* composed respectively of Italians, English, Provençals and Germans; at Padua there were similar divisions into Italians, French (i e , *Francigenae,* comprising both English and Normans), Provençals (including Spaniards and Catalans). According to Odofied, in the time of the eminent jurist Azo, who lectured at Bologna about 1200, the number of the students there amounted to some 10,000, of whom the majority were foreigners. It seems, therefore, reasonable to conclude that the number of these confederations of students (*societates scholarium*) at Bologna was yet greater.

The Rector.—In marked resemblance to the guilds, these confederations were presided over by a common head, the "rector scholarium," an obvious imitation of the "rector societatum" or "artium" of the guild, but to be carefully distinguished from the "rector scholarum," or director of the studies, with whose function the former officer had, at this time, nothing in common. Like the gilds, again, the different nations were represented by their "consiliarii," a deliberative assembly with whom the rector habitually took counsel. The students at Bologna were mostly of mature years. As the civil law and the canon law were, at first, the only branches of study, the class whom they attracted were often men already filling office in some department of the Church or State—archdeacons, the heads of schools, canons of cathedrals, and like functionaries forming a considerable element in the aggregate.

About the year 1200 were formed the two faculties of medicine and philosophy (or "the seven liberal arts"), the former being somewhat the earlier. It was developed, as that of the civil law had been developed, by a succession of able teachers, among whom Thaddeus Alderottus was especially eminent. The faculty of arts, down to the 14th century, scarcely attained to equal eminence. The teaching of theology at Bologna remained for a long time exclusively in the hands of the Dominicans; and it was not until the year 1360 that Innocent VI. recognized the university as a *studium generale* in this branch.

Colleges, as places of residence for students, existed at Bologna at a very early date, but it is not until the 14th century that we find them possessing any organization; and the humble *domus,* as it was termed, was at first designed solely for necessitous students, not being natives of Bologna. A separate house, with a certain fund for the maintenance of a specified number of scholars, was all that was originally contemplated. Such was the character of that founded by Zoen, bishop of Avignon, in Feb 1256 (O.S), the same month and year, it is to be noted, in which the Sorbonne was founded in Paris It was designed for the maintenance of eight scholars from the province of Avignon, under the supervision of three canons of the Church, maintaining themselves in the university Each scholar was to receive 24 Bolognese lire annually for five years. The college of Brescia was founded in 1326 by William of Brescia, archdeacon of Bologna, for poor foreign students, without distinction as to nationality The Spanish college, founded in 1364, for 24 Spanish scholars and two chaplains, is noted by Denifle as the one college, founded in mediaeval times, which still exists on the Continent.

Other Italian Centres.—The earliest foundations in Italy after that of Bologna were the universities of Reggio nell' Emilia and Modena, both of which had flourishing schools of civil law before the close of the 12th century Vicenza (founded 1204) and Padua (founded 1222) both originated in migrations of students from Bologna. The University of Naples was founded by the Emperor Frederick II in 1225 and was temporarily suppressed after his death It was reconstituted in 1258. Piacenza, founded by papal charter in 1248, had little importance until 1398 when it was reconstituted by Galeazzo Visconti, duke of Milan, who caused the University of Pavia to be transferred to Piacenza Pavia had long been famous as a school of Roman law, and for a time its fame was transferred to Piacenza From 1404 to 1412 both universities ceased to exist. But after that date Pavia became almost as famous a school of civil law as Padua itself Arezzo was a centre for legal study from 1215 to 1470 Rome had a university with schools of canon and civil law for poor foreign students in the 14th and 15th centuries Perugia University (founded 1308) specialised in law, and Pisa (founded by charter from Clement VI in 1343) had a period of prosperity under the patronage of Lorenzo de' Medici. The University of Florence (founded by the same pontiff in 1349) had a brilliant existence in the first half of the 15th century, but was closed in 1472. Siena, whose importance dates from 1357, though it was nominally founded in 1241, had faculties of jurisprudence, arts and medicine. The University of Ferrara was famous in the 15th century Parma and Turin had no universities in the middle ages Their foundation dates from the 15th century

PARIS IN THE MIDDLE AGES

Origin of University of Paris.—The early universities rose in response to new wants, and the commencement of the University of Paris supplies us with a further illustration of the fact. The study of logic, which, prior to the 12th century, was founded exclusively on one or two meagre compends, received, about the year 1100, on two occasions, a powerful stimulus—in the first instance from the memorable controversy between Lanfranc and Berengar; in the second, from the no less famous controversy between Anselm and Roscellinus. Dialectic was looked upon as "the science of sciences"; and when, somewhere in the first decade of the 12th century, William of Champeaux opened, in Paris, a school for the more advanced study of dialectic as an art, his teaching was attended with marked success. Among his pupils was Abelard, in whose hands the study made a yet more notable ad-

vance; so that, by the middle of the century, we find John of Salisbury relating how all learned Paris had gone well nigh mad in its pursuit and practice of the new dialectic. Abelard taught at first at the cathedral school at Notre Dame, and later at the schools on the Mont Ste Geneviève, of which he was the founder, and where he imparted to logic its new development.

The schools out of which the university arose were those attached to the cathedral on the Île de la Cité, and presided over by the chancellor—a dignitary who must be carefully distinguished from the later chancellor of the university. For a long time the teachers lived in separate houses on the island, and it was only by degrees that they combined themselves into a society, and that special buildings were constructed for their class-work. But the flame which Abelard's teaching had kindled was not destined to expire. Among his pupils was Peter Lombard, who was bishop of Paris in 1159, and widely known to posterity as the compiler of the famous volume of the *Sentences*. The design of this work was to place before the student, in as strictly logical a form as practicable, the views (*sententiae*) of the fathers and all the great doctors of the Church upon the chief and most difficult points in the Christian belief. The logicians seized upon it as a great storehouse of indisputable major premises, on which they argued with renewed energy and with endless ingenuity of dialectical refinement; and upon this new compendium of doctrine, which became the theological text-book of the middle ages, the schoolmen based their successive treatises *Super sententias*.

Early Organization of University of Paris.—The University of Paris became the model, not only for the universities of France north of the Loire, but also for the great majority of those of Central Europe as well as for Oxford and Cambridge.

The original university, as already stated, took its rise entirely out of the movement carried on by teachers on the island, who taught by virtue of the licence conferred by the chancellor of the cathedral. In the second decade of the 13th century, it is true, we find masters repairing to the left bank of the Seine and placing themselves under the jurisdiction of the abbot of the monastery of Ste Geneviève; but it was around the bestowal of this licence by the chancellor of Notre Dame, on the Île de la Cité, that the University of Paris grew up. It is in this licence that the whole significance of the master of arts degree is contained; for what is technically known as admission to that degree was really nothing more nor less than receiving the chancellor's permission to "incept," and by "inception" was implied the master's formal entrance upon, and commencement of, the functions of a duly licensed teacher, and his recognition as such by his brethren in the profession. The previous stage of his academic career, that of bachelordom, had been one of apprenticeship for the mastership; and his emancipation from this state was symbolized by placing the magisterial cap (*biretta*) upon his head, a ceremony which, in imitation of the old Roman ceremony of manumission, was performed by his former instructor. He gave a formal inaugural lecture, and was then welcomed into the society of his professional brethren with set speeches, and took his seat in his master's chair. (*See* also EXAMINATIONS.)

Some time between the years 1150 and 1170 the University of Paris came formally into being. Its first written statutes were not, however, compiled until about the year 1208, and it was not until long after that date that it possessed a "rector." Its earliest recognition as a legal corporation belongs to about the year 1211, when a brief of Innocent III. empowered it to elect a proctor to be its representative at the papal court. By this permission it obtained the right to sue or to be sued in a court of justice as a corporate body.

With papal support Paris became the great trans-Alpine centre of orthodox theological teaching. Successive pontiffs, down to the great schism of 1378, cultivated friendly relations with the University, and systematically discouraged the formation of theological faculties at other centres. In 1231 Gregory IX., in the bull *Parens Scientiarum*, gave full recognition to the right of the several faculties to regulate and modify the constitution of the university. The fully-developed university was divided into four faculties—three "superior," viz., those of theology, canon law and medicine, and one "inferior," that of arts, which was divided into four "nations." These nations, which included both professors and scholars, were:—(1) the French nation, composed, in addition to the native element, of Spaniards, Italians and Greeks; (2) the Picard nation, representing the students from the north-east and from the Netherlands; (3) the Norman nation; (4) the English nation, comprising, besides students from the provinces under English rule, those from England, Ireland, Scotland and Germany. The rector, in the first instance, was head of the faculty of arts, by whom he was elected. Eventually he became the head of the collective university, by the incorporation under him, first, of the students of the canon law and of medicine (which took place about the end of the 13th century), and, secondly, of the theologians, which took place about half a century later.

In the course of the 16th and 17th centuries this democratic constitution of the middle ages was largely superseded by the growth of a small oligarchy of officials. The tribunal of the university—the rector, deans and proctors—came to occupy a somewhat similar position to the old "Hebdomadal Board" of heads of colleges at Oxford and the *Caput* at Cambridge. Moreover, the teaching functions of the university, or rather of the faculty of arts, owing chiefly to the absence of any endowment for the regents or teaching graduates, practically passed to the colleges. Almost as much as the English universities, Paris came to be virtually reduced to a federation of colleges, though the colleges were at Paris less independent of university authority, while the smaller colleges sent their members to receive instruction in the larger ones (*collèges de plein exercice*), which received large numbers of non-foundation members. This state of things lasted till the French Revolution swept away the whole university system of the middle ages. It may be noted that the famous Sorbonne (*see* PARIS UNIVERSITY) was really the most celebrated college of Paris—founded by Robert de Sorbonne *c.* 1257—but as this college and the College of Navarre were the only college foundations which provided for students in theology, the close connection of the former with the faculty, and the use of its hall for the disputations of that body, led to the word Sorbonne becoming a popular term for the theological faculty of Paris.

In the 14th century the University of Paris had 40 colleges, governed either by secular or religious communities, and numbered among its students representatives of every country in Europe (Jourdain, *Excursions historiques*, c. xiv.). The university became known as the great school where theology was studied in its most scientific spirit, and the decisions of its great doctors upon those abstruse questions which absorbed so much of the highest intellectual activity of the middle ages were regarded as almost final. The popes themselves, as already stated, discouraged the creation of faculties of theology elsewhere. The apparent exceptions to this policy are easily explained: the four faculties of theology which they sanctioned in Italy—Pisa (1343), Florence (1349), Bologna (1362) and Padua (1363)—were designed to benefit the Italian monasteries, by saving the monks the expense and dangers of a long journey beyond the Alps; while that at Toulouse (1229) took its rise under circumstances entirely exceptional, being designed as a bulwark against the heresy of the Albigenses. The popes, on the other hand, favoured the creation of new faculties of law, and especially of the canon law, as the latter represented the source from which Rome derived her most warmly contested powers and prerogatives.

ENGLISH MEDIAEVAL UNIVERSITIES

Oxford.—Of the universities modelled on that of Paris, Oxford (*q.v.*) would appear to have been the earliest, and the manner of its development was probably similar. Certain schools, opened within the precincts of the dissolved nunnery of St Frideswyde and of Oseney abbey, are supposed to have been the nucleus round which the university grew up. In the year 1133 one Robert Pullen, a theologian of considerable eminence (but whether an Englishman or a Breton is uncertain), arrived from Paris and delivered lectures on the Bible. H. S. Denifle (*Die Entstehung der Universitäten*, p. 241), maintains that we have at best, only presumptive evidence of a *studium generale* at Ox-

ford in the 12th century. Of this, Rashdall inclines to find the beginning in a migration of English students from Paris about 1167 or 1168. In the first-mentioned year we are told by John of Salisbury that "France, the mildest and most civil of nations," has "expelled her foreign scholars" (*Materials for the History of Thomas Becket*, edit. Robertson, vi. pp. 235–236). At about the same time we hear of an edict of Henry II., during the quarrel with Becket, recalling all clerks holding benefices in England (as they loved their benefices), and forbidding all clerks in England to cross the Channel (*ibid.* i pp 53–54) Paris was at this time the great place of higher education for English students Immediately after 1168 allusions to Oxford as a *studium* and a *studium generale* begin to multiply. The natural inference is that the breaking off of relations between England and Paris, in 1167 or 1168, led to the growth of a *studium generale* in Oxford, formed, no doubt, in the first instance of seceders from Paris In the 13th century mention first occurs of university "chests," especially the Frideswyde chest, which were benefactions designed as funds for the assistance of poor students Halls, or places of licensed residence for students, also began to be established. In the year 1257, when the bishop of Lincoln, as diocesan, had trenched too closely on the liberties of the community, the deputies from Oxford, when preferring their appeal to the king at St. Albans, could venture to speak of the university as *schola secunda ecclesiae*, or second only to Paris. Its numbers about this time were probably some 3,000, but whenever plague or tumult led to a temporary dispersion, a serious diminution in its numerical strength generally ensued for some time after. Against such vicissitudes the foundation of colleges proved the most effectual remedy. Of these the three earliest were University college, founded in 1249 by William of Durham; Balliol college, founded about 1263 by John Balliol, the father of the king of Scotland of the same name; and Merton college, founded in 1264. The last-named is especially notable as associated with a new conception of university education, viz., that of collegiate discipline for the secular clergy, instead of for any one of the religious orders, for whose sole benefit all similar foundations had hitherto been designed The statutes given to the society by Walter de Merton are not less noteworthy, as characterized not only by breadth of conception, but also by a careful and discriminating attention to detail, which led to their adoption as the model for later colleges, not only at Oxford but at Cambridge

Cambridge.—The University of Cambridge (*q.v.*) although it rose into existence somewhat later than Oxford, may reasonably be held to have had its origin in the same century. There was probably a certain amount of educational work carried on by the canons of the church of St Giles, which gradually developed into the instruction belonging to a regular *studium*. In the year 1112 the canons crossed the river and took up their residence in the new priory in Barnwell, and their work of instruction acquired additional importance. In 1209 a body of students migrated thither from Oxford. Then, as early as the year 1224, the Franciscans established themselves in the town, and, somewhat less than half a century later, were followed by the Dominicans. At both the English universities, as at Paris, the Mendicants and other religious orders were admitted to degrees, a privilege which, until the year 1337, was extended to them at no other university. Their interest in and influence at these three centres were consequently proportionably great. In the years 1231 and 1233 certain royal and papal letters afford satisfactory proof that by that time the University of Cambridge was already an organized body, with a chancellor at its head. In 1229 and 1231 the numbers were largely augmented by migrations from Paris and from Oxford. Cambridge, however, in its turn suffered from emigration; while in the year 1261, and again in 1381, the records of the university were wantonly burnt by the townsmen Throughout the 13th century, indeed, the university was still only a very slightly and imperfectly organized community. Its endowments were of the most slender kind; it had no systematic code for the government of its members; the supervision of the students was very imperfectly provided for. Although both Oxford and Cambridge were modelled on Paris, their higher faculties never developed the same distinct organization; and while the two proctors at Cambridge originally represented "north" and "south," the "nations" are scarcely to be discerned. An important step in the direction of discipline was, however, made in the year 1276, when an ordinance was passed requiring that everyone who claimed to be recognized as a scholar should have a fixed master within 15 days after his entry into the university The traditional constitution of the English universities was, in its origin, an imitation of the Parisian chancellor, modified by the absence of the cathedral chancellor. But the feature which most served to give permanence and cohesion to the entire community at Cambridge was, as at Oxford, the institution of colleges The earliest of these was Peterhouse, first founded as a separate institution by Hugh Balsham, bishop of Ely, in the year 1284. In 1323 was founded Michaelhouse, and two years later, in 1326, Edward II. instituted his foundation of "king's scholars," afterwards forming the community of King's hall. Both these societies, in the 16th century, were merged in Trinity college. To these succeeded Pembroke hall (1347) and Gonville hall (1348) All these colleges were expressly designed for the benefit of the secular clergy. The foundation of Trinity hall (*Aula*) in 1350 by Bishop Bateman, on the other hand, as a school of civil and canon law, was probably designed to further ultramontane interests. That of Corpus Christi (1352), the outcome of the liberality of a guild of Cambridge townsmen, was conceived with the combined object of providing a house of education for the clergy, and at the same time securing the regular performance of masses for the benefit of the souls of departed members of the guild But both Trinity hall and Corpus Christi college, as well as Clare hall, founded in 1359, were, to a great extent, indebted for their origin to the ravages caused among the clergy by the great plague of 1349.

FRENCH AND SPANISH MEDIAEVAL STUDIA

France.—Montpellier was a recognized school of medicine as early as the 12th century Before the end of the century it possessed also a faculty of jurisprudence The university of medicine and that of law continued, however, to be totally distinct bodies, with different constitutions. On Oct. 26, 1289, Montpellier was raised by Nicholas IV to the rank of a *studium generale*

The University of Toulouse is to be noted as the first founded in any country by virtue of a papal charter. It took its rise in the efforts of Rome for the suppression of the Albigensian heresy, and its foundation formed one of the articles of the conditions of peace imposed by Louis IX. on Count Raymond of Toulouse. In the year 1233 it first acquired its full privileges as a *studium generale* by virtue of a charter given by Gregory IX The University of Orléans had a virtual existence as a *studium generale* as early as the first half of the 13th century, but in the year 1305 Clement V. endowed it with new privileges, and gave its teachers permission to form themselves into a corporation. The schools of the city had an existence long prior—as early, it is said, as the 6th century In the 14th century its fame as a school of law was surpassed by no other university in Europe. Prior to the 13th century it had been famed for its classical learning.

The other French universities famous in the middle ages were Angers, Avignon, Cahors and Grenoble At Perpignan and Orange there were schools of small note.

Spain.—Valladolid, which received its charter from Pope Clement VI. in 1346, attained great celebrity. In 1418, however, at the Council of Constance, Martin V. not only decreed that Valladolid should take rank as a *studium generale*, but also as a *universitas theologiae*. From this time, accordingly, the advance of the university in numbers was steady and continuous throughout the 15th century, and, along with Salamanca, it served as the model for Alcalà in 1409.

Seville was founded in 1254 by Alphonso the Wise, simply for the study of Latin and of the Semitic languages, especially Arabic. Salamanca had been founded in 1243 by Ferdinand III of Castile as a *studium generale* in the three faculties of jurisprudence, the arts and medicine. But the main stress of its

activity, as was the case with all the earlier Spanish universities, was laid on the civil and the canon law. In the early part of the 15th century, however, the efforts of Martin V. established a school of theology which was afterwards regarded almost as an oracle by Catholic Europe. About the year 1600 the students are shown by the matriculation books to have numbered over 5,000. According to Cervantes they were noted for their lawlessness. The earliest of the numerous colleges founded at Salamanca was that of St Bartholomew, long noted for its ancient library and valuable collection of manuscripts, which now form part of the royal library in Madrid

The only Portuguese university in mediaeval times had its seat alternately in Lisbon and in Coimbra, until, in the year 1537, it was permanently attached to Coimbra It had received from King Diniz a charter, the provisions of which were mainly taken from those of the charter given to Salamanca. In 1772 the university was entirely reconstituted.

MEDIAEVAL UNIVERSITIES IN CENTRAL EUROPE

Prague.—Of the universities included in the Austrian empire, Prague, which existed as a *studium* in the 13th century, was the earliest It was at first frequented mainly by students from Styria and Austria, countries at that time ruled by the emperor Charles IV, who was also king of Bohemia, and at whose request Pope Clement VI., on Jan. 26, 1347, promulgated a bull authorizing the foundation of a *studium generale* in all the faculties. In the following year Charles himself issued a charter for the foundation. Charles had himself been a student in Paris, and the organization of his new foundation was modelled on that university, a like division into four "nations" (although with different names) constituting one of the most marked features of imitation. The numerous students—and none of the mediaeval universities attracted in their earlier history a larger concourse—were drawn from a gradually widening area, which at length included, not only all parts of Germany, but also England, France, Lombardy, Hungary and Poland.

Cracow.—The University of Cracow, in Poland, was founded in May 1364, by virtue of a charter given by King Casimir the Great, but its real commencement must be considered to belong to the year 1400, when it was reconstituted Towards the close of the 15th century the university is said to have been in high repute as a school of both astronomical and humanistic studies

Vienna.—The Avignonese popes appear to have regarded the establishment of new faculties of theology with especial jealousy; and when, in 1364, Duke Rudolph IV. founded the University of Vienna, with the design of constituting it a *studium generale* in all the faculties, Urban V. refused his assent to the foundation of a theological school. Owing to the sudden death of Duke Rudolph, the university languished for the next 20 years, but after the accession of Duke Albert III., who may be regarded as its real founder, it acquired additional privileges.

Heidelberg.—The University of Heidelberg (the oldest of those of the German realm) received its charter (Oct. 23, 1385) from Urban VI. as a *studium generale* in all the recognized faculties save that of the civil law. It was granted at the request of the elector palatine, Rupert I But the real founder, as he was also the organizer and teacher, of the university was Marsilius of Inghen, to whose ability and energy Heidelberg was indebted for no little of its early reputation and success. In spite of the omission of the civil law in the original charter, it was included among its faculties almost from its first creation. No mediaeval university achieved a more rapid and permanent success.

Cologne.—Owing to the labours of the Dominicans, Cologne had gained a reputation as a seat of learning long before the founding of its university; and it was through the advocacy of some leading members of the Mendicant orders that, at the desire of the city council, its charter as a *studium generale* (May 21, 1388) was obtained from Urban VI. It was organized on the model of the University of Paris, as a school of theology, and canon law, and "any other recognized faculty"—the civil law being incorporated as a faculty soon after the promulgation of the charter. In common with the other early universities of Germany—Prague, Vienna and Heidelberg—Cologne owed nothing to imperial patronage, while it would appear to have been, from the first, the object of special favour with Rome. This circumstance serves to account for its distinctly ultramontane sympathies in mediaeval times, and even far into the 16th century.

Erfurt.—Erfurt, no less noted as a centre of Franciscan than was Cologne of Dominican influence, received its charter (Sept 16, 1379) from the anti-pope, Clement VII., as a *studium generale* in all the faculties. Ten years later it was founded afresh by Urban VI. In the 15th century the number of its students was larger than that at any other German university—a fact attributable partly to the reputation it had acquired as a school of jurisprudence, and partly to the ardour with which the nominalist and realist controversies of the time were debated in its midst; its readiness in according a hearing to novel theories causing it to be known as *novorum omnium portus*.

Budapest.—In Hungary, the university at Ofen (Hungarian *Buda*) was founded in 1475. It had a school of law at Pressburg, the sole remains of the university there founded by Mathias Corvinus in 1465. This, in 1914, was turned into a university, and forms to-day the Czechoslovak university of Bratislava.

Foundation of Louvain.—In the Netherlands the growing wealth and prosperity of the different States especially favoured the formation of new centres of learning. In the flourishing duchy of Brabant the University of Louvain (1426) was to a great extent controlled by the municipality; and their patronage, although ultimately attended with detrimental results, long enabled Louvain to outbid all the other universities of Europe in the munificence with which she rewarded her professors In the course of the next century the "Belgian Athens," as she is styled by Lipsius, ranked second only to Paris in numbers and reputation It possessed no less than 28 colleges, while its active press afforded facilities to the author and the controversialist of which both Cambridge and Oxford were at that time almost destitute. It embraced all the faculties, and no degrees in Europe stood so high as guarantees of general requirements Erasmus records it as a common saying, that "no one could graduate at Louvain without knowledge, manners and age."

Leipzig.—In Germany the conditions connected with the rise of the University of Leipzig are especially noteworthy, it having been the result of the migration of almost the entire German element from the University of Prague This element comprised. (1) Bavarians, (2) Saxons, (3) Poles (this last-named division being drawn from a wide area, which included Meissen, Lusatia, Silesia and Prussia), and, being represented by three votes in the assemblies of the university, while the Bohemians possessed but one, had acquired a preponderance in the direction of affairs which the latter could no longer submit to Religious differences, again, evoked mainly by the preaching of John Huss, further intensified the existing disagreements; and eventually, in the year 1409, King Wenceslaus, at the prayer of his Bohemian subjects, issued a decree which exactly reversed the previous distribution of votes—three votes being assigned to the Bohemian nation and only one to all the rest. The Germans took deep umbrage, and seceded to Leipzig, where, a bull having been obtained from Alexander V. (Sept 9, 1409), a new *studium generale* was founded by the landgrave of Thuringia and the margraves of Meissen. The members were divided into four nations—composed of natives of Meissen, Saxony, Bavaria and Poland

Rostock.—At Rostock, in the north, the dukes John and Albert of Mecklenberg conceived the design of founding a university from which the faculty of theology should be excluded The university was accordingly founded as proposed in 1419; but in 1431 Eugenius IV. instituted a faculty of theology. Six years later, the whole academic community having incurred the papal ban, was fain to migrate to Greifswald, returning, however, to Rostock in 1443, but with one important exception, that of a master of arts named Henry Rubenow, who remained to become burgomaster of the former city, and succeeded in persuading Duke Wratislaw of Pommern to make it the seat of a university. Calixtus III. granted a bull in 1456, but it was stipulated that the rector should be a bishop, and the professorial chairs were also

made partially dependent for endowment on canonries. Greifswald thus became exposed to the full brunt of the struggle which had ensued when the endeavour to nationalize the German Church was terminated by the Concordat of Vienna (1448).

Freiburg.—The universities of Freiburg, in Baden, and Tubingen, in Württemberg, alike owed their foundation to the countess Matilda, by whose persuasion her husband, the archduke of Austria, known as Albrecht VI, was induced to found Freiburg in 1455, and Count Eberhard (her son by a former marriage) to found Tubingen in 1477. At Freiburg, under the supervision of its first rector, Matthew Hummel of Villingen, the numbers were soon largely augmented by migrations of students from Vienna and from Heidelberg, while its resources, which originally were chiefly an annual grant from the city council, were increased by the bestowal of canonries and prebends Erasmus had made Freiburg his residence from 1529 to 1535, during which time he may have originated the tradition of liberal learning, but in 1620, under the rule of the archduke Maximilian, the control of the humanistic studies and of the entire faculty of philosophy was handed over to the Jesuits, who also gained possession of two of the chairs of theology

THE RENAISSANCE

Tübingen.—The University of Tubingen was founded in 1477 with the usual four faculties, and numbered John Reuchlin and Melanchthon among its teachers. (*See* TÜBINGEN)

France.—The earliest 15th century university in France was that of Aix in Provence. It had originally been nothing more than a school of theology and law, but in 1409 it was reorganized as a *studium generale* on the model of Paris Its students were divided into Burgundians, Provençals and Catalans

The University of Poitiers was instituted by Charles VII in 1431 with the design of creating a centre of learning less favourable to English interests than Paris had at that time shown herself to be He conferred on Poitiers all the privileges collectively possessed by Paris, Toulouse, Montpellier, Angers and Orleans, and at the same time placing the university under special royal protection

The University of Caen was founded under English auspices during the short period of the supremacy of the English arms in Normandy in the 15th century Its charter (May 1437) was given by Eugenius IV, and the bishop of Bayeux was appointed its chancellor After the expulsion of the English from France, it received a new charter From this time the University of Caen was distinguished by its loyal spirit and firm resistance to ultramontane pretensions; and, although swept away at the French Revolution, it was afterwards restored, owing to the sense of the services it had thus once rendered to the national cause. Other French 15th century foundations are Bordeaux (1441), Valence (1452), Nantes (1463), and Bourges (1465)

Central and Northern Europe.—The University of Basle was opened in 1460, under the auspices of its own citizens, and Pius II (Aeneas Sylvius) granted the charter (Nov 12, 1459) During the first 70 years of its existence the university prospered, and its chairs were held by eminent professors, among them historical scholars, such as Sebastian Brant and Jacob Wimpheling But with the Reformation, Basle became the arena of contests which menaced the very existence of the university itself, the professors being, for the most part, opposed to the new movement with which the burghers warmly sympathized Eventually, the statutes were revised, and in the latter half of the 16th century the university may be said to have attained its apogee.

The University of Ingolstadt was founded on April 7, 1459 But it was not until 1472 that the work of teaching was actually commenced there. Some long-existing prebends, founded by former dukes of Bavaria, were appropriated to the endowment. Nowhere did the Reformation meet with more stubborn resistance, and it was at Ingolstadt that the Counter-Reformation commenced. In 1556 the Jesuits made their first settlement in the university.

At Trier and Mainz universities were established in the second half of the 14th century. Trier received its charter as early as 1450; but the first academical session did not commence until 1473 In 1722 the assembly of deputies, by a formal grant, relieved the university from the difficulties in which it had become involved Sixtus IV. granted the charter to Mainz (Nov. 23, 1476) at the request of Archbishop Diether, who was himself a great humanist.

Other foundations were those of Uppsala (1477) and Copenhagen (1479), which, although lying without the political boundaries of Germany, rejected her influence The charter for Copenhagen was given by Sixtus IV as early as 1475.

The university founded at Wittenberg by Maximilian I (July 6, 1502) was the first established in Germany by imperial decree Its charter is, however, drawn up with the traditional phraseology of the pontifical bulls, and is evidently not conceived in any spirit of antagonism to Rome Wittenberg is constituted a *studium generale* in all the four faculties—the right to confer degrees in theology and canon law having been sanctioned by the papal legate some months before, on Feb 2, 1502 Wittenberg was the first academic centre north of the Alps where the Latinity and antiquated methods of the scholastic era were overthrown

Frankfurt-on-the-Oder received its charter in 1506

Scotland.—The first Scottish foundation was at St Andrews, founded in 1411 by Henry Wardlaw, bishop of that see, and modelled chiefly on the constitution of the University of Paris It acquired all its three colleges—St Salvator's, St Leonard's and St Mary's—before the Reformation The most ancient of the universities of Scotland, with its three colleges, was thus reared in an atmosphere of mediaeval theology, and undoubtedly designed as a bulwark against heresy and schism But "by a strange irony of fate, two of these colleges became, almost from the first, the foremost agents in working the overthrow of that Church which they were founded to defend" St Leonard's more especially, like St John's or Queen's at Cambridge, became a noted centre of intellectual life and Reformation principles

The University of Glasgow was founded as a *studium generale* in 1453, and possessed two colleges.

The University of Aberdeen, founded in 1494, at first possessed only one college, namely, King's, which was co-extensive with the university and conferred degrees Marischal college, founded in 1593, was independent of the university in Old Aberdeen, being itself also a college and a university, with the power of conferring degrees

The "College of Edinburgh" was founded by charter of James VI, dated April 14, 1582 The new foundation rose comparatively untrammelled by the traditions of mediaevalism Its first course of instruction was commenced in the Kirk of Field, under the direction of Robert Rollock, who had been educated at St Andrews under Andrew Melville, the eminent Covenanter In 1585 Rollock subscribed the National Covenant, and a like subscription was, from that time, required from those admitted to degrees in the college

General Aspects.—Generally speaking, the universities were conservative Hegius, John Wessel and Rudolphus Agricola carried on their work as reformers at places like Deventer remote from university influences That there was a considerable amount of mental activity going on in the universities themselves is not to be denied; but it was mostly of that unprofitable kind which, while giving rise to endless controversy, turned upon questions in connection with which the implied postulates and the terminology employed rendered all scientific investigation hopeless. At almost every university—Leipzig, Greifswald and Prague (after 1409) being the principal exceptions—the so-called Realists and Nominalists represented two great parties occupied with an internecine struggle At Paris, owing to the overwhelming strength of the theologians, the Nominalists were, indeed, under a kind of ban; but at Heidelberg they had altogether expelled their antagonists. It was much the same at Vienna and at Erfurt. At Basle, under the leadership of the eminent Johannes a Lapide, the Realists with difficulty maintained their ground Freiburg, Tübingen and Ingolstadt, in the hope of diminishing controversy, arrived at a kind of compromise, each party having its own professor, and representing a distinct "nation" At Mainz the au-

thorities adopted a manual of logic which was essentially an embodiment of nominalistic principles.

In Italian universities, it was decided that these controversies were endless and that their effects were pernicious. It was resolved, accordingly, to expel logic, and allow its place to be filled by rhetoric, thereby effecting that important revolution in academic studies which constituted a new era in university learning, and largely helped to pave the way for the Reformation Hence the Italian universities enjoyed a fortunate immunity from dissensions like those which distracted the centres of learning in Germany.

The professorial body in the great Italian universities attained an almost unrivalled reputation throughout Europe. For each subject of importance there were always two, and sometimes three, rival chairs, and a powerful and continuous emulation was thus maintained among the teachers "The call to a Paduan or Pisan chair was deemed the highest of all literary honours. The status of professor was, in Italy, elevated to a dignity which in other countries it has never reached, and not a few of the most illustrious teachers in the Italian seminaries were of the proudest nobility of the land While the universities of other countries had fallen from Christian and cosmopolite to sectarian and local schools, it is the peculiar glory of the Italian that, under the enlightened liberality of their patrons, they still continued to assert their European universality. Creed and country were, in them, no bar—the latter not even a reason of preference Foreigners of every nation are to be found among their professors; and the most learned man in Scotland, Thomas Dempster, sought in a Pisan chair that theatre for his abilities which he could not find at home" (Sir W Hamilton—*Discussions*).

Spain.—To such catholicity of sentiment the Spanish universities of this period offer a complete contrast, their history being strongly modified by political and religious movements Valencia, founded in 1501, and Seville, sanctioned by Julius II in 1505, appear both to have been regarded without mistrust at Rome Julius had approved the foundation of the University of Santiago as early as 1504, but the bull for its creation was not granted by Clement VII until 1526. The design of establishing a university at Granada was deferred until 1531 Little, indeed, is to be learnt respecting the new society until the foundation of the liberally endowed College de Sacro Monte by the archbishop of the province in 1605 Under the direction of the Jesuits the scholastic philosophy, together with a certain attention to Greek and Hebrew, became the dominant study Gregory XIII in 1574 authorized the foundation of the University of Oviedo; but this was not opened until 1608, and then only with a faculty of law After this time the universities in Spain shared in the general decline of the country; and, even after the expulsion of the Jesuits in 1769, no marked improvement is discernible in their schools until the second half of the 19th century.

REFORMATION AND POST-REFORMATION IN ENGLAND

The Renaissance.—The influence of the Renaissance, and the teaching of Erasmus, who resided for some time at both universities, exercised a notable effect alike at Oxford and at Cambridge. The names of Colet, Grocyn and Linacre illustrate this influence at the former centre; those of Bishop Fisher, Sir John Cheke and Sir Thomas Smith at the latter. The labours of Erasmus at Cambridge, as the author of a new Latin version of the New Testament, with the design of placing in the hands of students a text free from the errors of the Vulgate, were productive of important effects, and the university became a centre of Reformation doctrine some years before the writings of Luther became known in England. The foundation of Christ's college (1505) and St. John's college (1511), through the influence of Fisher with the countess of Richmond, also materially aided the general progress of learning at Cambridge. The Royal Injunctions of 1535, embodying the views and designs of Thomas Cromwell, mark the downfall of the old scholastic methods of study at both universities; and the foundation of Trinity college, Cambridge, in 1547 (partly by an amalgamation of two older societies), represents the earliest conception of such an institution in England in complete independence of Roman Catholic traditions. Trinity (1554) and St. John's (1555) at Oxford, on the other hand, founded during the reactionary reign of Mary, serve rather as examples of a transitional period.

Puritanism at Cambridge.—In the reign of Elizabeth, Cambridge became the centre of another great movement—that of the earlier Puritanism, St. John's and Queens' being the strongholds of the party led by Cartwright, Walter Travers and others. The movement continued to gather strength; and Emmanuel college, founded in 1584, owed much of its early prosperity to the fact that it was a known school of Puritan doctrine. Most of the Puritans objected to the discipline enforced by the university and ordinary college statutes—especially the wearing of the cap and the surplice and the conferring of degrees in divinity. The Anglican party, headed by such men as Whitgift and Bancroft, resorted in defence to a repressive policy, of which subscription to the Acts of Supremacy and Uniformity, and the Elizabethan statutes of 1570 (investing the "caput" with larger powers, and thereby creating a more oligarchical form of government), were the most notable results Oxford, although the Puritans were there headed by Leicester, the chancellor, devised at the same time a similar scheme, the rigid discipline of which was further developed in the Laudian or Caroline statutes of 1636 It was under these respective codes—the Elizabethan statutes of 1570 and the Laudian statutes of 1636—that the two universities were governed until the introduction of the new codes of 1858. The fidelity with which both universities adhered to the royal cause in the Civil War caused them to be regarded with suspicion by the Puritan party, and under the Commonwealth both Oxford and Cambridge were, for a brief period, in great danger owing to the distrust, which culminated among the members of the "Nominated Parliament" (July–Dec. 1653), of university education generally, as tending to foster contentiousness with respect to religious belief. It was even proposed by William Dell—himself the master of Caius college—to abolish the two universities altogether, as hopelessly pledged to antiquated and obsolete methods, and to establish in their place schools for the higher instruction throughout the country They were saved, however, by the firmness of Cromwell, at that time chancellor of Oxford, and, although Aristotle and the scholastic philosophy no longer held their ground, a marked improvement was observable both in discipline and morality among the students At Oxford, under the influence and teaching of Dr. Wilkins, Seth Ward and John Wallis, a flourishing school of mathematics was formed.

THE REFORMATION AND LATER FOUNDATIONS

The Reformation represents the great boundary line in the history of European universities. Even in Catholic countries its effects found expression in connection with the Counter-Reformation The influence of the humanists, and the special character which the Reformation assumed in Germany in connection with the labours of scholars like Erasmus, John Reuchlin and Melanchthon, augured well for the future. German university teaching was free from the frivolity, pedantry, and scepticism which characterized so much of the corresponding culture in Italy. It gave promise of resulting at once in a critical and enlightened study of the masterpieces of classical antiquity, and in a reverent and yet rational interpretation of the Scriptures and the Fathers. The bigoted and ceaseless controversies evoked by the promulgation of Lutheran or Calvinistic doctrine dispelled, however, this prospect, and converted the universities into gloomy fortresses of sectarianism For a century after the Reformation the history of Lutheran theology became almost identified with that of the German universities.

Marburg.—The first Protestant university was that of Marburg, founded by Philip the Magnanimous, landgrave of Hesse, May 30, 1527, and was mainly built up out of the confiscation of the property of the religious orders in the Hessian capital. It rapidly became famous, and attracted students from remote countries After 1605, when, by the decree of Count Maurice, its formulary of faith was changed from Lutheran to Calvinistic, its numbers greatly declined. This dictation of the temporal

power now becomes one of the most notable features in academic history in Protestant Germany.

Königsberg.—The Lutheran University of Konigsberg was founded Aug. 17, 1544, by Albert III, margrave of Brandenburg, and the first duke of Prussia, and his wife Dorothea, a Danish princess. King Sigismund of Poland gave the charter (Sept. 29, 1561), and students who graduated as masters in the faculty of philosophy ranked as nobles of the Polish kingdom. When Prussia was raised to the rank of a kingdom (1701) the university was made a royal foundation, and the "collegium Fridericianum," which was then erected, received corresponding privileges Konigsberg will always be remembered as the university of Kant. In 1862 the university buildings were rebuilt, and the number of the students soon after rose to nearly a thousand

Jena.—The Lutheran University of Jena was opened on Feb. 2, 1558. Distinguished for its vehement assertion of Lutheran doctrine, its hostility to the teaching of Wittenberg was hardly less pronounced than that with which both centres regarded Roman Catholicism For a long time it was chiefly noted as a school of medicine, and in the 17th and 18th centuries was in bad repute for the lawlessness of its students, among whom duelling prevailed to a scandalous extent

Helmstedt.—The Lutheran University of Helmstedt, founded by Duke Julius (of the house of Brunswick-Wolfenbuttel) received its charter, May 8, 1575, from the emperor Maximilian II. It was munificently endowed by the founder and by his son; and its "Convictorium," or college for poor students, expended in the course of 30 years no less than 100 000 thalers, an extraordinary expenditure for an institution of such a character in those days Distinguished by its comparatively temperate maintenance of the Lutheran tenets, it attracted a considerable concourse of students, especially from the upper classes Until suppressed in 1809, Helmstedt enjoyed the special and powerful patronage of the dukes of Saxony

Altdorf.—The "Gymnasium Aegidianum" of Nuremberg, founded in 1526, and removed in 1575 to Altdorf, represents the origin of the University of Altdorf Altdorf was about the poorest university in Germany, and long one of the most eminent. Its whole endowment never rose above £800 a year.

Giessen.—The conversion of Marburg into a school of Calvinistic doctrine gave occasion to the foundation of the Universities of Giessen and of Rinteln Giessen, founded by the margrave of Hesse-Darmstadt, Louis V, as a kind of refuge for the Lutheran professors from Marburg, received its charter from the emperor Rudolph II. (May 19, 1607) In 1625 the university was transferred to Marburg; in 1650 it was moved back again to Giessen

Strasbourg.—The University of Strasbourg was founded in 1621 on the basis of an already existing academy which, under the direction of John Sturm attracted students from all parts of Europe, and especially from Portugal, Poland, Denmark, France and England The method of Sturm's teaching became the basis of that of the Jesuits, and, through them, of the public school instruction in England. In 1621 Ferdinand II conferred on this academy full privileges as a university. In 1681 Strasbourg became French. It was refounded by the emperor William I, and before the close of the century numbered over 1,100 students At the end of the 18th century it was distinguished by an intellectual activity with which the name of Goethe is connected, after its reversion to Germany. Since 1918 the university has again become French, and is now enjoying much prosperity.

Russian Universities.—At the beginning of last century Russia possessed but three universities—that of Moscow (1755), founded by the empress Elizabeth, of Vilna (1578), which was Polish; and of Dorpat (to-day Tartu) which was virtually German Alexander I. founded the University of Kharkov (1804) for New Russia, that of Kazan (1804) for the countries about the Volga, but designed also for the populations of Finland and Siberia, and that of St. Petersburg (1819) Each of the foregoing six universities had a definite district assigned to it, and, as a further incentive to the pursuit of academic studies, a *ukaz* promulgated in 1809 proclaimed that in all appointments to official posts throughout the empire the holders of a university degree would receive the first consideration. In 1832 the foundation of the St. Wladimir university of Kiev absorbed the university at Vilna. Odessa, founded in 1865, was designed to represent the university of New Russia. Although at St Petersburg considerable attention was regularly given to the teaching of languages, especially those of Armenia, Georgia, and Tartary, the general status of the Russian universities continued, throughout the greater part of last century, exceptionally low, and in 1884 they were all reconstituted by the promulgation of a "universal code"; with this the statutes of the universities at Dorpat (1632) and Warsaw (1886) were essentially in agreement. The study of the Slavonic languages received a considerable stimulus, especially when, by a decree in May 1887, the use of the Russian language was made obligatory in all places of instruction throughout the Baltic provinces

The University of Tomsk in western Siberia, founded in 1888, depended chiefly on a grant from the State, aided by private liberality After 1860 the general influence of Dorpat rapidly spread far beyond the Baltic provinces, while the number of students, which in 1879 was 1,106, rose to nearly 2,000 in 1882. In 1889 the Russification of the university went far to deprive the university of its claim to be considered German Since the World War it has naturally become an Estonian university, and is now known as Tartu

Helsingfors.—In 1826 the university at Åbo in Finland was removed to Helsingfors, and still preserves the charter whereby, in its original home, it had been constituted a university by Queen Christina and her chancellor, Oxenstierna, in the year 1640.

Prague.—At Prague, where a Czech university had been established on an independent basis, the German university began its separate career in the winter session of 1882–83 The German foundation retained certain revenues accruing from special endowments, but the State subvention was divided between the two It is still in existence, though the country is now Czechoslovakia

THE COUNTER-REFORMATION

Bamberg.—The earliest university whose charter represented the counter-Reformation was that of Bamberg, founded by the prince-bishop and opened Sept 1, 1648. At first, however, it comprised only the faculties of arts and of theology; to these was added, in 1729, that of jurisprudence, and in 1764 that of medicine. The university library contains a collection of manuscripts from some 30 suppressed monasteries, convents, and religious institutions at the time of the "secularization"

Innsbruck.—The University of Innsbruck was founded in 1672 by the emperor Leopold I. In the following century, under the patronage of the empress Maria Theresa, it made considerable progress, and received from her its ancient library and bookshelves in 1745. In 1782 the university was reduced by the emperor Joseph II. from the status of a university to that of a lyceum, although retaining in the theological faculty the right of conferring degrees In 1791 it was restored to its privileges by the emperor Leopold II

Breslau.—The University of Breslau was founded by the emperor Leopold I in 1702. When Frederick the Great conquered Silesia in 1741, he took both the university and the Jesuits in Breslau under his protection, and when, in 1774, the order was suppressed by Clement XIV he established them as priests in the Royal Scholastic institute, at the same time giving new statutes to the university In 1811 the university was considerably augmented by the incorporation of that at Frankfurt-on-the-Oder, and was ultimately reconstituted on lines similar to those of the newly-founded University of Berlin

Jesuit Influence in France.—In no country was the influence of the Jesuits on the universities more marked than in France. The civil wars in that country during the 30 years which preceded the close of the 16th century told with disastrous effects upon the condition of the University of Paris, and with the commencement of the 17th century its collegiate life seemed at an end, and its 40 colleges stood absolutely deserted. To this state of affairs the obstinate conservatism of the academic authorities not

a little contributed. The Jesuits did not fail to profit by this excessive conservatism on the part of the university, and during the second half of the 16th century and the whole of the 17th they had contrived to gain almost a complete monopoly of both the higher and the lower education of provincial France Their schools rose at Toulouse and Bordeaux, at Auch, Agen, Rhodez, Périgueux, Limoges, Le Puy, Aubenas, Béziers, Tournon, in the colleges of Flanders and Lorraine, Douai and Pont-à-Mousson—places beyond the jurisdiction of the parlement of Paris or even of the Crown of France. Their banishment from Paris itself had been by the decree of the parlement alone, and had never been confirmed by the Crown "Lyons," says Pattison, "loudly demanded a Jesuit college, and even the Huguenot Lesdiguières, almost king in Dauphiné, was prepared to erect one at Grenoble The university was rescued from the fate which seemed to threaten it only by the excellent statutes given by Richer in 1598, and by the discerning protection extended by Henry IV.

17TH AND 18TH CENTURY FOUNDATIONS

Halle and Pietism.—But 1693 saw the foundation of the University of Halle, which has been described as "the first real modern university." It originated in a *Ritterschule* for the sons of the nobility Leopold I. granted (Oct 19, 1693) the requisite charter The primary object in founding a university in Halle was to create a centre for the Lutheran party, but its character, under the influence of its two most notable teachers, Christian Thomasius and A. H Francke, soon expanded beyond the limits of this conception. Thomasius and Francke had both been driven from Leipzig on account of their liberal and progressive tendencies Thomasius was the first to set the example, soon after followed by all the universities of Germany, of lecturing in the vernacular instead of in the customary Latin Francke, as the founder of that Pietistic school, exercised great influence Christian Wolf, who followed Thomasius as an assertor of the new culture, was driven from Halle by the accusations of the Pietists In 1740, however, he was recalled by Frederick II, and reinstated Throughout the whole of the 18th century Halle was the leader of academic thought and advanced theology in Protestant Germany, although sharing that leadership, after the middle of the century, with Gottingen.

Göttingen.—The University of Gottingen (named after its founder, "Georgia Augusta"), was endowed with the amplest privileges as a university by George II of England, elector of Hanover, Dec 7, 1736 The university included all the faculties, and two of its first professors—Mosheim, the eminent theologian, from Helmstedt, and G. L. Bohmer, the no less distinguished jurist from Halle—together with Gesner, the man of letters, at once established its reputation Not least among its attractions was also its splendid library, located in an ancient monastery, and now containing over 200,000 vol and 5 000 mss The Gottingen school of history became famous. The labours of the professors at Gottingen especially Putter, Gatterer, Schlözer and Spittler, combined with those of Mascov at Leipzig, did much towards promoting both a more catholic treatment and a wider scope The method of appointment of professors was reformed by the chief curator, Munchhausen, on lines similar to those already instituted in the universities of the Netherlands by Douza (*q v*).

Erlangen.—The University of Erlangen, a Lutheran centre, was founded by Frederick, margrave of Bayreuth. Its charter was granted by the emperor Charles VII in 1743. In 1791, Ansbach and Bayreuth having passed into the possession of Prussia, Erlangen also became subject to the Prussian Government.

THE 19TH CENTURY

Extinction of German Universities During 1798–1815.—The political storms which marked the close of the 18th and the beginning of the 19th century gave the death-blow to not a few of the ancient universities of Germany. Mainz and Cologne ceased to exist in 1798; Bamberg, Dillingen and Duisburg in 1804; Rinteln and Helmstedt in 1809; Salzburg in 1810; Erfurt in 1816. Altdorf was united to Erlangen in 1807, Frankfurt-on-the-Oder to Breslau in 1809, and Wittenberg to Halle in 1815. The University of Ingolstadt was first moved in 1802 to Landshut, and from thence, in 1826, to Munich, where it was united to the academy of sciences which was founded in the Bavarian capital in 1759. Münster, in Prussia, which was constituted a university by Maximilian Frederick (elector and archbishop) in 1771, was abolished in the year 1818, but two faculties, those of theology and philosophy, continued to exist, and in 1843 it received the full privileges of a Prussian university, together with the designation of a royal foundation. Of those of the above centres which altogether ceased to exist, but few were much missed or regretted—that at Mainz, which had numbered some 600 students, being the one notable exception The others had, for the most part, fallen into a perfunctory and lifeless mode of teaching, and, with wasted or diminished revenues and declining numbers, had long ceased worthily to represent the functions of a university Whatever loss may have attended their suppression was more than compensated by the activity and influence of the three great German universities which rose in the last century.

Munich, after having been completely reorganized, soon became a distinguished centre of study in all the faculties; and its numbers, allowing for the two great wars of 1866 and 1870, continuously increased. The eminence of its professoriate, among whom have been Dollinger, Liebig, Schelling, Zeuss and Giesebrecht, attracted students from all parts of Europe.

Berlin.—The University of Berlin, known as the *Royal* Friedrich Wilhelm university, was founded in 1809, when Prussia had been reduced to the level of a third-rate Power. Under Wilhelm von Humboldt, supported by Frederick William III, the principles adopted in connection with the new seat of learning not only raised it to a foremost place among the universities of Europe, but also largely conduced to the regeneration of Germany It not only incorporated the famous "Academy of Sciences," but expressly repudiated all attachment to any particular creed or school of thought It is the largest of the German universities, numbering in 1927 10,426 regular students Berlin with its system of schools for special subjects offers great opportunities to specialist students

Bonn.—The University of Bonn, founded in 1818 and also by Friedrich Wilhelm III, thus became known as the *Rhenish* Friedrich Wilhelm university. The king summoned to his aid the best available talent, including Niebuhr, A W von Schlegel, with C. F Nasse in medicine and G Hermes in theology. In the last-named faculty it combined the opposed schools of theological doctrine of the Evangelical (or Lutheran) and of the Roman Catholic Church

In 1878, a comparison of the numbers of the students in the different faculties in the Prussian universities with those for the year 1867, showed a remarkable diminution in the faculty of theology, amounting in Lutheran centres to more than one-half, and in Catholic centres to nearly three-fourths. In jurisprudence there was an increase of nearly two-fifths, in medicine a decline of a third, and in philosophy an increase of one-fourth

HOLLAND AND BELGIUM

Leyden.—The earliest, that of Leyden, founded in 1575, commemorated the successful resistance of the citizens to the Spanish forces under Requesens. Throughout the 17th century Leyden was distinguished by its learning, the ability of its professors, and the shelter it afforded to the more liberal thought associated at that period with Arminianism. Much of its early success was owing to the wise provisions and the influence of the celebrated Janus Douza Douza, in fact, did for Leyden and the Dutch, what Münchhausen afterwards did for Gottingen and the German universities. The appointment of the professors at Leyden was vested in three (afterwards five) curators, one of whom was selected from the body of the nobles, while the other two were appointed by the States of the province—the office being held for nine years, and eventually for life. With these was associated the mayor of Leyden for the time being. Leyden secured and has maintained a very high reputation for scientific work. Other Dutch universities with a famous history are Franeker (founded 1585), Harderwyk (founded 1600), Groningen (founded 1614),

and Utrecht (founded 1634), the latter being a great resort in the 18th century for English students. Amsterdam is a 19th century foundation dating from 1882.

Ghent and Liége.—The Universities of Franeker and Harderwijk were suppressed, and those of Ghent and Liége created in 1815, while a uniform constitution was given to Dutch and Belgian universities. It was provided that there should be attached to each a board of curators, consisting of five persons, "distinguished by their love of literature and science and by their rank in society," to be nominated by the king When, however, Belgium was created as a separate kingdom, further changes took place in the latter country. At Louvain, the chief Catholic centre, the faculties of law, medicine and philosophy had already, in 1788, been removed to Brussels.

Brussels.—In 1834 Brussels was constituted a free and independent university with a new fourth faculty of natural science, and supported mainly by contributions from the Liberal party Having, however, no charter, it continued incapable by law of possessing property Louvain and Brussels thus came to represent the two chief political parties in the realm, while the Universities of Ghent on the Scheldt and Liége on the Meuse recruited their students mainly from the two chief races—the Flemish and the Walloon For the struggles which arose over the Flemicisation of the University of Ghent in the present century *see* BELGIUM. In Holland, on the other hand, where no such marked racial differences exist, the Universities of Groningen, Leyden and Utrecht have been assimilated (1876) in constitution, each being administered by a consistory of five rectors with a senate composed of the professors in the respective faculties.

UNIVERSITIES OF SWEDEN AND NORWAY

The Royal university of Uppsala, whose foundation as a *studium generale* was sanctioned by Pope Sixtus IV in 1477, was roused to new life in the 17th century by the introduction of the Cartesian philosophy. In the 18th century lectures began to be delivered in Swedish; while the mediaeval division of the students into "nations" continued, as at Lund, until the second quarter of the 19th Gothenburg, on the other hand, with its society of science and literature, dating from 1841, has represented rather a popular institution, existing independently of the State, maintained chiefly by private contributions, and governed by a board called the *Curatorium*. For a long time it was not empowered to hold examinations Stockholm (1878) still remains a gymnasium, but its curriculum is, to a certain extent, supplemented by its connection with Uppsala, from which it is little more than 40 m distant by rail The University of Christiania (now Oslo), in Norway, founded in 1811, and the Swedish universities are strongly Lutheran in character; and all alike are closely associated with the ecclesiastical institutions of the Scandinavian kingdoms. The same observation applies to Copenhagen—where the labours of Rask and Madvig raised the reputation of the university for learning.

The royal university of Kiel was founded in 1665 by Duke Christian Albrecht of Holstein (who himself assumed the office of rector), with faculties of theology, law, medicine and philosophy. After the incorporation of Schleswig-Holstein with the kingdom of Prussia it made a marked advance. In the latter half of the last century it became famous as a school of chemistry, physiology and anatomy, while its library, in 1904, exceeded 250,000 volumes.

FRANCE IN THE 18TH AND 19TH CENTURIES

University of Paris from the 17th Century.—The University of Paris, indeed, was distracted, throughout the 17th century, by theological dissensions—in the first instance owing to the struggle that ensued after the Jesuits had effected a footing at the Collège de Clermont, and subsequently by the strife occasioned by the teaching of the Jansenists. Towards the close of the century a certain revival took place, and a succession of illustrious names—Pourchot, Rollin, Grenan, Coffin, Demontempuys, Crevier, Lebeau—appear on the roll of its teachers. But this improvement was soon interrupted by the controversies excited by the promulgation of the bull Unigenitus in 1713, condemning the tenets of Quesnel At last, in 1762, the parlement of Paris issued a decree (Aug 6) placing the colleges of the Jesuits at the disposal of the university, and this was immediately followed by another for the expulsion of the order from Paris, the university being installed in possession of their vacated premises. Concurrently with this measure, both history and natural science began to be cultivated with a certain success Then came the French Revolution. On Sept 15, 1793, the universities and colleges throughout France, together with the faculties of theology, medicine, jurisprudence and arts, were abolished by a decree of the convention, and the whole system of national education may be said to have remained in abeyance, until, in 1808, Napoleon I. promulgated the scheme of which many of its features still exist. The whole system of education, henceforth called the University of France, and including both secondary and primary, was made subject to the control and direction of the State All France was divided into 17 districts, designated "academies," each administered by its own rector and council, but subject to the supreme authority of the minister of public instruction, and representing certain faculties which varied at different centres, in conformity with the new scheme of distribution for the entire country

Lille, Lyons and Rennes.—While three new "academies"—those of Lille, Lyons and Rennes—date their commencement from 1808, many of the pre-existing centres were completely suppressed In some cases, however, the effacement of an ancient institution was avoided by investing it with new importance, as at Grenoble; in others, the vacated premises were appropriated to new uses connected with the department, as at Avignon, Cahors and Perpignan

Institution of "Free Faculties."—In 1895 the Government was prevailed upon to sanction the institution of certain "free faculties," as they were termed, to be placed under the direction of the bishop, and depending for support upon voluntary contributions, and each including a faculty of theology, the best known being those of Paris and Lille The faculty at Marseille, already mentioned, was now called upon to unite with the Académie of Aix, its faculties being restricted to mathematics and natural science (including a medical school), while faculties of law and philosophy were fixed at Aix, which possesses also the university library properly so termed In the capital itself, the University of Paris and the École Pratique des Hautes Études carried on the work of higher instruction independently of each other—the former with faculties of Protestant theology, law, medicine, science, letters and chemistry, distributed over the Quartier Latin; the latter with schools of mathematics, natural science, history, philology, and history of religions centred at the Sorbonne

In 1896, the higher education of France was decentralized and the existing academies, consisting of isolated faculties, were converted into regional universities, while the Sorbonne, from being the University of France became the University of Paris The total number of universities, including that of Alger, was 16 (since increased to 17 by the recovery of Strasbourg)

Collège de France.—The Collège de France, founded in the 16th century by Francis I, was from the first regarded with hostility by the Sorbonne As a school of gratuitous instruction in Latin, Greek and Hebrew, it not only held its ground, but at the Revolution ultimately survived the universities As reconstituted in 1831 it became chiefly known as an institution for the instruction of adults, and its staff of professors has comprised from time to time the names of not a few of the most distinguished scholars and men of science in the country

Switzerland.—In Switzerland the universities shared in the conflicts handed down from the days when the Helvetic republic had been first created In 1832, Basle having joined the League of the Catholic Cantons, the Confederates divided the canton into two, and agreed to raise the flourishing Hochschule, which already existed at Zurich, to the rank of a university—a measure which may be said to mark a turning-point and a new epoch in the history of the higher education of the republic The gymnasium of Berne, originally established under the teaching of Ulrich Zwingli, developed, in 1834, into a university with all the faculties. As early as 1586 Lausanne had been a noted school for the

education of Protestant ministers, but it was not until 1806 that chairs of philosophy and law were established, to which those of natural science and literature were added in 1836, and, somewhat later, that of medicine. It was not, however, until 1891 that Lausanne was formally constituted a university. At Geneva, the famous academy of the 16th and 17th centuries, long distinguished as a centre of Calvinistic teaching, became merged, in 1876, in a university, where the instruction (given mainly in the French language) was carried on by a staff of 41 professors With this was also incorporated an earlier school of science, in which De Saussure and De Candolle had once been teachers. Fribourg, founded in 1889, began with only two faculties—those of law and philosophy, to which one of theology was added in the following year.

Spain.—In Spain, by the act of 1857, the system was placed under the control of the minister of education, while the kingdom was divided into ten university districts—Madrid, Barcelona, Granada, Oviedo, Salamanca, Santiago, Seville, Valencia, Valladolid and Saragossa—the rector of the universities in each district representing the chief authority. The degrees to be conferred at each were those of bachelor, licentiate and doctor Each university received a rector of its own, selected by the Government from among the professors, and a precise plan of instruction was prescribed in which every hour had its appointed lecturer and subject Philosophy, natural science, law and medicine were to be studied at all these universities, and at the majority a school of chemistry was subsequently instituted But at Salamanca, Valladolid, Seville and Saragossa no school of chemistry was instituted, and at the first three that of medicine ultimately died out No provision was made for instruction in theology, this being relegated to the seminaries in the episcopal cities The University of Manila, in the Philippines, was opened in 1601 as a school for the nobility, and ten years later the famous College of St. Thomas was founded by the Dominican order; but it was not until 1857 that the university, properly speaking, was founded by royal Spanish decree

Austria-Hungary and Vienna.—In pre-war Austria the universities were largely modelled on the same system as those of the German empire. Vienna has long been chiefly distinguished for its school of medicine, which enjoyed, in the last century, a reputation almost unrivalled in Europe The University of Graz, the capital of Styria, was founded in 1586, and has long been one of the most flourishing centres, with nearly 2,000 students, chiefly in law and philosophy The University of Salzburg, founded in 1623, was suppressed in 1810; that of Lemberg (Lwow), founded in 1784 by the emperor Joseph II, was removed, in 1805, to Cracow, and united to that university. In 1816 it was opened on an independent basis In the bombardment of the town in 1848 the university buildings were burnt down, and the site was changed to what was formerly a Jesuit convent. Lwow is now Polish

Budapest, Klausenburg (Cluj) and Agram.—The universities of the Hungarian kingdom before the World War were three in number.—Budapest, originally founded by Tyrnau in 1635, under the auspices of the Jesuits, now possessing four faculties—theology, jurisprudence, medicine and philosophy; Kolozsvar (Klausenburg), once the chief Magyar centre, founded in 1872 and comprising four faculties, but where mathematics and natural science supply the place of theology. It is now known as Cluj, and is in Rumania. Zágráb (Agram), the Slovak university, now in Yugoslavia, originally founded by Maria Theresa in 1776 and reopened in 1874 with three faculties, viz., jurisprudence, theology and philosophy. The chief centre of Protestant education is the college at Debreczen, founded in 1531, which, in past times, was not infrequently subsidized from England. In 1914 it was raised to the dignity of a university.

Japan.—In Japan there are two imperial universities—Tokyo (1868) and Kyoto (1897)—the former representing the union of two pre-existing foundations, on which occasion it was placed under the control of the minister of instruction with yearly grants from the Treasury Kyoto was formed out of four previously existing colleges of law, medicine, science and engineering. The number of universities in the country has since been considerably augmented.

Athens.—The "National University" of Athens (founded May 22, 1837) was modelled on the university systems of northern Germany. It originally included only four faculties, viz., theology, jurisprudence, medicine and philosophy, to which one of applied mathematics was subsequently added

Rumania, Bulgaria and Turkey.—The University of Jassy (1860) in Rumania, was founded by its ruler, Prince Cuza, and together with the newly-founded University of Bucharest, received its completed organization in 1864. Both were constituted State institutions and were represented in the senate, although not receiving any fixed revenues from the Government. Its students are instructed and examined gratuitously The University of Czernowitz (Cernăuti), founded in 1875, is now Rumanian. In the University of Sofia (1888) in Bulgaria, faculties were established, in the course of the ensuing four years, of history, philology, physics, mathematics and jurisprudence, the main object in view being the training of competent teachers of schools and of lawyers, and affording them the means of gaining an intelligent insight into the real wants of the native population. The University of Constantinople (or Stambul) was founded, in 1900, at the jubilee festival in honour of the sultan's succession to the throne. It includes five faculties, with a school of dentistry

South America.—The beginnings of the University of Montevideo go back to 1840. Its importance, however, dates from the foundation of a medical school in 1876. Faculties in law and mathematics were subsequently added, and, still later, one in architecture The National university of La Plata was opened (1905–08) in the city of that name, under the auspices of the University of Philadelphia—university extension being a feature It possesses to-day eight faculties—law, mathematics, medicine, natural science, veterinary science, agriculture and art It contained, in 1825, nearly 2,000 students The Central university of Venezuela goes back to the old Spanish days, having been founded in 1725 For a long time it was little more than a branch of the royal Spanish academy for education in the Spanish language It now consists of four schools in mathematics and science, law, medicine and pharmacy. The largest university in Argentine is the National university at Buenos Aires, founded in 1920. It has six faculties and a large array of professors and over 8,000 students Rio Janeiro university was founded in 1920 out of two existing faculties in medicine and law Lima university has a long and interesting history In 1553 it was a Dominican seminary In 1574 it was separated from the Order and became an independent establishment for students in philosophy and theology. In 1633 medicine was added. To-day it has over 1,000 students. Santiago, in Chile, which dates back to 1743, has five faculties. The Central university of Ecuador, founded towards the end of the 18th century, was reorganized in 1895. It possessed 303 students in 1925. Other South American universities are Cordoba (Argentine) which goes back to 1613, with three faculties, La Paz and Sucre (Bolivia) each with three faculties, Asunción (Paraguay) with two. The Nazional Universidad de Litoral (at Santa Fé, Argentine) founded in 1920, has faculties in law, chemistry and agriculture This list is not exhaustive and it is difficult in some cases to assess the standard of work in some of the universities given above.

Central America and West Indies.—Havana university was created in 1728, but its present activities date from 1900, when it was refounded There are three faculties in letters and science, medicine and pharmacy, and law.

GREAT BRITAIN AND IRELAND. MODERN TIMES

The Cambridge Platonist Movement.—After the Reformation Cambridge had become the centre of a remarkable movement (a reflex of the influence of the Cartesian philosophy), which attracted for a time considerable attention. Its leaders, known as the Cambridge Platonists, among whom Henry More and Cudworth were especially conspicuous, were men of high character and great learning, although too much under the influence of an ill-restrained enthusiasm and purely speculative doctrines. The

spread of the Baconian philosophy, and the example of a succession of eminent scientific thinkers, among whom were Isaac Barrow, master of Trinity (1673–77), the two Lucasian professors, Isaac Newton (prof. 1669–1702) and his successor William Whiston (prof. 1702–11), and Roger Cotes (Plumian prof. 1707–16), began to render the exact sciences more and more an object of study, and the institution of the tripos examinations in the course of the first half of the 18th century established the reputation of Cambridge as a school of mathematical science. At Oxford, where the study had, in turn, declined, and where the statutable requirements with respect to lectures and exercises were suffered to fall into neglect, academic culture declined. But in the 19th century the range of studies was extended both at Oxford and Cambridge; written examinations took the place of the often merely formal *viva voce* ceremonies; at Cambridge the study of the classics was raised, in 1824, to the dignity of a new tripos. The number of the students at both universities increased, the matriculations at each rising to over 400. The recommendations of the Royal Commission of 1830 were not all carried into effect, but the professoriate was considerably increased, reorganized and re-endowed, by means of contributions from colleges. The colleges were emancipated from their mediaeval statutes, were invested with new constitutions, and acquired new legislative powers The fellowships were almost universally thrown open to merit The great mass of vexatious and obsolete oaths were swept away; and, though candidates for the M.A degree and persons elected to fellowships were subjected to a religious test, it was abolished for matriculation and the B A.

In 1869 non-collegiate students were admitted at Cambridge The entire abolition of tests followed After being rejected on several occasions in parliament, it was eventually carried as a Government measure, and passed the House of Lords in 1871

Reforms of 1877.—In 1877 the reports of two new commissions were followed by the diversion of a certain proportion of the revenues of the colleges to the uses of the university, especially with a view to the encouragement of studies in natural science; the enforcement of general and uniform regulations with respect to the salaries, selection and duties of professors, lecturers and examiners; the abolition (with a few exceptions) of all clerical restrictions on headships or fellowships; and the limitation of fellowships to a uniform amount.

A remarkable increase in numbers followed at both universities, especially at Cambridge, where the number of undergraduates, which in 1862 was 1,526, rose in 1887 to 2,979 In the academic year 1862–63 the number of matriculations was 448, and in 1906–07, 1,083. The 22 universities and colleges have since been affiliated to the university, including many institutions throughout the empire. The general effect of the reforms inaugurated in 1877 has been the conversion of the college teaching staff into a permanent profession, and the growth of a resident and working university professoriate. At the same time there has been a gradual growth of "inter-collegiate lectures." At Oxford nearly all honour lectures given by college tutors and lecturers were thrown open to all members of the university: the college tutor was recognized by the university as a teacher in the faculty to which he belonged while boards of faculties were instituted. At Cambridge the system of inter-collegiate lectures has been developed. At both the old English universities the great widening of the courses of study open to senior students (honours men), which began about the middle of the 19th century, has been continued For more recent developments *see* Cambridge University and Oxford University

Durham.—For the University of Durham founded in 1657 by Cromwell *see* Durham In 1871 the corporation of the university, in conjunction with some of the leading landed proprietors in the adjacent counties, founded a college of physical science at Newcastle-upon-Tyne, subsequently designated Armstrong college, and designed to teach scientific principles in their application to engineering, mining, manufactures and agriculture. Students who had passed the required examinations were made admissible as associates in physical science of the university. There is also at Newcastle the College of Medicine.

University of London.—The University of London had its origin in a movement initiated in the year 1825 by Thomas Campbell, the poet, in conjunction with Henry (afterwards Lord) Brougham, Joseph Hume and influential Dissenters. The first council, appointed Dec 1825, comprised names representative of nearly all the religious denominations, including (besides those above mentioned) Zachary Macaulay, George Grote, James Mill, William Tooke, Lord Lansdowne, Lord John Russell and the duke of Norfolk. On Feb. 11, 1826, the deed of settlement was drawn up; and in the course of the year 7 ac., constituting the site of University college, were purchased, the foundation stone of the new buildings being laid by the duke of Sussex on April 30, 1827 In Oct. 1828 the college was opened as the University of London. King's college (incorporated Aug 14, 1829), opened Oct. 8, 1831, was designed to combine with the original plan instruction in "the doctrines and duties of Christianity, as the same are inculcated by the United Church of England and Ireland" In 1836 it was decided to dissociate the University of London from University college as a "teaching body," and to limit its actions simply to the institution of examinations and the conferring of degrees—the college itself receiving a new charter, and being thenceforth designated as University college, London, while the rival institution was also incorporated with the university, and was thenceforth known as King's college, London The charters of the University of London and of University college, London, were signed on the same day, Nov 28, 1836 In 1869 both the colleges gave their adhesion to the movement for the higher education of women which had been initiated elsewhere, and in 1880 women were, for the first time, admitted to degrees

By the University of London Act, 1898, and the statutes of the commissioners named therein (issued in 1900), the University of London was reconstituted For its rapid development since this reorganization *see* the section under London.

The University of Manchester.—The Owens college, Manchester—so called after its original founder—was founded on March 12, 1851 This formed the nucleus of the university, which received its charter on April 20, 1880, as the "Victoria University of Manchester" Since then, Liverpool (*q.v*) (1881) and Leeds (*q v*) (1904), the Mason University college at Birmingham (1900) and the University college at Sheffield (1905) have attained university rank.

Scottish Universities.—In 1747 an act of parliament was obtained for the union of the two colleges of St. Salvator and St. Mary In 1880 the university college at Dundee was instituted as a general school both of arts and sciences in similar connection. Glasgow, in the year 1577, received a new charter, and its history from that date down to the Restoration was one of almost continuous progress The re-establishment of episcopacy, however, involved the alienation of a considerable portion of its revenues, and the consequent suspension of several of its chairs. With the Revolution of 1689 it took a new departure, and several additional chairs were created The act of 1858 made great changes in all the four universities In Aberdeen, King's college and Marischal college, with their independent powers of conferring degrees, were amalgamated In Glasgow, the distribution of the "nations" was modified in order more nearly to equalize their respective numbers

A complete transformation of both the organization and the curriculum of each university was effected by the commission of 1889. The government was transferred from the senatus to the courts, which were further to include representatives from the senatus, the general councils of graduates, and the municipality within which the university is situated. The principal, the lord rector, his assessor, the chancellor's assessor, and the lord provosts of the cities of Aberdeen, Edinburgh and Glasgow, and the provost of St Andrews also have seats in the courts of their respective universities The provost of Dundee occupies a seat in the university court of St. Andrews To the court is entrusted the management of the property and finances, and, in most cases, such patronage as does not belong to the Crown; but, in the case of Edinburgh, the patronage of some of the older chairs is in the hands of a body of curators. Disciplinary powers are retained by the senatus, and the general council remains, as under the act of

1858, a purely advisory body. Another advisory body—the students' representative council—was added by the commission. The curriculum of all the faculties (except divinity) was reorganized; the most important alterations consisted in the abolition of the once sacred six as compulsory subjects in arts (Latin, Greek, mathematics, natural philosophy, logic and moral philosophy). The curriculum was greatly widened, an elaborate scheme of "options" introduced, and a new system of honours degrees was established. The length of residence required was reduced from four years to three, and the courts were empowered to institute summer sessions, and to admit women to lectures and degrees in all faculties.

There has been, since the act of 1858, a great development of university life in Scotland All the four universities of Scotland were aided from time to time in the last century by grants from Government, and in 1905 received a material addition to their resources by the donation of £2,000,000 from Mr. Carnegie.

Trinity College, Dublin.—Trinity college. Dublin, was founded in 1591 A royal charter nominated a provost and a minimum number of three fellows and three scholars as a body corporate. The first five provosts of Trinity college were all Cambridge men, and under the influence of Archbishop Loftus, the first provost, and his successors, the foundation received a strongly Puritan bias, but the policy of Laud and Wentworth was to make the college more distinctly Anglican as regards its tone and belief At the Restoration its condition was found to be that of a well-ordered home of learning and piety, with its estates well secured and its privileges unimpaired Under Bishop Jeremy Taylor, who succeeded to the vice-chancellorship, its progress in learning was considerable, and the statutes underwent a further modification Prior to the year 1873 the provostship, fellowships and foundation scholarships could be held only by members of the Church of Ireland; but all such restrictions were abolished by Act 36 Vict c 21 Other university institutions established in Ireland were the Queen's university (founded 1830), reconstituted in 1880 as the Royal University, and the Queen's colleges at Belfast, Cork and Galway founded in Dec 1845 A scheme for the reorganisation of university education in Ireland put forward by James Bryce in 1907 failed of acceptance Eventually Augustine Birrell carried a measure by which Trinity college was left intact, while two new universities were created, one in Dublin (to-day the National University of Ireland), and one in Belfast, the former involving the erection of another college (towards the expense of which the Government was pledged to contribute) and the incorporation of the Queen's colleges at Cork and Galway, while the college in Belfast was to form the nucleus of the second university The new university in Dublin had a nominated senate of 35 members, of whom the great majority were Roman Catholics; that of Belfast had a similar body, of whom all but one were Protestants In all these new centres there were no religious tests either for professors or students.

Welsh Universities.—The University of Wales, which received the royal charter in 1893, is composed of the university colleges of Aberystwyth, Bangor, Cardiff, and Swansea (added in 1920). St David's college at Lampeter was founded in 1822 for the purpose of educating clergymen in the principles of the established Church of England and Wales, mainly for the supply of the Welsh dioceses, but, although affiliated to both Oxford and Cambridge, retained its independence and also the right of conferring the degrees of bachelor of arts and of divinity. Bangor, in North Wales, on the other hand, which received its charter in 1885, is designed to "provide instruction in all the branches of a liberal education except theology." (J B. Mu ; C. Br)

THE UNITED STATES

History.—The first white settlers who came to North America were typical representatives of those European peoples who had made more progress in civilization than any other in the world. Those settlers, in particular those from England and from Holland, brought with them the most advanced ideas of the time on the subject of education. The conditions of life in the New World emphasized the need of schools and colleges, and among the earliest public acts of the settlers were provisions to establish them. The General Court of Massachusetts in 1636 made the first appropriation for what was to become Harvard college, taking its name in honour of the minister, John Harvard, who died in 1638, leaving his library and one-half of his property, having a value of £800, to the new institution

Through religious zeal or philanthropy colleges were founded as far south as Virginia, and no fewer than ten of these institutions were in operation in 1776 Their present names and the dates of their foundation are: Harvard university (1636); College of William and Mary (1693); Yale university (1701); Princeton university (1746); Washington and Lee university (1749); University of Pennsylvania (1751); Columbia university (1754); Brown university (1764); Rutgers college (1766); and Dartmouth college (1770).

These colonial colleges, though in some cases in receipt of money grants from Governments, had owed their origin to private initiative and were privately controlled. The 19th century was to see the growth of a different group, the State tax-supported universities, destined to become one of the important and characteristic American types. While some of these institutions had their beginning in the 18th century (North Carolina, established 1789, opened 1795), the most notable early example of this type was the University of Virginia which, through the influence of Thomas Jefferson, was established by legislative act in 1819 though not opened until 1825 By 1894 all States south and west of Pennsylvania had established such universities, and in 1917 Rutgers university was designated as the State University of New Jersey The only States not having State tax-supported universities are Massachusetts, Rhode Island, Connecticut, Pennsylvania and New York The distinguishing characteristics of the typical State tax-supported university are: (1) creation and direct support by the State government, (2) absence of any denominational control, (3) the State's share in the selection of trustees, (4) free, or nominal, tuition to students living within the State

Another group of colleges which developed during the 19th century was the Land Grant colleges (*q v*) which owed their existence to the Morrill Act, passed by Congress in 1862 This act gave to the States a large amount of public land, 30,000 ac. for each member of congress from the State, for the establishment of colleges of agriculture and mechanic arts Such colleges were to be started by 1874 but the exact method of their creation was left to the States which met the problem in different ways. In 18 States, the appropriation was added to the endowment of the State universities, in three, Massachusetts, New Jersey and New York, it was turned over to endowed institutions, the Massachusetts Institute of Technology, Rutgers college and Cornell university. The remaining States established new institutions

Meanwhile colleges for women (*see* WOMEN'S COLLEGES) had been growing up since the middle of the second quarter of the century Though women were not entirely excluded from existing colleges—Oberlin was co-educational from its establishment in 1833—the opportunities open to them were so limited that their demand for college training could be met only by the formation of new institutions. The foundation of Mount Holyoke seminary in 1837 was followed by that of Elmira college in 1853. Vassar (incorporated 1861, opened 1865) dates from the Civil War, and after it came Wells (1868), Wellesley (1871, 1875), Smith (1871, 1875), Hunter (1871), Bryn Mawr (1881, 1885), etc, all established as independent colleges. Barnard college (1889, incorporated in the Educational System of Columbia university in 1900) and Radcliffe (1879, affiliated with Harvard in 1892) are examples of a different type, the college for women established in a university parallel to a college for men. Michigan, Illinois, Missouri and California began to admit women in 1870, and now no State-tax-supported university is entirely closed to women, though Virginia admits them to graduate and professional courses only. Of the endowed universities, Cornell admitted women by 1872 and Stanford and Chicago have been co-educational from their beginning. In 1926 the number of women studying in American colleges and universities was 313,163, *i.e.,* 38% of the total number of students. This number included 247,793 undergraduates, 12,341 graduate students, and 5,822 in professional

schools of law, medicine, education, etc.

The last quarter of the 19th century saw the growth of another type of university—that endowed by individual munificence. Cornell university was founded with an original gift from Ezra Cornell of $500,000, later increased through other gifts and profits on the sale of land scrip which Mr. Cornell bought for the university, to $5,381,925. As Cornell receives State aid for three of its colleges and is also a Land Grant college, it is not a typical example of the endowed institution. Johns Hopkins university, opened 1876, was founded by Johns Hopkins, a merchant of Baltimore, who bequeathed $700,000 for the establishment of a university and a hospital Leland Stanford Jr. university was founded by Senator Stanford, of California, with a gift (1885) of 90,000 ac of land in California; this initial gift was later increased by his bequest and by deeds from Mrs Stanford, to a total endowment of more than $25,000,000. An outstanding example is the University of Chicago (incorporated 1890) to which John D. Rockefeller, from 1889 to 1910, has given a total of $34,708,375 A more recent instance of large endowment is Duke university, for which in 1924, Mr. J B Duke made a large gift.

Organization and Work.—The American college, although it is the outgrowth of the English colleges of Oxford and of Cambridge, has developed into an institution which has no counterpart in Europe The college course of study, at first three years in length, was soon extended to four years, and the classes are uniformly known as the freshman, the sophomore, the junior and the senior. The traditional degree which crowns the college course is that of Bachelor of Arts (A B) The studies ordinarily insisted on in the case of candidates for this degree are Latin, Greek, mathematics, English, philosophy, political economy, history, at least one modern European language (French or German), and at least one natural science The degrees of Bachelor of Science (B S), Bachelor of Philosophy (Ph B), and Bachelor of Letters (B L) are conferred by some colleges upon students who have pursued systematic courses of study which do not include Greek or the Latin required for the degree of Bachelor of Arts.

Each college, however small or ill-equipped, exercises a helpful local influence Seventy-five per cent of all college students attend an institution within their own States Few colleges have a national constituency, and even in these cases an overwhelming preponderance of the students come from the immediate neighbourhood This explains, in a measure, the powerful influence which the college has exercised in the life of the nation. While hardly more than one in a hundred of the white male youth of the country has had a college education, yet the college graduates have furnished more than one-half of all the presidents of the United States, most of the justices of the Supreme Court, about one-half of the cabinet officers and United States senators, and nearly one-third of the House of Representatives. Before the Revolution 11 colleges were founded From 1776 to 1800, 12 more were added; from 1800 to 1830, 33, from 1830 to 1865, 180; from 1865 to 1899, 250; from 1900 to 1925, 75. Their standards, efficiency and equipment are very diverse, many of the so-called colleges being less effective than some of the better organized secondary schools

Putting aside tentative attempts to develop genuine university instruction much earlier, it may safely be said that the opening of the Johns Hopkins university at Baltimore in 1876 began the movement to organize carefully advanced study and research, requiring a college education of those who wish to enter upon it. This is university instruction properly so called, and though found elsewhere it is given chiefly at 26 institutions: University of California, Catholic University of America, University of Chicago, Clark university, Columbia university, Cornell university, Harvard university, University of Illinois, Indiana university, State University of Iowa, Johns Hopkins university, University of Kansas, University of Michigan, University of Minnesota, University of Missouri, University of Nebraska, University of North Carolina, Northwestern university, Ohio State university, University of Pennsylvania, Princeton university, Leland Stanford Jr. university, University of Virginia, Washington university, University of Wisconsin and Yale university. All these institutions, except the Catholic University of America, also maintain colleges.

The combination of collegiate and university instruction under one corporation and one executive administration is distinctive of higher education in the United States, and its chief source of strength. The crowning honour of the university student is the degree of Ph D , although that of A M.—obtainable in less time and much easier conditions—is also sought The minimum period of study accepted for the degree of Ph D is two years after obtaining the bachelor's degree; but in practice, three, and even four, years of study are found necessary. In addition to carrying on an investigation in the field of his main subject of study, the candidate for the degree of Ph D. is usually required to pass examinations on one or two subordinate subjects, to possess a reading knowledge of French and German (often of Latin as well), and to submit—usually in printed form—the dissertation which embodies the results of his researches The methods of instruction in the universities are the lecture, discussion and work in laboratory or seminar—the latter transplanted from the German universities. The degree of Master of Arts is conferred upon students who, after one year of university residence and study, pass certain prescribed examinations. This degree, like those of D D., S T D , and LL.D., is often conferred by colleges and universities as a purely honorary distinction. The degree of Ph D. is not so conferred any longer by the best universities.

Not a few of the universities maintain schools of law and medicine. Harvard and Yale universities maintain schools of theology as well The learned publications issued by the universities, or under the direction of university professors, are of great importance, and constitute an imposing body of scientific literature. The National and State Governments make increasing use of university officials for public service requiring special training or expert knowledge. In 1871–72 there were only 198 resident graduate (or university) students in the United States. In 1897 this number had risen to 4,392 and in 1926 to 32,500

ENTRANCE TO ADMINISTRATION BUILDING OF THE UNIVERSITY OF NORTH CAROLINA AT CHAPEL HILL, N C.

Throughout the country, but especially in the West and Middle West, Junior colleges are becoming numerous Some of these institutions are derived from small colleges without support from taxation, some of these colleges, finding themselves financially unable to continue satisfactorily the full four-year course, limit themselves to two years; others more significantly form the upward extension of the vigorous public high schools. Of the 200 Junior colleges in the United States in 1922, 125 were reorganized small colleges. This type not only brings the opportunity for higher education within the reach of many who could not leave the immediate vicinity of their homes, but also reacts favourably on the pupils and teachers of the secondary schools The college remains the most characteristic feature of education in the United States In 1926 there were enrolled 595,458 collegiate students as compared with 174,213 in 1910.

Professional Education.—Schools for professional training have grown rapidly Whereas early in the 19th century professional education comprised little more than preparation for the ministry, it now includes theology, medicine, law, the profession of engineering, education, architecture, journalism, pharmacy, business, library science and two offshoots of medicine—dentistry and veterinary medicine.

The typical organization of the large university provides for a group of professional schools, sometimes in close conjunction with the rest of the university, occasionally scattered but under single university control. Formerly many professional schools

were separate institutions, but the tendency has been to decrease the number of independent schools until in most fields the university professional schools far outnumber the independent organizations. Of the 44 dental schools reported on by the Carnegie Foundation in its survey (1926), 36 are connected with universities Of the 71 medical schools to which the American Medical Association assigns the grade A, 61 are university schools. The Federal Bureau of Education lists 144 law schools, of which 110 are university schools

Medicine.—The medical schools of the United States were slow to adjust themselves to the new conditions brought about by the growth of medical science They followed the model of continental Europe rather than that of Great Britain, in that the teaching was almost exclusively by lectures and imposed no definite requirement as to the preliminary education. There was lacking also, for the most part, stimulating contact with colleges or universities of high academic ideals; and therefore there developed an organization which lent itself readily to commercialism. Later, however, medical teaching was revolutionized, and it now exemplifies the highest standards of professional education The rapid development of physiology and physiological chemistry, bacteriology, pathology and hygiene necessitated the enlargement of the curriculum to include these subjects. Laboratory methods of teaching have been introduced Satisfactory preliminary education is held essential, and all recognized medical schools in 1926 required of candidates for admission the completion of the four-year secondary school course and at least two years of college work, including physics, chemistry and biology

Cornell, Western Reserve and Leland Stanford require three years of college for entrance, Harvard and Columbia a degree from, or two years of high rank in, a college or scientific school; Johns Hopkins and Chicago a bachelor's degree or its equivalent. Most significant of all, the student is again brought into intimate contact with the patient; hospitals and dispensaries are used as laboratories where the prospective physician may acquire skill in examining patients and familiarity with the manifestations of disease. The degree of Doctor of Medicine is conferred on completion of the medical course, which in nearly all schools is four years in length A few institutions require also, before granting the degree, a fifth year, spent as an interne in a hospital Advancing educational requirements, the consequently greater cost of medical training, and the increasing knowledge and interest of the public in matters of public health combined to reduce the number of medical schools from its maximum of 162 in 1906 to 80 in 1927; of medical students from 28,142 in 1904 to 19,532 in 1926–27; of medical graduates from 5,747 in 1904 to more than 4,000 in 1927.

Engineering.—The beginnings of American technological training were made in a group of special schools, independently founded, such as the Massachusetts Institute of Technology, in Boston, and Stevens institute, in Hoboken, N J Later the universities eagerly took up education in engineering, developed elaborate departments and offered the greatest variety of courses. Engineering schools require of applicants for admission the completion of the four-year secondary school course Instruction is largely by means of laboratory courses The degree of Bachelor of Science, with or without specification of the branch studied, is commonly conferred after four years of college work. The degrees of Civil Engineer, Mining Engineer and so forth are awarded for undergraduate work by some schools in place of the B.Sc., by others reserved for more advanced study

Dentistry.—Since 1900 there had been increasing uniformity among dental schools until, in 1921, all recognized schools required for admission at least the completion of a four-year secondary school course, and many of them demanded an additional collegiate year of preliminary training, followed by four full years of professional training. The increasing recognition of the relation of dental pathology to health and disease in the body as a whole tends to make dentistry a branch of the study of medicine, and a leading group of dental schools decided to demand in 1927 the same two years of collegiate preliminary training now required of medical students, followed by four years of dental training.

University Extension Work (*see* UNIVERSITY EXTENSION).

Certain private corporations, not directly engaged in teaching, have influenced education in the United States. The General Education Board, for example, incorporated in 1903, employed the funds at its disposal in assisting institutions of higher learning throughout the country, and in the Southern States it also promoted the development of the secondary schools and the teaching of agriculture. Later it entered the field of medical education. From 1902 to 1926 its total appropriations for universities and colleges were $70,769,821.61, and for medical schools $42,100,-225 94 The Carnegie Foundation for the Advancement of Teaching, incorporated in 1906, starting with a programme of pensions for retiring college professors, has been led into the field of investigations and surveys. (N. M. B.; I. G. M.)

BIBLIOGRAPHY.—F. C. von Savigny, *Geschichte des römischen Rechts im Mittelalter* (7 vols., 1826–51) throws light on the early history and organization of the mediaeval university. The earlier histories of Du Boulay (1665) and Crevier (1761) of Paris university, have been largely superseded for the early portions by H. Denifle's monumental work on *Die Enstehung der Universitäten des Mittelalters bis 1400* (1885), which is the standard authority on the beginnings of the older universities. H. Rashdall (now dean of Carlisle), in his *Universities of Europe in the Middle Ages* (1895), incorporates much of Denifle's work and deals especially with the beginnings of Paris, Oxford and Cambridge. For Oxford: *see* also Anthony Wood, *History and Antiquities of the University and of the Colleges and Halls of Oxford,* edit. with continuation by Rev. J. Gutch (5 vols, 1786–96), *Alumni and Fasti Oxonienses,* edit. by Dr. P. Bliss (4 vols, 1813–20), and *A History of the University of Oxford, from the earliest times to 1530* by H. C. Maxwell Lyte (1886). For other and later publications *see* OXFORD, *Bibliography.* For Cambridge. *see* C. H. Cooper, (1) *Annals of Cambridge* (5 vols., 1842–1908), (2) *Athenae Cantabrigienses* (2 vols, 1858–61), *Memorial of Cambridge* (3 vols, new ed, 1884); J. B. Mullengers' *A History of the University of Cambridge* (last edition, 1888), from the earliest times to 1535, 1873, etc, is the standard work. (*See* also CAMBRIDGE, *Bibliography.*) The history of London university is given in a section of the *Historical Record of the University*—second issue, 1836–1926. The other sections deal with donations, graduates, etc. For Manchester: see *Owen's College,* by P T Cornish (1900) and the *Victoria University of Manchester,* giving a short history and description (1926). A complete history of Sheffield is contained in *Floreamus,* a chronicle, published terminally. The new *University of Reading,* by Principal W. M. Childs, gives a sketch of the university and its aims up to 1926. For other British universities *see* the historical notices in the *Year Book of the Universities of the Empire* (1929).

For German universities. Zarache's *Die Deutschen Universitaten im Mittelalter* (1857), von Sybel's *Die deutschen Universitäten* (2nd ed, 1874), G. Kaufmann's *Geschichte der deutschen Universitäten* (2 vols.), are of first-rate importance

For the modern period down to the end of the 19th century the chief authority is F. Paulsen's *Geschichte des gelehrten Unterrichts auf den deutschen Schulen und Universitäten vom Ausgang des Mittelalters bis zur Gegenwart. Mit besondere Rücksicht auf den Klassichen Unterricht* (2nd ed, 2 vols.); Eng. trans. by Mr. (now Sir) M. E. Sadler (1906).

For the statutes of the French universities Fournier's *Statutes et privilèges des universités françaises* (1890) and the Chartularium of Paris university down to 1452, edited by Denifle and Chatelain (4 vols, Paris, 1889–97) are valuable. For later times *see* Gréard, *Nos adieux à le vieille Sorbonne,* and L. Liard, *L'Enseignement supérieure en France, 1789–1794* (2 vols., Paris, 1894); A. Aulard, *Napoléon et le monopole universitaire* (1911), which gives an account of the origins and working of the Imperial university. For the numerous monographs on the history of the foundation of the different universities *see* the long list given in G. Pariset's *Le Consulat et l'Empire* (Histoire de France, contemporaine vol. iii, p. 319–200), and in G. Weill, *l'Enseignement secondaire en France de 1802–1920* (1921).

There appears to be no general history of Italian universities. For Padua and Bologna respectively *see* Ricci, *I primordi Studio di Bologna* (Bologna, 1833), and H. Denifle, *Die Statuten der Juristen-Universität Padua vom Jahre 1331.* The history of the growth of Spanish universities is dealt with by Vicente de la Fuente in his work *Historia de las Universidades y demás establecimientos de enseñanzo en España* (1884), which, as its title indicates, deals not only with universities, but all forms of public instruction. On the university side, however, it is not entirely satisfactory. Solio and Vilche's *Libro Memoria* (1895) is specially concerned with Madrid.

For Portugal, the history of Coimbra is largely dealt with in the elaborate history of its theological faculty by Dr. M. E. da Motta Veiga (1872). The *Universidades y Colegios* of Dr. J. V. González (1907) relates the story of university beginnings in Argentina.

For Indian University education the monumental Government *Report on Calcutta University,* edit. by Sir Michael Sadler, in 26 vols.

(1917–19) is indispensable.

For the Colonial universities *see* the short historical notes prefixed to each university in the *Yearbook of the Universities of the Empire* (1929).

See also, generally: Minerva, *Jahrbuch der gelehrten Welt; Index Generalis;* the *College Blue Book,* U.S. colleges and Universities of Liberal Arts and Sciences (1923). *Bulletins* of the League of Nations committee on Intellectual Co-operation, and especially *University Exchanges in Europe*. a handbook published by the League of Nations Institute of Intellectual Co-operation (Paris, 1928).

United States—Association of American Universities, *Journal of Proceedings and Addresses* (1900–27); C. F. Thwing, *History of Higher Education in America* (1906); U.S. Bureau of Education, *Bulletins* (1906–28); Carnegie Foundation for the Advancement of Teaching, *Bulletins* (1907–27); C. W. Eliot, *University Administration* (1908), N. M. Butler, ed., monographs, *Education in the United States* (1910) and *Meaning of Education; Contributions to a Philosophy of Education* (1915); A. L. Hall-Quest, *The University Afield* (1926), D. A. Robertson, *American Universities and Colleges* (1928); R. L. Kelly, ed., *The Effective College* (1928). (J. B. Mu.; C. Br.)

BRITISH DOMINIONS

India.—The foundation of universities in India was the direct outcome of the parliamentary enquiry which preceded the confirmation of the old company's charter by parliament in 1853 London university—as a purely examining university—was taken as a model rather than Oxford and Cambridge, and in 1857 the three oldest universities were founded; Calcutta on Jan 24, Bombay on July 18, and Madras on Sept 5 The framers of the policy did not intend the universities should have no teaching functions, but, in point of fact, the universities for some time were practically only examining bodies In 1882 and 1887, the universities of the Punjab and of Allahabad were established. But since the University Act of 1904 professorships, readerships and lecturerships have been established, but mainly for advanced work, and except in Calcutta, on a very small scale Benares (the Hindu university), Mysore and Patna were established in 1916 and 1917 The Nizam's university, Hyderabad, was established in 1917 and began work in 1919. The whole question of the organization of higher education in India was examined by the Calcutta University commission, 1917–19 In Calcutta little change has since been made, but the recommendations served largely for models in the creation, during 1920–22, of Aligarh, Decca, Delhi, Lucknow and Rangoon, and in the reorganization of Allahabad in 1921 Nagpur was founded in 1923 and Madras reorganized in the same year In 1926 affiliated universities were established at Agra and Begwala. (The Ondhra university instituted for the study, among other things, of Telegu, Ondu and other native languages) In 1925 the Bombay University Reform committee recommended the establishment of a university at Poona The Universities of Calcutta, Bombay and the Punjab are governed by the constitution framed under the act of 1904. There is a senate with an executive called the Syndicate. Into the Punjab university an academic council has been introduced Bombay and Madras have constitutions closely resembling Calcutta. The newer universities follow generally the recommendations of the Calcutta university commission. There is: (1) a court which makes statutes and recommendations on the finance and annual report, (2) an executive council elected by the court and by the academic council with certain ex-officio members, (3) an academic council for all educational purposes.

The outstanding feature of Indian universities is the comparatively adequate provision for higher education compared with the lack of facilities for other branches of education.

Canada.—The universities in Canada fall, roughly, into four groups (the first, which follow the Oxford tradition, such as King's, Halifax; the second, which are modelled on Edinburgh, Dalhousie, McGill, Queen's, in Kingston, Ontario; the third, Laval, the Universities of Montreal and Ottawa, which have copied the French system, while the Universities of Manitoba, Saskatchewan, Alberta and British Columbia rather approximate to the American type.

The McGill university had its beginnings in the McGill College university—instituted by royal charter in 1821 on the foundation of the Honourable James McGill, who died in 1813. With it have since been affiliated, among other institutions, two agricultural colleges and four Protestant colleges in Montreal. Munificent bequests from Sir William Macdonald, the Carnegie Corporation, the Rockefeller Foundation, the Provincial Government and the citizens of Montreal (who gave nearly four and a half million dollars) have augmented its activities. It has good provision for instruction and research in applied science, especially in engineering and has a very flourishing medical school Laval university (Quebec) was originally founded by the seminary of Quebec. It received its charter in 1852 It is under the general supervision of the Catholic archbishop of Quebec Montreal university was founded as a branch of Laval in 1878 Since 1839 it has been practically independent It was incorporated in 1920. It is administered by a senate, commissions of administration and studies, a university council and executive committee. It has now outstripped in size and numbers the parent institution. The University of Toronto was first established under the title of King's college by royal charter in 1827. (*See* TORONTO)

Queen's university, Kingston (Ottawa), was originally a Presbyterian foundation, incorporated in 1841 In 1912 the faculty of theology was separately incorporated as Queen's Theological college, but left in affiliation with the university It is administered by a board of trustees, on which the professors and graduates are represented The University of Western Ontario, at London, originally a Church of England foundation, is now under provincial and municipal control

Acadia university (Nova Scotia) was founded by the N.S. Baptist Educational Society, and incorporated in 1840. The university of Bishops' college, Lennoxville, Quebec, is an Anglican foundation which dates from 1842, and was incorporated in 1853. Dalhousie university (Halifax), founded in 1818, incorporated in 1841, was closed in 1845 Reopened in 1863, it is now, thanks to private benefactors, a flourishing institution. McMaster university (Toronto) incorporated in 1887, has no religious test, but its governing body is elected by the Baptist convention Mount Alison university, New Brunswick, incorporated 1858, is controlled by the Union Church of Canada, but there are no tests for its students The University of New Brunswick at Fredericton is one of the oldest; its original charter as the College of New Brunswick dates from 1800 It received a royal charter in 1828 as King's college, and became the University of New Brunswick in 1857 The University of Ottawa is a Catholic university incorporated in 1889, having started as a college 1849. The University of St Francis Xavier, Antigonist, Nova Scotia, received its first charter in 1866 It is under the direction of the Catholic Church There are, however, no religious tests for entrance or degrees

The four Western provincial universities of Alberta (founded 1906), Saskatchewan (founded 1907), Manitoba (founded 1887) and British Columbia (founded 1915) are all increasing in importance.

Australia.—In Australia the University of Sydney was incorporated by the colonial legislature, which received royal assent in Dec 1857 In 1912 its statutory endowment was doubled and the Senate was altered to include six Government members. The University of Melbourne, founded by the legislature in 1853, is the largest in point of numbers of the Australian universities. Adelaide, established 1874, owes its origin to private beneficence and State grants. The University of West Australia, at Perth, was established in 1911 and opened in 1913 The University of Queensland dates from 1909 The University of Tasmania (Hobart) was founded in 1890 and received a royal charter in 1915.

Two points are noteworthy in Australian universities; one is the large part played by the State in the government of the universities, due to the large grants it makes, and the other the existence in Sydney and Melbourne of university colleges, with an instance also at Adelaide. The colleges date from the act of 1884, since which time colleges representing the Episcopalian, Presbyterian, Roman Catholic and Methodist churches have been founded with, in some cases, halls for women, who, since 1804, have been admitted to degrees. All these colleges are self-governing and receive no financial aid from the universities concerned, who are all undenominational in character

New Zealand.—The University of New Zealand was founded on the London model in 1870, and reconstituted in 1874–75 by royal charter, with power to grant certain degrees To this university, University college at Auckland, Canterbury college at Christchurch, and the University of Otago at Dunedin, and Victoria University college, Wellington, have been successively admitted in connection as affiliated universities, the latter, in 1894, having agreed to hold in abeyance its power of granting degrees. There is a council of 23 members, including four Government nominees. The offices of the university are at Wellington There is an annual grant of £4,000 from the Government A royal commission, in 1925, recommended the establishment of a Federal university, an extension of university teaching and the establishment of special (technical) schools, an increase in college hostels and development of university extension work.

South Africa.—The beginnings of higher education in South Africa date from the foundation of the South African college in 1829. In 1858 a board of examiners in literature and science was founded, which prepared the way for the University of the Cape of Good Hope in 1873. Like its model, London university, it was a purely examining body, its principal candidates coming from the South African college, the College of Stellenbosch (afterwards Victoria college), founded 1874, and St. Andrews college, Grahamstown (founded 1858), which became, in 1904, Rhodes college In the latter year a mining institute was founded at Johannesburg, which later became a college for higher education. In 1908 a university college was founded at Pretoria, and in 1909 a similar one at Pietermaritzburg In 1904 began a movement for instituting a teaching for an examining university In 1908 an inter-colonial conference on university education reported in favour of a federal as against a single college university. In 1918 charters were given to both the South African college and the Victoria college, henceforth styled the Universities of Cape Town and Stellenbosch and the old University of the Cape of Good Hope was reincorporated as a federal university embracing all the other colleges under the name of the University of South Africa. In 1924 the University College of Johannesburg became an independent university. Each of the four universities is governed by a council, senate and convocation A joint committee of the four universities has been established, consisting of the four vice-chancellors, to promote co-ordination in all academic matters.

Other institutions of higher education within the empire and mandated territories are the Imperial Agricultural college in Trinidad, the College of Agriculture in Mauritius, the University of Malta, the Ceylon university college, Colombo, the King Edward VII. College of Medicine at Singapore, the Hongkong university and the Hebrew university at Jerusalem. Mention may also be made of the Shantung Christian university in China, which was founded in 1904 by British and American missionaries, with its headquarters in Toronto (J. B MU.; C. BR.)

MODERN DEVELOPMENTS

Fourteen new universities have been founded in Western Europe since 1910, most of them after the World War. Of these, four are in Italy, three in Germany, two in Portugal and one in England, Holland, Spain and Iceland. In the so-called "new countries" of Central Europe, including the Baltic and Balkan States, 16 new universities have been established, almost all of them since the war, many of the older universities in these countries having been entirely reorganized on passing under a new State. Among such universities are Lublin (1918), Abo-Turku (Swedish university), Bratislava (started as the Hungarian university of Poszonyi, 1914); Brno, Ljubjana, Poznan, Riga, Skoplje (philosophy only), Subotica (law only) and Wilno in 1919; Turku (Finnish university, 1920), Szeged (1921), Kaunas (1922), Pécs, Salonika (1925). In Russia, White Russia and Ukraine several universities were inaugurated during the war, and a great many came into existence after the revolution. Some of the latter were soon closed. Instead of the seven universities which existed in 1910 on the present territory of the Soviet republics, there are now about 20. The general increase in Europe is approximately from 140 to 180. The total number throughout the world is about 450.

This development is not less remarkable on the other continents. Where many universities had come into existence during the 10th century only a few foundations are to be recorded since 1910, some of which were reorganizations of older institutions. In Latin America at least 13 new universities have been created since that year. In South Africa, which had one university only in 1910, there are now four India possessed only five universities in 1910 and has now 20, including two women's universities and the International university founded by Rabindranath Tagore. Two new Imperial universities have been founded in Japan since 1910, so that the number in that country, including the private universities, now reaches 15. In China, where university life is still in formation, we find now about 20 universities. Further foundations in other Asiatic countries, such as Palestine (the Catholic university), Persia, Siam, and even in Hawaii (1920) have also to be recorded

Numbers of Students.—There has been a considerable increase in the number of students in the great majority of the universities except in Germany (*i e.*, Berlin 14,034 in 1909–10 and 11,169 in 1927). This is particularly striking in the United States Columbia university, with 32,244 students in 1927 (6,529 only in 1909–10), has now the largest enrolment of students in the world Other interesting figures are· New York university, in the same city, which had 4,036 students in 1909–10 and 20,383 in 1925–26; for Temple university, Philadelphia, the same figures are 5,033 and 8,579; the University of California in 1906–07 had 3,684 students and 18,969 in 1925–26 Paris, however, is first in regard to whole time students, of whom there were 21,455 in 1925. An extraordinary development is to be noted also in some universities of Central Europe, like Athens (2,800 students in 1909–10, 15,370 in 1925–26), Belgrade (902 students in 1908–09, 5,790 in 1926), Bucharest (3,478 in 1909–10, 13,540 in 1926–27), Warsaw (1,263 in 1909–10, 9,539 in 1926–27)

The extension of the provision of secondary education which resulted from the World War in most countries of Europe and America has been one of the principal causes of the increase in the number of students, particularly in the more strictly professional faculties of law and medicine. In the faculties of art and pure science, the growth is largely due to the increasing number of women who seek to prepare themselves for the wider opportunities of service now opening up for them by courses of academic study The teaching staff has not increased in the same proportion, and must be regarded as inadequate when compared with the number of students.

Institutes.—University institutes, both for teaching and for research, have reached an extremely large number. Many universities possess more than 100 such institutions This development is due to the adoption, in almost all countries, in modified forms, of the so-called "seminar" system, started in Germany during the 19th century, and to developments which found no place in the traditional university organization; so new institutions, either connected with the old faculties or independent of them, were established. In most European countries there existed, since the early years of the 19th century, many specialized institutions for higher education which, while independent of the universities, had obtained university rank They were created mainly for the study of technical sciences, of agriculture, mining and forestry, of commerce, of fine arts and so on. In many cases the schools of education, of political science, of dentistry and veterinary medicine were independent establishments. The number of these institutions has already grown steadily. Since 1910 some 50 or 60 schools of this kind have been founded in Europe. In the more important centres of intellectual life, the number of independent higher schools surrounding the university has become very considerable. Paris attains, undoubtedly, the record with its more than 40 schools. In other countries, mainly in America, but also in Great Britain, the British dominions, and some of the new European countries (*e.g.*, Latvia, where the University of Riga has 11 faculties), all branches of higher education have been included in the curricula of the universities, which therefore possess faculties of engineering, applied science, veterinary medicine, agricul-

ture, commerce, education, fine arts, music, etc. In some universities the number of faculties has doubled since the World War.

Faculty Organization.—In many universities of to-day there are faculties which are entirely different from the traditional ones. These, again, have been divided, owing to the developing needs of life and to the specialization of science. Thus for theology, in some universities two or even three (*e g.*, Warsaw) different theological faculties have been formed, to meet the requirements of various denominations Economic and social sciences have been separated from law and have formed a new faculty (*e.g.*, Geneva). In some countries (*e.g.*, France) a faculty of pharmacy has been created separate from the faculties of medicine, thus following the practice which has prevailed in America for many years. The division of the traditional faculty of philosophy into faculties of letters (arts, humanities) and sciences (natural and physical sciences), which started very early in Western Europe, has strongly influenced the other countries. Since the World War many universities in Central Europe, even in Germany, have adopted this system. In several cases a special faculty of mathematics has been instituted.

New Chairs.—In all faculties, old and new, many new chairs have been established for subjects which, 10 or 20 years ago, either did not appear at all or appeared only exceptionally in university curricula These new chairs and subjects may be divided into three groups In the first place, new branches of science have developed into individual subjects, *e g.*, radiology, or have been recognized as independent sciences, *e g*, sociology, and therefore chairs have been founded for their teaching In the second place, the closer association of universities with practical life has necessitated the establishment of new chairs for various branches of applied sciences, even for subjects like journalism and nursing. Finally, it has been realized that knowledge of foreign nations needs an intensive study, not only of their languages, but of their whole civilization. history, literature, political institutions, economic conditions and so on. Therefore, not only have many new lecturers been appointed for teaching languages, but chairs, and in some cases special institutes, have been founded for the systematic and comprehensive teaching of what in Germany is called "Auslandskunde"

Post-graduate and Research Work.—The measures taken for furthering research work, especially of post-graduates, are mainly of two different kinds. Frequently university "seminars" have been developed into research institutes grouping the students who wish to devote themselves to pure science On the other hand, the system of fellowships which has been developed, especially in the Anglo-Saxon countries, offers to the students and post-graduates certain possibilities of continuing their research work

INTERNATIONAL RELATIONS

Nationalism.—During the whole 19th century, university life, which had been undoubtedly international in the middle ages, and in the times of the Renaissance and the Reformation, became more and more closely connected with national development and national feeling. The World War and its consequences have rather strengthened this connection. In many territories which passed from one State to another the national character of the universities and higher schools changed with the political *régime.* Many nations, especially in Central and Eastern Europe, which before the war, owing to political conditions, had either no universities, or insufficient universities of their own, have profited by their independence, creating universities as living symbols of their liberty and proofs of their intellectual progress or maturity. In all such cases university development has been directed by the national ideal.

National Co-operation.—In countries where the number of universities was large the necessity of promoting co-operation between the national universities began to be recognized more strongly. In 1910 the well known "Office des Universités et écoles françaises" was founded in Paris. In 1912 the numerous universities of the British empire held their first congress and decided to establish a common universities bureau, which started its activities during the war and a few years later organized the second Imperial Universities Congress. Similar offices came into existence in Switzerland, Italy, Belgium, Holland, etc. For the United States a similar *rôle* has been assumed by the various associations of universities, by the Institute of International Education in New York, and by the American University Union in Europe. These national organizations bring the universities of their own country into closer contact, and promote co-operation with the universities of other countries.

International Co-operation.—International university co-operation, which was almost entirely interrupted during the war, plays an extremely important *rôle* in the university life of to-day. Ambitious schemes have been proposed to organize it systematically. The project of an international university has been advanced on various sides Up to now, this idea has been realized in a limited, but perhaps more practical, form, by organizing in various places international courses and summer schools, like those started in Brussels, Vienna, Geneva, The Hague (international law), Williamstown, Mass., etc

Exchanges of Professors and Students.—International exchanges of professors and students have been recently facilitated by means of international conventions General conventions of that kind being still impossible, such agreements have been concluded between one country and another (*e.g*, between France and a great number of other European nations since the war; also between various Latin-American countries) and between one university and another. Lectures or series of lectures given occasionally by travelling professors in foreign universities are more frequent than exchanges of teachers in the proper sense. A practice has grown up in the United States and Canada of professors "visiting" other universities by invitation for the purpose of delivering lectures. Exchanges of students promoted by organizations created for this purpose and, in general, study abroad, have been facilitated by progress towards the international recognition of the equivalence of studies and degrees. While no general conventions have been concluded for this purpose, various countries have published official lists of foreign degrees recognized by their national universities.

Conferences of universities of two different countries (France and Switzerland in 1919, England and Switzerland in 1922) mark progress in that direction. Students who are more and more interested in international affairs have developed international associations. The International Students' Confederation, founded in 1919, is the most representative of these federations. The splendid results achieved by the European Student Relief Fund of the World's Student Christian Federation, and the activity of the International University Federation for the League of Nations should also be mentioned, as well as the International Federation of University Women (post graduates) and the International Secretariat of the Catholic Students Association (called Pax Romana)

The League of Nations.—All these problems have been taken up by the League of Nations, and carefully studied, since 1922, by its committee on intellectual co-operation. The International University Information Office, established by the committee in 1923, was the nucleus of the International Institute of Intellectual Co-operation, offered to the League by the French Government and opened in Paris in Nov. 1925. The institute's special section for inter-university relations publishes a quarterly bulletin containing information on international university development.

(*See* also UNIVERSITY COLLEGES; EDUCATION; SCHOOLS; EXAMINATIONS; ACADEMIES; EDUCATION and INDUSTRY; TECHNICAL EDUCATION; POLYTECHNICS, etc.) (O HA.; A E TW.)

UNIVERSITY ARCHITECTURE. The earliest universities, such as Paris, Bologna, Prague, Salamanca and others were established in towns, and it is with the buildings of the towns that the universities grew and became mingled They were often housed under the protection of religious establishments in monastic and church buildings, and, if under secular control, in old palaces or other structures hired or lent by the civil authorities and not always planned for the purposes of the university

Modern European Universities.—Nearly all modern univer-

sity structures on the Continent of Europe are Renaissance; the remainder are classic in style. Exigencies of the site, such as land values and density of the surroundings, have in many cases imposed a form of building with a closely knit plan entirely occupying a city block. Uninterrupted exterior walls correspond with the street building lines. Within are one or more courts providing light and air. These courts are usually surrounded by a colonnade which gives access to the various rooms. An example of this type is the Sorbonne (Nerot, architect; 1885–1900). Where the site is sufficiently open the U- and H-shaped plans or a combination of these are found. An imposing group of university buildings laid out in modern style is at Strasbourg. Other universities of a modern type are to be found at Vienna (Ferstel, architect; 1885), Uppsala, Munich, Bucharest, Budapest.

Oriental Universities.—The University of Cairo resembles a mosque (*q.v.*). At the imperial University of Peking new buildings influenced by western design are taking the place of the native one or two-storey structures of gray brick, built about small square courts, opening into each other through broad gateways, and said to have been originally palaces. The 50 buildings of the modern University of Tokyo indicate the influence of German universities, and like them provide for education in the sciences.

South American Universities.—University buildings in South America invariably contain one or more courts or patios, from the galleries of which the surrounding rooms are entered. The exteriors are in the Renaissance style as taught at European architectural schools—notably those of France—and found in modern buildings of that country and of Spain. Mansard roofs are much in favour for buildings upon a large and pretentious scale, and abundant ornament characterizes both interiors and exteriors. Of this order are the National University of Mexico at Mexico City, the university buildings at La Plata, Argentina, the University of Montevideo, Uruguay, and the Catholic university at Santiago, Chile.

English Traditional Type.—Oxford and Cambridge typify the English university system, and are so singularly venerable and traditional that, in the English-speaking world, their names are almost synonymous with the word university. The congeries of buildings that grew up at Oxford round the University Church of St. Mary and the Schools, consisted first of halls, which were scarcely more than inns or hostels for the students, that is to say, rows of separate dwellings, each with its entrance on the side away from the street and each independent of its neighbour. Later the colleges were erected, each sufficient unto itself, with its own chapel and antechapel, library, masters' lodge and hall, common room, student lodging, dining hall (commons), kitchen, buttery, bake-house, brew-house, cellars and other offices. Additional rooms were contrived later in the attics, by means of roof and wall dormers, additional storeys and by additional colleges. The early colleges were so constructed as nearly to enclose a quadrangular sequestered space.

These establishments epitomize the history and development of the national styles ranging from the monastic period through the centuries marked by the Perpendicular, Tudor, Elizabethan, Jacobean and Modern styles. In spite of their variations, the oldest of the colleges have in common an architectural character that has been designated the English Collegiate Gothic style. The old English universities dominate the town and yet defer to it in so far as the architectural boundary lines conform to the streets, none of which are rectilinear. Instead of rigidly formal lay-outs or grouping of buildings, there is a happy picturesqueness Modern buildings have, however, made their appearance.

The modern Universities of London, Manchester, Liverpool and Birmingham differ radically from Oxford and Cambridge, and being urban, student lodgings play little or no part in their design.

American Universities.—The influence of both English and Continental university architecture is seen in the building for educational institutions which has taken place on a prodigious scale in America during the past 50 years. The earliest foundations to develop with the towns in which they were situated were Harvard and Yale. The typical American university, however, differs from these in having, often isolated in rural districts, its own separate domain, the heart of which is the campus (*q.v.*) or college yard.

The University of Virginia, designed by Thomas Jefferson and dominated by the classic library, is believed to be the first general scheme realized. After the period of stagnation of the arts, and following the awakening caused by the Centennial at Philadelphia and the work of Richardson and other pioneers (*see* MODERN ARCHITECTURE), the first university to attempt a comprehensively developed plan was that of Stanford, Cal. (C. A. Coolidge, architect; 1886). Developments on a comprehensive pre-arranged plan are at the University of Illinois, Louisiana State university, University of Rochester, Duke university, Johns Hopkins, Washington university (St. Louis), and the University of Minnesota.

The earliest university buildings were designed in the style brought from England by the colonists. New buildings of this character are also found at Harvard, Franklin and Marshall, Rutgers, Delaware, Johns Hopkins and Brown universities. At the end of the 19th century, however, a counter-current set in. College buildings in English collegiate style having been carried out with measurable success by Cobb at Chicago, Haight at Yale and Cope and Stewardson at the University of Pennsylvania, a predilection for this style arose. Curiously enough, this was more pronounced at the American universities where the Colonial tradition was formerly strong, so at Yale and Princeton, for example, Gothic is seen side by side with the traditional colonial.

Yet another aspect of the development of university architecture in America is the so-called "sky-scraper" type of building such as is now (1928) under construction at the University of Pittsburgh (Klauder, architect). The building is to have 40 storeys, the centre of population being at the fourth floor. It is an interesting solution of the many problems involved in building for colleges and universities Some of these problems are to foresee the demands of teaching and the needs of the community; to make the buildings permanent, harmonious entities yet permitting of expansion and to embody in them all possible known improvements. (C. Z. K)

UNIVERSITY COLLEGES. The so-called university colleges in England owe their rise to the desire, in the 19th century, to bring higher education within the reach of the population of certain regions to whom the existing universities were, for reasons of cost or distance, inaccessible The earliest of such colleges, Owens college, Manchester (opened in 1851), was specifically founded for that purpose, and many of its students were long prepared for the external examinations of London university. Subsequently, in Manchester and elsewhere, the technical side was developed. Other similar foundations were the Yorkshire college, Leeds, the New University college, Liverpool, the Mason college, Birmingham, the Firth college, Sheffield. Later on certain of these colleges became affiliated colleges of a single university (*see* UNIVERSITIES), but such colleges, and even others which did not go through the intermediate stage, have now become independent universities, with the exception of Armstrong college, Newcastle, which is still part of Durham university. In fact, a university college to-day is regarded as a university in the making. The most recent to attain that dignity is Reading, while University college, Nottingham (*see* below) should soon win its charter. (C. BR.)

Exeter.—When the Royal Albert Memorial building was erected in 1865, part of the premises was set aside for educational purposes. Here various extension courses provided by the University of Cambridge were instituted. These were co-ordinated in 1893 and the work placed under the direction of a principal. At the beginning of the present century courses were developed to prepare students for the external degrees of the University of London. In 1922, the institution was incorporated as the University college of the south-west of England, and its status was recognized by grants from the University Grants committee. It is hoped in time to develop this institution as a university of the south-west of England. In June 1927 the prince of Wales laid the foundation stone.

Hull.—The University college of Hull opened for the first time

in Oct. 1928. The college has been established as a result of gifts by the Rt. Hon. T. R. Ferrens, amounting to £272,000. The corporation of Hull has also given £150,000 towards the initial building scheme and has resolved to make an annual maintenance grant of £2,500. The policy of the college is to aim at quality rather than quantity. It has, therefore, been decided to begin as only two faculties, arts and science.

Leicester.—In 1921 an institution was established to prepare students for the examinations of the University of London under the style of the Leicester, Leicestershire and Rutland college In 1926 the name was changed to Leicester University college, when the endowment fund had reached a total of £130,000.

Nottingham.—The University college was first opened in 1881, having developed out of courses conducted by the Extension Board of the University of Cambridge. It was housed till 1928 in buildings in the centre of the town, provided by the municipality. Through the generosity of Sir Jesse Boot, an admirable site and a fine building, opened by the King in the year named, have been provided at a cost of over £500,000. An appeal is now being made for an adequate endowment fund The college prepares its students, both in day and evening classes, for the London university examinations in art, science and law. It has a very active University Extension department.

Southampton.—University college was opened as the Hartley institution by Lord Palmerston in 1862 At the outset the work was mostly evening work, by which students were prepared for the examination of the Science and Art department; the day was rather preparatory to university work than of real academic standard. In 1902, under a scheme of the Board of Education, the institution became the Hartley University college, and received a grant from the Treasury. Just before the World War new buildings had been provided at Highfield, but they were not occupied by the college till 1919

Wales.—*Lampeter* St David's college, Lampeter, was founded in 1827 to provide a liberal education to persons intended for the Church, especially in Wales It was subsequently affiliated to Oxford and Cambridge, where its students have special privileges. Under royal charters it has received the right to confer degrees in arts and theology, the examinations being conducted by examiners appointed by Oxford and Cambridge Residence for a certain number of terms is also essential. (A E. Tw.)

UNIVERSITY COURTS, in the English universities of Oxford and Cambridge, courts of inferior jurisdiction, administering the form and procedure of the canon law

At Oxford the chancellor, in 1244, acquired jurisdiction over actions of debt and actions affecting movables in which one party was a clerk; in 1275 over all personal actions in which either party was a member of the university, and in 1290 over all crimes, except homicide and mayhem The chancellor, vice-chancellor and the vice-chancellor's deputy are justices of the peace for Oxford, Oxfordshire and Berkshire, where scholars are concerned, and so exercise jurisdiction under the Summary Jurisdiction acts. By the Oxford University act 1854, the procedure of the common law was substituted for that of the canon law.

At Cambridge the chancellor enjoyed a jurisdiction similar to that of the Oxford chancellor, but limited to cases arising in the town and suburbs of the university. Previous to 1891, women of light character, who had been convicted of consorting with or soliciting members of the university *in statu pupillari*, were detained in a house of correction called the "spinning house," but in that year a conviction was held bad (*ex parte Hopkins* [1891]), with the result that the clause in Elizabeth's charter of 1561 giving power to imprison women was repealed. *See* H. Rashdall, *Universities of Europe in the Middle Ages* (1895); D. S. Holdsworth, *Hist. Eng. Law* (1921). (H. H. L. B.)

UNIVERSITY EXTENSION, a term applied to the provision of lectures or other teaching by universities for the general public, not members of the university.

Great Britain.—The idea of extending the range of advanced teaching beyond the walls of the universities was not a wholly new one in the 19th century, but it was not taken up with pertinacity till the early '70s. At that time a young Fellow of Trinity, James Stuart, approached his own university of Cambridge for the recognition of extra-mural work. He had been specially impressed with the needs of two classes who had sought his help—the working men of Crewe and an association for the higher education of ladies in the north of England. Cambridge gave its official support in 1873 and Mr. (afterwards Professor) Stuart developed a system, not merely of lectures, but of classes.

Before long Oxford followed suit and a London society was formed which has since been absorbed by the University of London. The old Victoria university (Manchester, Liverpool, Leeds) took its share of the work.

Before the end of the century every large town in England and most small ones had a university extension centre, the subjects studied including history, geography, literature, art, music, science, economics. Since then the older type of extra-mural work, called officially university extension at Oxford and London and university local lectures at Cambridge, has continued to advance Even during the World War a large number of courses were delivered.

The period since the war has shown a remarkable development of university tutorial classes, begun by Oxford in 1908 and soon taken up by other universities. The system, like the older type, provides for lectures, discussion classes and paper work; but the membership is limited to a small number, formerly 32 and now 24, of students pledged to fulfil the conditions for three years In 1910–11 the number of classes was 72 and students 1,829; in 1927–28 these had increased to 591 and 10,778 respectively. In addition there were 83 preparatory classes with 1,709 students. Substantial grants in aid are made by the Board of Education and local authorities

The central joint advisory committee on tutorial classes, formed in 1909, was one of the first bodies to represent all the universities and university colleges in England and Wales. It also has direct representation of the joint committees which manage the work in each case, and which include members nominated by the Workers' Educational Association (*q.v.*). In 1925 a consultative committee was formed, consisting of all the extra-mural officials. It is concerned with all branches of the movement and not only with the tutorial classes. At the congresses of universities of the empire, held in 1912 and 1921, a prominent place was given to teaching work outside the walls. The tutorial class movement has flourished in Australia and New Zealand.

Every university and university college in England and Wales is now conducting tutorial classes. Several have started university extension work of the older type, a development which has been made possible by the issue in Aug. 1924 of new regulations of the Board of Education in providing for grants in aid.

One of the most promising developments is the plan, recommended by the royal commission, of bringing up to the university adult students who have gone through a course of extra-mural instruction. At both Oxford and Cambridge a number of such students are now in residence for at least a year, and experience is already showing that, besides widening their own outlook, they contribute an element of great value to the undergraduate life of the places. All will return to their homes with powers of greater service to the community, and many will become valuable teachers in the adult education movement. (*See* also ADULT EDUCATION.)

Draper, *University Extension: a Survey of 50 years (1873–1923)* (1923); Albert Mansbridge, *University Tutorial Classes* (1913); R St. J Parry, *Cambridge Essays on Adult Education* (1920); *Reports* of the Adult Education Committee appointed by the president of the Board of Education. (D. H S. C.)

The United States.—To trace the history of university extension in the United States to any definite initial movement is impossible. It grew out of the public demand for the extension of the advantages of the university to the community in general A hint of the desire to broaden the service of higher education may be found in the series of lectures open to the public for a small fee offered by Columbia college at its original site in College Place, New York, in 1830. This was premature and failed to arouse interest. We may refer also to the American National lyceum founded in 1831, the Lowell Institute in Boston (1839), the Peabody Institute in Baltimore (1859), all having features of univer-

sity extension particularly of the lyceum (*see* LYCEUM AND CHAUTAUQUA) or short lecture course type. Then the summer school (*q v*) was organized at *Chautauqua* in 1874 which through its literary and scientific circles developed a form of correspondence study The next incident in the development centred around the public libraries in such cities as Chicago and St Louis, for it was at the meeting of the American Library Association in Sept. 1887, when Prof. Herbert B Adams of Johns Hopkins university spoke on the university extension of England Extension work under the auspices of public libraries was endorsed and earnestly advocated by Melvil Dewey, librarian of Columbia university, before the regents of the University of the State of New York in 1888. In 1890, when Mr. Dewey had become the librarian of the State library of New York, the regents following his suggestion, endorsed by 31 colleges of the State, determined to establish a system of university extension and obtained from the legislature an appropriation of $10,000 for administrative expenses

The University of Chicago and the University of California, 1891–92, were pioneers in the acceptance of extension instruction in their scheme of university study. This naturally led to the gradual disbanding of organizations established outside of the universities. The first 20 years of the 20th century witnessed the organization of extension teaching in at least 30 State universities Only a few institutions which rely largely upon private endowment—as Columbia university (1902 and 1910), New York university (1908), University of Rochester (1916), Syracuse university (1920) and University of Pennsylvania (1913)—have included university extension as part of their public service in education.

Early Forms of University Extension.—As in England so in the United States the early form of university extension was that of the lyceum or short lecture course, not too profound, often illustrated, intended to entertain as well as to instruct Although the short lecture course served a useful purpose, yet the lyceum as a means of education, with its difficulty of maintaining a balance between the serious and the entertaining, proved unsatisfactory. It became necessary to approximate much more closely the form of instruction followed in the established schools and offered to students in regular attendance Those who could not attend classes were given courses by correspondence (*see* CORRESPONDENCE SCHOOLS), which assumed a more or less academic form and exactness, and classes were established at convenient centres and in university buildings. The large universities of the West, *e g*, the University of Chicago and the University of Wisconsin, built up great departments of correspondence although using class instruction in a restricted degree

Credit for Extension Courses.—Certain privately endowed universities and colleges, particularly those in the East, have believed that their special function would be jeopardized if they should supplement their classes by those intended for the irregular student Thus Princeton gives no indication of a desire to enter this field. Yale is cautious in its active interest in adult education. Harvard co-operates with Tufts college, Massachusetts Institute of Technology, Boston university and Wellesley college in offering courses of a collegiate grade to qualified, though not formally matriculated, students Massachusetts has a well organized department of university extension. As to credit toward degrees for extension students the policy varies in different institutions. The State universities in the West generally grant credit for class and correspondence courses. Columbia gives credit for established class instruction but not for home study. Harvard grants credit in co-operation with other institutions toward a special degree of A A., associate in arts

The National Association of University Extension is an organization of universities and colleges which have established departments of extension teaching This was organized in 1914 and publishes annual reports which contain the records of meetings of the association. The American Association for Adult Education held its first annual meeting at the Hotel Drake in Chicago, on March 26, 1926. The latter organization is a most active agent for the study and extension of adult education. In 1926–27, under the auspices of the Carnegie Corporation, four studies covering the field of adult education were published One of these entitled *The University Afield*, by Alfred L. Hall-Quest (1926), is a carefully prepared examination of educational opportunities offered by American universities in university extension.

UNIVERSITY SETTLEMENT: *see* SOCIAL SETTLEMENTS

UNRUH, FRITZ VON (1885–), German writer, was born in Coblenz, of an aristocratic family He joined the Prussian Guard, and was tutor to a prince. His first plays, *Offiziere* (1912) and *Louis Ferdinand, Prinz von Preussen* (1914) caused consternation. In the World War Unruh served on the staff of the Crown Prince, and in 1916 was requested to write a book to keep up the morale of the troops His *Opfergang* (1916; English tr. 1928, *Way of Sacrifice*) expressed his revolt against militarism with such sardonic force that its author was declared insane. When released, Unruh lived in Switzerland, later in Oranien, Hesse. His trilogy *Ein Geschlecht* (1918–21) was also impressionist The later *Flügel der Nike* (1924), *Heinrich aus Andernach* (1925), and *Bonaparte* (1926, English tr. 1928) were still expressive of revolt but they had lost some of the wildness, and with it some of the force, of *Opfergang*. In 1928 Unruh was elected to the Prussian Academy of Letters.

UNTERMYER, SAMUEL (1858–), American lawyer, was born at Lynchburg (Va), on March 2, 1858. He was educated at the College of the City of New York and at the Columbia law school, and was admitted to the bar in 1879, practising thereafter in New York city. He was counsel in many celebrated cases covering almost every phase of corporate, civil, criminal and international law As counsel for H Clay Pierce he prevented the Standard Oil Co, after its dissolution in 1910, from dominating the Water-Pierce Company. In the same year he effected the merger of the Utah Copper Co with the Boston Consolidated and the Nevada Consolidated Cos, involving more than $100,000,000 In 1903 he undertook the first judicial exposure of "high finance" in connection with the failure of the U S. Shipbuilding Co, organized as a consolidation of the larger shipbuilding companies in America. After this he conducted a number of similar exposures. In 1911 he delivered an address entitled, "Is There a Money Trust?" which led the following year to the so-called Pujo money trust investigation by the committee on banking and currency of the Federal House of Representatives. Mr. Untermyer urged measures like the compulsory regulation of stock exchanges, reform of the criminal laws and the regulation of trusts and combinations He took part in preparing the Federal Reserve Bank law, the Clayton bill, the Federal trade commission bill and other legislation curbing trusts. He was a delegate to Democratic conventions and a strong supporter of President Wilson, who appointed him to serve on the commission which sat at Buenos Aires in 1916 to frame uniform laws for the Pan-American countries

Untermyer acted for Governor Smith in a water-power controversy over the Niagara, St. Lawrence river, Adirondack forest reserve and other hydro-electric power rights, resulting in the defeat of the grant of the water-power rights of the State to private interests He was counsel for Herman Bernstein in the first suit brought against Henry Ford because of attacks on the Jewish people published in the *Dearborn Independent*. In July 1927, Mr. Ford agreed to destroy the publications.

UNTERWALDEN, a canton of Switzerland, consisting of the basins of two streams, both called Aa, flowing into the Lake of Lucerne and divided into Obwalden and Nidwalden. The area of the canton (1923–24) is 296·4 sq.m. Forests cover 84·2 sq.m. and glaciers occupy over 5 sq.m. The highest point is the Titlis—10,627 ft.—south of Engelberg. As Obwalden includes this region, it is generally more mountainous than Nidwalden. The latter in-

cludes much more lake surface than Obwalden. The inhabitants are devoted to pastoral and, in a much less degree, to agricultural pursuits. In 1920 the total population was 17,567 in Obwalden and 13,956 in Nidwalden. The majority of the inhabitants were German-speaking Catholics. Since 1814 the canton has been practically administered by the bishop of Coire; formerly it was a part of the diocese of Constance. The capital of Obwalden is Sarnen (pop. 4,980), and of Nidwalden, Stans (pop. 2,980).

There are no main line railways; a light railway runs from Lucerne to Brünig pass via the Sarner-Aa valley; an electric railway from Stansstad ascends the other main valley as far as Engelberg, and mountain railways give access to the summits of Pilatus, Stanserhorn, Bürgenstock and Seelisberg—all of which overlook the Lake of Lucerne. Each area forms a single administrative district, with its own independent local institutions; in Obwalden there are seven communes and in Nidwalden 11. In each "half" canton the supreme legislative authority is the *Landsgemeinde,* or primitive democratic assembly (meeting in both cases on the last Sunday in April), composed of all male citizens of 20 (Obwalden) or 18 (Nidwalden) years of age. These assemblies have had an uninterrupted existence since 1309

The people have always been deeply religious. In the church of Sachseln, on the Sarnersee, still lie the bones of the holy hermit, Nicholas Lowenbrugger (1417–87), known as Nicholas von der Flüe, or "Bruder Klaus," while at Sarnen, near by, are several convents; the most famous of all the monasteries in the canton is the great and still wealthy Benedictine house of Engelberg (founded about 1120) Another site of historical interest is Stans, the birthplace of Arnold von Winkelried, the real or legendary hero of Sempach (1386) Some of the old and valuable "common lands" are still in the hands of the old gilds, and "communes" consist of natives, not merely residents. In Obwalden, these "burgher communes" contribute to the expenses of the new "political communes" of residents, but in Nidwalden the latter have to raise special taxes. (*See* SWITZERLAND. *Administration*)

History.—Historically, both Obwalden (save a small area in the Aargau) and Nidwalden were included in the Zurichgau. On Aug. 1, 1291, Nidwalden (Obwalden is not named in the text of the document, though it is named on the seal appended to it) formed the "Everlasting League" with Uri and Schwyz (this being the first known case in which its common seal is used). In 1304 the two valleys were joined together under the same local deputy of the count, and in 1309 Henry VII confirmed to them all the liberties granted by his predecessor—though none is known to have been granted. This placed Unterwalden on an equal political footing with Uri and Schwyz, and as such it took part (1315) in Morgarten fight (also driving back an invasion over Brunig pass), in the renewal of the Everlasting League at Brunnen (1315), and at Sempach (1386), and in driving back the Gugler or English freebooters (1375).

In 1798 Unterwalden resisted the Helvetic republic, but, having formed part of the short-lived Tellgau, became a district of the canton of the Waldstatten Obwalden submitted at an early date, but Nidwalden, refusing to accept the oath of fidelity to the constitution, mainly on religious grounds, rose in revolt (Sept. 1798), and was only put down by the arrival of 16,000 armed men and by the storming of Stans. In 1803 its independence as a canton was restored, but in 1815 the refusal of Nidwalden to accept the new constitution resulted in the transfer (1816) to Obwalden of the abbey lands of Engelberg (*See* SWITZERLAND: *History*)

UNYAMWEZI, a region in the Tanganyika Territory. A plateau between the two rift-valleys and 4,000 ft above sea level, it is well watered, fertile and wooded, or covered with long grass. In the west are swamps. From south to north it extends some 200 m. and east to west about 150 m. It includes the town of Tabora (*q.v.*) founded by Arab slave traders from Zanzibar.

The country is named from its inhabitants, the Nyamwezi (in Swahili, Wanyamwegi), and was mentioned by Portuguese chroniclers of the 16th century and by the navigator Antonio Pigafetti as Munemugi "The Land of the Moon," the exact equivalent of the native name Wu-nya-mwezi. The Nyamwezi, a large tribe, or group of tribes—the Sukuma, Sumbwa, Fipa, Winsa, Konongo and Kimbu among others—are both agriculturists and traders. They appear to have come early into contact with the Arabs and Indian merchants established on the coast. Quarrels between them and the natives became common, chiefly over the heavy transit tolls levied by the Nyamwezi on the Arabs. The first Europeans to enter Unyamwezi were Richard Burton and J. H. Speke, who visited Kaze (Tabora) in 1857. About 1858 the Arabs among them Tippoo Tib, a native of Tabora, defeated the Nyamwezi, but in 1871 the Arabs were defeated by a warrior named Mirambo (*c.* 1830–87), who by his military skill made himself master of most of the country. When Unyamwezi fell into the German sphere the Tabora Arabs offered no opposition, and Emin Pasha hoisted the German flag there in Aug. 1890. The Nyamwezi, however, resisted, and it was not until Jan 1893 that the Germans succeeded in storming the *boma* of their chief, Sike by name, who was killed It took the Germans many expeditions before they were fully masters of the country. As a result of the World War, it passed out of German possession

The Nyamwezi numbered (1921) about 500,000 persons. They are Bantu of medium size and negroid features, but with long noses and curly rather than woolly hair. They tattoo, file or extract the upper incisor teeth and load their arms and legs with brass and copper wire rings. They make cloth of cotton in their own looms, smelt and work iron, and grow tobacco extensively.

See the works of Burton, Speke and Stanley, H Brodie, *Tippoo Tib, the Story of his Career in Central Africa* (1907), *Handbook of German East Africa* (1917), a British Admiralty publication. (F. R C)

UNYORO, properly, and now officially, **BUNYORO,** a country of east central Africa lying north-west of Uganda, with which the British protectorate, dating from 1896, is now merged.

It has an area of 5,619 sq m Most is plateau land, 3,200 to 3,800 ft. above sea level, intersected by swamps, deep valleys and hills rising to 4,800 ft During the 19th century the states of Bunyoro and Buganda appear to have been rival overlords of the region between the Bahr-el-Jebel (Mountain Nile) and the great lakes. The Bunyoro number about 100,000. They had a certain civilization and were skilled in iron-work, pottery and wood-work. The ruling class is of Hima stock

The first Europeans to enter the country were J H Speke and J H Grant, who spent part of 1862 there, Kamurasi, the *Mukama,* (king), objecting to their further journey down the Nile. In 1864, Sir Samuel and Lady Baker discovered the Albert Nyanza Ivory and slave traders, nominally Egyptian subjects, penetrated as far south as Unyoro, and (1870–74) Baker, as governor-general of the Equatorial Provinces, placed a garrison at Foweira on the Victoria Nile. He annexed Unyoro to Egypt in 1872. General Gordon, who succeeded Baker, established posts at Masindi and Mruli. With King Kabarega, a son of Kamurasi, the Egyptians had many encounters Egyptian authority ceased with the withdrawal of Emin Pasha in 1888, but Kabarega in 1891 found himself in conflict with Captain (afterwards Lord) Lugard, who entered Unyoro from the south (*see* UGANDA: *History*) In 1889 he was deported first to Kismayu and, in 1901, to the Seychelles. In 1923 he was allowed to return, but died before regaining Unyoro

Another chief had to be deposed for incompetence. The next mukama, Andereya Dukaga, was a man of progressive ideas. He was about the 40th of Kabarega's 250 or so children, could read and write and was a Protestant As the country settled down the powers of the native administration were enlarged. The mukama presides over a *Lukiko* (council or parliament), which has the legal authority. This indirect government worked well and during the World War the Bunyoro gave the British substantial help.

Unyoro has played rather an important rôle in the past (unwritten) history of Equatorial Africa as being the region from which the ancient Gala (Hamitic) aristocracy, coming from Nileland, penetrated the forests of Bantu Africa, bringing with them the Neolithic civilization, the use of metals and the keeping of cattle. In the west and south-west of the country are the primaeval forests of Budonga (160 sq m.) and Bugoma (80 sq m), containing large chimpanzees and a peculiar sub-species of straight-tusked elephants (only found in Unyoro)

See the works of Speke, Grant and Baker; also *Colonel Gordon in Central Africa* (4th ed, 1885); F D. Lugard, *The Rise of Our*

East African Empire (1893); H. H. Johnstone, *Uganda Protectorate* (1902); H. R. Wallis, *Handbook of Uganda* (1920).

UPAS, a Javanese word meaning poison, and specially, the gum of the anchar tree (*Antiaris toxicaria*), of the fig-family (Moraceae), and a native of the Sunda Islands, which was used to envenom the darts of the natives. According to the absurd fable (professedly by one Foersch, who was a surgeon at Samarang in 1773) published in the *London Magazine*, December 1783, and by Erasmus Darwin (*Botanic Garden*, pt. ii), the tree destroys all animal life within a radius of 15 miles. The tree has a straight stem rising without a branch to 60 to 80 feet. It has a whitish bark and yields the juice from which the poison is prepared.

UPDIKE, DANIEL BERKELEY (1860–), American printer, was born in Providence, R.I, on Feb. 24, 1860. In 1893, he began to establish the Merrymount Press. In 1895 he revived the Scotch-cut type produced by Alexander Wilson about 1835. He later acquired the 17th century Dutch fonts of Janson and the matrices of the Mountjoy type, and he has led in the revival of classical typography in America. Special types, among them the Merrymount type, have been designed by Bertram Goodhue and Herbert Horne. He received the degree of A.M at Brown university in 1910. From 1910–17 he was lecturer on printing in Harvard university. He was selected to print the *Standard Book of Prayer* in the revision of 1928. His published works include: *On the Dedication of American Churches* (with Harold Brown; Cambridge, 1891); *Printing Types—Their History, Forms, and Use* (Cambridge, 1921); *In the Day's Work* (Cambridge, 1924). Also he edited. *A Dissertation Upon English Typographical Founders and Foundries*, by Edward Rowe Mores, with appendix by John Nichols (1924).

UPHOLSTERY. In modern usage, an upholsterer is one who supplies coverings, cushions, padding and stuffing for chairs, sofas or beds, or who repairs the same, and more generally one who also provides carpets, curtains and household furniture. The word first appears as "upholder," then as "upholdster" or "upholsterer," that is, a broker who holds goods up to public view.

The earliest example of upholstery consisted in simply stretching a piece of leather across a seat somewhat on the principle of a hammock. Subsequently, springs were added. These springs, at first shallow, developed in height until they were liable to bend over and be "crippled," as it is termed in the trade. This led to a greater amount of lashing or tying of the springs together; and to double springing, that is, one layer of springs of lighter weight superimposed upon a lower layer of heavier gauge.

Later, there has been the hour-glass shaped spring. This allows the use of a wide base and top. On compression, the coils do not "chatter" or rub together when sat upon.

Manufacture.—Across the base of the seat webbing is stretched and tacked to the wood frame To this the springs are sewn with cord, and subsequently lashed or tied together to ensure that they do not get bent over on one side If the chair is to have what is called a spring edge, a piece of cane is bent round at the front of the seat and also lashed to the springs, so as to form a firm edge, and at the same time ensure that the springs work in unison. After this, canvas is stretched over the springs and tacked down to the wooden frame. The chair is then first stuffed with whatever material may be chosen, such as fibre or hair, a light canvas or scrim is placed over the filling, and the edge stitched by hand to form a firm portion which determines the outline and form of the chair. The chair is then second-stuffed with a further layer of hair or some cheaper material. This hair is then covered with a layer of wadding to prevent it from working through the cover. The same treatment is applied to the back and arms, which may also be sprung. The upholstered articles may now be first covered in calico, or the final cover put on.

Spring Frames.—As the web foundation for a chair has sometimes proved unreliable, it is sometimes superseded by the employment of a spring frame. This consists of a series of springs held together by suitable metal links and surrounded by a wire edge bent to the shape of the outline of the seat. Alternatively, other makers have employed lace webbing as a foundation on which to impose the layer of stuffing underneath the cover. The lace webbing resembles wire-woven mattresses.

The principal raw materials employed in upholstery are timber for the framework, webbing, springs, hair, fibre, flock, woodwool, canvas, wadding, tacks, twine and laid cord; various coverings, such as leather, moquettes, velvets, tapestries, silks and damasks. (*See* FURNITURE MANUFACTURE.) (W. H. S.)

UPPER SIND FRONTIER, a district of British India, in the Sind province of Bombay, with administrative headquarters at Jacobabad (*q.v.*). Area, 2,695 sq m.; pop. (1921) 240,619. The land is watered by canals from the Indus, of which the chief are the Begari and Desert canals Principal crops are millets, oil-seeds, pulses, wheat and rice, most of which is sent to the sea-board; the trade from Central Asia into Sind crosses the district, bringing wool and woollen goods, fruits, carpets and horses. The district is crossed by the Quetta branch of the North-Western railway, and from Jacobabad a 2½ ft. gauge line runs to Kashmor

UPPINGHAM, a market town of Rutland, England. Pop. (1921) 2,453. The Church of SS Peter and Paul has Decorated portions in the nave, tower and spire. The pulpit is of the 17th century. Jeremy Taylor was rector here at the outbreak of the Civil War. The principal institution of Uppingham is the school. It is coeval with the grammar school of Oakham (1584), and had the same founder, Robert Johnson, archdeacon of Leicester. During the nineteenth century, the school was developed by Edward Thring into a public school of great educational influence. (See *Life and Letters of Edward Thring* by E. R. Parkin, published 1898)

UPPSALA or **UPSALA,** a city of Sweden, 41 m. N. of Stockholm Pop. (1928), 30,198. The name originally belonged to Old Uppsala, nearly 2 m. N of the present city. This Uppsala, mentioned in the 9th century, was famous for its heathen temple, which gleamed with gold Three huge grave mounds remain here. In the same place the first cathedral of the bishops of Uppsala was erected (*c.* 1100) But on its destruction by fire, convenience caused removal in 1273 of the archiepiscopal see to the present city, then called Ostra Aros, but later Uppsala, which became a kind of ecclesiastical capital Here the kings were crowned, after their election at the Mora Stones, 10 m S E of Uppsala.

In 1567 Eric XIV. murdered in the castle five most eminent men of the kingdom, three of them belonging to the family of Sture In 1593 was held the great synod which marks the final victory of Protestantism in Sweden, in the same year the university was restored by Charles IX In the castle, Christina, daughter of Gustavus Adolphus, resigned her crown to Charles X. in 1654. In 1702 nearly the whole city was burnt down.

Uppsala has water-communication with Stockholm by the river Fyris and the northward arm of Lake Mälar, into which it flows. The older part of the city lies on its sloping west bank.

The university, the chief and oldest in Sweden, was founded in 1477 by Archbishop Jakob Ulfsson The university building, completed in 1887, lies west of the cathedral. The library building was erected in 1819–41. It is on the site of the Academia Carolina, founded by Charles IX., and is known in consequence as *Carolina Rediviva.* Since 1707 the library has had the right of receiving every work printed in Sweden. Among the mss. is the famous *Codex Argenteus* (6th century), a translation of the Gospels in the Gothic of Bishop Ulfilas (4th century). In the old botanic garden, Linnaeus had his residence. The new botanic garden was given by Gustavus III. in 1787. The observatory was founded in 1730. The Victoria museum contains Egyptian antiquities The Royal Society of Sciences, founded in 1710 by Archbishop Erik Benzelius, has a valuable library. Much of the revenue is drawn from the estates granted by Gustavus Adolphus in 1624. Every student must belong to a "nation" (*landskap*), of which there are 13, each representing a particular part of the country and having generally its own club-house and fund. For singing, the students have a high reputation.

The cathedral stands nobly above the town; its tall western towers with their modern copper-sheathed spires are visible for many miles. It is of simple form, and mainly French in style (the first architect was a Frenchman, Étienne de Bonneuil) modified by the use of brick as building material. Ornamentation is

thus slight except at the southern portal. The church was building from 1287 to 1435. It suffered from several fires, and a thorough restoration was completed in 1893. The easternmost chapel is the fine mausoleum of Gustavus Vasa The castle was founded in 1548 by Gustavus I. It was destroyed by fire in 1702, and is still in part ruined. Uppsala is a book-printing centre

UR, a very important Sumerian site and the reputed early home of Abraham (Biblical Ur of the Chaldees). Ur lies about 140 miles south of Babylon, and about 6 miles south of the modern bed of the Euphrates, about two miles from the modern Ur junction on the Baghdad–Basra railway, in 31° N., 46° E. In ancient times the Euphrates ran west of Ur, reaching open water near Eridu The river was diverted so that it passed by Ur in the time of Rimsin. The city also lay near the ancient junction of the Tigris with the Euphrates, when the former flowed along the Shatt al Hai. Ur lies close to the low hills which form the edge of the Arabian desert. It commanded the communications of both rivers. It was close to the sea and at the same time a convenient entrepôt for the commodities of the desert. The gradual change in the coast line and in the course of the rivers has left the ruins in the desert Although most of the ruins of Ur as seen to-day,—and the *ziggurat* is one of the best preserved in Mesopotamia,—belong in their present form to the Neobabylonian period, recent excavations have shown that the site has been occupied from extreme antiquity. Original excavations were undertaken by Taylor in 1854, but a serious examination of the site was not made till after the World War by Hall His work has since been ably continued by Woolley.

Amid the extensive remains of cemeteries, the most recently found graves, which lie south-east of the sacred enclosure, are the most interesting. The graves fall into three periods, and are dated provisionally by Woolley at 3500 B.C., the second series are comparable with Cemetery A at Kish, and are dated by Woolley at about three centuries later, while the third series are some centuries later, but at present are undated

The richest graves of all belong to the earliest period. Their wealth of precious metal shows that there was a very considerable and prosperous civilization, while the settled style of the art shows that this civilization was already an old one. The graves antedate the first dynasty of Ur by 400 years, they come therefore in the period subsequent to "the flood," a period in which Sumerian historians placed two dynasties, those of Kish and Erech For these periods and for the first dynasty of Ur they record only the names of the kings, often exaggerating the length of their reigns to an absurdly great degree The excavations at Ur have, however, produced inscriptions of the first dynasty and these early graves show that the occupation of the lower river valley is extremely ancient, while additional confirmatory evidence of an early date has recently been found at Kish

The great temple area at Ur is both striking and has had many archaeological results The temenos or sacred enclosure as it exists to-day is the work of Nebuchadrezzar. The outer wall appears to have been pierced by six great gateways On the north-east side the more northerly had a corner stone with an inscription of Bur-Sin. The southerly was restored by Cyrus, the son of Cambyses. On the south-western side the gateway opposite the ziggurat had an inscription of Nabonidus.

The ziggurat stands in the north-west corner of the sacred area. It consists of three stories The lowest, which measures 210 × 140 × 20 feet, was built by Ur-Nammu and Dungi and was built so well that further restoration was apparently never needed. The second stage was restored by Nabonidus A small building crowned the third stage. This was the bedchamber of the god and goddess, not a temple as Herodotus supposed The face of the first stage was blackened, the second and third was of red stone, while the shrine on the top was encased in blue brick, the work of Nabonidus. On the north-east side there were three stairways, leading from the platform to the second stage, two ran along the face of the tower from the north and east angles respectively and met in the middle, from which point there was a third stairway, running towards the face of the tower, at right angles to the other two.

East of the ziggurat lay the great temple of E-num-mah. The ruin is of three periods, prehistoric to Neobabylonian, and of the time of Cyrus. The old Sumerian foundation wall was made of unbaked brick built on a foundation of clay which had been beaten hard On this there were two courses of unbaked bricks of Bur-Sin, 8 ft. 9 in. thick and 8 ft. 5 in high, which had been restored at various times. On either side there are a row of rooms. The temple was laid in ruins between the time of Hammurabi and the Kassite dynasty. Nebuchadrezzar II. made a complete restoration. The old temple had no great open court, an obvious need in a great temple, for this Nebuchadrezzar made provision.

South-east of the ziggurat was a much ruined temple of Ningal. The middle cella and the side chapels lie on the north-west side of the court, and the entrance, through a great recessed doorway is on this side On either side there were two rooms connecting with antechamber and chapels and the plan recalls the temple of Ishtar at Babylon. A roadway led from the south-east of the temple of Ningal, ending in a great double gateway which gave access to the court of a great rectangular building east of the temple. There was communication from the south corner of the temple court to this street through a pair of recessed gates. At the other end of the roadway the excavators found a recess with a door opening on to a building of the Kassite period.

Between the temple of Ningal and E-num-mah lay the shrine of Nannar, E-dub-lal-mah. This is mentioned in an old liturgy as a temple of Ur and buildings of this name occur in other cities, such as Adab, Larsa, Lagash and Isin. The town itself was excavated by Woolley It has been shown that the old town of Ur, as it presented itself to Abraham's view, cannot have differed much from the modern mudbrick towns of Mesopotamia.

See, for earlier excavations, *Cambridge Ancient History*, vol. 1, 1923 (bibliography), H R Hall, *Museum Journal*, XV Woolley's reports are appearing annually in the *Antiquaries Journal* (Vol III onwards). A short summary of excavations from 1918 with bibliography in S. Langdon, *Der alte Orient*. 26 (1928) (L. H. D. B.)

URAL-ALTAIC LANGUAGES. The Ural-Altaic languages consist of two groups The first is the Uralian group (Finno-Ugrian languages [*q v.*], and the Samoyedic languages), spoken round the Ural mountains; and the second, the Altaic (Turkish [*q.v*], Mongolian [*q.v*], and Tungus tongues) in derivation from the mountain range of that name.

The Phonetic System.—Almost without exception the Ural-Altaic languages recognize a law of vocalic harmony Exceptions exist but are explained consistently with the general principle: that in any single word only vowels of the same "timbre" may appear, thus, if the radical vowel of a word be *o* or *u*, the vowels in the other syllables must be *o*, *u* or *a*. In other words, vowels in the same word must harmonize in method of articulation. On the other hand, if the root-vowel is *e* or *i*, the vowels of other syllables of the same word must be pre-palatals or anterior-vowels (*i e.*, articulated in the forepart of the mouth like *e* and *i*).

We have thus in Finnish the word *kesi* "hand," *kivi*, "stone," *metsä*, "forest," opposed to *kala*, "fish," *sulka*, "feathers," etc. The same applies to Hungarian, *repul*, "to fly," *lélek*, "soul," *segit*, "to help," presenting vocalic contrast to *három*, "three," *olvad*, "to smelt," *savanyu*, "bitter," etc. Turkish is even more observant of detail. *deri*, "skin," *dudak*, "lip," *bajak*, "leg, thigh," *böjük*, "big, tall," etc. (These examples are from Osmanli)

In actual practice, there are numerous exceptions Nevertheless, in Mongolian, Turkish, Hungarian and Finnish, vocalic harmony, without being general, tends to establish a balance between the divisions and dispositions of words, and is thus an important factor in the phonetic structure of Ural-Altaic languages.

Consonantal Alternation.—In any given word the consonant which ends the root syllable is subject to various mutations according to the nature of the syllable following (open or closed). It is especially characteristic of certain Uralian tongues, like Lapp, Finnish and the Samoyedic languages. In the other languages it has not developed beyond the merest trace. Thus, in Finnish, *kukka*, "flower," but *kukan* (genitive), "of the flower"; *kuto-*, "to weave," but *kudon*, "I weave"; *repo*, "fox," but *revon* (gen.) "of a fox"; *onki*, "fish-hook," but *ongen* (gen.) "of a fish-hook"; *lintu*, "bird," but *linnun* (<*lindun*), "of the bird," etc. In their present form

the consonantal alternations, so numerous and so varied in Finnish and, above all, in Lapp, give no indication of what they once were. In early times, it seems probable that at the end of the root syllable, there was an alternation of degree—a strong one and a weak one, *tt. kk pp.* and *t k p.* There was also an alternation which produced a contrast between *p. t. k.* and *β. δ. γ*; *m. n.* ɔ, and *β. δ. γ.*, etc. This alternation extended to groups of consonants opposing a strong *mt* to a weak *md*, *mp* to *mb*, *ks* to *γz*.

This alternation theory (German *Stufenwechsel*) was formulated by the Finnish linguist, E. N. Setälä, who proposed to extend it to Altaic tongues, where Ramstedt had discovered it in part. It is unlikely that consonantal alternation can be demonstrated in Mongolian, Turkish and Tungus except at a very early stage.

Vocalic Alternation.—There exists also an alternation of vowels by which, according to the suffixes which a word may take, the vowel of the root syllable may be modified or changed. Thus, in Finnish, *pala*, to burn (intrans.), and *polttā*, "to burn" (trans.); in Ostyak, *n'āləm*, "tongue," and *n'ilməm*, "my tongue," etc. These instances are rare in modern Ural-Altaic speech, and the Uralian tongues have best preserved the traces, although examples are also found in Turkish and Mongolian.

The rules which determine the beginning and ending of words are that no word can begin with more than one consonant, and when a foreign word so beginning is borrowed it is simplified accordingly. The Swedish word *stor*, "big," becomes *suuri* in Finnish Elsewhere a vowel is put before the double consonant to facilitate enunciation: the Slav word *stolu* is in Hungarian *asztal* (pron. *ostol*) and the English "steam" is, in Osmanli, *istim*, etc.

The accent varies in position and quality. Finnish and Hungarian stress regularly the first syllable and Turkish the last. In Samoyedic and other idioms such as Ostyak it varies.

Morphology.—In the first place, no language of the group uses prefixes; all the grammatical modifications expressed in English by prepositions (viz, to, on, of, for, etc) are effected by means of suffixes "I enter the house," is, in Hungarian, *belépek a ház-ba* (*ház*, "house"—*ba*, suffix meaning "into"). In a tale written in Kazan Turkish we find: *ber keše urmanγa barγan dej*, "a man went into the forest" (*urman*, "forest"—*γa*, "into") The majority of the grammatical relations affecting words are therefore expressed by suffixes, which differ in form from language to language, but play the same rôle throughout These suffixes are strengthened by post-positions: thus (Hungarian), *egy fa alatt*, "under a tree" (*egy*, "one, a," *fa*, "tree," *alatt*, "below")

The possessive case is formed by suffixes except in Mongolian and Tungus. Hungarian *szem-e-m*, "my eye" (*szem*, "eye" + *m*, "my," with euphonic *e*) *szemed*, "thine eye" (*-d*, "thy, thine"); *szeme*, "his eye" (*-e*, "his"); *szemunk*, "our eye" (*-unk*, "our"), etc. Osmanli Turkish also has this form, *ev-im*, "my house" (*ev* "house," *im*, "my"); *ev-in*, "thy house" (*-in*, "thy"); *ev-i*, "his house" (*i*, "his"); *evimiz*, "our house" (*-imiz*, "our"), etc. This use of the possessive prefix is, however, comparatively modern, since it does not exist in Mongolian and Tungus and, further, since in Hungarian as in Turkish these suffixes are added directly to the root before other suffixes, while in other tongues (Finnish, Lapp, etc.) they follow all other suffixes. Compare Hungarian *a házamban*, "in my house" and Turkish (Osmanli), *evimde* (idem) with Finnish *kodassa-ni* (*-ni*="my").

The Uralian languages, Turkish, Mongolian and Tungus appear to have developed their system of word-building as we know it to-day at a date which, if not recent, was well after the time when the languages were closely related. Only a few suffixes can be restored throughout the family; it may be suggested tentatively that one method of forming the plural was to suffix a *-t* to substantives, as in modern Mongolian, Tungus and Uralian, a process of which Turkish has conserved a few traces. The main characteristic of the Ural-Altaic tongues is the difficulty, even in modern speech, of distinguishing between nouns and verbs by their outward forms. The conjugation of the verb is reminiscent of the possessive-suffix system of the noun and many verbal suffixes are identical in form with those which are used to construct new nouns. The adjective has no proper declension.

Vocabulary.—All words dealing with rudimentary civilization are common to all the languages, such as those expressing relationship (father, mother, uncle, aunt, etc.), certain elements, animals and plants, primitive occupations and simple movement and gesture words. The comparative philology of these languages demonstrates a neolithic civilization of the type of which traces have been found in different parts of the Urals. This primitive vocabulary, the common patrimony of all the tongues, is augmented by words of very diverse origin. Mongolian and Turkish have borrowed much from Chinese and Indian languages. Uralian languages have drawn largely on Indo-European stocks and in modern times many Iranian terms have been admitted. In modern days Hungarian, Wogul, Ostyak, Cheremiss and Wotjak have taken many words from Turkish lexicography. Tungus has a large percentage of Mongolian words; Osmanli Turkish has adopted much from Arabic and Persian. Mongolian and Turkish have lent to, and borrowed from, each other, and Palaeo-Asiatic elements have enriched and varied the vocabularies of the Ural-altaic languages spoken in Asia. In Europe, Finnish, Lapp and Estonian have borrowed much from Germanic, Baltic and Slav languages, Hungarian from Ossetian, Slav tongues and German. The vocabularies of the Finno-Ugrian and Turkish languages spoken on Russian territory are rapidly becoming Russianized

Numerals.—The Ural-Altaic numeral system is decimal throughout. The names of the numbers in the different languages differ widely, because the primitive Ural-Altaic speech had not developed a proper numerical system before the dispersion.

CLASSIFICATION OF URAL-ALTAIC LANGUAGES

A. URALIAN LANGUAGES

Finno-Ugrian Languages (*q v.*) —1. Lapp: Southern Lapp, Ume-Lapp, Swedish-Lapp, Norwegian-Lapp, Enare-Lapp and Kola-Lapp. 2. Finnish: *Suomi* (of Finland), Karelian, Olonetsian, Ingrian, Ludik, Vepse, Wote, Estonian, Livian. 3. Mordvinian, Moksha, Erza. 4. Cheremiss. 5. Permian: Wotjak, Syryene. 6 Ugrian: Wogul, Ostyak, Hungarian (Magyar).

Samoyedic Languages.—Yurak, Tawgy, Yenisseian, Kamass (or Sayan Samoyedic), and Ostyak-Samoyedic.

B. ALTAIC LANGUAGES

Turkish Languages.—1. Turkish of Altai, Uzbeg, Kirghiz, Bashkir. Tatar: Azeri, Turkmen, Osmanli, etc. 2. Yakut. 3. Chuvash

Mongolian Languages.—1. Eastern Mongol (Khalkha, Tsakhar, etc.). 2 Western Mongol (Kalmuck). 3. Northern Mongol (Buriat).

Tungus Languages.—1. Eastern Tungus: Goldic, Olcha, Lamut, Orochene, etc. 2. Southern Tungus: Dahur, Solonic, etc 3 Western Tungus (Tungus of Vershoïansk, Yakutsk and of the Yenissei, etc.), Manchu.

Many sub-dialects are necessarily annulled, and this brief classification does not imply, so far as Altaic languages are concerned, any definite relationship. The relationships of these different tongues are, as yet, far from being elucidated.

BIBLIOGRAPHY —There are numerous publications on the Ural-Altaic languages. Apart from special works of interest only to scholars, may be mentioned· A Sauvageot, "Langues Finno-Ougriennes et Samoyèdes" in *Les Langues du Monde* (1923); J Deny (*ibid*) "Langues turk, mongoles, tongous"; Szinnyei, *Finnisch-ugrische Sprachwissenschaft*; J. Németh, *Türkische Grammatik*; P. W Schmidt, *Die Sprachstämme des Erdkreises*, E. N. Setälä (Tietosanakirja X, p. 244. Helsingfors). (*See* bibliographies under TURKISH LANGUAGE, HUNGARIAN, FINNISH, MONGOL.) (A. SAU.)

URAL MOUNTAINS, a mountain system which extends north to south, from the Arctic ocean to the Caspian sea and separates Europe from Asia. The Urals have been affected by a series of separate upheavals, some having a north to west strike and some a north to east They reach their maximum altitudes along a zone stretching nearly north and south. The composite nature of the Urals is best seen at the extremities of the system, where the upheavals form a distinct chain of mountains.

The Paē-khoy or coast ridge (Samoyedic "stony ridge") is independent of the Urals proper. It has a distinct north-north-west and north-west trend, and although cut through by the Yugor strait it is continued in Vaigach island and Novaya-Zemlya. Its

dome-shaped summits rise 1,000 ft.

The Obdorsk or Northern Urals begin near the head of Kara bay and extend south-west to the 64th parallel and form a distinct range, stony and craggy, sloping steeply towards the south-east and gently towards the marshes of European Russia Its highest peaks are Khard-yues, 3,715 ft., and Paë-yer, 4,752 ft. Sometimes the main chain has on the west two or three secondary chains, formed by sedimentary rocks, and the highest peaks of the Urals (Sablya, 5,402 ft., and Töll-poz-iz or Muraï-chakhl, 5,537 ft) occur in the south of one of these. Dense forests, chiefly fir, pine and larch, clothe the mountain slopes, but every species, except the larch, gradually disappears in the north, and the upper limit of vegetation (2,400 ft. in the south) rapidly descends to the base of the mountains near the Arctic Circle, and forest vegetation disappears about 65° N (67° in the plains).

The section between 64° and 61° N has again a wholly distinct character. Here the main water-parting is a succession of plateaus stretching in a north-westerly direction It has broad, flat, marshy valleys, whilst here and there are isolated summits, mostly under 3,000 ft (Yang-tump, 62° 43′ N, 4,170 ft). The whole region, except the mountain summits, is densely clothed with coniferous forests. This part of the range is uninhabited.

The Middle Urals, about 80 m. broad, contain rich iron, copper and gold mines (Bogoslovsk, Goroblagodatsk and Ekaterinburg Urals). The Denezhkin Kameñ in the north (4,841 ft) and the Tara-tash in the south (2,800 ft.) mark the limits of this section. Here the orographical structure is more complicated. In the north (61st to 60th parallel) there is a succession of chains with a distinct north-eastern trend South of Kachkanar (2,866 ft) the Urals assume the appearance of broad swellings 1,000 to 2,000 ft in height, deeply trenched by ravines. These low plateaus have been utilized for centuries as the chief highway to Siberia. The water-parting between the Russian and Siberian rivers is here not more than 1,245 ft. above sea-level on the great eastward road, west of Sverdlovsk (Ekaterinburg). The valleys have a decidedly south-eastern direction, as has the railway from Perm to Kurgan. The Middle Urals are densely forested. The valleys and lower slopes have a rich soil and contain large and wealthy villages. The mines also support a considerable population.

The Southern Urals (55° 30′ to 51° N) consist of three parallel chains running north-east and south-west and constitute an independent part of the Ural system. The Urals proper are a low sinuous chain hardly exceeding 2,200 to 2,800 ft. in altitude. Farther west there is a parallel chain which, although pierced by rivers, reaches 5,230 ft.; whilst farther west still is another series of equally high chains. The gentle slopes of the hilly tracts are dotted with woods, mostly of deciduous trees, while the hollows contain rich pasture grounds. The region is being colonized.

Farther south the main range, except when deeply trenched by the rivers, is a plateau which hardly reaches 1,500 feet. It is continued towards the Volga under the name of Obshchiy Syrt.

South of the great bend of the Ural river, quite independent ranges of hills, or flat swellings, appear (*e.g.*, Dzhaman-tau, Mugodzhar hills). A range of heights connects the Mugodzhar hills with the Ust-Urt plateau.

Geology.—The Ural mountains are no more than the western edge of a broad belt of folding of which the greater part is buried beneath the Tertiary deposits of western Siberia. Throughout the greater portion of the chain a broad strip of granites, diorites, peridotites, gneisses and other crystalline rocks rises directly from the Siberian plain, and is covered towards the west by Silurian, Devonian, Carboniferous, Permian and Triassic strata, which are thrown into numerous folds parallel to the length of the chain and usually rise to much greater heights than the crystalline zone. For the mineral wealth of the Urals *see* URALSK AREA.

URALSK, a town of Asiatic Russia, on the Ural river, where the railway crosses it. Pop. (1926) 35,994. Founded in 1775, it is a centre for grain and cattle from the Kirghiz steppe. There are seven flour mills and four leather and gut preparing works with iron and woollen industries; also a model farm, a museum, and branches of the Russian Geographical and of the Fisheries Societies.

URALSK AREA, an administrative division of Russia, lying partly in Europe, and partly in Asia, and which should not be confused with the former Uralsk province of pre-1917 Asiatic Russia, which is now included in the Kazakstan A.S S.R. (*q v*). It stretches southwards from the Arctic Ocean to the Kazakstan A S.S.R on the east, and the Tatar A S S R, Bashkiria and Orenburg province on the west. The Siberian area forms its eastern boundary, and to the west lie the autonomous Komi (Zirian) area, the Vyatka province and the Votyak autonomous area It occupies 1,692,810 sq km. and has a population of 6,791,875 (1926), 91·2% of whom are Russians, the remainder being chiefly Turco-Tatars, Finns, Poles, Jews, Lithuanians and Latvians. Most of the Ural range lies within its borders.

It reveals many aspects of the complex life of Russia, up-to-date electrified industry side by side with peasant mining and metal *artels*, a railway net in the south, trackless wastes in Tobolsk, rich corn-growing lands, meadow cattle pastures, sheep-grazing lands, nomad reindeer breeders, fishing, the hunting life of the coniferous and deciduous forest, and the bleak desert tundra of the Arctic shores. East of the Urals there are the winds from Asia; the rainfall varies between 8 to 16 in. east of the Urals to 20 in. west of them. Summer in the south is as hot as in Odessa, while winter is much more severe. Spring, especially in the south-east is very short. The rivers are frozen from 144 days in the south to 200 in the north. The north lies within the Arctic circle.

The economic life of the Uralsk region centres on the vast mineral wealth of the Urals. A wide zone of the western region of the Urals is covered with Permian deposits rich in copper, salt and salt springs.

Rivers and Lakes.—On the eastern foothills are a series of freshwater lakes formed in natural hollows and quite distinct in type and origin from the salt lakes of the Aralo-Caspian depression. The rivers on the west, the Kama, and its tributaries especially the Kolva, Vyshera, and Chusova, are of great importance, and link the region with the Volga, and by a canal system, with Leningrad. The eastern drainage links with the Ob (*q.v*) and the Arctic, and is therefore less valuable for navigation, especially as the stream beds are often interrupted by rapids; they are, however, sources of potential electric energy. Efforts are being made to establish trade via the Ob river and the north, and a trading expedition in 1928 visited the mouths of the Ob and Yenisei; the transport cost of wheat, fur and asbestos sent this way is less than half of that sent via Leningrad. But the difficulties are great and the season short. Better harbour facilities and a close net of wireless stations along the coast are necessary if the route is to develop. A commission is, however, considering the possibility of shortening the route by cutting a canal from the Ob to Kara bay, thus avoiding the journey round the Yalmal peninsula, and of extending the railway from the Tavda northwards to the Ob, or possibly to the canal itself. The sources of the Ural river (Yaik) and its tributaries the Sakmara, Or and Ilek, and of the Pechora and Usa in the north lie in the area.

Mining.—The beginning of salt, iron and copper exploitation was made in the 16th century by the brothers Stroganov, to whom the land was given by the Moscow government in 1558. Later Peter the Great founded several iron-works and after the discovery of gold in 1745, colonization proceeded rapidly. Until 1861 the work in the mines was carried on by serfs, either belonging to private persons (especially the Stroganovs and Demidovs) or to the Crown. Russia and Sweden, using charcoal, were formerly the chief iron producers, but when coal began to be used, especially in England, the market passed from them The Urals ceased to be the chief mining district in Russia, and the Donetz basin in the south took its place. Even after the revival of the Ural iron industry in 1898, when foreign capital (especially British) redeveloped and improved it, the ratio of iron production as between southern Russia and the Urals was 67:19. In the post-revolution period the region was in the centre of the disturbances and the Czech army and Kolchak's troops both held it temporarily. Much of the plant of the mines and metal works was destroyed, and the bridges, permanent way and rolling stock of the railways were damaged. This, combined with the revolution in the economic

régime brought industrial life almost to a standstill and many branches have not yet fully recovered, especially the copper industry (1928). Important changes have taken place in the industry in the period of re-organization. The freightage costs of fuel are heavy, the good coke of the Kuznetsk district is much better for smelting furnaces than the local coal, but its transport cost raises the price of metal and puts it at a disadvantage in the market. The timber for charcoal in the accessible regions is rapidly diminishing and the power problem became acute after 1921. It has been partly met by electrification, and within the period 1923–28, electric power has been supplied at Chelyabinsk, using brown coal, at Kizelovsk, at Sverdlovsk (Ekaterinburg), using peat fuel, and on the Chusov river, using water power; a further station is under construction at Egorshin, while the capacity of that at Chelyabinsk is being increased Naphtha has also been introduced as fuel and the rôle of timber and charcoal as a source of power compared with other sources diminished in the district from 70 30 in 1922–23 to 52 47 in 1924–25. The industry has also been helped by concentration, the smaller and less profitable undertakings having been closed down. It is still, however, bearing the burden of keeping mines in repair which cannot be opened for lack of capital and of restoring war damages, so that the full effect of the reconstruction is not yet felt.

Iron, chiefly magnetite, is found on the eastern Urals, especially on the Blagodak, Vycok and Magnitnaya hills, the iron ore of the Zlatoust district is of very high quality. The Alapaev mines in the Tagil district in which manganese is worked are productive and developing rapidly. Metal is worked in Nadezhdinsk on a large scale, at Chusovaya and Lysva, near Perm and at Zlatoust. Coal production has reached pre-war level The Kizelovsk mine produces the best quality and supplies the railway; anthracite is mined in Egorshin and along the Troitsk-Orsk railway. Brown coal, with a high calorific value, but much ash, is mined at Chelyabinsk and near Tagil Four of the mines have cheapened cost by using electricity. The coal passes over into graphite towards the north. The vast peat resources of the district are being exploited for electric power, especially at Sverdlovsk and Zlatoust. Copper of good quality is found associated with sulphur pyrites and malachites, and in some cases with gold, silver, zinc, selenium and tellurium. In pre-war times it was exported in quantity; capital, however, is needed for its restoration and at present (1928) the Kyshtym and Kalatinsk mines only are working, while the Pyshminsk-Klyuchev is being kept in repair. In view of its importance in the electrical industry, the copper industry will probably revive.

Gold was formerly an important product and there is a Government gold laboratory in Sverdlovsk. In pre-war times the annual output was 10·9 tons, but it is now declining and the east Siberian goldfields are taking its place on the market. It was mainly a peasant industry centring on Mias, near Zlatoust, Sverdlovsk and Troitsk. The gold obtained from the sands in the south-east is not valuable. Platinum from the Urals formed 90% of the world market supply in pre-war times; it was first exploited in 1824 and is found in the Tagil district. In 1926 the platinum produced was 92,700 troy ounces, as against 157,453 in 1913: the fall was mainly due to lack of dredgers, but these are gradually being replaced The salt works on the upper Kama are very ancient and produce about 18% of all the salt in Russia Rich deposits of potassium salts have recently been discovered extending from Solikamsk in 59° 38′ N., 56° 50′ E, to Usolsk, the terminus of a branch railway from Perm: it is estimated that much will be available for export in addition to that used in local agriculture, and cheap water transport to Rostov-on-Don or Leningrad is available. Superphosphates are produced near Sverdlovsk and the upper Kama, soda at the Beresnikov factory, chromium ore is worked at Shaitansk, and dynamite and nitrite at Kyshtym. Sulphuric acid from the by-product sulphur of the copper is also produced. Asbestos is worked at Alapaev and near Sverdlovsk, and the output of asbestos sheets, asbetite and other products is greater than in pre-war times, partly because the other asbestos mines in the U.S.S.R. are not yet re-started (1928). The Ural precious stones, especially emeralds, are famous and include chrysoberyl, topaz, beryl, tourmaline and amethyst.

Industries.—Of industrial enterprises, smelting and the making of machinery and metal goods occupy the first place. Of special importance is the supply of agricultural machinery to Asiatic Russia, where demand at present far exceeds supply. Sverdlovsk, Perm, Zlatoust, and the Tagil district are centres for heavy industry. Railway repair shops exist here and at other points on the line. There are china, glass, cement, brick and worked stone industries, and aluminium is made from local bauxite. The fine building material is little exploited owing to transport difficulties. Of industries for local needs, leather is prepared in Kungur, Tyumen and Sverdlovsk, and footwear is made at Sarapul; cloth and linen products though greater than in 1913, do not meet the demand Food products include flour, dairy produce, which is organized in about 1,000 co-operative *artels,* brandy, beer and meat preserves. Makhorka tobacco is made and matches in Perm and Tyumen, where there are also saw mills, and cardboard works In the Tagil district there is sawmilling, and a paper and cellulose industry. On the east of the Urals koustar or peasant industries are widely developed, and include small iron ware; every variety of wood product from pitch and tar preparation to furniture making; leather goods; saddlery; flour milling and the polishing of stone and marble

Agriculture.—Much of the Uralsk area consists of the vast tundra of the north and the Yalmal peninsula, and is unsuitable for agriculture Omitting this area, more than half of the remainder is covered with coniferous or deciduous forest. In the valleys of the foothills and on the eastern plain is rich black earth, merging into less favourable, but still fertile, chestnut-coloured soil. In these areas cultivation is densest, wheat, with oats second, forms the main crop in the Troitsk, Chelyabinsk, Shadrinsk, Kurgan and Ishim districts, oats, with wheat second, in Irbit, Sverdlovsk, Tyumen and Zlatoust, while rye is the main crop in Sarapul and Tobolsk, and oats in the Upper Kama, Perm, Tagil and Kungur. Cultivation thins out with height on the Ural plateau, and, in dependence on climate and soil conditions, almost disappears north of the Sverdlovsk-Omsk railway Its northern limit on the east lies roughly along 57° N, and is markedly further south than on the west of the Urals. Isolated patches of potato and vegetable cultivation lie to the north in the alluvial river soil

Camels are bred in the south-east steppe and reindeer north of lat. 52° N. Pigs are reared in the Irbit-Tobol-Tyumen districts Fishing is a supplementary industry in the Urals, but very important in the Ob and its tributaries Even the valuable fisheries of the Lower Ob are feeling the effects of destructive exploitation and there is great need for fishing *artels* and for the building of factories for salting and preserving The catch is mainly perch, ruff, silurus, carp, bream, roach, sturgeon, herring and nelma Hunting is important in the Perm and Upper Kama districts and in Irbit and Tobolsk.

The chief animals hunted are squirrel, hare, elk and deer and heath cock and grouse; others are fox, bear, wolf, marten, ermine, badger, seal, northern deer, and partridge, goose and duck. Hawk hunting is still practised in the steppe regions. Turgut, Obdorsk, Berezov, Tobolsk, Tyumen and Irbit are centres of collection. The latter was noted for its fur fair in February and March, but its importance is diminishing

Communications.—The Perm-Sverdlovsk-Tyumen line, linked from Sverdlovsk with the Tavda river, Chelyabinsk, Troitsk and Kurgan and with some other centres, is the only one. The link with Perm will be very valuable when the plan to link Kotlas with the Murman railway, and thus provide a winter outlet for the Ural products, is carried out. Though this southern net is a contrast to the absence of lines in much of the area, it is inadequate for the needs of an industrial region. Roads are poor and absent in many places, and the improvement of communications, here as elsewhere in Russia, is a problem facing industry. Sverdlovsk (*q.v.*) is the administrative centre, pop. (1926) 136,494; other towns (*q.v.*) are Perm 119,420, Zlatoust, Chelyabinsk and Tyumen, over 47,000, Kurgan, Sarapul, Tobolsk, Troitsk, Kungur, Irbit, Ishim and Shadrinsk.

Population.—Of Finnish tribes the Permyaks of the Kama river are closely related to the Komi (*q.v.*) and speak a language resembling theirs. The Voguls (Maniza) are most numerous in the valley of the Konda, but extend over the Urals and are found in Perm. They are dark, brachycephalic, with broad faces and flat features. Their main occupations are fishing and hunting. The Ugrian Ostyaks are dolichocephalic, short in stature and have some Mongolian features, perhaps due to intermixture with Tatars in the 16th and 17th centuries. Their language is akin to Hungarian. They fish, hunt, and gather cranberries and cedar-nuts. Some have become settled and have built earthen huts, and keep horses and cattle. Their standard of living is higher than that of many tribes, especially amongst the southern Ostyaks. The northern Ostyaks retain more of their ancient customs; they regard the bear with veneration, practice Shamanism and bury their dead in canoes, or leave them in the forest with a covering of skins. In the neighbourhood of Obdorsk are the Yuraks, a branch of the Samoyedes; who are mainly nomad reindeer breeders, with fishing and hunting as supplementary occupations The Samoyedes of the Yalmal peninsula are prosperous, and have large herds of reindeer. (R. M. F.)

See O. A. Konstantinov, *Uralsk Area* (1926), in Russian.

URANIUM (symbol U, atomic number 92, atomic weight 238·2). Pure uranium is a lustrous white metal although it may be obtained as a brown or black powder. The metal is malleable, softer than steel and slightly paramagnetic At 13°C it has a density of 18·685, and although its exact melting point is not known it is stated to be of the order of 1,850°C. Uranium exhibits marked chemical activity. It burns readily in oxygen at 170°C. and reacts vigorously with the halogens With nitrogen at 1,000°C a yellow nitride is formed whilst with carbon it yields a crystalline carbide, UC_2 Uranium is soluble in dilute hydrochloric and sulphuric acids with evolution of hydrogen, whilst with nitric acid a nitrate is formed Aqueous alkalis are apparently without action on the element So far as is known, uranium is the element of highest atomic weight and highest atomic number Its chief use at the present time is in the ceramic industry, the compounds usually employed being the sodium or ammonium diuranates and the green oxide U_3O_8. By varying the composition of the glaze and the firing conditions, colours such as yellow, orange, shades of brown and even dark green may be obtained. In the manufacture of glass, uranium compounds produce an opalescent yellow, green by reflected light. It is claimed that uranium will replace satisfactorily tungsten in high-speed steels. The uranium is added to the steel as an alloy, ferro-uranium, made by heating oxides of uranium and iron with coke in the electric furnace Uranium salts have been used in photography and are useful in the laboratory for volumetric determinations of phosphates and arsenates.

Prior to 1789 varying views were held as to the composition of the mineral pitchblende. In that year Klaproth advanced the opinion that the ore contained a new element definitely distinct from zinc, iron or tungsten, and by reduction of the mineral at a high temperature, isolated a metallic-looking product which he believed to be the new metal To this new substance he gave the name uranium in honour of Herschel's discovery of the planet Uranus in 1781. Not till 1841 was it discovered that the so-called element was in reality an oxide, now written as UO_2. Peligot prepared, in that year, a new chloride (now identified as UCl_4) of which the composition indicated that Klaproth's uranium was not an element, and in the next year, by reduction of the new chloride with potassium, Peligot isolated the element itself. Uranium is not widely distributed in nature but is found in a number of rare minerals. The two principal commercial ores are pitchblende and carnotite. Pitchblende or uranitite is an impure uranium oxide of the formula U_3O_8, in which the uranium may be considered to be present partly as UO_2 and partly as UO_3. The ore may contain 40–90% of U_3O_8 associated with such impurities as silica, thoria, the rare earths, and compounds of lead, iron, calcium, magnesium, manganese, bismuth, etc. Radium and helium are always present. Pitchblende is a dark bluish-black massive mineral, found in igneous rocks, and possessing a pitch-like lustre from which fact its name is derived. The most celebrated deposits are those of St. Joachimsthal in Austria where the mines have been worked since 1517. Other deposits are known in Cornwall, in the United States, Russia, Sweden and Norway. A high-grade uranium ore containing pitchblende is found at Katanga in the Belgian Congo. Carnotite, a canary-yellow mineral of secondary origin, occurs principally in sandstone deposits, especially in the United States. Other deposits are in South Australia and in Portugal Carnotite is essentially a complex vanadate of potassium and uranium of the approximate composition $K_2O{\cdot}2UO_3{\cdot}V_2O_5{\cdot}3H_2O$. Of the less important uranium ores, the yellow autunite, a hydrated phosphate of calcium and uranium, $Ca(UO_2)_2(PO_4)_2{\cdot}8H_2O$, is generally associated with pitchblende. Uranium occupies an important place in the history of scientific discovery. In 1896, Henri Becquerel exposed a photographic plate, wrapped in black paper to the action of the beautiful fluorescent salt, potassium uranyl sulphate, $K_2SO_4,UO_2SO_4,2H_2O$, and made the momentous observation that a distinct impression had been produced on the plate. Further experiments indicated that metallic uranium, all uranium salts and uranium minerals (especially pitchblende) gave rise to the same phenomenon. This epoch-making discovery, which initiated the study of radioactivity, was closely followed by the discovery of radium in pitchblende. Increasing knowledge of radioactive processes clearly showed that uranium was continuously undergoing atomic disintegration whereby products of less atomic weight were produced. Amongst these products was radium, and its presence in all uranium minerals was found to be a direct outcome of the degradation of uranium atoms Moreover, in uranium ores, where the conditions have been such that the radium has not been removed mechanically, it has been found $3{\cdot}4 \times 10^{-7}$ gram of radium is in equilibrium with one gram of uranium So well is this relationship established that in the sale of radium-bearing ores it is the common practice to estimate the radium, not by analysis, but by calculation from the determined uranium content

The value of radium in medicine has centred attention on radium-bearing ores, with the result that pitchblende and carnotite are treated, primarily, for their radium content, whilst the extraction of uranium is of secondary industrial importance. To extract uranium from pitchblende the broken-up ore may be treated with sulphuric acid, to which some nitric acid has been added, the concentrations being so adjusted that whereas the uranium goes completely into solution the radium remains behind quantitatively with the insoluble sulphates of barium, lead, calcium, etc. From the acid filtrate containing uranyl sulphate, UO_2SO_4, the uranium may be obtained as follows. Addition of excess of sodium carbonate solution precipitates iron, aluminium, etc, whilst the uranium forms a double carbonate soluble in the alkali carbonate solution The addition of sodium hydroxide precipitates the uranium as insoluble sodium diuranate $Na_2U_2O_7{\cdot}6H_2O$ in which form uranium comes on to the market and is sold by the trade as yellow oxide of uranium The extraction of uranium from carnotite is based on the same fundamental reactions as outlined above It must be noted, however, that many alternative methods of extraction are available The preparation of the pure element is a matter of difficulty. By reduction of U_3O_8 with carbon in the electric furnace, Moissan obtained a product always containing carbon, but Rideal obtained uranium as a powder containing 99·6% of the element by reduction of the oxide with magnesium From the reaction of uranous chloride, UCl_4, with sodium, potassium or calcium, uranium may be isolated. Electrolysis of an aqueous solution of a uranium salt does not produce uranium; instead, hydrogen is obtained at the cathode, often accompanied by a deposit of hydrated uranium oxides. By using a mercury cathode in an aqueous solution of uranium tetrachloride, uranium amalgam is said to be formed, from which by distillation *in vacuo* the mercury is volatilized, leaving pyrophoric uranium.

Elemental uranium exhibits a valency of either 2, 3, 4, 5, or 6 in its compounds, but the most stable derivatives are those containing sexavalent uranium. The oxide UO_3 exists in yellow and red modifications and has both basic and acidic properties. It dissolves in acids yielding green-yellow solutions from which *uranyl* salts, such as the nitrate, $UO_2(NO_3)_2{\cdot}6H_2O$, chloride,

$UO_2Cl_2 \cdot H_2O$, and sulphate, $UO_2SO_4 \cdot 3H_2O$, can be isolated. The only true normal salt of sexavalent uranium is the fluoride, UF_6. The addition of alkali hydroxides to uranyl salts produces insoluble diuranates such as $Na_2U_2O_7 \cdot 6H_2O$, $K_2U_2O_7 \cdot 3H_2O$. The highest chloride is UCl_6. Uranous compounds corresponding to the basic oxide UO_2 are usually green or blue but their solutions are unstable and revert in the air to the sexavalent state. Solid uranium salts when shaken, crushed, or rubbed, emit light, *i.e.*, they have the property of triboluminescence. This is readily observed in a darkened room. Moreover, uranyl salts in solution exhibit a brilliant greenish-yellow fluorescence, destroyed by ferric or uranous salts. In the presence of organic matter uranyl salts are decomposed by light, undergoing reduction to a lower-valency stage. This latter phenomenon is known as photolysis and has been widely investigated. Photolysis and fluorescence seem to be connected, for substances which destroy fluorescence accelerate photolysis.

(W. Wa.)

URANUS, Heaven, in Greek mythology, the husband of Gē, and father of Cronus (*q.v.*) and other deities (*see* Titans). As such he represents the generative power of the sky, which fructifies the earth with the warmth of the sun and the moisture of rain.

The Roman Caelus is simply a translation of the Greek *Οὐρανός* not the name of a distinct national divinity. In art, Uranus is shown as an old, bearded man holding a robe stretched out over his head in the form of an arch.

URANUS, in astronomy, the seventh major planet in the order of distance from the sun, and denoted by the symbol ♅. It was discovered by Sir William Herschel on March 13, 1781. He saw it as a round nebulous disc, slowly moving among the stars, and at first supposed it to be a comet, and announced it as such to the Royal Society. A few weeks' observation, however, showed it to be moving in a nearly circular orbit at a distance from the sun about nineteen times that of the earth. Its planetary character was thus established, and Herschel named it the Georgium Sidus in honour of his royal patron "The Georgian" was used in the *Nautical Almanac* up to 1850; but it was disliked outside England as was Herschel's name, proposed by Lalande The name Uranus was proposed by Bode

The mean distance of Uranus from the sun is 1,782,800,000 miles, and the time required for a revolution in its orbit just over 84 years. The diameter has been found to be about 30,900 miles, and, since observations of the satellites show its mass to be 14·6 times that of the earth, its density is very low: viz., 0·25 that of the earth, and 1·36 times that of water. The spectrum of the planet contains a number of strong absorption bands of as yet unknown origin, similar to those in the spectra of Jupiter, Saturn and Neptune. They are much more intense than those of Jupiter and Saturn, but less strong than those of Neptune. It is evident that Uranus is in the same physical state as the other planets of the outer group. Despite its distance from the sun Uranus, in consequence of its high albedo, shines as a star slightly brighter than the 6th magnitude. It is therefore, under favourable conditions, within the reach of naked eye vision. Indeed, long before its discovery by Herschel, Flamsteed had taken it for a star. Lemonnier during the opposition of 1768–69 observed it eight times, but did not detect its planetary character.

Its disc, which is of a pale sea-green colour, has a diameter of rather less than 4″, and measurements by several observers have shown it to be definitely elliptical. A white streak has also been recorded crossing the centre and some faint dusky bands or belts have been noted, but it has not been possible to determine the period of its rotation in the usual way by observation of definite surface features Spectroscopic observations, based on the Doppler principle (*see* Light), by the late Professor Lowell and Dr. Slipher in 1912, however, indicated a rotation period of $10^h\ 45^m$, and photometric observations by Leon Campbell at Harvard have revealed variations of brightness, which might well be due to an outbreak of spots combined with axial rotation, in excellent accord with this value.

Satellites of Uranus.—In Jan. 1787 Herschel detected two satellites of Uranus of which the inner one, now known as Titania, had a period of 9 days, the outer, Oberon, of 13½ days. He also on other occasions saw what he supposed to be two additional satellites, but these objects could not have been of this character. In 1851–52 William Lassell at Malta, in conjunction with his assistant A. Marth, observed two satellites yet nearer the planet than those of Herschel. These are now known as Ariel and Umbriel. Their periodic times are about 2½ and 4 days respectively. Lassell's telescopes, which were reflectors, were superior in light-power to others of his time, and these inner satellites were not seen by other astronomers for more than twenty years after their discovery. Indeed, doubts of their reality were only resolved in 1873, when they were observed with the Washington 26-in. telescope.

The most remarkable feature about these satellites is the very high inclination of their orbit planes. This amounts to 98° to the plane of the planet's orbit, and 97·8° to the ecliptic, so that the motion of the satellites is really retrograde. The result of the high inclination is that, as Uranus revolves in its orbit, there are two opposite points at which the planes are presented edgewise to view, and the satellites will be seen to travel nearly north and south in the telescopic field. At intermediate points their orbits will appear circular. The former appearance last occurred in 1924, and the latter will next be seen in 1945

The Satellites of Uranus

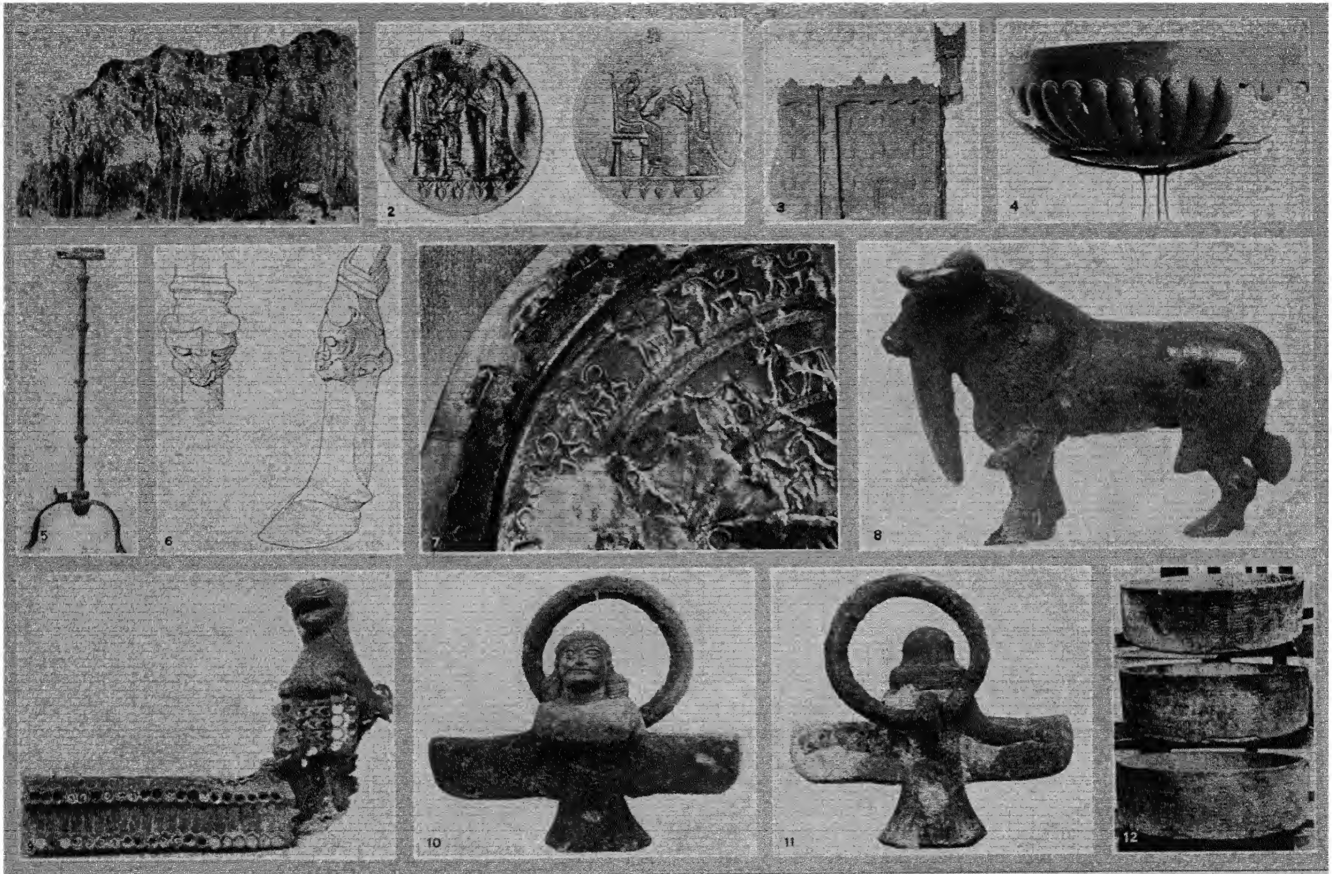
Satellite	Distance from Uranus in miles	Sidereal period	Stellar magnitude
		d. h m. s.	
i Ariel .	119,100	2 12 29 20·8	16
ii Umbriel	165,900	4 3 27 36·7	16–17
iii Titania .	272,200	8 16 56 26·7	14
iv. Oberon . .	364,000	13 11 7 3·5	13

For the irregularity in the motion of Uranus which led to the discovery of Neptune, *see* Neptune.

URARṬU, the Assyrian name for the country called later on Armenia and for its inhabitants. It is identical with the country of Ararat, on one of whose mountains Noah's ark stopped, according to Genesis, the name survives in the Armenian province of Ararat and has been transferred to Mount Ararat south of the river Araxes. Herodotus's Alarodoi are the Urarṭaeans who after the immigration of the Armenians (after 600 B C) retained or formed a distinct nation in the valley of the Araxes. The inhabitants of Urarṭu, however, in their cuneiform inscriptions call themselves *Chaldini* (plural).

The writing of the cuneiform inscriptions of the Urarṭaeans was taken from the Assyrians; but whereas Assyrian is a Semitic language, Urarṭaean is neither Semitic nor Indo-European The Urarṭaeans or Chaldians must have immigrated from the west into what was then to a greater part called Naïri Apparently Sardur I., son of Lutipris, who built a fort to the west of the rock of Van, out of huge stones brought from afar, united the "Naïri-countries" under his rule after a long war against the Assyrians about the time of Assurnaṣirabal II., the father of Shalmaneser III. This kingdom of Naïri was replaced by the kingdom of Urarṭu-Chaldia. Aram, who was the king of Urarṭu, was fought by Shalmaneser III. (859–824 B.C.), and so was his successor Sardur (Seduri II.), father of King Ispuinis who chose the rock of Van for his residence and as the holy seat of the god Chaldis. Ispuinis was the contemporary of Adadnirari IV. of Assyria—son of Shalmaneser III. and husband of Queen Shammuramat, *i.e.*, the historical Semiramis—whom he fought successfully, these successes enabling him to found a Chaldian colony at Muṣaṣir, west of the pass of Kelishina. A bilingual Chaldian and Assyrian inscription was erected by Ispuinis upon this occasion.

Menuas, his son, was the mightiest and most successful of the Chaldian rulers. His greatest work is the aqueduct (the so-called Shamiram-su "river of Semiramis") more than 75 km. in length, irrigating the plain of Van to this day and bringing drinkable water to the eastern borders of Lake Van (whose water is undrinkable), thus enabling him to found a "Menuas-city." Menuas was succeeded by Argistis I., a son, who left records of 14 years of his reign and his successful wars, on the outer walls of the set of chambers hewn into the solid rock of Van. His son Sardur



REMAINS OF URARTU CIVILIZATION

1. Rock of Van Kalah showing dwellings and staircases, the former probably built during the fourteenth year of the reign of Argistis I.
2. Gold medal showing goddess and female worshiper; excavated near Van in 1899 (left, photograph; right, engraving)
3. Bronze model of wall with gate and tower
4. Bronze vessel inscribed with unknown signs
5. Candelabrum excavated in 1899 at Toprak Kalah, near Van
6. Detail of foot, zoomorphic juncture. Bull's foot coming out of lion's mouth
7. Sacred shield adorning wall of Temple at Toprak Kalah with inscription of Rusas III.
8. Bronze bison; one of three chief races of big cattle living in Babylonia in the oldest times
9. Mythical animal (Tiamat); holes partly filled with ornamental glass
10. Bronze vase handle in form of winged disc of the sun with goddess (front side)
11. Reverse side of bronze vase in fig. 10
12. Stone vessel of King Ispuinis, founder of the fortress on the Rock of Van. (Three views)

III., contemporary of Assurnirari (755–745 B.C.) and of Tiglath-pileser III. (745–727) of Assyria, was defeated by the latter, who destroyed the Menuas-city (735 B.C.).

Rusas I. (714 B.C.), son of a Sardur, belonging to a side-line of the dynasty, removed the capital to a hill called Toprakkalah nowadays, after digging an artificial lake, the outflow of which irrigated the side of the hill and the plain where he founded the Rusas-city. All this he recorded in a *stela* set up only a few years after the traditional date of the founding of Rome (754 B.C.). It was taken (1898–99) to the Berlin museum. Rusas I. was a most energetic enemy of Sargon II. of Assyria (722–705 B C.) against whom he summoned a coalition of the states of Western Asia, of which Mardukabaliddin of Babylonia (the Merodach-Baladan of the Bible) probably was one In a bilingual *stela* erected over against the capital of Muṣaṣir, which had developed into a sort of independent buffer-state, Rusas commemorated his feats against Assyria in re-establishing Chaldian sovereignty and the petty king Urzana in Muṣaṣir

But in 714 the Cimmerians, breaking into the north of Urarṭu through the passes of the Caucasus, drove Rusas to suicide Sargon had made a raid into Urarṭu and on his return had conquered Muṣaṣir, robbing its temple and overthrowing and mutilating Rusas I.'s *stela*, which, however was later on re-erected, evidently by Rusas II., the grandson of Rusas I who once more restored the power of Chaldia Rusas II used Cimmerian mercenaries in his combats with Esarhaddon of Assyria (680–668 B C.) and succeeded in getting rid of the bulk of the Cimmerians who went on to the west of Asia Minor Rusas III, son of Erimenas, finished the temple of Chaldis on Toprakkalah Sargon's sculpture of the temple of Muṣaṣir shows its front adorned with ornamented shields, a custom which the Chaldians had in common with the Cretans of Minoan times. Such shields, with inscriptions chiefly of Rusas III., were excavated in Toprakkalah. Their circular friezes are divided into semicircles upon which the animals are going in different directions so as to prevent any one appearing to stand on its head (fig 7), a peculiarity only recurring on Cretan shields of the archaic period The royal residence at Toprakkalah and the temple of Chaldis were evidently destroyed under Rusas III. The Medes must have overrun Urartu before they crossed arms with the Lydians on the Halys (May 28, 585 B.C.).

The pottery excavated at Toprakkalah, apart from other peculiar features, partly shows in red, and sometimes in black, a glazed surface which is practically equal to "bucchero." The gold medal (fig 2) showing a goddess of fertility and her female adorer in beaten work, has peculiarities which have left their mark in archaic Greek, especially Ionic art A candelabrum (fig. 5) and parts of a throne with a baldachin show a wreath of falling leaves the latter in exactly the shape in which it (the forerunner of the *kymation*) appears on the eldest Ionian or pre-Ionian capitals. The legs of the above mentioned candelabrum (fig. 8) and of another one preserved in Erlangen show the "zoomorphic juncture," one member of an animal coming forth out of the mouth of the same or another animal: this feature being entirely restricted to the art of the Chaldians and of the Etruscans. The bronze vessel from Toprakkalah (fig. 2) with vertical rims has innumerable parallels in Etruscan tombs. The way the Chaldians built their walls and towers is illustrated by a model found at Toprakkalah (fig. 3). A very striking likeness of the bison, one of the three chief races of big cattle living in Babylonia in the oldest times, in bronze stressing the beard as its special feature (fig. 6) shows its existence in ancient Armenia in the first millennium B.C. The attaches or handle figures of big bronze vessels in the form of a female divinity in the winged disc of the sun (fig. 10) are a Chaldian speciality, recurring in archaic Greek and in Etruscan art. The bronze snake, probably Tiamat, the animal of the Chaos, shows, as do numerous other pieces, a combination of different materials, the holes, for example, being partly filled with coloured glass.

The Chaldians must have come from more western parts of Asia Minor where they were in touch with elements of Minoan culture; their culture is principally western with only minor traces of Assyrian influence; they influenced archaic Greek art in their turn, and had peculiar relations to the Etruscans which were probably based on a former relatively close proximity. When the Armenians invaded Urarṭu, the Chaldians withdrew into the mountains keeping up their warlike spirit and their metallurgic accomplishments. They were also called Chalybes, probably from the name of the steel which they were the first to produce The region south of Trebizond was one of the last resorts of the Chaldians The Byzantine *thema* of this region was called Chaldia and an archbishopric of the Greek church about Gumushchana is called Chaldia to the present day

URBAN (Urbanus), the name of eight popes

ST. URBAN, first pope of that name, was bishop of Rome from 222 to 230. Preceded by Calixtus, he was followed by Pontianus

URBAN II. (Odo or Otho or Eudes de Lagary), pope from March 12, 1088, to July 29, 1099, was born near Reims, became archdeacon of Auxerre, and later joined the congregation of Cluny, when he became sub-prior. He was created cardinal-bishop of Ostia in 1078 by Gregory VII., to whom he displayed such loyalty, especially as papal legate in Germany (1084), that he was imprisoned for a time by Henry IV. He was designated by Gregory as one of four men most worthy to succeed him, and, after a vacancy of more than five months following the decease of Victor III, he was elected pope on March 12, 1088, by an assembly of cardinals and others at Terracina Throughout the major part of his pontificate he had to reckon with the presence of the powerful antipope Clement III. (Guibert of Ravenna) in Rome He maintained an alliance with the Norman Duke Roger, Robert Guiscard's son and successor, and united the German with the Italian opposition to the emperor by promoting the marriage of the Countess Matilda with young Welf of Bavaria He aided Prince Conrad in his rebellion against his father and crowned him king of the Romans at Milan in 1093. By excommunicating Philip I. of France for matrimonial infidelity in 1095, Urban opened a struggle which was not terminated until after his death. Invited to Tuscany by the Countess Matilda, he convoked a council at Piacenza in March 1095, attended by so vast a number of prelates and laymen that its sessions were held in the open air, and addressed by ambassadors of Alexis, the Byzantine emperor, who sought aid against the Mussulmans. Urban crossed the Alps in the summer, and remained over a year in France and Burgundy. He held a largely attended council at Clermont in November 1095, where he preached the First Crusade. His sermon is printed in J. R. Watterich, *Pontif. Roman. Vitae* Crusaders on their way through Italy drove the antipope Clement III. finally from Rome in 1097, and established Urban firmly in the papal see With a view to facilitating the crusade, a council was held at Bari in October 1098, at which religious differences were debated and the exiled Anselm of Canterbury combated the Eastern view of the Procession of the Holy Ghost. Urban died suddenly at Rome on July 29, 1099, fourteen days after the capture of Jerusalem, but before the tidings of that event had reached Italy. His successor was Paschal II.

See authorities quoted under PAPACY; also M. F. Stern, *Zur Biographie des Papstes Urbans II* (Berlin, 1883); A. de Brimont, *Un Pape au moyen âge—Urbain II.* (Paris, 1862).

URBAN III. (Uberto Crivelli), pope from Nov. 25, 1185, to Oct. 20, 1187, was a Milanese, and had been made cardinal-priest of St. Lorenzo in Damaso and archbishop of Milan by Lucius III., whom he succeeded. He continued vigorously his predecessor's quarrels with the emperor, including the standing dispute about the territories of the Countess Matilda. His opposition to the pretensions of the Roman senate to govern the Papal States, moreover, compelled him to remain in exile through his pontificate. He suspended the patriarch of Aquileia for crowning the emperor's son, Henry, king of Italy (January 1186), in violation of his own rights as archbishop of Milan, and only the entreaties of

the citizens of Verona, where he was stopping, prevented him from excommunicating Frederick. In 1187 he exhorted the Christian kings to renewed endeavours in the Holy Land, and the fall of Jerusalem (Oct. 2) is said to have caused his death. He died at Ferrara and was succeeded by Gregory VIII. His letters are in J. P Migne, *Patrol Lat*, vol. 202.

URBAN IV. (Jacques Pantaléon), pope from Aug. 29, 1261, to Oct. 2, 1264, was the son of a shoemaker of Troyes. Having received a monastic education, he became archdeacon of Liége and papal legate of Innocent IV to Poland and Prussia; he was consecrated bishop of Verdun in 1253, and two years later was translated to the patriarchate of Jerusalem He was on a visit to Italy when he was elected to succeed Alexander IV. in the Holy See. He spent most of his pontificate at Orvieto Under him began that preponderance of the French in the curia which later led to the papal residence at Avignon, and indirectly to the Great Schism. In 1264 he instituted the festival of Corpus Christi. He favoured the claim of Charles of Anjou to the crown of the Two Sicilies Urban died before the arrival of Charles of Anjou, and was succeeded by Clement IV.

The registers of Urban IV. have been published by L. Dorez and J. Guiraud in the *Bibliothèque des écoles françaises d'Athènes et de Rome* (Paris, 1892)

URBAN V. (Guillaume Grimoard or Grimaud de Beauvoir), pope from Oct 28, 1362, to Dec 19, 1370, was born in 1309 near Lozère in Languedoc, and entered the Benedictine priory of Chiriac. He held many preferments, and was returning from a mission as papal legate to Italy, when he heard that he had been chosen to succeed Innocent VI He was consecrated at Avignon Nov. 6, 1362 Urban witnessed the completion of the work of tranquillizing Italy under the able Cardinal Albornoz, and in 1364, in the interests of peace, made heavy concessions to Bernabo Visconti Moved by Peter of Lusignan, king of Cyprus, and by the celebrated Carmelite Peter Thomas, who had come to Avignon in February 1363, the pope proclaimed another crusade, which found some echo in France and resulted in the temporary occupation of Alexandria (1365) Urban, yielding to the entreaties of the Emperor Charles IV and of Petrarch, left Avignon on April 30, 1367, despite the opposition of the French cardinals, and made his entry into Rome on Oct 16. The following year he was visited by Charles IV, and crowned the Empress Elizabeth (Nov. 1), and in 1369 he received the Greek emperor, John Palaeologus. Urban sanctioned the order of Jesuates and founded the medical school at Montpellier He at length announced his intention of returning to France, avowedly to settle trouble between France and England. He arrived at Avignon on Sept. 24, 1370, died on Dec 19. Urban was serious and humble, opposed to all nepotism, simony and secular pomp He was himself of blameless morality and reformed many abuses in the curia He was honoured as a saint immediately after his death, and beatified by Pius IX in 1870 Urban's successor was Gregory XI

See H J Tomaseth, "Die Register u Secretare Urbans V u. Gregors XI" in *Mitteilungen des Instituts für osterreichische Geschichtsforschung* (1898).

URBAN VI. (Bartolommeo Prignano), pope from April 8, 1378, to Oct. 15, 1389, was born at Naples in 1318 He was made bishop of Acerenza in 1364, and in 1377 was translated to the archiepiscopal see of Bari and placed in charge of the papal chancery. On the death of Gregory XI., who had finally returned to Rome from Avignon, he was elected pope Urban VI. turned his attention at once to the reformation of the higher clergy, and, in spite of the warnings of Catherine of Siena, so angered the cardinals by his harsh and ill-tempered measures that they assembled at Anagni in July 1378, and revoked his election, in which they declared they had acted under fear of violence On Sept. 20, they elected at Fondi the Cardinal Robert of Geneva, who called himself Clement VII and took up his residence at Avignon. Urban, on the other hand, remained at Rome, where he appointed twenty-six new cardinals and excommunicated Clement and his adherents. Thus began the Great Schism which divided the Western Church for about fifty years Urban deposed Joanna of Naples (April 21, 1380) for adhering to France and Savoy in support of the antipope, and gave her kingdom to Charles of Durazzo. Charles was crowned at Rome on June 1, 1381, but three years later quarrelled with the pope and shut him up in Nocera Urban escaped to Genoa, where he put several of his cardinals to death for suspected disloyalty. On the death of Charles he set out with an army apparently to seize Naples for his nephew. To raise funds he proclaimed, by bull of April 11, 1389, a jubilee for every thirty-three years, but before the celebration could be held he died of injuries caused by a fall from his mule.

The chief sources for the life of Urban VI. are in Baluzius, *Vitae Pap. Avenion.* (Paris, 1693); *Theoderici de Nyem De schismate Libri tres*, ed by G. Erler (Leipzig, 1890), Sauerlande, "Actenstücke zur Gesch des Papstes Urban VI," in *Hist Jahrbuch der Görres-Gesellschaft*, xiv (1893); "Acta Urbani VI et Bonifatii IX," ed C Krofta, in *Monumenta vaticana res gestas Bohemicas illustrantia* (Prague, 1905); *Der Liber Cancellariae Apostolicae vom Jahre 1380*, ed. by G. Erler (Leipzig, 1888); *Il Trattato di S. Vincenzo Ferrer intorno al grande schisma d'Occidente*, ed by A Sorbelli (Bologna, 1906). *See* also W St C Baddeley, *Charles III of Naples and Urban VI* (1894); J. B. Christophe, *Histoire de la papauté pendant le XIVe siècle*, vol. 3 (Paris, 1853)

URBAN VII. (Giovanni Battista Castagna), successor of Sixtus V, was born on Aug. 4, 1521 He became governor of Bologna, archbishop of Rossano, and was long nuncio to Spain. Gregory XIII made him a cardinal, 1583; and in 1590 he was elected pope by the Spanish faction, but died twelve days later, on Sept. 27, 1590. and was succeeded by Gregory XIV

See Ciaconius, *Vitae et res gestae summorum Pontiff Rom.* (Rome, 1601–02), Cicarella, continuator of Platina, *De vitis Pontiff Rom.* (both contemporary; the latter prolix and tedious); Arrigho, *Vita Urbani VII* (Bologna, 1614); and Ranke, *Popes* (Eng. trans, Austin), ii 227.

URBAN VIII (Maffeo Barberini), pope from 1623 to 1644, was born in 1568, of a wealthy Florentine family He early entered the prelacy, became prefect of Spoleto, twice nuncio to France, cardinal (1606), and finally, on Aug. 6, 1623, succeeded Gregory XV. as pope. Urban accepted the papacy chiefly as a temporal principality, and made it his first care to provide for its defence and to render it formidable He built Castelfranco on the northern frontier; fortified the port of Civita Vecchia; and strengthened the Castel Sant' Angelo, equipping it with cannon made from the bronze of the Pantheon, an act of vandalism which the Romans punished by the epigram, "Quod non fecerunt barbari, fecerunt Barberini" He also established an arsenal and a factory of arms But the only territory gained during Urban's pontificate, the duchy of Urbino, the last addition to the papal states, was acquired by reversion (1631); and in his one war, with the duke of Parma, for the district of Castro, he met defeat and humiliation (1644) The Thirty Years' War Urban professed to regard as waged for political, not for religious, ends He therefore threw in his lot with France, supported the duke of Nevers in the Mantuan Succession, and, under stress of fear of Habsburg supremacy, suffered himself to be drawn into closer relations with the Protestants than beseemed his office.

Urban was the last pope to practise nepotism on a grand scale. He failed to found a princely house; but he enriched his family to an extent that astonished even the Romans. Urban bore a hand in the condemnation of Galileo. He acknowledged the genius of the astronomer, and had not approved of the action of the Inquisition in 1616; but subsequently, believing himself to have been caricatured in the *Dialogo*, he permitted the Inquisition to have its way and to compel an abjuration (1633). Urban also denounced the doctrines of Jansen, 1644. (*See* JANSENISM.) He promulgated the famous bull *In Coena Domini* in its final form, 1627; published the latest revision of the Breviary, 1631; founded the College of the Propaganda for the education of missionaries, 1627; and accorded the title of "eminence" to the cardinals, 1630. Urban did much to embellish the city. Conspicuous among his works are the Barberini Palace, the College of the Propaganda, the Fountain of the Triton, and the baldachin of St. Peter's. His hymns and poems, which have frequently been published, are evidence of his literary taste and ability. Urban died on July 29, 1644, and was succeeded by Innocent X.

For contemporary accounts of Urban *see:* Tommasucci, in Platina, *De vitis Pontiff. Rom.;* Oldoin, continuator of Ciaconius, *Vitae et res gestae summorum Pontiff. Rom.;* and Simonin, *Gesta Urbani* (Antwerp,

TABLE I. *Population of the United States in Urban and Rural Groups 1900–20*

Class of places	1920 Number of places	1920 Population	1910 Number of places	1910 Population	1900 Number of places	1900 Population	Percentage of total population 1920	1910	1900

1637). A rich collection of materials was made by Andrea Niccoletti, *Della vita di Papa Urbano VIII e storia del suo pontificato*, never published, but extensively used by Ranke and others *See* also Gregorovius, *Urban VIII im Widerspruch zu Spanien u dem Kaiser* (Stuttgart, 1879), and Weech, *Urban VIII* (London, 1905).

URBANA, a city of eastern Illinois, U S A Population 10,244 in 1920 (94% native white) Urbana and the adjoining city of Champaign (*q v*) are separately incorporated, but otherwise form practically one community. Urbana is the seat of the University of Illinois (*q v*)

URBANA, a city of Ohio, U S A, the county seat of Champaign county. Pop (1920) 7,621 (87% native white); 1928 local estimate 8,500 It is the seat of Urbana university (Swedenborgian), a junior college founded in 1850

Urbana was founded in 1797 by Col William Ward, of Greenbriar, Virginia, who owned the land and gave many lots to the county on condition that the proceeds from their sale should be used for public improvements The village was incorporated in 1805 and was chartered as a city in 1867

URBANIZATION. The growth of cities has characterized the increase in the population of all countries. This urban tendency which has affected the whole social order of the modern world, continued almost unbroken until the World War Since then, in the inevitable redistribution of population consequent upon a slowing down of industry, there has been a suggestion of a decrease in the movement both in Europe and America

Distribution of Population.—The extraordinary changes in population resulting from economic conditions have been statistically measured in the United States (*see* Table I), but in Europe enumerations have been detailed and systematic only in Great Britain and France. According to the most recent (available) censuses covering Europe (ranging from 1912–25) there were in that continent, exclusive of Russia (U S S R), 449 cities having more than 50,000 inhabitants, representing approximately 23% of the total population. In the United States the corresponding percentage was 31.

Most of the principal countries have taken a census of population since 1920, but the methods followed in determining the size of the places to be considered as urban communities were not uniform. The population reported for the urban places was that residing within the city limits, but in some cases the city limits give only an inadequate idea of the population grouped about the urban centre. In large cities there are suburban districts outside the city limits, which, from many standpoints, form part of the city. Many of the residents have their business or employment in the city and, to some extent, persons living in the city are employed in the suburbs

The population of the world in 1926 was placed at 1,800 millions, this figure including estimates for the considerable portion of the total who live in countries not taking censuses. The countries which distinguish between urban and rural areas had an aggregate population of 782,319,328 and included under the urban classification 248,426,233 persons, or 31 8% of the total The data for these countries are presented in Table II These figures omit many cities of Asiatic countries, of southern Europe and Russia, for which statistics are not available

United States.—As defined by the census, urban territory includes all incorporated places of 2 500 inhabitants or more, and in three New England States, all towns (townships) of that size; all other territory is classed as rural The urbanization of the population has been notable for the increase in the large cities. There are four cities in the United States, including Detroit, that have a population of more than a million. China, Germany, Great Britain, Japan, India and Russia, each, have two cities of this class, and Argentina, Austria, Brazil, France and Turkey, each, have one city with more than a million inhabitants In the United States there were only six cities in 1790 that had 8,000 or more inhabitants, and their population amounted to 131,472, forming 3 3% of the total population At the census of 1920 there were 924 cities in this class, and they had 46 307,640 inhabitants, or 43 8% of the total The census of 1920 was the first to show that more than half (51·4%) of the inhabitants resided in places having a population of 2,500 or more, the proportion having increased from 28 6% in 1880

In many instances the population of the cities has been increased by the annexation of territory and the extension of the municipal boundaries so as to include suburbs (W M St)

URBINO, a city of the Marches (*Urvinum Metaurense*), Italy. Pop (1921) 6,212, town, 19,932, commune It is picturesquely situated on an abrupt hill 1,480 ft. above sea-level; its streets are narrow and crooked, and the town has a mediaeval aspect It is dominated by the ducal palace erected by Luciano di Laurana, a Dalmatian architect, in 1465–82, for Federigo Montefeltro (well represented in a picture by Justus of Ghent in the gallery), and regarded by the contemporaries of the founder as the ideal of a princely residence The monumental staircase, sculptured doorways, chimneys and friezes of the interior are especially fine Some are by Domenico Rosselli of Florence. The rich intarsia work of the Duke's study is by Baccio Pontelli.

In the cathedral there is a Pietà in marble by Giovanni da Bologna Opposite the palace is the church of S Domenico, a Gothic building with a good early Renaissance portal and a relief in the lunette by Luca della Robbia (1449) S Francesco has a fine 14th century portico and campanile, and a handsome portal of a chapel in the interior by Constantino Trappola (15th century). S. Bernardino, outside the town, is a plain early Renaissance structure. On the walls of the chapel of San Giovanni Battista are frescoes by Lorenzo and Giacomo Salimbeni da San Severino (1416). The modest house where Raphael was born and spent his boyhood forms a museum of engravings and other records of Raphael's works. A monument was erected to him in the piazza in 1897. The theatre, decorated by Girolamo Genga, is one of the earliest in Italy; in it was performed the first Italian

TABLE II. *Total and Urban Population of Selected Countries*
(This list comprises only countries which at recent censuses have classified their populations as urban and rural)

Country	Census date	Population			Basis of urban classification
		Aggregate	Urban		
			Number	Per cent	
Europe					
United Kingdom					
England and Wales	1921	37,886,699	30,035,417	79·3	1,154 urban districts
Scotland	1921	4,882,497	3,771,762	77·3	Places having 1,000 inhabitants or more
Ireland	1911	4,390,219	1,470,595	33·5	Civic areas having 2,000 inhabitants or more.
Belgium	1920	7,402,276*	4,224,225	57·1	Places having 5,000 inhabitants or more
Czechoslovakia	1921	13,595,816	5,884,576	43·3	Places having 2,000 inhabitants or more.
Denmark	1921	3,267,813	1,418,551	43·4	Cities and villages.
Finland	1920	3,364,807	543,046	16·1	Towns.
France	1921	39,209,518	18,205,492	46·4	Places having 2,000 inhabitants or more.
Germany	1925	62,410,619†	40,191,588	64·4	Places having 2,000 inhabitants or more.
Netherlands, The	1920	6,865,314	6,327,928	92·2	Places having 2,000 inhabitants or more (not defined as urban).
Norway	1920	2,649,775	785,404	29·6	Towns.
Portugal	1920	6,032,991	1,050,500	17·4	Cities having 2,000 inhabitants or more (not defined as urban).
Yugoslavia	1921	12,017,323	7,804,506	64·9	Places having 2,000 inhabitants or more (not defined as urban)
Sweden	1920	5,904,489	1,813,422	30·7	Thickly populated area, not absolutely defined
Ukraine	1923	29,020,304**	5,087,595	19·9	Only places having 500 inhabitants or more enumerated.
America

comedy, the *Calandria* of Cardinal Bibbiena, the friend of Leo X. and Raphael The magnificent library formed by the Montefeltro and Della Rovere dukes was incorporated in the Vatican library in 1657. There is a free university founded in 1506

The ancient town of *Urvinum Metaurense* takes its name from the river Metaurus The walls can be traced. It was important in the Gothic wars, and is mentioned by Procopius. About the end of the 12th century Urbino came under the rule of the family of Montefeltro, and especially of Federigo da Montefeltro, lord of Urbino from 1444 to 1482, who was an unusually enthusiastic patron of art and literature.

Federigo da Montefeltro much strengthened his position by his own marriage with Battista Sforza, and by marrying his daughter to Giovanni della Rovere, the favourite nephew of Pope Sixtus IV., who conferred upon Federigo the title of duke. Federigo's only son Guidobaldo, who succeeded his father, married in 1489 the gifted Elizabeth Gonzaga, of Mantua. Guidobaldo in 1508 bequeathed his coronet to Francesco Maria della Rovere, nephew of Julius II. In 1626 the last descendant of Francesco, Francesco Maria II., abdicated in favour of Pope Urban VIII, and Urbino, with its subject towns, which included Pesaro, Fano, Fossombrone, Gubbio, Castel Durante and Cagli together with outlying small villages, about 300 in number, became incorporated in the domain of the Papal States.

During the reigns of Federigo and Guidobaldo, Urbino was one of the foremost centres of activity in art and literature in

Italy. Here Piero della Francesca wrote his celebrated work on the science of perspective, Francesco di Giorgio Martini his *Trattato d' architettura* and Giovanni Santi his poetical account of the chief artists of his time.

Throughout the 16th century the state of Urbino manufactured majolica, especially at Gubbio and Castel Durante Most of the finest pieces were made for the dukes Famous citizens include the Ferrarese painter and friend of Raphael, Timoteo della Vite, and Bramante (*q v.*) This city was also the birthplace of Pope Clement XI, of several cardinals of the Albani family, and of Raffaelle Fabretti, and other scholars.

See E. Calzini, *Urbino e i suoi monumenti* (1897); G. Lipparini, *Urbino* (Bergamo, 1903).

URDU, the name of that variety of Hindustani which borrows a great part of its vocabulary from Persian and Arabic, as contrasted with "Hindi," the variety which eschews such words, but borrows from Sanskrit instead It is spoken by Muslims and those Hindus who have come under Muslim influence, and has a considerable literature *See* HINDUSTANI and HINDUSTANI LITERATURE

UREA or **CARBAMIDE,** a colourless crystalline substance known for about 150 years as a constituent of urine. It results from the oxidation of certain nitrogenous materials—proteins (*q v*)—in the animal organism and is not only present in the urine of higher animals (mammals) but also in their blood, bile, milk, perspiration and other body fluids. Moreover, it has been recognised in many lower forms of animal life—coelenterates, echinoderms, insects, worms, crustaceans, molluscs and fish, and has been identified in certain plants and in fungi and moulds, in the leaves of endive, potato, spinach, carrot and turnip, and in the seedlings of cereals and leguminates Human urine contains 2 to 5% of urea which is excreted by an adult man to the extent of about 30 grams (one ounce) daily.

In 1773 H M Rouelle obtained, by alcoholic extraction of the solid residue from evaporated urine, an alkaline nitrogenous substance which on bacterial fermentation yielded carbonic acid and ammonia Subsequently A F Fourcroy and Vauquelin (1798) prepared urea nitrate from urine and the isolation of pure urea from this liquid was first accomplished by M Proust in 1821. F. Wohler in 1828 announced his famous discovery of the artificial formation of urea from ammonia and cyanic acid Potassium cyanate, obtained by fusing potassium ferrocyanide with red lead or manganese dioxide, was mixed with ammonium sulphate, and the solution evaporated to dryness, when an alcoholic extract of the residue yielded urea

The isolation of urea from urine is most conveniently effected through its nitrate or oxalate, which are two of its most characteristic salts. Urea crystallises in long rhombic needles or prisms having a cooling taste It is readily soluble in water or alcohol but not in ether It melts at 132° C and may be vaporised *in vacuo*, but when more strongly heated it yields ammonia, biuret, ammelide and cyanuric acid.

Commercial Synthesis of Urea and its Derivatives.—Urea contains 46% of combined nitrogen in a form which is easily converted into ammonia in the soil, and it is therefore a much more concentrated nitrogenous fertiliser than either ammonium sulphate or sodium nitrate. It is, moreover, easy to handle and stable under ordinary factory and farm conditions, so that it possesses advantages over calcium cyanamide and calcium nitrate Hence it is now manufactured on an extensive scale for use as an artificial manure (*See* AGRICULTURAL FERTILISERS)

A century ago the synthetic production of an ounce of urea was a noteworthy scientific achievement, at present a daily output of 100 tons is the routine practice of a modern fertiliser plant. The following processes are available: (1) The regulated acidic hydrolysis of cyanamide (made from calcium cyanamide) in presence of an iron oxide as catalyst, $CN\cdot NH_2+H_2O=O:C(NH_2)_2$. (2) The heating under pressures of 33–53 atmospheres of ammonium carbonate obtained from carbon dioxide and ammonia, $NH_2\cdot CO_2\cdot NH_4 \rightleftharpoons H_2O+NH_2\cdot CO\cdot NH_2$: equilibrium is reached at 130–150° C with yields of 30–45% of urea. (3) Dry ammonia is passed into phenyl carbonate obtained from carbonyl chloride and phenol in presence of alkali,

$$2NH_3+CO(OC_6H_5)_2=CO(NH_2)_2+2C_6H_5\cdot OH:$$

the phenol is recovered and utilised again. (4) The process of treating carbonyl chloride with ammonia is more practicable for urea derivatives than for urea itself Thus, carbonyl chloride and ethyl aniline give diphenyldiethylcarbamide,

$$C_6H_5(C_2H_5)N\cdot CO\cdot N(C_2H_5)\cdot C_6H_5,$$

a crystalline substance known as "Centralite" and employed as a stabiliser in smokeless gunpowders

By heating together urea and *p*-aminoacetanilide a diacetylcarbamide is produced which on hydrolysis yields *pp*-diaminodiphenylcarbamide,

$$CO(NH\cdot C_6H_4\cdot NH_2)_2,$$

a diamine giving rise to important azo-dyes such as benzo fast yellow. (*See* DYES, SYNTHETIC)

Applications of Urea and its Derivatives.—For use as a fertiliser, urea is frequently employed in combination with calcium hydrogen phosphate (superphosphate), the product being known as "Phosphazote" Its complex salt with calcium nitrate is also recommended for agricultural purposes

Urea gives a remarkable condensation product with formaldehyde known as "Pollopas," a transparent, colourless, lustrous solid resembling flint glass in appearance and refractive index, but differing from glass in that it is non-splintering and can be worked on a lathe (*See* RESINS, SYNTHETIC.)

With hydrogen peroxide urea forms a crystalline additive compound, $CO(NH_2)_2.H_2O_2$, employed as a disinfectant and as an oxidising agent. Urea finds employment as a stabiliser in nitrocellulose explosives and has many medicinal uses such as an antipyretic and a diuretic Urea salicylate (ursal) is recommended in gout and rheumatism Urea acetylsalicylate and urea quinate (urol or uracol) have similar uses, and urea calcium bromide, $CaBr_2.4CO(NH_2)_2$, known as ureabromin, is prescribed in epilepsy and neurasthenia.

Urea is the starting point in the manufacture of many important synthetic drugs Veronal (*q.v.*) or diethylmalonyl urea, is the condensation product of urea and diethylmalonyl chloride, its sodium salt is medicinal. Proponal is dipropylmalonyl urea and bromural is α-bromo*iso*valeryl urea

Chemical Constitution of Urea.—Urea has long been regarded as the diamide of carbonic acid (carbamide) with formula I, but E A Werner has brought together considerable evidence in favour of the cyclic formula II, and he visualises also the transient existence of an active tautomeric enol form (formula III) which has been stabilised in certain *iso*urea derivatives

(I) (II.) (III)

When heated slightly above its melting point, urea dissociates into ammonia and the keto-form, NH:CO, of cyanic acid This acid acting on unchanged urea produces biuret,

$$NH_2\cdot CO\cdot NH\cdot CO\cdot NH_2.$$

At 195° C biuret decomposes into ammonia, cyanic acid, which polymerises to cyanuric acid, $C_3N_3(OH)_3$, and ammelide, $\underline{HN\cdot CO\cdot NH\cdot C(NH)\cdot NH\cdot CO}$. The transformation of ammonium cyanate to urea in boiling aqueous solution is a bimolecular reversible reaction, and equilibrium is reached in a decinormal solution with 95% of urea and 5% of cyanate At 80° C dry ammonium cyanate passes rapidly into urea, which is also produced by hydrolysis of lead cyanate (A C Cumming, 1903), and together with biuret by heating under pressure a solution of carbon monoxide in ammoniacal cuprous chloride (Jouve, 1899).

Thiourea, the sulphur analogue of urea, is now prepared on a manufacturing scale for employment in photography, synthetic resins, the treatment of weighted silk fabrics and as a starting material in the production of important azo-dyes and sulphur colours. It may be prepared (1) by heating ammonium thiocyanate at 160–170° C, when a reversible reaction takes place proceeding to equilibrium with 25% of thiourea; (2) by the action

of hydrogen sulphide on cyanamide.

Thiourea crystallises from water or alcohol in colourless, six-sided prisms or silky needles melting at 172–7° C. When condensed with formaldehyde, thiourea forms insoluble products which form the basis of important synthetic resins (*q.v.*). These resins are used in making moulding powders and moulded articles including vases, bowls and tea services, which admit of decorative treatment in mottled colourings.

Isomerism among thiourea derivatives is more noticeable than with those of urea Derivatives corresponding with formula I are the true thiocarbamides, their isomerides (termed isothioureas) are derived from the active thiol form (III) which is regarded by Werner as existing in equilibrium with the cyclic modification (II.)

(I) (II.) (III.)

In most of its reactions thiourea behaves as a thiol, with diazomethane it yields methyl isothiourea, $NH\ C(SCH_3)\ NH_2$, and with chloracetic acid it gives rise to a complex thiolacetic acid, $NH.C(NH_2)\ S\ CH_2\ CO_2H$ Moreover, thiourea reacts in the thiol form with chloroacetaldehyde to furnish aminothioazole. (*See* THIAZOLE)

Both urea and thiourea are monacidic bases, a characteristic which is in accordance with Werner's view of their constitution. Urea nitrate is $NH\ C(OH){\cdot}NH_3{\cdot}NO_3$ and thiourea hydrochloride is $NH{\cdot}C(SH){\cdot}NH_3Cl$

BIBLIOGRAPHY—E A Werner, *The Chemistry of Urea* (1923); T. E. Thorpe, *Dictionary of Applied Chemistry*, vol. vii (1927).

(G. T. M.)

URETHANE is synthesized from ammonia and ethyl chlorocarbonate or diethyl carbonate, by digestion of urea with alcohol under pressure, or by the action of warm alcohol on urea nitrate with addition of sodium nitrite. Urethane, ethyl carbamate, $NO_2{\cdot}CO_2C_2H_5$, crystallizes in large plates, readily soluble in water and melting at 49–50° and boiling at 184° C. When heated with ammonia to 180° C, it gives urea. Cold alcoholic potash decomposes it into potassium cyanate and alcohol. When treated with very concentrated nitric acid it yields nitro-urethane, $NO_2{\cdot}NH{\cdot}CO\ OC_2H_5$, from which nitramide $NO_2{\cdot}NH_2$ was isolated. Physiologically, urethane has a rapid hypnotic action, producing a calm sleep and having no depressant effect on the circulation. It is especially suitable for children and is much used as an anaesthetic for animals. Di-urethane, $NH(CO_2C_2H_5)_2$, and hedonal, $NH_2CO_2CH(CH_3){\cdot}(C_3H_7)$, are also narcotics, the latter being, in addition, a powerful diuretic.

URFÉ, HONORÉ D', MARQUIS DE VALBROMEY, COMTE DE CHÂTEAUNEUF (1568–1625), French novelist and miscellaneous writer, was born at Marseilles on Feb 11, 1568, and was educated at the Collège de Tsarnon. A partisan of the League, he was taken prisoner in 1595, and, though soon set at liberty, he was again captured and imprisoned. During his imprisonment he read Ronsard, Petrarch and above all the *Diana enamorada* of George de Montemayor and Tasso's *Aminta* Here, too, he wrote the *Epîtres morales* (1598). Honoré's brother Anne, comte D'Urfé, had married in 1571 the beautiful Diane de Châteaumorand, but the marriage was annulled in 1598 by Clement VIII Anne D'Urfé was ordained to the priesthood in 1603, and died in 1621 dean of Montbrison. Diane had a great fortune, and to avoid the alienation of the money from the D'Urfé family, Honoré married her in 1600. This marriage also proved unhappy; D'Urfé spent most of his time separated from his wife at the court of Savoy

In Savoy he conceived the plan of his novel *Astrée*, the scene of which is laid on the banks of the Lignon in his native province of Forez. It is a leisurely romance in which the loves of Céladon and Astrée are told with digressions. Some episodes suggest the adventures of Henry IV The shepherds and shepherdesses of the story are of the conventional type usual to the pastoral, and they discourse of love with a casuistry and elaborate delicacy that are by no means rustic. The two first parts of *Astrée* appeared in 1610, the third in 1619, and in 1627 the fourth part was edited and a fifth added by D'Urfé's secretary Balthazar Baro. *Astrée* set the fashion temporarily in the drama as in romance, and no tragedy was complete without elaborate discussions on love in the manner of Céladon and Astrée. D'Urfé also wrote two poems, *La Sireine* (1611) and *Sylvanire* (1625). He died from injuries received by a fall from his horse at Villafranca on June 1, 1625, during a campaign against the Spaniards.

E. Rostand, *Deux Romanciers de Provence, H. d'Urfé et E. Zola* (1921), p. 73.

URGA (the Russian form of the Mongol Orgo = palace of a high official), a city of Mongolia, on an affluent of the Tola river It is the holy city of the Mongols and the residence of the "living Buddha," metropolitan of the Kalka tribes, who ranks third in degree of veneration among the dignitaries of the Lamaist Church. The lama acts as the spiritual colleague of the Chinese amban, who controls all temporal matters.

Hurae, as the Mongols call Urga (Chinese name K'ulun) stands on the high road from Peking to Kyakhta (Kiachta), about 700 m. N.W. of Peking and 165 m S of Kyakhta. There are three distinct quarters: the *kuren* or monastery, the residence of the "living Buddha", the Mongol city proper (in which live some 13,000 monks), and the Chinese town, 2 or 3 m from the Mongol quarter. Besides the monks, the inhabitants number about 25,000. Within living memory bricks of tea formed the only circulating medium for the retail trade at Urga, but Chinese brass cash then became current. There is a considerable trade in cattle, camels, horses, sheep, piece-goods and milk

URI, an ancient canton, south of central Switzerland The name is popularly derived from Urochs and Auerochs (wild bull), two bull's horns, the cantonal symbol still being borne aloft at the head of the annual *Landsgemeinde* processions. (*See* below) The total area (1923–24 determinations) is 414 7 sq m., of which only 52·7% (the lowest figure in the confederation) are reckoned as "productive" (forests covering 48 sq m.), while 7½ sq m are occupied by a part of the Lake of Lucerne and more than 22% of the unproductive area is covered with glaciers. The highest summit in the Uri is the Dammastock (11,929 ft.), north of the Furka pass; the lowest commune is Fluelen (1,437 ft.) on the Lake of Lucerne. Little of the land is capable of further cultivation, for Uri is composed of the torrent section of the Upper Reuss, draining, with its tributaries, steep-sided valleys. The chief, and practically the only, railway is the main St. Gotthard line. Near Wassen are the very remarkable looped and spiral tunnels. An electric railway connects Göschenen with Andermatt, and another one connects Altdorf with its port, Flüelen Communication is largely by the excellently planned roads which lead to the mountain passes; these give access to the cantons lying east and south, *e g.*, Glarus (the Klausen pass, 6,404 ft.), the Grisons (Oberalp pass, 6,733 ft.), Ticino (St. Gotthard pass, 6,935 ft.), the Valais (Furka pass, 7,992 ft.).

In 1920 the aggregate population was 23,973 (only 58 to 1 sq m —the Grisons, the least densely populated, had 43), of whom 22,403 were German-speaking, 1,382 Italian-speaking, and 87 French-speaking, while 22,036 were Catholics, 1,853 Protestants, and five were Jews. Since 1814 Uri has been administered by the bishop of Coire, previous to this date all the canton except Andermatt (Urseren) was in the diocese of Constance. The capital and largest town is Altdorf (pop. 4,160), indissolubly connected with the legend of William Tell (*q.v.*).

Uri forms an administrative district and contains 20 communes. The legislature of the canton is a primitive democratic assembly (*Landsgemeinde*) composed of all male citizens of 20 years of age. This assembly has met, uninterruptedly, since 1309, usually once annually, near Altdorf, on the first Sunday in May, but (1928) it has been abandoned. The procedure was controlled by many antique ceremonies. Uri is entitled to but one member in the Federal *Nationalrat;* he is elected by a popular vote. (*See* SWITZERLAND: *Administration*)

History.—Uri is first mentioned in 732 as the place of banishment of Eto, the abbot of Reichenau, by the duke of Alamannia. In 853 it was given by Louis the German to the nunnery (*Frauenmünster*) at Zürich which he had just founded,

and of which his daughter, Hildegard, was the first abbess. As early as 1243 Uri had a common seal, and in the confirmation of its privileges (1274) granted by Rudolf of Habsburg mention is made of its "head-man" (*Amman*) and of the "commune" (*universitas*). It took part, with Schwyz and Unterwalden, in founding the "Everlasting League" (*q.v.*) on Aug. 1, 1291, defending its liberty in the fight of Morgarten (1315) and renewing the League of the Three at Brunnen (1315). It took part in the victory of Sempach (1386), and (1512) the conquest of Lugano. At the Reformation Uri clung to the old faith. In 1798, on the formation of the Helvetic republic Uri became part of the huge canton of the Waldstätten and lost all its Italian possessions. In 1803 Uri became an independent canton again, with Ursern, but without the Val Leventina It tried hard to bring back the old state of things in 1814–15, and opposed all attempts at reform, joining the League of Sarnen in 1832 to maintain the pact of 1815, opposing the proposed revision of the pact, and being one of the members of the Sonderbund in 1845 (*See* SWITZERLAND: *History.*)

URIC ACID, in organic chemistry, an acid which is one of the penultimate products of the tissue waste in the human body. (*See* PURINES.) While the bulk of the nitrogen of the albuminoids is excreted by kidneys and bladder as urea, a small portion of it stops at the uric acid stage. Human urine contains only a fraction of a per cent of the acid, chiefly as sodium salt; abundance of uric acid is met with in the excrement of serpents and birds, in which it is the principal nitrogenous product of tissue waste Pure uric acid, $C_5H_4N_4O_3$, forms a snow-white microcrystalline powder, devoid of smell or taste, soluble in 1,800 parts of boiling and in 14,000 parts of cold water. For its detection in urine, excess of hydrochloric acid is added when uric acid separates, generally coloured red by impurities The precipitate is dissolved in a few drops of nitric acid and after evaporation to dryness the residue on addition of ammonia assumes the intense purple colour of murexide (*q v*)

URICONIUM (more correctly *Viroconium* or *Vriconium*), *chef-lieu,* as proved by an inscription, of the Cornovii, now Wroxeter on the Severn, 5 m E. of Shrewsbury At first perhaps (47–65) a Roman legionary fortress, held by Legiones XIV. and XX against the Welsh hill tribes When the garrison was removed, it became a flourishing town with public baths (excavated 1859–61), town hall, and market (excavated 1924–27)

Bibliography—*See* J P Bushe-Foxe, *Excavations at Wroxeter in 1912, 1913, 1914* (*Soc Antiq Research Reports,* i , ii and iv.) ; G F. Hill, *Numis Chron* (1925), 336, *Report of Excavations* by D Atkinson (*Birmingham Arch Soc*), *in the Press*

URIM and **THUMMIM,** in the Bible. These descriptive terms are applied to one of the methods of divination employed by the ancient Hebrews, which, it is now generally agreed, consisted in a species of sacred lot Together with "dreams" and the prophetic oracle it formed the recognized channel by which divine communications were given (*cf* I Sam. xxviii 6). That some method of casting lots is denoted by the terms is evident from I. Sam xiv 41, *f*

From this illuminating passage it is clear (*a*) that by means of the Urim and Thummim the guilt or innocence of the suspected parties was determined; (*b*) that this was effected by a series of categorical questions implying the simple alternative of "yes" or "no," or something positive or negative A further inference (*c*) from a comparison of I Sam xiv. 41, *f.* with ver. 36 (Greek text) is that this method of casting the sacred lot was closely connected with divination by the Ephod (*q.v.*), and was the prerogative of the priests For this last point the "Blessing of Moses" (Deut. xxxiii.), where the opening words of the Benediction on Levi run thus (text as emended by Ball, following LXX ; *Proc. of Soc. of Bibl. Arch.* 1896): "Give to Levi Thy Thummim, and Thy Urim to the man of Thy favour " For a similar Arabic custom, *cf.* G. F. Moore *Ency. Bib.* IV., col. 5236.

In the post-exilic Priestly Code the Urim and Thummim figure as part of the equipment of the High Priest (*cf.* Ex. xxviii. 30; Lev. viii. 8; Num. xxvii. 21). Here it is stated that they are kept in a square pouch which is worn upon the high priest's breast ("the breastplate of judgment"), and attached to the ephod. Thus the association of the Urim and Thummim with the ephod, is retained

That Urim and Thummim were not then in use is shown by Neh. vii. 65 (Ezra ii. 63, I. Esdras v 40). Later references (Ecclus. xiv. 10; in Josephus and the Talmud) prove that no real tradition survived on the subject As vocalized in the Massoretic Hebrew text the names= 'Lights and perfections " But the Greek translators read the former *orim* and connected it with *torah,* "decision"; it would thus mean "doctrine", so Symmachus (*cf.* I. Esd v 40)

BIBLIOGRAPHY—For the older views, *see* Spencer, *De leg Hebr rit Diss* VII , and a useful summary by Plumptre in Smith's *Bib Dict* For modern discussions, *see* the articles "Urim and Thummim" in the Bible Dictionaries, the relevant sections in the treatises on archaeology, and W. Muss-Arnolt, "The Urim and Thummim" (*Amer Journ of Semitic Lang.,* 1900) (G H. B)

URINARY SYSTEM. The urinary system in the fully developed human being consists of (1) the kidneys, (2) the ureters, (3) the urinary bladder, and (4) the urethra

The Kidneys.—The *kidneys* are two firm, reddish brown organs about 4½in long, placed obliquely behind the other abdominal viscera—one on each side of the last thoracic and three upper lumbar vertebrae Each is imperfectly covered on its ventral surface by peritoneum Around them there is usually much fat and

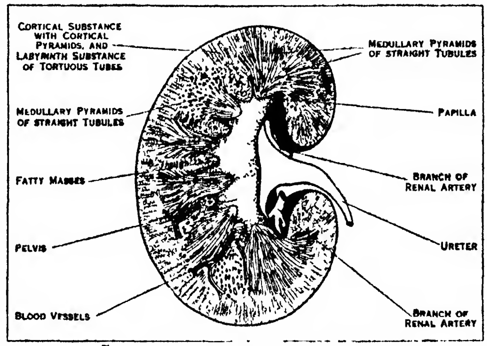

FIG 1 —VERTICAL SECTION OF THE KIDNEY

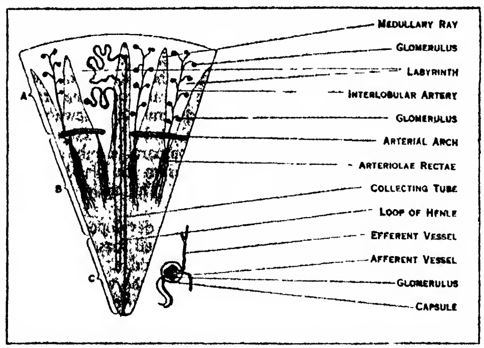

FROM A F DIXON IN CUNNINGHAM, 'TEXT BOOK OF ANATOMY' (OXFORD MEDICAL PUBLICATIONS)

FIG 2 —DIAGRAMMATIC REPRESENTATION OF THE STRUCTURES FORMING A KIDNEY LOBE

areolar tissue. The degree to which the kidney is fixed in position varies somewhat In so-called moveable or floating kidney the mobility may give rise to symptoms. The kidney in the foetus is lobulated, but becomes smooth in later years of childhood. Each organ has a firm, fibrous capsule, easily stripped off when the kidney is healthy. The inner and ventral margin of each kidney is concave

(*hilum*) and contains the renal artery and vein and the ureter which is always behind and below the blood vessels. Longitudinally divided from hilum to outer edge, the cut surface is seen to consist of two parts—an outer layer, the cortex, and an inner part, the medulla (fig 1). The latter consists of a series of eight to sixteen pyramids, whose bases and sides are invested with cortical matter, and whose apices or papillae project into the pelvis of the

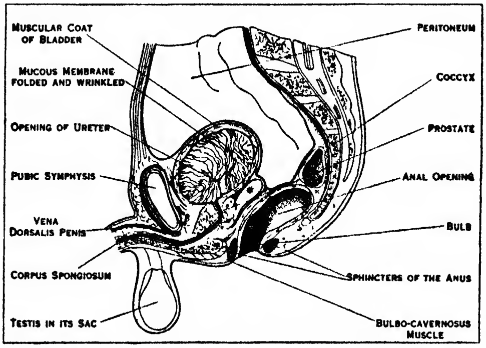

FIG 3.—VERTICAL SECTION THROUGH PELVIS, SHOWING THE URINARY BLADDER AND RECTUM IN SITU

kidney, where they are severally surrounded by membranous tubes (calices), which by their union make up the ureter In minute structure the kidney is the most complex gland in the body.

Ureter, Bladder and Urethra.—The *ureter* or duct of the kidney begins at the hilum and descends on the back wall of the abdominal cavity to open into the bladder. It is usually about 12in. in length and as thick as a goose quill At its termination it passes obliquely through the coats of the bladder, so that when the bladder is distended the lumen of its end is closed The *urinary bladder* is a membranous bag lying in the pelvic cavity directly behind and above the dorsal surface of the pubes In the foetus and infant, however, the bladder lies in the abdomen, not in the pelvis. During life it is seldom distended so as to hold more than about 10oz. When distended it rises and is applied closely against the back of the ventral abdominal wall. The bladder has a strong wall of unstriped muscle in several layers, which are innervated by branches from the sacral nerves. It has a peculiar epithelial lining of several strata, the superficial cells of which are cubical when the sac is collapsed, but flattened and scale-like when it is distended. At the lower part of the bladder is a triangular space known as the trigone, the angles of which are formed by the openings of the two ureters and the urethra In this space the mucous membrane is smooth and firmly bound to the subjacent muscle; elsewhere it is thrown into numerous folds when the bladder is empty. The female urethra is 1½in in length and is comparable only with that part of the male urethra which extends from the bladder to the openings of the seminal ducts (fig 3) The male urethra is described under REPRODUCTIVE SYSTEM

Embryology.—The excretory organs are developed as a series of small tubes situated in the intermediate cell mass, the ventral part of which projects to form the Wolffian ridge. Three sets of these tubes appear in succession and occupy the whole length of the body from the cervical to the lumbar region The most anterior—*pronephros* or *head kidney*—is represented in man by only two or three small tubules on each side which appear as ingrowths from the neighbouring coelom (fig. 4). It is probable that these are only mere vestiges Although the pronephros is rudimentary, the duct which in lower types carries away its excretion is well developed. This is the *Wolffian duct,* which appears in man before the pronephric tubes are formed, and runs longitudinally back in each intermediate cell mass to open into the cloaca (fig. 4). In certain parts of its course it is, at an early date, close to the skin on the dorsal side of the intermediate cell mass, and many embryologists hold that it is originally ectodermal and has sunk into the mesoderm secondarily. Morphologically, this view seems likely.

When the pronephric tubules disappear, which they do early in the embryo's development, the Wolffian duct persists as the drain for another and more important series of tubules (the *mesonephros* or *middle kidney*), formed in the intermediate cell mass behind the pronephros (fig 4) There is some doubt whether these tubes are strictly homologous and in series with those of the pronephros; they are of later development.

By about the sixth week of intra-uterine life these tubules reach their maximum development and form the *Wolffian body,* which projects into the coelom as the now very definite *Wolffian ridge* and acts as the functional excretory organ of the embryo When the permanent kidney is formed this organ degenerates; for its ultimate fate *see* REPRODUCTIVE SYSTEM.

The *metanephros* or *hind kidney* begins as a diverticulum from the dorsal side of the Wolffian duct close to its opening into the cloaca (*see* fig 4); this organ occurs about the fourth week of intra-uterine life, and the diverticulum grows forward (cephalad), dorsal to the hind end of the Wolffian body. In doing this it forms a duct—the *metanephric duct* or *ureter*—the cephalic end of which enlarges and divides to form the calices of the kidney. From the calices numerous smaller ducts grow into the mesoderm of the hind (caudal) end of the intermediate cell mass and become the collecting tubes of the kidney. While this is going on another set of tubules, probably in series with the mesonephric tubules, develops independently in the intermediate cell mass and forms the rest of the tubular system of the kidney. Toward these tubules, at one point, branches from the aorta push their way and invaginate each tube, thus forming the Malpighian corpuscles.

By the eighth week the kidney is definitely formed and takes over the excretory work of the mesonephros, which now atrophies.

At first, as has been stated, the ureters open into the Wolffian ducts, but later on each gains a separate opening into the cloaca, and eventually these shift ventrally until they reach their permanent connection with the allantoic bladder.

The *bladder* is developed from that part of the allantois which is nearest the cloaca. At first it is tubular, but after the second month becomes pyriform, the stalk of the pear corresponding to the fibrous *urachus* which reaches the umbilicus.

The *Müllerian ducts* (fig. 4) are formed after the Wolf-

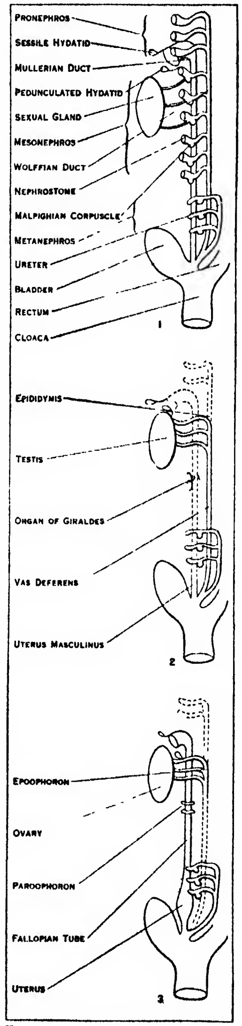

FIG. 4.—DIAGRAM OF THE FORMATION OF THE GENITO-URINARY APPARATUS

The first figure is the generalised type, the second the male, and the third the female specialised arrangements. The suppressed parts are dotted

fian ducts are fully developed. A ridge appears in the intermediate cell mass ventral to the Wolffian duct, and into the anterior (cephalic) end of this a tubular process of the coelom forces its way backward (caudad). Before reaching the cloaca the two Mullerian ducts coalesce and open between the orifices of the two Wolffian ducts These ducts form the oviducts, uterus and at least part of the vagina.

Comparative Anatomy.—In the Acrania (Amphioxus) the nephridial tubules are segmental and are only found in the pharyngeal region; each opens into the coelom by several ciliated funnels (nephrostomes) and also into the atrium, which is the exterior of the animal, by an opening called the nephridiopore

Among the Cyclostomata (lampreys and hags) the pronephros persists throughout life in Bdellostoma and probably in the hag (Myxine), but a Wolffian (archinephric) duct has been evolved so that the tubules no longer open on the surface by nephridiopores. In the Teleostomi (bony and ganoid fish) the pronephros is aborted and the mesonephros is the functional kidney.

In the Elasmobranchii (sharks and rays) the pronephros is more completely and more early aborted than in the last subclass, and the mesonephros is divided into an anterior or genital part (which receives the vasa efferentia in the male from the testis and thus is the first appearance phylogenetically of an epididymis) and a posterior or renal part The Wolffian duct therefore acts both as a vas deferens for the sperm and a ureter for the urine, though in the female it is merely a ureter

The Dipnoi or mudfish are remarkable for having a cloacal caecum which probably functions as an urinary bladder

In the Amphibia the snake-like forms (Gymnophiona) show a very primitive arrangement of the kidney tubules, each having its nephrostome, Malpighian capsule and short convoluted part leading to the Wolffian duct which acts both as ureter and vas deferens

In Reptilia the hind kidney or metanephros is developed and takes over all the excretory work; it is usually lobulated, its nephridia are never provided with nephrostomes and its duct (the ureter) opens into the Wolffian duct or vas deferens before reaching the cloaca Birds resemble reptiles very closely in their urinary system except that there is no bladder and that the ureters and vasa deferentia open independently into the cloaca

In the Mammalia the bean shape of the kidney is fairly characteristic. In foetal life the organ is always lobulated, and this often persists in the adult as in the ox, bear, seal and whale

URMIA, a town in the province of Azerbaijan in Persia, on a plain at an elevation of 4,400 ft, in 37° 34′ N., and 45° 4′ E., 78 m from Tabriz The population before the war was roughly estimated at 45,000, being mainly Turkish, with Armenian and Nestorian minorities The town has a wall beyond which extend many houses in gardens and orchards. It is clean with broader and less oriental-looking streets than in most Persian towns Special features are the Citadel with its arsenal and barracks; and the bazaars, a maze of domed and brick-vaulted corridors. The plain of Urmia is fertile. By means of irrigation, cultivation especially of fruits and tobacco (*tutun*), reached a high standard

Then came the World War There was a wholesale exodus of Christians—said to have reached 59,000 souls—in July 1918, in the Turkish advance after the Russian debâcle; and, in the same year, there were massacres by the Turks and Kurds of two-thirds of those who remained. In 1919, the remnant of 600 Christians was transferred to Tabriz Some survivors have been repatriated by the Persian Government, and by loans for the repair of buildings and the purchase of seed, oxen and implements, some agriculture has been restored. Relief was given by the British in 'Iraq.

URMIA, LAKE OF, in north-western Persia, between 37° 10′ and 38° 20′ N. and between 45° 10′ and 46° E, which takes its name (Pers *Deryacheh i Urmia,* Turk *Urmi gol*) from the town of Urmia, situated near its western shore, but is also known as the Deryacheh i Shahi and Shahi gol The limits of the lake vary much, the length (north to south) from 80 to 90 m, the width (east to west) from 30 to 45, being greater in the season of high water in spring when the snows melt

The mean depth of the lake is 15 to 16 ft, and its greatest depth probably does not exceed 50 feet. The lake has in recent years exhibited extraordinary changes of level, either due to a movement of the earth's crust or merely to an increase of rainfall as compared with evaporation De Morgan gives an area of 4,000 and 6,000 sq km. (1,544 and 2,317 sq m) for low and high water respectively. In the south is a cluster of about 50 rocky islands, the largest of which, Koyun daghi, *i e.,* "Sheep-mountain," is 3 to 4 m long and has a spring of sweet water near which a few people graze their goats and sheep. All the other islands are uninhabited The lake is about three-fifths as salt as the Dead sea—far too salt to permit of any life, except of lower organisms

By the U S S R treaty with Persia, of 1921, the railway from Tabriz to Julfa and branch line from Sofian to Lake Urmia and all the properties pertaining to navigation on the lake—formerly a Russian concession—were gratuitously transferred to Persia From the port of Sharaf-Khaneh on the eastern shore of the lake a fleet of motor boats of 20–160 h p. is operated in conjunction with the railway. The service is weekly. The lake is also navigated by clumsy craft with round bows and flat sterns carrying enormous sails (*See* Urmia)

URODELA, the name for that division of the Amphibia (*q v*) which includes the newts and salamanders (*qq v*) and is characterized by the possession of a tail throughout life and by the aquatic larval stage in their life history, which last feature, however, they share with the Anura (*q v*).

UROLOGY. The branch of medicine—chiefly surgical—that deals with diseases of the genito-urinary organs Recent progress in urology has been due largely to improvements in the cystoscope, advances in radiology, use of diathermy and close co-operation between urologists, bacteriologists, and bio-chemists Endovesical instruments are now available from the simplest cystoscope, consisting of a telescope within an irrigating sheath, to complicated instruments with which lesions can be treated surgically under direct vision instead of by an open operation.

Similarly, advances in radiology have led to the detection of calculi hitherto regarded as transparent to the rays, and to stereoscopic radiograms indispensable for locating a suspicious shadow in the neighbourhood of the kidney or ureter Pyelography also gives information concerning the size and shape of the renal pelvis and calices A skiagram is taken after a fluid opaque to the X-rays (*e g*, sodium iodide or lipiodol) has been introduced into the renal pelvis by means of a ureteric catheter It is of great value in diagnosing early dilation of the kidney, silent hydronephrosis, polycystic kidney, malformation of the pelvis and renal tumours encroaching on the pelvis; in localising shadows in the renal area such as calcified mesenteric glands and gall stones, and in differentiating between abdominal and renal tumours By similar means, silhouettes of the bladder or male urethra can be obtained, though in the latter instance they are not indispensable, for the canal can be examined easily and thoroughly with a urethroscope.

Perirenal inflation with CO_2 was introduced by Carelli of Buenos Aires and in radiographs shows clearly alterations in shape, size and density, therefore being useful in such conditions as early hydronephrosis, polycystic kidneys, tuberculosis, tumours and stones not dense enough to show by ordinary radiography; but its greatest value lies in giving a clear and distinct radiogram of the suprarenal capsule.

Diathermy.—Diathermy (*see* Electro-Therapy) acts by virtue of the heat generated in the tissues by the resistance they offer to the passage of an electric current. For this purpose a very strong current must be used, deprived of its stimulating and electrolytic properties by alternations of not less than 500,000 per second

The only sensation produced by a current of such high frequency is one of heat ranging, according to the strength of the current, from a pleasing warmth to a temperature high enough to char the tissues for a distance of about 1 cm. from the electrode. All degrees of diathermy are used for diseases of the genito-urinary system, the lower temperatures for testicular neuralgia and epididymo-orchitis, chronic urethritis and prostatitis, and benign enlargement of the prostate when a radical operation is inadvisable Destructive diathermy is now the method of choice in the treatment of certain forms of papilloma of the bladder and urethra, and in the median bar type of prostatic obstruction. It has been used with moderate success for carcinoma of the prostate

Use of Radium.—Radium (*q.v.*) has been used extensively for carcinoma of the prostate and bladder. It is applied in the form of needles and emanation tubes or seeds implanted directly into the growth, but has not yet emerged from the experimental stage. Caution is required in its use, for large doses produce great irritation and may be followed by excessive infiltrations of the bladder neck. Again, emanation tubes placed too close to the pouch of Douglas have caused peritonitis and death. In view of these disadvantages and the discouraging results they have encountered many urologists are now averse to using it at all.

Urinary Antiseptics.—Both mercurochrome and hexyl-resorcinol are powerful antiseptics, and though not "ideal" are valuable additions to the comparatively few powerful bactericides which can be administered with safety. Mercurochrome can be used either locally or intravenously. In cases of chronic cystitis, usually due to the colon bacillus, instillation of a watery solution (0·2–1·0%) sometimes has a remarkable effect. In pyogenic coccal infections the results are not so striking In pyelitis, irrigation with mercurochrome is not so irritating as with silver nitrate Instillations appear to be particularly valuable for chronic posterior urethritis, especially when complicated by prostatitis and vesiculitis When given intravenously in doses of from 1 to 5 mg. per kg. of body weight results have been most encouraging, especially in acute coccal and bacillary infections of the genito-urinary tract associated with pyrexia Chronic afebrile colon bacilluria, on the other hand, does not always respond so readily to this treatment. In rare cases, pronounced febrile and gastro-intestinal reactions follow the injection but these usually subside in 24 hours. The danger to the kidneys of such a powerful mercurial compound must never be overlooked, but Young (Baltimore) considers it may be used intravenously without fear of injury.

Hexyl-resorcinol [$C_6H_3(OH)_2C_6H_{13}$] is a synthetic compound first described by Leonard. Possessing forty-five times the germicidal power of phenol, it conforms experimentally to the qualifications necessary for an ideal urinary antiseptic in that it is chemically stable, non-toxic, non-irritating to the urinary tract, has an antiseptic and bactericidal action in high dilution in urine of any reaction, and is eliminated in high percentage by the kidneys. On the other hand, it can only exert its germicidal properties on tissues with which the urine comes in contact, and therefore infections of the renal parenchyma and submucous tissues of the urinary tract are not affected by it. If taken on an empty stomach the drug may cause griping or catharsis. Infections due to pyogenic cocci appear to yield to the drug with remarkable rapidity. *B. coli* infections of the urinary mucosa with a low bacterial count can be cured with hexyl-resorcinol, but when the count is high and the sub-mucous tissues are infected, prolonged treatment combined with appropriate local treatment is necessary. When administered prophylactically two days before, and daily after operations on the bladder, the wounds remain healthy and healing is accelerated.

Tests of Renal Function.—Tests for estimating the function of one or both kidneys are now employed regularly. Though not conclusive, they are capable of giving a warning which should be heeded, particularly in operations on the urinary tract. Thus in prostatectomy they serve to determine a one- or two-stage operation, and since they have been adopted as a routine the mortality from uraemia has become almost negligible. The chief tests in use in England are: (1) The urea concentration test (Maclean and de Wesselow), (2) estimation of blood urea; (3) colour tests. The technique of applying these tests can be found in text-books

The range of normality of the blood urea is so great that this test alone is of little value unless the urea retention is above 50 mg per 100 cu.cm. of blood, but when combined with the urea concentration test it gives an excellent indication of the renal efficiency. In some clinics on the Continent great reliance is placed on the elimination of creatinin and chlorides as tests of renal efficiency. The dyes chiefly employed for colour tests are indigo-carmine and phenolsulphonaphthalein. Indigo-carmine can be employed during a cystoscopy and gives a good indication of the function of one kidney without the use of a ureteric catheter (chromocystoscopy). A 0·4% solution injected either intravenously (5 c.c) or intramuscularly (20 c.c) should tinge the urine of a healthy kidney in five minutes. Phenolsulphonaphthalein is excreted solely by the kidneys and so differs from indigo-carmine, which is only partly excreted by the kidneys In America it is used almost exclusively, but in England it has not been popular owing to the somewhat elaborate technique required and to the difficulty, since the War, of obtaining a reliable preparation of the dye. The test is very reliable provided the pure compound is used

The capacity or otherwise of a patient to resist the spread of sepsis to the upper urinary tract after an operation, such as prostatectomy, is a factor which may upset the calculations of both surgeon and bio-chemist MacAdam and Shiskin have found that the *cholesterol content* of the blood gives a fair indication of the power of resistance. The average in a series of healthy adults under 50 years of age was found to be 0·16%. Above 50 years it ranges between 0·13% and 0·19%. Practical experience led these workers to conclude that in prostatic obstruction a blood-cholesterol below 0·13% indicates such a lowered resistance to the spread of sepsis as to constitute a bad operative risk Cases with a high blood-urea and a normal blood-cholesterol all recovered from a two-stage prostatectomy, but out of eight cases with a high blood-urea and a low blood-cholesterol all died save one.

The Kidney.—Dudgeon and others have pointed out that the combination of pus cells and a pure culture of staphylococcus albus in the urine of one kidney is almost pathognomonic of a stone in that kidney. With certain reservations all cases of renal calculus are now subjected to operation, for the stone, whether causing symptoms or not, slowly but surely injures the kidney and often determines a serious bacterial infection. Small stones are more dangerous than large ones, for they may lodge in the ureter and cause hydronephrosis, anuria and so on.

The problem of bilateral lithiasis is a difficult one, but on the whole urologists advocate operation on the healthiest kidney first, as there is always the possibility that nephrectomy may be necessary on the side which is more grossly affected. Pyelolithotomy is now performed in preference to nephrolithotomy whenever possible.

Decapsulation of the kidney for nephritis has been performed on many occasions with varying success, but is viewed with increasing favour. The benefit obtained is probably due to the mechanical relief of renal tension, and this certainly explains the immediate improvement following unilateral decapsulation in eclamptic uraemia. The indications for this operation are uraemia, anuria, oedema, excessive albuminuria and obstinate haematuria. Contra-indications are age, heart diseases and extensive cardiovascular changes.

Renal Tuberculosis.—Investigations by Braasch in the Mayo clinic have disproved the common opinion that renal tuberculosis is usually primarily unilateral. In seven out of 22 apparently unilateral cases, the urine from the supposed healthy kidney was proved to contain tubercle bacilli by animal inoculation, a fact which goes far to explain the comparatively heavy mortality in the first few years after nephrectomy. Continental writers estimate

that in life the infection is bilateral in about 15% of cases, whereas in the post-mortem room it is as high as 65%. This fully bears out the experience that spontaneous cure is extremely rare and that the only rational treatment of unilateral tuberculosis is early nephrectomy. In bilateral infections, Ekehorn advocates and practises removal of that kidney which is found by inspection to be the most diseased, or is thought to be the cause of pyrexia and distressing bladder symptoms. In 20 cases reported by him the results were good enough to justify the operation. The treatment of the tuberculous ureter is still under discussion, most workers considering that it heals naturally after the diseased kidney has been removed, while others advocate a primary nephro-ureterectomy to prevent infection of the lower urinary tract by the diseased ureter. All are now in favour of a post-operative course of tuberculin.

Movable Kidney.—Operations for nephroptosis are decreasing in number year by year, for surgeons have now realised that the condition is commonly associated with Glenard's disease and with such general symptoms as headache, gastric discomfort, neurasthenia and ptoses of various kinds, for which fixation of the kidney gives no relief whatever. Nephropexy is now reserved chiefly for cases of intermittent hydronephrosis, haematuria, casts and albuminuria, and for uncomplicated renal pain relieved absolutely by rest in the horizontal position.

Ureteral Calculus.—In the case of small stones impacted in the ureter most urologists favour removal by manipulative and other methods rather than by ureterolithotomy. The chief methods employed are: (i.) dilation of the ureter combined with instillation of sterile liquid paraffin, subcutaneous injection of atropine, and forced diuresis with Contrexéville water; (ii.) intra-ureteral instillation of 5 cu.cm of a 2% solution of papaverine sulphate, selected for its analgesic and antispasmodic properties; (iii.) dilation of the ureter by diathermy, and (iv.) division of the ureteric meatus with scissors through a cystoscope.

Severe reactions after cystoscopic manipulations, and irregular stones greater than 1 cm. in diameter are indications for ureterolithotomy. The pelvic portion of the ureter is now always exposed extraperitoneally, either through a paramedian subumbilical incision or by Kidd's inguinal operation.

Bladder.—The ureter may be implanted into another part of the bladder, either for stricture of its extramural portion or after partial cystectomy for growths involving the ureteric orifice. For inoperable bladder growths and for extrophy of the bladder, Coffey has devised a method of simultaneous transplantation of both ureters into the pelvic colon, which does not obstruct the ureters or disturb kidney function.

The bacteriology of cystitis and pyelocystitis has received much attention from bacteriologists. The most important recent communications on this subject are by Dudgeon, Wordley and Bawtree. These workers have isolated from different cases —

(1) A special group of haemolytic bacilli, strongly resembling but not identical with the paratyphoid bacillus; (2) the colon bacillus; (3) Proteus.

Improvements in the cystoscope have led to earlier recognition of diverticula. Swift Joly reviews the whole subject and discusses the relative value of the different operations. He also points out that accompanying prostatic or urethral obstruction should be treated at the same time whenever possible.

Papilloma.—These tumours are now treated by fulguration through a cystoscope whenever possible, and in many instances can be destroyed completely at one sitting and under local anaesthesia. When the papilloma is sessile and diathermy can only be applied to the surface nearest the cystoscope, several treatments at intervals of a week or ten days may be required, a portion of the growth being destroyed at each sitting. Subsequently a cystoscopic examination should be made at intervals of three to six months for at least three years, so that fresh growths can be kept in check. Open operation by the suprapubic route is reserved for large growths, especially if sessile and for those involving the ureteric orifice. In some cases the tumour can be destroyed by diathermy with a large electrode, in others a partial cystectomy, with or without transplantation of the ureter, is necessary. Attention has been called to the danger of "graft-recurrences" in the abdominal wall after removal of papillomata by the suprapubic route, and Maybury and Dyke have reported a case in which three successive implants grew in the abdominal wall. The primary vesical growth was benign but the recurrent implants became progressively malignant. Carcinoma should be excised whenever possible, for as yet the results of treatment with imbedded radium is disappointing and uncertain. In the flat ulcerating form of carcinoma, peculiar to the aged, a fair measure of comfort and relief can be obtained from deep X-ray therapy.

The Prostate.—For chronic inflammatory lesions of the prostate and seminal vesicles diathermy is valuable and acts, not only on the gland itself, but also on the arthritic and other complications so frequently associated with gonorrheal prostatitis and vesiculitis. In cases of enlarged prostate where operation is impossible owing to age, cardiovascular changes, advanced renal disease, etc., a fair measure of relief can be obtained by medical diathermy or by deep X-ray therapy. In all other cases prostatectomy is undoubtedly the correct procedure. The type of enlargement most suitable for operation is that due to chronic lobular prostatitis with pronounced adenomata; the second type, chronic interstitial prostatitis or fibrous prostate, presents many difficulties to the operator but should be removed whenever possible, as it causes a severer degree of obstruction and consequent impairment of the renal function than the adenomatous variety. Before deciding on an operation the chemical tests of renal efficiency should be carried out, for the type of operation selected will depend almost entirely on these tests. Careful preliminary treatment, often lasting several weeks, is nearly as important as the operation itself.

After much discussion, the majority of urologists have decided in favour of the suprapubic operation in one or two stages. The two-stage operation has reduced the mortality from uraemia to a negligible quantity and is indicated in all cases with renal deficiency, severe cystitis, retention, or four or more ounces of residual urine. The Thomson-Walker operation is undoubtedly an improvement on the somewhat crude but remarkably effective operation practised by Freyer. It takes longer but eliminates the risk of post-operative stricture. The perineal operation, performed almost exclusively by Young of Baltimore, is in England reserved for carcinoma and for the fibrous type of prostate. Here the advantages of control of haemorrhage and perfect drainage are outweighed by the dangers of pelvic cellulitis, perineal fistula and incontinence of urine.

In about 25% of patients with symptoms of prostatic obstruction but without palpable enlargement of the prostate, a careful cystoscopic examination reveals the presence of a ridge of hypertrophied tissue, either on the posterior lip of the prostate overhanging the internal meatus, or projecting upwards from the floor of the prostatic urethra and constituting the so-called median bar. For the relief of this type of obstruction H. Young invented his well-known punch, later improved by Kenneth Walker, by adapting it for diathermy. (*See* ELECTRO-THERAPY.)

Hitherto, treatment of prostatic carcinoma by radium has been so unsatisfactory that many surgeons have ceased to use it. Diathermy has been more or less successful in conferring relief, but the results can hardly be described as brilliant. Whenever possible, Young's perineal resection appears to be the most satisfactory procedure; failing this, excellent results have been sometimes obtained from deep X-ray therapy.

The Testis.—Steinach of Vienna performed vasoligation in *senile* rats with a view to increasing the internal secretion of their testes and thereby stimulating their failing energies. For two to four weeks after bilateral division of the vas between ligatures no appreciable change was noticeable. The rats then began to show a return of sexual excitement and vigour, in some instances equalling that of young males. This was followed in rapid succession by a return of pugnacity, increase in muscular energy and a copious growth of fur. The change lasted for about six months, when the animal gradually lost his youthful appearance and powers and became senile again, eventually dying within a few weeks of the onset of the change. Steinach found that the operation induced degeneration of the seminal epithelium (later followed by regeneration) and an increase in the interstitial tissue. In man the operation has been attended by very variable results. The

greatest successes appear to have occurred in cases of premature old age; when performed for impotence alone it is not so satisfactory, and is quite useless if the testis be already atrophied. Some cases of arteriosclerosis have been greatly benefited by it.

Testicular Grafts (*see* REJUVENATION).—Grafts from lower animals have been employed for many years with more or less similar results, viz., improvement shortly after implantation, followed by atrophy and absorption of the graft, and a return on the part of the patient to the original condition. Voronoff in 1920 used testes of anthropoid apes and found that they survived for three years or longer, and that the initial improvement in the patient's condition was maintained. Kenneth Walker has on several occasions employed a healthy human ectopic testis. He concludes that the life of a hetero-graft is not longer than two years, that absorption of the graft does not necessarily imply a return of the patient to his former condition, and that permanent improvement is probably due to increased growth in other endocrine tissues stimulated into activity by the graft.

Tuberculous Epididymitis.—When this disease is advanced castration is indicated, but when it is localised to the globus major or minor epididymectomy is now regarded as the correct procedure. The full extent of the disease must always be determined with care.

The Urethra.—The great improvement in urethroscopes has simplified the diagnosis and treatment of urethral conditions. With the Joly type of posterior urethroscope, diathermy can be applied where formerly a serious cutting operation was necessary. There is now an increasing tendency to revert to former methods and to treat stricture of the urethra by gradual dilatation with metal sounds or gum elastic bougies, urethrotomy being reserved for resilient and cartilaginous strictures and those complicated by fistulae. If contraction recurs after internal urethrotomy many surgeons advocate excision of the stricture and axial anastomosis. When a large amount of cicatricial tissue has been excised, the gap has been successfully bridged in one case by implantation of the patient's appendix, and in another by a child's prepuce fashioned into a canal around a catheter.

UROTROPIN, known also as uritone, a chemical substance (hexamethylenetetramine) formed by the action of ammonia on formaldehyde, used in medicine. It consists of colourless granular crystals freely soluble in water and having an alkaline reaction. Urotropin is among the most powerful of urinary antiseptics. It is used to render the urine acid in cases where it is alkaline, loaded with phosphates or purulent, as in cystitis. It is slightly diuretic. Experimentally it has been shown to have a solvent action on uric acid, but its action in this direction in the body requires confirmation. Urotropin is valuable in sterilizing the urine of "typhoid carriers" (*See* CARRIERS.) Analogous preparations are cystamine, helmitol and hetralin. Chinotropin is urotropin quinate, and borovertin is urotropin triborate.

URQUHART, DAVID (1805–1877), British diplomatist, was born at Braelangwell, Cromarty. He was educated in France, Switzerland and Spain, and at St. John's college, Oxford. He served (1827–28) in the Greek navy in the War of Independence, being severely wounded. In 1830 his reports on the new Greek frontier, as determined by the protocol of March 22, 1829, were of great service to the British Government. In Nov. 1831 he was appointed attaché to Sir Stratford Canning (Lord Stratford de Redclyffe, *q.v.*) on his mission to the sultan for the final delimitation of the frontiers of Turkey and Greece. In 1833 he went on a secret mission to Turkey in the interests of British trade, but he was recalled by Palmerston on account of his indiscreet advocacy of British intervention on behalf of the sultan against Mehemet Ali. In 1835 he founded the *Portfolio*, printing in the first issue a series of Russian State papers, which made a profound impression. As M.P. for Stafford (1847–52) he vigorously opposed Palmerston's foreign policy. He protested against the action of England in the Crimean War, advocating Turkish autonomy. He organized "foreign affairs committees" (known as "Urquhartite") throughout the country, in opposition to the Government, and in 1855 founded the *Free Press* (renamed in 1866 the *Diplomatic Review*) to which Karl Marx was a contributor. His health obliged him to retire to Montreux in 1864, and he died in Naples on May 16, 1877.

He published *Turkey and its Resources* (1833); and *England, France, Russia and Turkey* (1833), both violently anti-Russian; and *The Lebanon* (1860).

URQUHART or URCHARD, **SIR THOMAS** (1611–1660), Scottish translator of Rabelais, was the son of Sir Thomas Urquhart of Cromarty, and of Christian, daughter of the fourth Lord Elphinstone. After part of his estate had been alienated he received a "letter of protection" from his creditors from Charles I in 1637. He took part in the "Trot of Turriff" in 1639, and was knighted in 1641. He then published his *Epigrams*. In 1645, he produced a tract called *Trissotetras*, a treatise on logarithms, adjusted to a kind of memoria technica, like that of the scholastic logic. In 1649 he was proclaimed a traitor for taking part in the rising at Inverness. At Worcester, he was wounded and taken prisoner. His mss. were almost wholly destroyed. Urquhart was released by Cromwell's orders in 1651. He published during 1652 and 1653 three tracts with quaint titles and quainter contents, the last being on a universal language.

The *Translation of Rabelais* (Books I. and II.), which Urquhart produced in 1653, is a masterpiece of translation. Though not a close rendering, it reproduces the spirit of the original. The translation was reprinted in 1664; and in 1693 that of the Third Book was added. It is said the Urquhart sought refuge during the Commonwealth, like other cavaliers, on the continent, and died (1660) of a fit of laughing, brought on by joy over Restoration.

URSA MAJOR ("The Great Bear"), in astronomy, a constellation of the northern hemisphere, supposed to be referred to in the Old Testament (Job ix. 9, xxxviii. 22), and mentioned by Homer, Ἄρκτος θ', ἣν καὶ ἄμαξαν ἐπίκλησιν καλέονται (*Il.* 18. 487). The Greeks identified this constellation with the nymph Callisto (*q.v.*) placed in the heavens by Zeus in the form of a bear together with her son Arcas as "bear-warder," or Arcturus (*q.v.*); they named it Arctos, the she-bear, Helice, from its turning round the pole-star. The Romans knew the constellation as *Arctos* or *Ursa*; the Arabians termed the quadrilateral formed by the four stars α, β, γ, δ, *Na'sh*, a bier, whence it is sometimes known as *Feretrum majus*. The Arabic name should probably be identified with the Hebrew name *'Ash* and *'Ayish* in the book of Job (*see* G. Schiaparelli, *Astronomy in the Old Testament*, 1905). Ptolemy catalogues eight stars. Of these, the seven brightest (α of the 1st magnitude, β, γ, ϵ, ζ, η of the 2nd magnitude, and δ of the third magnitude) constitute one of the most characteristic figures in the northern sky; they have received various names—Septentriones, the wagon, plough, dipper and Charles's wain (a corruption of "churl's wain," or peasant's cart). With the Hindus these seven stars represented the seven Rishis. The stars α and β are called the "pointers," since they point to the pole-star. Five stars of the Plough form an associated group with common proper motion; but α (the upper pointer) and η (the last star of the tail) have no connection with the others. Stars in other parts of the sky have been found to belong to the same cluster; in particular Sirius is a stray member of it.

URSA MINOR ("The Little Bear"), in astronomy, a constellation of the northern hemisphere, mentioned by Thales (7th century B.C.). By the Greeks it was sometimes named *Cynosura* (Gr. *κυνός*, dog's; *οὐρά* tail), alleging this to be one of the dogs of

Callisto, who became *Ursa major*. The Phoenicians named it Phoenice, or the Phoenician constellation, possibly in allusion to the fact that the brightest star, Polaris, being situated very close to the north pole, is of incalculable service to navigators. Polaris, a second magnitude star, is at present distant 1° 9′ from the celestial pole. It is a Cepheid variable with very small light-range.

URSINS, MARIE ANNE DE LA TRÉMOILLE, Princess des (1642–1722), lady of the Spanish court, daughter of the duke of Noirmontier and Renée Julie Aubri. After the death of her second husband, Flavio Orsini, duke of Bracciano, she assumed the title of Princess des Ursins, a corruption of Orsini, and for her unofficial services in securing Neapolitans and Spaniards of rank at Rome as French partisans in view of the approaching death of Charles II of Spain, she was rewarded in 1699 by a pension. When Philip, duke of Anjou, grandson of the French king was declared heir by the will of Charles II the princess took an active part in arranging his marriage with a daughter of the duke of Savoy. Appointed *Camarera Mayor* by quiet diplomacy and the help of Madame de Maintenon, she accompanied the young queen to Spain in 1701. Till 1714 she was the most powerful person in the country. She was expected to look after French interests in the palace, and to manage the Spanish nobles. But she wisely held that the young king should rely on his Spanish subjects and was in frequent conflict with the French ambassadors. Recalled in 1704, she still had the support of Madame de Maintenon, and her own tact placated Louis XIV. In 1705 she returned to Spain, with practically the power to name her own ministry During the war of the Spanish Succession she was the real head of the Bourbon party. She was so far from offending the nation, that when Louis XIV. threatened in 1709 to desert his grandson, she dismissed all Frenchmen from the court On the death of the queen, acting by advice of Alberoni, she arranged a marriage for the king with Elizabeth Farnese of Parma She was rudely disillusioned in her hopes of governing the new queen as she had done the old. Driven from Elizabeth's presence with insult, at Quadraque, whither she had gone to meet her, she was sent out of Spain without being allowed to change her court dress. After a short stay in France, Madame des Ursins went to Rome, where she died Dec 5, 1722.

See F. Combes, *La Princesse des Ursins* (1858), *Lettres inédites de Mme. de Maintenon et de . . . la Princesse des Ursins* (1826; Eng trans, 1827); *Lettres inédites de la princesse des Ursins* (1859), C Hill, *Story of the Princess des Ursins in Spain* (1905)

URSULA, ST., and her companions, virgins and martyrs, are commemorated on Oct. 21. The *Breviary* gives no legend; but in current works, such as Butler's *Lives of the Saints*, it is to the effect that "these holy martyrs seem . . . to have met a glorious death in defence of their virginity from the army of the Huns. . . . They came originally from Britain, and Ursula was the conductor and encourager of the holy troop" The scene of the martyrdom is placed near the lower Rhine

The date has been assigned by different writers to 238, *c* 283 and *c.* 451. The story, however, is unknown both to Jerome and to Gregory of Tours—and this though the latter gives a somewhat detailed description of the Cologne church dedicated to that Theban legion with which the tradition of the martyred virgins was very early associated. The story of their fate is not entered under Oct. 21, in the martyrology of Bede (*ob. c.* 735), of Ado (*c* 858), of Usuard (*ante* 877), Notker Balbulus (896) or Hrabanus Maurus (845); but a 9th-century life of St Cunibert (*ob.* 663) associates a prominent incident in the life of this saint with the basilica of the sacred virgins at Cologne (Surius vi 275, ed 1575). Not only does Archbishop Wichfrid attest a grant to the church of the sacred virgins outside the walls of Cologne (in 927), but he was a large donor in his own person. Still earlier a Cologne martyrology, written, as Binterim (who edited it in 1824) argues, between 889 and 891, has the following entry under October 21. "xi. virg. Ursule Sencie Gregorie Pinose Marthe Saule Britule Satnine Rabacie Saturie Paladie." Much shorter entries are found in two of the old martyrologies printed in Migne (cxxxviii 1207, 1275). A more definite allusion to the legend may be found (*c.* 850) in Wandelbert of Prüm's metrical martyrology (Oct. 21):

Tunc numerosa simul Rheni per littora fulgent
Christo virgines erecta tropaea maniplis
Agrippinae urbi, quarum furor impius olim
Millia mactavit ductricibus inclyta sanctis.

The full legend first makes its appearance in a festival discourse (*sermo*) for Oct. 21, written, as internal evidence seems to show, between 731 and 839 This *sermo* does not mention St. Ursula, but makes Pinnosa or Vinnosa the leader of these spiritual "amazons," who, to avoid Maximian's persecution, left their island home of Britain, following their bridegroom Christ towards that East whence their faith had come a hundred years before. The concurrent traditions of Britain, Batavia, *i e*, the Netherlands (where many chapels still preserved their memory), and Cologne are called in evidence to prove the same origin. The legend was already very old and the festival "nobis omni tempore celeberrima"; but, as all written documents had disappeared since the burning of the early church erected over the sacred bones, the preacher could only appeal to the continuous and careful memory of the society to which he belonged (*nostrates*).

Two or three centuries later the *Passio XI MM. SS. Virginum*, based apparently on the revelations made to Helentrude, a nun of Heerse near Paderborn, gives a wonderful increase of detail. The narrative in its present form may date somewhere between 900 and 1100, while Helentrude apparently flourished before 1050. According to her account, the son of a powerful pagan king demands in marriage Ursula, the beautiful daughter of Deonotus, a king "in partibus Britanniae" Ursula is warned by a dream to demand a respite of three years, during which time her companions are to be 11,000 virgins collected from both kingdoms. After vigorous exercise in all kinds of manly sports, to the admiration of the populace, they are carried off by a sudden breeze in eleven triremes to Thiel on the Waal in Gelderland Thence they sail up the Rhine by way of Cologne to Basel, at which place they make fast their vessels and proceed on foot to Rome Returning, they re-enter their ships at Basel, but are slaughtered by the Huns when they reach Cologne Their relics are then collected and buried "sicut hodie illic est cernere," in a spot where "to this day" no meaner sepulture is permitted

The legend of Cologne grew to further dimensions with the revelations of St. Elizabeth of Schonau in the 12th century, motived apparently by the opening up of an old Roman burial ground in Cologne It advanced still further with Hermann Joseph, a Praemonstratensian canon of Steinfeld in 1183, who explained the presence of the bones of little children among those of the sacred virgins

See H Crombach, *Vita et Martyrium S Ursulae* (Cologne, 1647), and the Bollandist *Acta Sanctorum*, 21st October, where the story fills 230 folio pages The rationalization of the story is to be found in Oscar Schade, *Die Sage von der heiligen Ursula* (Hanover, 1854), of which there is a short *résumé* in S Baring-Gould's *Lives of the Saints* See also S Baring-Gould, *Popular Myths of the Middle Ages;* A G Stein, *Die Heilige Ursula* (Cologne, 1879) The credibility of some of the details was doubted as early as the 13th century by Jacobus de Voragine in the *Legenda aurea.* (T. A. A; A. J. G.)

URSULINES, a religious order founded at Brescia by Angela Merici (1470–1540) in November 1535, primarily for the education of girls and the care of the sick and needy. It was approved in 1544 by Paul III, and in 1572 Gregory XIII. declared it a religious order under the rule of St Augustine In the following century it was encouraged by St Francis of Sales and the Ursulines in Canada did valuable work among the French, the Indians and half-breeds About 1700, the order embraced some 20 congregations, with 350 convents and from 15,000 to 20,000 nuns

URTICACEAE (nettle family), in botany, a family of flowering plants belonging to the order Urticales, which includes also Ulmaceae (elm family), Moraceae (mulberry, fig, etc) and Cannabaceae (hemp and hop) It contains 41 genera, with about 480 species, mainly tropical, though several species such as the common stinging nettle (*Urtica dioica*) are widely distributed and occur in large numbers in temperate climates. Two genera are represented in the British Isles, *Urtica* (*see* Nettle) and *Parietaria* (pellitory, *q.v.*). In addition to *Urtica* and *Parietaria*, four other genera,—*Boehmeria, Hesperocnide, Laportea* and *Pilea,* are represented in North America, with some 15 native species.

The plants are generally herbs or somewhat shrubby, rarely, as in some tropical genera, forming a bush or tree The simple, often serrated, leaves have sometimes an alternate sometimes an opposite arrangement and are usually stipulate—exstipulate in *Parietaria*. Stinging hairs often occur on the stem and leaves The bast-fibres of the stem are generally long and firmly attached end to end, and hence of great value for textile use. Thus in ramie (q.v., *Boehmeria nivea*) a single fibre may reach nearly 9 in in length, and in stinging nettle as much as 3 in. *Maoutia* and *Urtica* have also been used as sources of fibre. The small inconspicuous regular flowers are arranged in definite (cymose) inflorescences often crowded into head-like clusters. They are unisexual and monoecious or dioecious The four or five green perianth leaves (or sepals) are free or more or less united; the male flowers contain as many stamens, opposite the sepals. The flowers are adapted for wind-pollination The female flower contains one carpel bearing one style with a brush-like stigma and containing a single erect ovule The fruit is dry and one-seeded, it is often enclosed within the persistent perianth The family is divided, according to Engler, into two main classes. (1) the *Urereae* with stinging hairs, including the genera *Urtica, Urera, Laportea,* and (2) others, which are without stinging hairs.

COMMON NETTLE. (URTICA DIOICA)

URTICARIA, popularly known as nettlerash, is characterised by the appearance on the skin of slightly raised red or white patches, varying in shape and size, termed wheals, which develop suddenly, persist for a few hours, and then fade spontaneously and completely. The eruption is invariably accompanied by sensations of itching or burning which may be very pronounced. It is customary to distinguish between an acute and a chronic variety of urticaria The former is marked by its abrupt onset, the profuse and extensive character of the eruption, and in many cases by the general symptoms which accompany the rash, such as fever, diarrhoea and vomiting. Acute urticaria is often caused by tainted food, and the whole attack is usually limited to a few hours or a few days. In chronic urticaria the eruption is either continuously present over periods of months or years, or is developed in bouts with intervals of comparative or absolute freedom The onset as a rule is insidious, and the general health is little disturbed unless the degree of itching is sufficient to interfere with sleep or repose

Nettlerash is now generally held to represent a symptom rather than a genuine disease, for it may be provoked by a great many and very different agents acting externally (nettles, jellyfish), or internally. The theory of sensitisation has a special application in urticaria. For example different kinds of foods are capable of causing urticaria under special conditions A certain individual suddenly becomes unduly "sensitive" to some article of diet which has, up to this point, been eaten without harm, while a second individual develops "hypersensitiveness" to a completely different type of food, a third to something different again, and so on. This acquired condition is specific, that is to say the individual who is "sensitised" only reacts to what is now his own harmful substance (*see* ANAPHYLAXIS).

The human tissues can also become "sensitised" to many other agents besides food, such as the poisons liberated from collections of germs in the teeth, tonsils, bowel and other regions of the body (focal infection) In other cases a second injection of horse-serum (diphtheria or tetanus anti-toxin), if given at a sufficient interval of time after the first will sometimes cause urticaria and anaphylactic shock. The mechanism of the reaction is similar in all these cases and the same degree of specificity is observed. The theory of sensitisation does not cover every case as, for example, where the eruption is related to an emotional crisis.

(H. MacC.)

URUGUAY (officially the Oriental Republic of the Uruguay, and still locally called the *Banda Oriental,* the "eastern shore" of the Uruguay river), the smallest independent State in South America. It lies between Brazil on the north and the estuary of the Río de la Plata on the south, extending from the Uruguay river to the Atlantic coast It has a sea-board of some 120 miles, a shore-line on the Plata of 235 miles and one of 270 miles along the Uruguay. The southern part of the country is mostly undulating plains, an extension eastward of the Argentine Pampas The coast-line is fringed with tidal lakes and sand dunes; the banks of the two bordering rivers are low, unbroken stretches of level land The northern section of the republic presents greater variety of relief, with occasional ridges and low ranges, alternating with broad valleys, a true southward extension of southern Brazil None of the sierras or mountains of Uruguay exceed 2,000 ft in elevation.

There are no large rivers within the territory of Uruguay. The Río Negro, which crosses the country from north-east to south-west, is the largest stream Throughout most of its length it is not navigable, its one river port being the town of Mercedes, 20 m. from its junction with the Uruguay. No other streams are navigable except for vessels of light draught. The Santa Lucía, the Queguay and the Cebollati are the principal water courses. These, as well as the Uruguay, are fed by numerous smaller streams (*arroyos*), affording an intricate network of drainage. The Uruguay river offers navigable waters along the border for steamers of 14 ft. draught from the island of Martín García at its mouth to Paysandú, and above that point for smaller vessels to the falls at Salto, 200 m in all. Beyond here navigation is interrupted by rapids (C L C, G M. McB.)

Geology.—The eastern and southern half of Uruguay is a low, rolling prairie, whose subsoil consists of weathered ancient schist and granite, through which protrude some low ridges composed of less weathered rocks. In central and north-central Uruguay a basement of ancient schist is overlain by nearly horizontal Permian beds, which form a low plateau The north-western part of Uruguay is occupied by a southward extension of the Parana plateau of southern Brazil. This plateau is formed of horizontal beds of Triassic red sandstone of continental origin, which are in places faulted and capped by sheets of Triassic basalt The plains of Uruguay are covered with Pleistocene deposits of sand and clay like those found on the pampas of Argentina and with alluvial beds. (G. McL. Wo.)

Climate.—Uruguay enjoys the reputation of possessing an excellent climate from the viewpoint of human health and comfort. The latitude ensures a fair uniformity of temperature throughout the year, the average for the summer months of January and February being 71° F and that of the coldest month, July, being 50°; frost is almost unknown Moreover, the climate of both summer and winter is marked by great variability from day to day, due to the passing of cyclonic storm centres. Brusque windshifts are common, the hot northerly *zonda* sometimes being followed immediately by the chill *pampero* from the south-west and bringing a sudden drop in temperature. These changes, while less extreme than in the pampas of the Argentine, give a middle latitude character to the climate of Uruguay. There are no decided rainy and dry seasons. A rainfall maximum is reached in the autumn (April and May), not in the winter months as is often supposed even by the residents of the country. Winter rains are most frequent but autumn rains are heaviest. The mean annual precipitation is about 35 in., decreasing with distance from the sea, but everywhere well distributed throughout the year. Many of the summer-time *tormentas* are thunderstorms, convectional and purely local in character. These do not always bring rain and are seldom accompanied by hail. Fogs are frequent from May to October, but seldom last all day on land. There are well developed land and sea breezes, especially in the summer season, when their influence is welcome.

Flora.—Uruguay is primarily a grass-producing country, a true

continuation eastward, in this respect also, of the Argentine pampa. There are more trees, however, both native and introduced, than on the pampas, but these are found chiefly in narrow ribbons along the bottom lands of the water-courses. The principal species are the ombú, alder, aloe, poplar, acacia, willow and eucalyptus. The *montes,* by which are understood plantations as well as native thickets, produce, among other useful wood, the *algarrobo,* the *guayabo,* the *quebracho* and the *urunday.* Indigenous palms grow in the valleys of the Sierra de San José Ignacio, as also to some extent in the departments of Minas, Maldonado and Paysandú. The myrtle, rosemary, mimosa and the scarlet-flowered ceibo are common. The valleys within the hills are fragrant with aromatic shrubs. The prairies are gay with the scarlet and white verbenas and other brilliant wild flowers

Fauna.—As in most of the inhabited parts of the world, the wild animals have largely disappeared. Even the rhea (the American ostrich) is now seldom seen, except in a semi-domesticated state. Pumas and jaguars are found on the wooded islets and banks of the larger rivers and along the northern frontier The fox, deer, wild cat, the *carpincho* or water hog, and a few small rodents nearly complete the list of native quadrupeds A little armadillo, the *mulita,* is the living representative of the extinct giants, mylodon and megatherium, whose fossils are found over the pampa There are a few specimens of the vulture, a native crow (lean, tall and ruffed) and many partridges and quails Parakeets are plentiful in the *montes* and the lagoons swarm with water-fowl. The most esteemed is the *pato real,* a large duck A characteristic sight on the prairies is that of the tiny burrowing owl, sitting on top of every little eminence Large flocks of the lapwing, *teru-teru,* are common, with their habit of warning other game of the approach of danger Of birds of bright plumage the humming bird and cardinal—the scarlet, the yellow and the white—are the most attractive, while white herons are frequently seen in swampy lands. The scorpion is rare, but large and venomous spiders are common The principal reptiles are a lizard, a tortoise, the *vivora de la cruz* (a dangerous viper, so called from marks like a cross on its head) and the rattle-snake in Maldonado and the stony lands of Minas. Along the upper waters of the Uruguay river the *caimán* (alligator) is not uncommon. Seals are found on small islands off the south-east coast, particularly Lobos island, which so gets its name

Area and Population.—The area of the republic is estimated at 72,210 sq m and it has a population of 1,042,668 according to the census of 1908, the estimate of 1925 giving 1,758,334 The country is divided into 19 departments, the area and population of which, according to the census of 1908, were as follows.

Departments	Area square miles	Population
Artigas	4,392	26,298
Canelones	1,833	87,931
Cerro Largo	5,753	44,806
Colonia	2,192	54,679
Durazno	5,525	42,313
Flores	1,744	16,158
Florida	4,763	45,393
Maldonado	1,584	28,804
Minas	4,844	51,170
Montevideo	256	309,231
Paysandú	5,115	38,528
Río Negro	3,269	10,909
Rivera	3,790	35,653
Rocha	4,280	34,110
Salto	4,863	46,304
San José	2,687	46,267
Soriano	3,560	30,431
Tacuarembó	8,074	46,027
Treinta-y-Tres	3,686	28,756
Totals	72,210	1,042,668

The average density of population on the above figures is 12·9 per square mile, ranging (exclusive of Montevideo) from 47·9 in Canelones to 5·8 in Tacuarembó and 6 in Artigas. In 1925 this average density had increased to 24·4 per square mile, showing Uruguay to be the most densely populated of the South American countries. There is a large number of foreign born inhabitants, the majority of these being Italians or Spaniards, with lesser numbers, in descending scale of Brazilian, Argentine and French birth. British, Swiss and Germans are comparatively few The number of immigrants varies greatly from year to year In 1907 there were 26,105 Italians arriving, 21,927 Spaniards, 2,355 British, 2,315 French and 1,823 Germans In 1924 the principal groups arriving at Montevideo were distributed as follows· Argentina, 33,361; Spain, 9,978; Italy, 7,514; Germany, 3,671, Brazil, 2,648; England, 1,902; France, 1,564 In the north there is a strong Brazilian element The average annual birth-rate is about 35 per thousand, and the death-rate about 15 5. About 26% of the births are illegitimate. The principal towns are Montevideo, the capital, with an estimated population (June 30, 1925) of 381,228, Paysandú, at the head of deep water navigation on the Uruguay river, with some 21,000 people; Salto, farther up the same river, with about 20,000 inhabitants, and Mercedes, an agricultural and live stock centre on the lower Río Negro, with a population of 16,000.

Agriculture.—In 1885 Uruguay imported most of her breadstuffs; now not only is wheat grown in sufficient quantities to meet the local demand, but a small surplus is annually available for export However, only 5% of the land is under cultivation Land for farming purposes is expensive, and wages are high, leaving small profit, unless it happens that a man, with his family to assist him, works his own land The farmers are chiefly Italians, Canary islanders and Frenchmen The principal crops in addition to wheat are oats, barley, maize, linseed and bird seed Since 1890 the cultivation of the grape and the manufacture of wine have considerably extended, especially in the departments of Salto, Montevideo, Canelones and Colonia.

Cattle-breeding and sheep-farming, however, are the principal industries Nearly 80% of the land is devoted to grazing, and the stock census of 1924 showed an existence of 8,425,196 head of cattle and 14 514,060 sheep The cattle are destined chiefly for the great packing houses which, since the development of refrigeration, consume most of the meat produced There are modern meat-packing establishments in Uruguay where beef and mutton are chilled or frozen for export Large quantities of liquid extract of beef are also prepared for the European trade A smaller amount of meat each year is being sent to the *saladero* establishments for the preparation of *tasajo,* or jerked beef, for the Brazilian and Cuban markets In the south, where the farmers are European, the breed of cattle is improved by breeding

Sheep farming flourishes chiefly in Durazno and Soriano Uruguayan wool is favourably regarded in foreign markets, on account of the clean state in which it is shipped, this being largely due to the natural conditions of the land and climate

Mining.—Mining is of slight importance in Uruguay Minerals are known to exist in the northern section of the republic, and gold-mining is carried on to a small extent Expert opinions have been advanced that gold-mining in Uruguay is capable of development into an important industry The other minerals found are silver, lead, copper, talc and lignite coal In 1924 large deposits of manganese were discovered

Commerce.—The economic development of Uruguay was long retarded by poor governments, by revolutionary outbreaks and by the transference of commercial undertakings from Montevideo to Buenos Aires on the opening of the harbour and docks at that port Recent years have brought renewed commercial activity.

The principal imports consist of machinery, textiles and clothing, food substances and beverages, fuel and live stock The chief exports are animal products and agricultural products The accompanying table, given in thousands of gold pesos, contains the latest available statistics of foreign commerce —

Countries	Imports		Exports	
	1923	1924	1923	1924
Great Britain	11,592	11,398	25,536	24,253
United States	10,340	14,917	14,013	7,103
Germany	5,166	6,613	12,530	17,731
Argentine	5,460	6,211	6,007	11,384
France	2,378	3,516	10,429	13,791
Brazil	4,927	5,295	1,802	6,135

Trade is controlled by foreigners, the British being prominent in banking, finance, railway work and the higher branches of commerce; the Americans in the meat packing business; Spaniards, Italians and French in the wholesale and retail trade. Uruguayans find an insignificant place in commerce The foreign trade passes mainly through Montevideo, where the port has been greatly improved

Communication.—There are 2,240 m. of national roads, and more than 3,100 m of departmental roads of which some 300 m are metalled. The railways have a length of 1,625 m open for traffic, radiating from Montevideo and connecting Uruguay at several points with the Argentine and Brazilian borders, rail travel now being possible from Montevideo to São Paulo and Río de Janeiro Mail and passenger aeroplane service is maintained with Buenos Aires, flights being made three times per week

Government.—The legislative power of the State rests with the general assembly, consisting of two chambers, one of senators (19 in number) and one of representatives The deputies of the lower house are elected for three years directly by the people, one deputy for every 12,000 adults who can read and write One senator is named from each department by an electoral college, whose members are elected directly by the people The senators are elected for six years, and one-third of their number retire every two years The executive power is exercised by the president of the republic, who is elected by direct popular vote for a four years' term. He is assisted by a National Administrative Council of nine members, elected by popular vote for a six year period, three retiring every two years There is no vice president. Cumulative voting provides for a representation of the minority. Woman's suffrage was adopted in 1921, Uruguay being the only South American country which has introduced this measure.

Education.—At the beginning of the twentieth century, nearly half the population over six years of age was illiterate. Since that time, however, marked improvement has taken place. Primary education is now compulsory and most of the children of school age attend In 1923 there were 1,045 Government schools, with 120,583 children in attendance Moreover (in 1922), private schools enrolled 20,168 pupils, and evening courses for adults were attended by 6,678 Higher education is provided for by the national university at Montevideo which in 1922 had a student body of 1,615, a State supported technical school, a military college and a national agricultural college, modelled on the best European and United States institutions Vocational training was given gratuitously to 185 pupils

Finance.—Of the national revenue nearly one-third is derived from customs duties, taxes being levied also on real estate, licences, tobacco, stamped paper and in other ways Nearly half the expenditure goes to meet debt charges, while Government, education, internal development, and defence absorb most of the remainder. The public debt of Uruguay was 129,774,119 pesos in 1900 and 176,693,631 pesos in 1924, a small relative increase. The budget estimates for 1924–25 were. revenue, 45,182,207 pesos and expenditure, 45,120,052 pesos Revenue for 1923–24 was 44,963,678 pesos and expenditure 43,033,998 pesos. Customs receipts in 1924 were 14,573,890 pesos

The Bank of the Republic was established in 1896 with a nominal capital of 12,000,000 pesos and in 1899 it received the right to issue further shares amounting to 5,000,000 pesos. Its note issue (for which it has an exclusive right) may not exceed the value of half the subscribed capital Besides a number of local banks, branches of German. Spanish, French and several British banks are established in Montevideo

There is no Uruguayan gold coin in circulation, but the theoretical monetary unit is the gold *peso nacional*, weighing 1 697 grammes, ·917 fine The silver peso weighs 25 g, ·900 fine A half, fifth and tenth of a peso are coined in silver

Army.—There is a standing army with a peace strength of about 7,000 officers and men. Service is voluntary In addition to this there is compulsory service in the National Guard (*a*) in the first class, consisting of men between 17 and 30 years of age, liable for service with the standing army, and numbering some 15,000; (*b*) in the second class, for departmental service only, except in so far as it may be drawn upon to make up losses in the active units in time of war, consisting of men from 30 to 45 years of age, and (*c*) in the third class, for local garrison duty, consisting of men between 19 and 45 years old. The army and guard are well equipped with modern arms.

History.—In 1512 Juan Díaz de Solís entered the Paranaguazú or sea-like estuary of the Plata and landed about 70 m east of the present city of Montevideo. Uruguay at that time was inhabited by Indians, of whom the dominant tribe was called Charrúa, a people described as physically strong and well-formed, and endowed with a natural nobility of character

Solís, on his second visit, 1515–16, was slain by the Charrúas in Colonia. Eleven years later Ramón, the lieutenant of Sebastian Cabot, was defeated by the same tribe In 1603 they destroyed, in a pitched battle, a veteran force of Spaniards under Saavedra During the next 50 years three unsuccessful attempts were made by the Spaniards to subdue this courageous people The real conquest of Uruguay was begun under Philip III by the Jesuit missions It was gradually consummated by the military and commercial settlements of the Portuguese, and subsequently by the Spaniards, who established themselves formally in Montevideo under Gov. Zavala of Buenos Aires in 1726, and demolished the rival Portuguese settlement in Colonia in 1777. From 1750 Montevideo enjoyed a provincial government independent of that of Buenos Aires The colonial history consists chiefly of a struggle between Spain and Portugal for the Banda Oriental del Uruguay which lay on the border between their possessions The American Revolutionary War, the French Revolution and the British invasions of Montevideo and Buenos Aires (1806–07), under Gens Auchmuty and John Whitelocke, all contributed to the extinction of the Spanish power on the Río de la Plata During the War for Independence, Montevideo was taken in 1814 by the Buenos Aires general Alvear (*see* further MONTEVIDEO) The long struggle for dominion in Uruguay between Brazil and the revolutionary Government of Buenos Aires was concluded in 1828, through the mediation of Great Britain, Uruguay being declared a free and independent State The republic was formally constituted in 1830 Subsequently Juan Manuel Rosas, dictator of Buenos Aires, interfered in the intestine quarrels of Uruguay: and Montevideo was beseiged by his forces, allied with the native partisans of Gen Oribe, for nine years (1843–52)

After the declaration of independence the history of Uruguay became a record of intrigues, financial ruin, and political folly and crime. The two great political factors for generations have been the *Colorados* and the *Blancos* So far as political principles were concerned, there was small difference between them Men were *Colorados* or *Blancos* largely by tradition and not from political conviction. The *Colorados* have held control for many years, and the attempts of the *Blancos* to oust them have caused a series of revolutions, the last of these being in 1910. The military element, moreover, has frequently conspired to elect a president amenable to its demands. The old *Blancos* and *Colorados* are superseded by conservatives or progressives, the latter favouring advanced social legislation.

In May 1910, a boundary treaty between Uruguay and Brazil settled several minor but long-pending questions. A treaty of May 7, 1913, since carried out, provided for delimiting the boundary Brazil ceded to Uruguay "the waters and navigation" of Lake Mirím and the Jaguarão river, and the parties agreed not to fortify their new frontiers

The social and educational progress of the country continued during the second administration of José Batlle y Ordóñez (1911–15), who succeeded Williman. Hours of labour were regulated, a National Insurance Bank was established and experts were brought from the United States and Europe to advance education, particularly industrial and agricultural training A law of July 12, 1911, set aside 100,000 pesos for the encouragement of immigration. The first South American International Conference of Agricultural Defence was held at Montevideo on May 2, 1913, and 200,000 gold pesos (1 peso = $1.03) annually was appropriated for free seeds for farmers. Uruguay continued to prosper under President Feliciano Vieira (1915–19), who relied on able advisers

of the young and progressive group who had studied abroad.

In 1916 a convention met to discuss a new constitution to replace that of 1830 This came into effect on March 1, 1919. There was the definite separation of Church and State. The Church was given control of those places of worship wholly or partly constructed by funds from the national treasury. The clergy were eligible for election as representatives or senators Decentralization of the Federal Government was brought about and the executive power was divided between the president and the National Administrative Council In the latter part of Vieira's administration, Uruguay broke off diplomatic relations with Germany (Oct. 1917). On Nov. 9, 1917, the eight German merchant vessels in Montevideo harbour were seized by the Uruguayan Government. No military or naval aid was sent to the Allies A credit of 15,000,000 pesos (approximately £3,000,000) was advanced to England by the Uruguayan Government at 5%, to be used for the purchase of supplies in Uruguay

Uruguay's youngest president, Baltasar Brum, took office on March 1, 1919. Uruguay ratified the Treaty of Versailles in 1919, and also concluded obligatory arbitration treaties with Great Britain and Italy in that year. In 1922 Uruguay became a non-permanent member of the Council of the League of Nations A system of old-age pensions was introduced in 1919, and a total of 20,000 pensions had been granted by 1925 José Serrato, an engineer of Italian descent, served as president from 1923 to March 1, 1927, when Dr Juan Campisteguy was inaugurated for the term ending in 1931

URUGUAYANA, a city and river port of Rio Grande do Sul, Brazil, on the Uruguay river, 348ft. above sea-level. Pop (1900) 13,638, (1920) 20,776 The upper Uruguay is navigable from the Quarahim to the town of São Tomé Opposite Uruguayana is the Argentine town of Restauracion, or Paso los Libres The river is 2m. wide at this point, and 154ft above sea-level Uruguayana is prettily situated on a low hill rising gently from the riverside and its low houses are surrounded by orange groves. There are military barracks near the shore, a theatre and a custom-house Uruguayana was captured by a Paraguayan force under Gen Estigarribia on Aug. 5, 1865, and was recaptured without a fight by the allied forces under Gen Bartolomé Mitre on Sept. 18

URUMTSI (URUMCHI, TIHWAFU), the capital of the Chinese province of Sinkiang, in a valley of the Tienshan, at about 3,000 ft. above sea-level Estimates of population vary up to 50,000 There is a large Turki element and some Mongols. The place trades in furs and skins. It is on the main route from Kansu to Dzungaria and the Ili region.

USBEGS. The Usbegs form the ruling clan in Bokhara, Khiva and Kokand, occupying there a very similar position to that of the Osmanli in Turkey. They are also found in Samarkand and in some parts of Syr Daria and Ferghana, in which latter place the Kipchak also live, and should probably be classified as Sarts They are a mixed people, closely allied to the Mongols, and are in a transition from a nomad to a sedentary life

USHAK, a town of Asia Minor, altitude 3,160 ft. in the Kutaiah vilayet, connected with Smyrna and Konia by rail Pop (1927) 88,665 It is noted for its heavy pile carpets, *khali*, known as "Turkey carpets" The Oriental character of the carpets has been impaired by the adoption of aniline dyes

USHANT (Fr *Ouessant*), the most westerly of the islands off the coast of France, about 14 m from Finistère Pop (1926) 2,512 Ushant was ravaged by the English in 1388 In 1778 a naval action was fought off Ushant between the English and the French. Ushant is about 3 850 ac. in extent and granitic, with rugged coasts accessible only at a few points, and rendered dangerous by fogs The island pastures a breed of small black sheep

USHAS, in Vedic Hindu mythology goddess of the dawn (from the same root as Lat *Aurora* and Gr Ἠώς) Celebrated in some 20 hymns of the *Rig-Veda*, she is its most graceful creation Borne on a car drawn by ruddy kine, the sun is her lover. She rises resplendent . showing her charms—ever shortening the lives of men she reveals their paths and bestows new life . . . she opens the doors of darkness as the cows their stalls

USHER (or USSHER), **JAMES** (1581–1656), Irish divine and archbishop, was born in the parish of St. Nicholas, Dublin, on Jan 4, 1581 He was sent to a school in Dublin opened by two political agents of James VI of Scotland, who sought to secure a party for James in Ireland in the event of the queen's death In 1594 Usher matriculated at the newly founded university of Dublin, whose charter had just been obtained by his uncle, Henry Usher, archbishop of Armagh He graduated M A in 1600, became a fellow of Trinity College, and was ordained in 1601 In 1607 he became regius professor of divinity and also chancellor of St Patrick's cathedral, Dublin In 1613 he published his first printed work, though not his first literary composition—*Gravissimae Quaestionis de Christianarum Ecclesiarum. . Historica Explicatio*, wherein he took up the history of the Western Church from the point where Jewel had left off in his *Apology for the Church of England*, and carried it on from the 6th till past the middle of the 13th century James nominated him archbishop of Armagh in 1625 As archbishop he discountenanced (1629) Bishop William Bedell's proposal to revive the Irish language in the service; he shared in drafting (1634) the code of canons of the Irish Church, and defeated the attempt to make the Irish Church conform exactly to the doctrinal standards of the English In 1640 he paid another visit to England on one of his usual scholarly errands, meaning to return when it was accomplished But the Great Rebellion of 1641 prevented his return Usher pleaded in vain with Charles I not to abandon Strafford By way of compensation for the loss of his Irish property he received the temporalities of the vacant see of Carlisle In 1643 he declined a seat in the Assembly of Divines at Westminster He quitted Oxford in 1645 and went into Wales, where he remained till 1646, when he returned to London, and was in 1647 elected preacher to the Society of Lincoln's Inn, an office which he continued to hold until near his death In 1648 he conferred with Charles I in the Isle of Wight, on the abortive negotiations with parliament on the question of episcopacy In 1650–54 he published the work which was long accounted his most important production, the *Annales Veteris et Novi Testamenti*, in which he propounded a now disproved scheme of Biblical chronology, whose dates were inserted by some unknown authority in the margin of reference editions of the Authorized Version In 1655 Usher published his last work. *De Graeca LXX. Interpretum Versione Syntagma* He died on March 20, 1656, in Lady Peterborough's house at Reigate, and was buried in Westminster Abbey

Usher's works are very numerous, and were first collected by C R Elrington and J. H Todd, Dublin (1847–64, in 17 vols). See *Life* by Carr (1895); W B Wright, *The Ussher Memoirs* (1889).

USK, a small market town on the Usk river, Monmouthshire, England Pop. (1921) 1,494 It was a Roman fort, *Burrium*,

and there are ruins of a castle built by the de Clares in defence of the Welsh marches The castle was taken by Simon de Montfort in 1265 and suffered under Owen Glendower The church of St. Mary perpetuates a Benedictine nunnery founded by Richard de Clare in 1236. There is 12th century work. Usk is well known to anglers

USK, a river of Wales and England, 70 m. long, flowing to the Bristol Channel The source is the north flank of Carmarthen Van, a summit of the Brecon Beacons; the course passes Brecon, Crickhowell and Abergavenny, below which the valley broadens, and the river becomes sinuous as it flows by Usk and Caerleon. The river is noted for its salmon and trout fishing.

USKOKS, a Serbo-Croat name meaning "refugee," applied to certain Christians who, after the Turkish conquest of Bosnia in 1463, fled, first to Ghssa, in Dalmatia, then to Zengg, in the Croat military frontier They soon turned to piracy, and, became the terror of Adriatic commerce, which was largely either Venetian or protected by Venice They received covert support from Austria, and an unsuccessful attempt by Turkey in 1592 to capture Zengg led to war between Turkey and Austria In 1602 Austria allowed Venice to send a force against Zengg; but it was defeated; and the piracy went on until in 1615 the outrages led to war between Austria and Venice The Treaty of Madrid (1617) provided that the Uskoks should be disbanded and their ships destroyed; they were accordingly transported inland to the mountains to which they gave their name.

USTARANA, a Pathan tribe living to the extreme south of Dera Ismail Khan in the North-West Frontier of India

USTER (1,532 ft), a town in the canton of Zürich, Switzerland, near the Greifen See and on the railway Zürich-Rapperswil. It is an industrial centre with 10,000 inhabitants who speak German and are chiefly Protestant.

ÚSTÍ NAD LABEM, a town in N N.W. Bohemia, in a highland district at the confluence of the Bela and the Elbe, is the most important Czechoslovak port Pop. (1921), 64,876

USTYUG VELIKIY, a Russian town in the North Dwina province. lat. 60° 47′ N , long. 46° 22′ E. Pop. (1926) 19,092. The town is the focus of post roads to Vologda and Nizhniy-Novgorod. It has distilleries, breweries, timber mills, leather factories and workshops for the production of agricultural machinery. It has two annual fairs. Special crafts include silver engraving and the making of boxes with secret locks

USURY. The practice of lending at interest which exceeds a lawful or reasonable rate. For an account of professional money-lenders, legal rates of interest and legal control over usurious transactions, *see* MONEY-LENDING.

A long legal development has accompanied the allowance of interest against defaulting creditors By Roman law the defaulting party to a contract was compelled, beyond fulfilment of the agreement, to pay compensation for the difference (*id quod interest*) to the creditor's position caused by his default. This difference could be based on actual loss accrued, and also on the profit that might have been made had performance been carried out. Mediaeval lawyers used the phrase *damna et interesse* for such compensation, and for damages and indemnity generally Thus *interesse* became applied to the charge for the use of money, disguised as an indemnity for failure to perform a contract At English common law an agreement to pay interest was only implied when supported, as in the case of negotiable instruments, by mercantile usage, or by the constant practice of a trade or business, or by the course of dealing between the parties. Otherwise an express agreement was required. By the Civil Procedure Act of 1833, provision was made for the allowance of interest at a rate not exceeding the current rate of interest upon debts evidenced by a written instrument from the time when their payment became due and in debts not so evidenced from the time a written demand for their payment had been made. In the United States the law regarding the allowance of interest has been more liberal. When there is default in the payment of a money debt, interest at the legal rate is allowable as damages for the delay in payment. Many States upon a similar theory allow interest upon unliquidated contractual demands where the default consists in something other than a failure to pay money. As in England, no interest is allowable upon claims for damages consequent upon a tort, but in America interest upon damages for torts to property is generally allowed In both countries compound interest is only claimable by express agreement or by established mercantile practice.

In the United States a most significant development in the field of usury is the attempt to control the lending of small sums of money at usurious rates. The early statutes were ineffective to prevent usurious interest being demanded of necessitous borrowers, fixing rates of interest so prohibitively low as to drive the business outside the law. To remedy this situation a Uniform Small Loan Law, since adopted in many States, required licenses of lenders making loans under $300, supervised the conditions under which such loans were made, and permitted an interest rate not exceeding 3½% a month on unpaid balances. This legalizing of the small loan business at adequately remunerative rates has been highly effective, driving the illegal and extortionate lender from the field and opening it to the lawful investment of capital *See* Ham, *Small Loan Legislation* (1922) (J M LA)

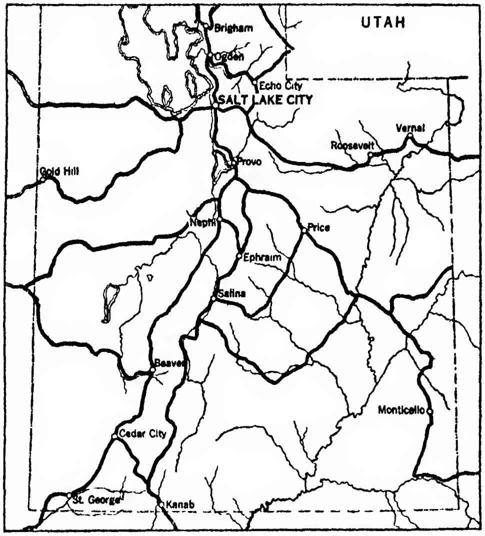
In the United States, where a penalty for usury is fixed both by State and Federal statutes, it is well settled that the penalty fixed by Federal legislation is superior to and exclusive of any State penalty

UTAH, long called "Deseret," which in the *Book of Mormon* means "land of the working bee," is one of the Rocky mountain States in the western part of the United States It is situated between 37° and 42° N and 109° and 114° W Its area is 84,990 sq m , of which an average of 2,806 sq m is water surface The area is equal to that of England and Scotland combined. Utah was the main habitat of the Ute tribe of Indians.

Physical Features.—A line drawn with a slight westward concavity from the middle of the northern boundary to the south-western corner would divide Utah into its two main physiographic regions, the Great Basin to the west and the plateau region to the east For a long distance this line would follow the high crest of the Wasatch mountains, a magnificent range running north and south, forming the great backbone of the State, and dividing the drainage of the Colorado river system from that of the Great Basin. Centuries ago the Great Basin region was covered by a vast expanse of water, about 19,000 sq m. in area, known to geologists as Lake Bonneville Shoreline at 17 distinct levels can still be traced on the mountain side Great Salt Lake is a shrunken remnant of this inland sea, and the rest of the basin is its one-time bed. The land of the basin floor, parched and barren in its uncultivated state, unless alkaline, is very fertile, and produces abundantly when irrigated. Along the eastern fringe of the basin, where the land can be watered by the streams flowing down from the Wasatch range, are to be found the most populous districts of Utah The monotony of the level basin floor is broken here and there by steep isolated north and south mountain ranges of monoclinal structure which rise abruptly several thousand feet above the plain. There is no drainage outlet, so the streams merely flow into the low places where, during the dry season, the water evaporates, leaving barren "mud flats" on the basin floor. In the larger depressions the water does not entirely evaporate but remains, forming saline lakes whose areas increase and decrease with the season. The largest of these is Great Salt Lake, having an area at its greatest extent of 2,000 sq. miles. One-third of this area is lost annually by evaporation. Its waters have an average salt density of 17% or about 3½ times that of the ocean. The lake is fed by Bear river from the north, Weber river from the north-east and Jordan river from the south-east. The Jordan carries the overflow from Utah lake, a fresh water body 127 sq.m. in area. South-west of Great Salt Lake is a broad flat stretch, more arid and barren than the rest of the basin, known as the Great Salt Lake desert. It is low, and in the spring covered partly by water. South of this desert and in the west central part of the basin is Sevier lake, fed by the Sevier river. This Lake at times attains an area of 188 sq.m., but during the dry season evaporates completely, leaving a crystalline residue of impure

sodium chloride and sulphide 5 in. in depth to mark the lowest portion of its site. The Great Basin as a whole rises gradually and imperceptibly from an elevation of 4,300 ft. at the shores of Great Salt Lake to an altitude of about 6,000 ft. in the south of the State.

East of the Wasatch range is the so-called "plateau region," much higher on the average than the Great Basin but deeply cut by valleys and canyons, which carry its drainage to the Colorado



MAP SHOWING THE MAIN ROADS IN UTAH

river On the north this area is bounded by the Uinta mountains, the highest range in Utah and the only important range in the United States to run directly east and west It extends at right angles to the Wasatch range and almost meets it on the west. King's peak (13,498 ft) is the highest altitude in the State, while Mt. Emmons (13,428), Gilbert peak (13,422), Mt Lovenia (13,250) and Tokewanna peak are the others rising above the 13,000 ft mark Between the peaks local glaciation has carved deep amphitheatre-like valleys, many of them containing alpine lakes, wild and difficult of access South of the Uintas the plateau summits rise to 9,000, 10,000 and 11,000 feet They are generally forested, but are too high and difficult of access to be inhabited. The people of this region live in the valleys along the streams between the plateaux. South toward the Colorado river the plateaux drop rapidly in a series of brightly coloured sandstone cliffs resembling giant terraced steps, and are named from the colour of the outcropping sandstone. The Pink Cliffs are the highest and most conspicuous; then come the White Clifts, Vermilion Cliffs and Grey Cliffs. In this southern portion also are several interesting mountain groups which do not properly belong to the plateau system. They have been formed by the intrusion of molten igneous rock between the layers of sediments, causing the overlying layers to arch up into dome mountains. Such groups are the Henry mountains, west of the Colorado, and the La Sal and the Abajo mountains, east of the Colorado. South-east of the Colorado, and especially in the region drained by the San Juan river, there are almost no areas capable of cultivation; the soil is sandy and the population scanty. Much of the area is relatively inaccessible even by pack horse for trails, and watering places are few. Yet here some of the most picturesque scenery of Utah is to be found. The richly coloured sandstone has been moulded by erosion into such fantastic figures as the Navajo Twins, Organ Rock, Needle Rock, Train Cliff, Ostrich Rock and the famous pear-shaped balancing rock in the La Sal mountains. In Monument park slender spires and mighty bluffs lift steep red stone sides perpendicularly to great heights. The region abounds in natural bridges, including the graceful Rainbow bridge, 308 ft. high and 274 ft. between its abutments. Dainty Kachina with a width of 186 ft. and height of 205 ft., and the massive Sipapu, 222 ft. high and 261 ft long, are wedged in the White Canyon Innumerable prehistoric ruins and cliff-dwellings are found in this region also, and are the best described in Byron Cumming's bulletin entitled *The Ancient Inhabitants of the San Juan Valley*. Many of these are in giant crevices several hundred feet above the canyon bottoms The region has been only partly explored archaeologically, and new ruins are constantly being reported Other caves have been found to contain remains of the basket-makers, predecessors of the cliff-dwellers. Many caves are covered with Indian pictographs and large paintings of animals In one place tracks of the prehistoric dinosaur were found imprinted in the sandstone In the Henry mountains, where the fossilized remains of dinosaurs and many other prehistoric animals have been found, Dinosaur National Monument has been created This whole region of south-eastern Utah, a vast, strange and weird land, was one of the last parts of the United States to be explored. It was not until 1904 that the outside world heard of its natural bridges, the largest in the world The deep twisting canyons provide the most awe-inspiring scenery but the greatest obstacles to travel through the region Besides the great canyons of the Colorado, the Green and Grand rivers, there are many of similar grandeur in the tributary streams The San Juan Canyon is sometimes called the "Little Grand Canyon of the Colorado" On the Rio Virgin in south-western Utah is Little Zion Canyon, now set aside as Zion National park It was named by the Mormons who discovered and settled it, though their settlers were later driven out by the Indians. In Bryce Canyon there are acres of fantastic tower and turret formations formed by erosion only, the softer red rocks being capped by a harder stratum which resists weathering

In Utah climatic conditions vary by altitude as well as by latitude In the lower valleys of the Great Basin the summer heat is often disagreeably high. Moderate summer temperature is found in the mountains and on the plateaux. Precipitation also varies with the altitude from 42 in at Silver lake in Brighton to 5 or 10 in. in the lowlands, and to 4 9 in at Salduro in the deserts The higher plateaux and mountain ranges bear forests of fir, spruce and pine, and the lower slopes are dotted with piñon, juniper and scrub cedar. Willows and cotton-woods grow along the streams Sagebrush is characteristic of the desert areas, and on the hill-sides bunch-grass affords valuable pasturage Bird life is prolific in Utah Besides the usual varieties found in the Rocky mountains, white pelicans have established a rookery on Hat island, so named from being shaped like a cowboy's hat, now known as Bird island, where vast members of pelicans, blue herons and sea-gulls live happily together Large numbers of geese (snow, Canada, black brant and others) thrive about the lake. Bird sanctuaries are being provided by law

Population.—Utah's first census, taken in 1850, gave a population of 11,380 In 1920 it was nearly 40 times as much or 449,396. The estimate of the U.S census bureau for 1927 was 522,000 The increase between 1900 and 1910 was 34 9% and between 1910 and 1920 20 4% The density per square mile increased from 3·4 in 1900 to 4·5 in 1910 and 5·5 in 1920 In 1920 there were 441,901 whites, 1,446 negroes, 2,711 Indians (as opposed to 3,123 in 1910), 342 Chinese and 2,936 Japanese Foreign born made up 19·4% of the population in 1900 and 12·8% in 1920. Of the 56,455 foreign-born whites 19,657 were from the British Isles, 15,152 from the Scandinavian countries, 3,589 from Germany, 3,225 from Italy and 3,000 from Greece Other countries furnished less than 2,000 each It is partly because of the proselytizing of the Mormons, their zealous work for new settlers and their judicious treatment of immigrant bands that Utah has such a variety of nationalities. In very early days Brigham Young received whole communities from the countries of the Old World and planned systematic settlements for them in the many fertile valleys of the State The numbers of males and females are more nearly equal in Utah than in other

western mountain States In 1920 62·6% of the females and 59·1% of the males over 15 years of age were married In 1924 births numbered 13,969 and deaths 5,048 The birth rate per 1,000 was 28·8, a figure exceeded only by North Carolina with a rate of 32·2 per 1,000. The infant mortality rate of 64 deaths per 1,000 infants under one year is very low.

The urban and the rural population are nearly balanced, the figures in 1920 showing 48% urban and 52% rural In 1910 the percentage had been 46·3 urban and 53 7 rural The rate of shift from the country to the city was probably accelerated after 1920 by the farm depression Approximately half of the total population are Mormons or Latter Day Saints Next in strength are the Catholics. The Methodists and Presbyterians are the leading Protestant denominations Salt Lake City, the capital and largest city, has a population of 133,000 (1926 estimate of U S census bureau) and Ogden, the next largest city, has 37,600.

Government.—The Constitution of Utah was formed by a convention at Salt Lake City, March 4–8, 1895, submitted to the people on Nov. 5 and ratified by a vote of 31,305 to 7,687. It came into effect Jan. 4, 1896, the day Utah was admitted to the Union. It provides that no law can be passed restricting the freedom of the press or the establishment of religious sects There is no imprisonment for debts unless the debtor absconds Males and females enjoy equal privileges in civil, political and religious rights One provision, which guarantees religious freedom, forbids sectarian control of public schools, prohibits polygamy and defines the relation of the State to the public lands of the United States, is irrevocable unless with the consent of the U S Government All citizens of the United States who have lived in Utah a year, in the county four months and in the precinct 60 days have the right of suffrage Only those who have paid a property tax the year before may vote in elections levying a special tax creating indebtedness or increasing the State rate of taxation.

The powers of Government are divided into three distinct departments, the legislative, executive and judicial The legislative power is vested in (1) a senate and a house of representatives, and (2) the legal voters, who are given the power of initiating desirable legislation and of referendum on all laws not passed by a two-thirds vote of both houses No person is eligible for office in the legislature who is not a citizen of the United States, 25 years of age or more, a qualified voter in the district from which he is chosen, and a resident of Utah for three years or of his district for one year Regular sessions of the legislature are held in odd-numbered years, opening on the 2nd Monday in January They cannot last more than 60 days except to try cases of impeachment Representatives are elected for two years; senators for a four-year term, one half the number retiring every two years The number of senators must not exceed 30 and the representative body must be at least twice as large as the senate. In 1927 there were 20 senators and 55 representatives.

The executive officials are the governor, secretary of State, State auditor, State treasurer, attorney general and superintendent of public instruction. The auditor and treasurer are ineligible to election as their own successors. The governor and secretary of State must be at least 30 years of age, the attorney general at least 25 and in good standing at the bar The governor has the right of veto unless overruled by the bill repassing with a two-thirds majority in both houses. The governor, justice of the supreme court and attorney general compose the board of pardons.

The judicial power is vested in the senate sitting as a court of impeachment, a State supreme court, district courts, city courts, justices of the peace and other courts inferior to the supreme court as established by law

Finance.—There are four major sources of State revenue. The most important is the general property tax. In 1926 this amounted to 7·4 mills on an assessed valuation of taxable property amounting to $696,061,566. For an odd period of 19 months (due to a change in the fiscal year), Dec. 1924 to June 1926, $9,495,811 or $40.08 per caput was obtained from this source; 76·4% of the amount was credited to educational purposes, and the rest devoted to general administration expenses. The next most important source is the special taxes, such as the tax on gasolene sold, fees for motor vehicle registration, corporation tax, inheritance tax, etc. This source for the same 19 months yielded $3,666,717 or 20 69% of the revenue The third important source is the income derived from the sale and rental of Federal and State lands, and interest on investments belonging to the State land grant funds From this source $851,922 was derived for that period The fourth is the income received from the Federal Government for the building of new roads throughout the State. This amounted to $1,760,867. All other sources, including fees from State officials and State institutions, amounted to $1,941,152

Total receipts for the period amounted to $22,491,420 and total disbursements to $22,966,236. Of the disbursements 33 55% went for educational purposes—$6,508,810 to public schools and $1,195,232 to the university, agricultural and branch agricultural college—17·79% or $3,975,643 was for highways and $4,933,995 for the general fund which, in addition to paying the salaries and expenses of State officials, provided for the financing of the State Industrial School, State Mental Hospital, State Prison and School for the Deaf and Blind The bonded indebtedness of Utah amounted to $9,660,000 in 1926 Over $7,000,000 of this was for roads and $1,600,000 for the capitol building fund

The value of all tangible property in the State in 1922 was $1,535,000,000 or $3,247 per caput The first bank in Utah, established by the Walker Brothers in Salt Lake City in 1859, and the Deserêt National Bank, the first national bank established by Brigham Young in 1872, are still doing business For many years banking was handled mostly by important Morman officials and such strong confidence was developed that during the severe panic of 1893 not a bank closed its doors In 1925 there were 111 banking institutions in Utah with capital and surplus of $19,084,000, resources of $162,000,000, and savings deposits of $61,161,000 Twenty-one were national banks The savings deposits had increased from $27,904,000 in 1913 to $51,600,000 in 1920

Education.—In Utah school attendance for at least 20 weeks annually is compulsory for all children from 8 to 18 years of age, unless they are lawfully excused As a result 141,483 pupils, or 98% of a school census population of 148,811, were enrolled in 1926–27; 114,309 of these were grade pupils and 27,174 high school students There were 2,985 elementary school teachers, 590 junior high school teachers and 876 high school teachers Much time and money have been spent by Utah in the consolidation of rural schools. Buses are used to carry the children from smaller districts; and in 1926–27 11,640 children were transported at a cost of $394,889 Through consolidation better equipment and teachers were provided for 13,741 children, and only 94 one-room schools were left in the State

The expenditure for education in Utah increased from $30 76 per caput of the school population in 1909–10 to $77 43 in 1926–27 In 1920 slightly over one-third of the total public expenditure, State and local, was for education, and in this ratio Utah was exceeded only by Montana While the State ranked 34th in its per caput income, it ranked sixth in its per caput expenditures for education The income for education in 1926–27 was $10,566,560, of which $3,205,840 was provided by a tax of 4·8 mills and $6,652,306 by local district taxes The expenditure for education in 1926–27 totalled $11,076,674. Expenses for instruction were $4,379,538 for elementary schools, and $1,681,744 for high schools The average salary for elementary teachers in one-room schools was $841; two-room schools, $906; and larger schools was $1,064 This does not include salaries of principals. The average high school teachers' salary exclusive of principals was $1,432 The State has also endeavoured to further education by supporting libraries and for this purpose $207,957 was expended in 1924–25

The University of Utah, at Salt Lake City, was organized in 1850 as the University of Deseret, and placed under the control of a chancellor and board of 12 regents appointed by the governor. It closed in 1851 for lack of funds and did not reopen until 1867, though during all this period the board was regularly appointed and functioned in supervising the public schools. In 1869 the university was reorganized to include classical and normal schools and in 1892 was given its present name The registration in

1927–28 was 3,065 for the regular session and 913 for the summer session. In the extension department 3,900 more were enrolled. The proportion of men to women students was about three to two. The Utah Agricultural college at Logan has co-operated efficiently with the farmers on arid-land problems. The Latter Day Saints church maintains the Brigham Young university at Provo, which had an enrolment of 1,417 in the regular session of 1926–27 and 458 in the summer session of 1927. Its 12 trustees are elected triennially by the vote of the church. Four normal schools are also supported by the Latter Day Saints. Other private schools are the Sacred Heart academy at Ogden, Logan Junior college at Logan, St. Mary of the Wasatch, Rowland Hall and Westminster college at Salt Lake City, and Wasatch academy at Mount Pleasant. The 1920 census placed Utah ninth lowest among the States in illiteracy. In 1923 the number of illiterates within the State totaled 6,264 or 1·9% of the entire population. Most of these came from the foreign-born population.

Charitable and Penal Institutions.—The State Prison is in Salt Lake City. The number of prisoners decreased from 321 in Dec. 1924 to 203 in June 1926. Prison labour cannot be let out on contract, but "honour prisoners" are allowed to work on roads and irrigation projects, on additions and repairs to prison buildings and on the prison farm. While doing so their families are paid one dollar per day, and, at the end of his confinement, the prisoner receives a $15 gratuity. The State Industrial school at Ogden, established for delinquent boys and girls, endeavours to help them by teaching manual training, home economics, printing and mechanical repair work. A School for the Deaf and Blind, also at Ogden, teaches caning of chairs, broom-making and printing and linotyping. The Mental Hospital, at Provo, cares for the insane. Efforts are being made to segregate the feeble-minded. Legal provision is made for juvenile courts and for minors under 18 years of age.

Agriculture and Live Stock.—In Utah farm lands make up but 9·5% of total land area of the State, a much smaller percentage than in any other State except Nevada. Agriculture is, where possible, dependent almost entirely upon irrigation which counteracts drought. Soil that can be watered is generally very rich. In early days, under the Mormon system, farm plots were but five, ten or twenty acres. Gradually the average size of farms grew until in 1900 it was 212·4 ac., after which it slowly dropped till in 1925 it reached 192·2 acres. The total acreage in farms in 1925 was 5,000,724, of which 1,425,000 ac. is crop land. The total value of the crops, an exceptional year, was $50,000,000. In 1927 the crops were valued at $39,000,000. Between 1920 and 1925 the acreage of farm land remained about the same, but agricultural depression is reflected in the decline of farm population from 140,249 to 108,856. The value of farm land also decreased from $210,998,000 to $159,908,000 or from an average of $41.78 to $32.00 per acre. The area irrigated in 1909, 999,410 ac., increased to 1,100,000 ac. in 1919. By 1919 $32,037,351, or $18.84 per ac. had been invested in irrigation projects. The average yearly cost of maintenance was $1.08 per acre. In the Strawberry project, water is brought from the east side of the Wasatch mountains, through a four-mile tunnel and used in the Utah valley 45 m. away. The Great Salt Lake Basin project, under construction in 1929, is designed to double the irrigated area in the northern valleys. It is an immense scheme, the completion of which requires several years. The water of all streams in Utah is the property of the public and the State engineer has entire charge of its distribution.

The most important crop is hay. In 1927, 644,000 ac. produced 1,574,000 tons of cultivated hay (3·06 tons per ac.) valued at $13,776,000; also 100,000 tons of uncultivated hay; of wheat, 242,000 ac. yielded 5,678,000 bu. (23·2 bu. per acre) valued at $5,792,000. Potatoes in 1927 yielded 2,970,000 bu. on 32,000 ac. (135 bu. per acre). Their value was estimated at $2,228,000. The year 1926 was a poor one for sugar-beets, 52,000 ac. producing but 391,000 tons, the yield per acre being only 7·52 tons as compared with 15·43 tons for 1925. In 1927, 56,000 ac. produced 678,000 tons; 12·1 tons per acre. The production of oats in 1927 on 51,000 ac. was 2,143,000 bu. (40 bu. per acre), valued at $1,285,-000. Barley amounted to 1,410,000 bu. on 30,000 ac. (estimated value, $1,072,000), and Indian corn 494,000 bu. on 19,000 ac. (valued at $543,000). The elevation, in general, is high for Indian corn. In 1927, 34 car-loads of pears, 1,783 car-loads of peaches and 1,660,000 bu. of apples were shipped out of the State.

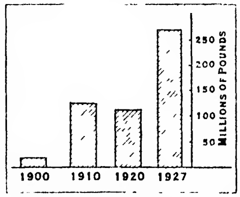


DIAGRAM SHOWING INCREASE IN COPPER PRODUCTION, 1900–27

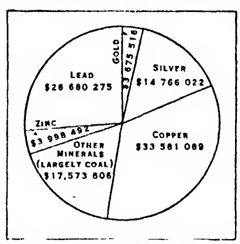
Live stock on the farms (Jan. 1, 1928) was estimated at 2,730,-000 sheep valued at $30,517,000, 368,000 beef cattle valued at $15,014,000; 92,000 milch cows and heifers valued at $7,360,-000, 98,000 swine valued at $1,-225,000, and 106,000 horses and mules valued at $6,479,000. Butter production amounted in 1925 to 7,034,000 lb. as compared with 3,567,000 lb. in 1920. Cheese production similarly increased from 849,000 lb. to 1,753,000 pounds. The wool production for 1927 was 19,975,000 lb., an increase of 8,274,700 lb. or 71% over the production of 1920, giving Utah a rank of fifth among the States.

Mining.—In 1924 Utah led all States of the Union in metal output. Her total mineral production was valued at $84,356,626. Mining products supplied 85% of the freight traffic originating within the State. The mines and mills furnished employment to over 18,000 men, and the wages paid amounted to about $30,-000,000. In value copper was the leading mineral, the 1926 production being worth $36,045,027. The lead production was valued at $23,621,600, coal output at about $12,000,000, silver at $12,079,754, gold at $3,758,800 and zinc at $7,138,453. Utah is very rich in copper, silver, gold and zinc, but, owing to the fact that the ores are always found in combination, it has been impossible, until recently, to recover a high enough percentage of each to realize on the State's fortune. The invention of new selective flotation processes between 1915 and 1925 worked a mining revolution in Utah and sent its production skyward. From 1910 through 1922 Utah had ranked fourth in the production of copper, but from 79,665,000 lb. in 1922 the output leaped in a single year to 210,118,000 lb. for 1923. This placed the State third, and in 1924 it was second, but in 1925 it was passed again by Montana and so dropped to third place. In 1926 Arizona only surpassed Utah in copper output, the amount being 257,464,482 lb. The total metal output for 1926 was $82,622,884. The higher percentage of recovery together with increased prices caused Utah to produce 306,669,824 lb. of lead in 1925, breaking her own record and taking second place among the States. In the same year Utah broke her own record and maintained first place among the States in silver production with 21,276,689 oz. to her credit. Leaching mills with a chloridizing-roasting process were used to recover the silver precipitate.



GRAPH SHOWING VALUE OF MINERAL PRODUCTS MINED IN 1925

The most important non-metallic mineral in Utah is coal, 4,488,157 tons being produced in 1924 and 4,630,000 tons in 1925. Bituminous coal mining was begun for small bee-hive ovens near Cedar City in 1882 to secure enough fuel to work the neighbouring iron mines. Nine-tenths of the coal produced in the State comes from Carbon and Emery counties. Salt, another valuable product, is obtained by means of solar evaporation of the salt brine deposits in the Great Salt Lake regions; 88,000 tons were produced in 1925. During the World War when phosphates were in demand they were mined from large deposits around Great Salt Lake, the Salduro Marsh Alunite especially being used as a source. Since the war, however, this has not paid, but the deposits may be very valuable in the future. Another phosphate

bed 35 ft. thick extends through the Uinta mountains. Native asphalt to the amount of 36,536 tons valued at $664,280 was produced in 1924, also 90,221 tons of gypsum valued at $335,588. In 1925 268,529 tons of iron ore valued at $361,251 were shipped from Utah mines The rare metals uranium and vanadium are produced in small quantities on Yellow Cat, Wash.

Forests and Lumbering.—Heavy spring floods have caused vast damage especially where cutting has left the slopes exposed to erosion. The interests of irrigation also demand that the water be retained on these slopes as long as possible in the spring. Thus, though not so valuable commercially, Utah's forests are highly important as soil conservers. Eight national forests cover 7,455,070 ac. and contain 95% of the timber in the State. Their stand is estimated at 5,225,000,000 board feet Injudicious cutting between 1880 and 1900 almost bared the western slopes of the Wasatch range near Great Salt Lake The cut in 1889 amounted to 14,000,000 and in 1899 to 18,000 000 board feet, but regulation has decreased the output until between 1921–24 it averaged but 7,000,000 board feet annually The mills supply only about one-tenth of the local demand The receipts for annual sales already exceed the cost of the national forests.

Manufacturing.—In 1925 there were 586 manufacturing plants employing 15,901 workers and paying them $19,784,000 annually in wages. The cost of raw material used amounted to $191,590,000 and the value added by manufacturing was $61,838,000. In the various processes 141,671 primary horse power was used The most important products are beet sugar, metal articles, textiles, cement and lime, flour, cereals, butter and cheese Meat-packing plants, creameries and condenseries, canneries, flour mills, saw mills and the various mills for reducing and refining ores are numerous. Between 1920 and 1925 $4,000,000 of capital was added to the flour-mill business In 1924 the manufacture of pig iron was undertaken by the Columbia Iron and Steel Corporation, with a capital of $20,000,000. This corporation has coal mines at Columbia, Utah, iron mines at Iron Springs and blast furnaces at Ironton.

Transportation.—The Old Spanish trail, the Great Salt Lake trail and the Overland trail all aided in the early development of the State. The Union Pacific was the first railway and has continued to be the dominating one, sending its branches into nearly every important mining or commercial centre Other railways are the Denver and Rio Grande Western, the Southern Pacific and the Los Angeles and Salt Lake, operated by the Union Pacific. In 1928 all railways had 3,031 62 m of steam track and 310 61 m. of electric track, exclusive of street railways, within the State. At the close of the 1927 season 3,436 m of road within the State belonged to the State highway system Of this, 1,400 m. were graded and drained, 1,400 were surfaced, either paved or gravelled. The mileage of local and country roads in 1928 was 20,249, of which 3,000 miles were unimproved.

History.—Utah was acquired by the United States from Mexico in 1848 by the Treaty of Guadalupe Hidalgo, which terminated the Mexican War Before Mexico had become an independent nation, however, Utah was a part of Spanish possessions and the Spaniards were its first explorers The first extensive exploration occurred in 1776, when Father Escalante and Father Dominguez set out to find an overland route from Santa Fe to Monterey, on the California coast. Crossing south-western Colorado, they entered Utah in the east about where the Grand river enters the State, continued west across the Green river, followed an Indian trail over the Wasatch range, and descended the Spanish Fork to Lake Utah, where they camped and preached to a large gathering of Indians. From them the fathers heard of a great salt lake to the north, but they did not visit it. Instead they headed south-west, crossing the divide to the Sevier river and thence across Sevier desert. Here their guide deserted them, so they decided to return to Santa Fe. The fathers did not fully accomplish their purpose, but the first part of their route later became part of the old Spanish trail from Santa Fe to Monterey. Three separate parties of American trappers under Wolfskill and Ewing Young journeyed over the entire route in 1830. It was also the road taken by Frémont on his return eastward in 1843–44.

The first Americans to penetrate Utah or the Great Basin region it seems, were the four men Miller, Hoback, Robinson and Rezner, detached in 1811–12 from the overland expedition of John Jacob Astor to trap in eastern Idaho. Their vague account seems to indicate that they crossed north-eastern Utah. There has been much discussion as to who discovered Great Salt Lake. On a map of North America engraved for Gutherie's *New System of Geography* (1811) a considerable lake with no outlet is represented in the same position approximately as Great Salt Lake, and it bears this legend "Lake, etc., laid down according to Mr. Lawrence, who is said to have travelled through to California in 1790–91." As nothing further is known of Lawrence, credit is usually given to James Bridger, who came into the country with a trapping expedition sent out in 1824 by William Ashley of St Louis. The expedition was divided into detachments, Bridger accompanying that which wintered on Bear river, while Étienne Provost led another which may have wintered on Great Salt Lake. If so, Provost was the discoverer of the lake, for Bridger did not make his discovery until the spring of 1825, when, to settle a wager as to the outlet of Bear river, he went down its course to the lake. Finding it salt he believed it was an arm of the ocean. In 1826, the next year, Smith started from Great Salt Lake to explore the unknown south-west to the Pacific. On his return he struggled 20 days across the deserts of Nevada and Utah to reach Great Salt Lake, which he did without loss of a man It was the first expedition to cross the western country by the central route or to penetrate any distance into the basin west of Great Salt Lake, so opening up a vast territory.

It was July 24, 1847 that the first company of Mormons looked upon Salt Lake Valley, and Brigham Young, their leader, said "This is the place." From Feb, 1846, when they were forced to leave Nauvoo, Ill, they had been on the move About 15,000 Mormons crossed Iowa that summer, and wintered along the Missouri in camps they built. In April, Brigham Young's advance party of 143 men, 3 women and 2 children left Missouri with 73 wagons loaded with seeds and implements. In July Parley P. Pratt's party of 1,550 started with 580 wagons This party, typical of later ones, was divided into companies of 100 wagons, and these again into companies of ten, each with its captain. Horses, cattle, sheep, hogs and chickens were taken along. About 2,000 Mormons were in Salt Lake Valley at the end of autumn in 1847. In 1848 other parties were on their way, and about 1,000 wagons arrived that year. But this did not end the expeditions. Missionaries were working throughout the east and in Europe, especially in England and the Scandinavian countries, preaching of the new Zion Party after party crossed the plains by ox-teams in the years following until the Union Pacific railway was built in 1869. Many of the immigrants came from far lands. A fund was provided by the Church to aid the poor, and the money was returned as soon as the immigrant could afford to pay. In 1856 there was such an increased number of poor refugees from Europe that a cheaper way to transport them to Utah was needed. So handcarts were provided them at Iowa City, the terminus of the railroad, and three expeditions set off during the summer. The first reached Utah safely, but the last two were caught by winter storms on the plains, and before they could be rescued 66 of the first party and nearly 250 of the second died from lack of food and the cold

The winter of 1848–49 severely taxed the resources of the pioneer community at Salt Lake, but after the emigration of gold-seekers to California began in 1849 matters brightened. A large percentage of the teams came by way of Salt Lake City and found the settlement a welcome stop on their long journey. The Mormons traded with them, receiving high prices for fresh horses and food supplies. In Feb. 1849, after the South-west was transferred to the United States, a convention was called to organize a State under the name of Deseret. The petition for Statehood was sent in at once and a provisional State Government set up to function meanwhile. In the first election Brigham Young, already the president of the church, was elected governor. Instead of gaining Statehood at this time, Deseret was only made a Territory and its name was changed to Utah. Young's election was confirmed by appointment from the President. In contrast to other

western States, order and harmony prevailed in Utah before the government was established because the Church superintended matters and acted as a Government. Its officials distributed provisions, apportioned lots and farm plots, and ordered what work was to be done and the methods to be followed Even after the territorial government was under way, the church continued to direct affairs, and so often came into conflict with the appointive officers sent out by the Federal Government.

The very same afternoon that the advance body of Mormons reached the valley of Great Salt Lake, three ploughs were put into the soil, potatoes were planted and the waters of City Creek turned over the plot. Thus began the agricultural life upon which their communities were founded, and thus also began the irrigation which was to make agriculture possible. The Mormons were the first to practise irrigation on a large scale in the United States The farm area grew quickly along the western slopes of the Wasatch range, but the church did not rely on that only Explorers were sent in all directions to select the most fertile valleys with plenty of convenient water available. Colonists were then selected, 30 or 40 families from those that were constantly coming, to go and settle each valley. In 1848 the Ogden valley was settled, in 1849 the Sampete valley, in 1850 Utah valley and the valley of Little Salt Lake In time there were few valleys in Utah that Mormon colonies had not settled, spreading like bee swarms from the mother hive at Salt Lake City They really settled by church congregations as in early New England, and the meetings where the pioneers came together and discussed their local affairs resembled the New England town meetings Most of the manufactured articles needed were made in the home, though small grist and saw mills and tanneries were quickly set up In 1850 the U S. census gave the value of manufactures in Utah as $291,-220. Merchants were establishing stores and bringing their stock over the plains from the east by long freight trains, one of them in 1853 numbering more than 400 wagons Coal was early sought, and the mines developed In 1849 iron was discovered, plans for an iron foundry laid, and the call sent to Europe for "blowers, moulders and all kinds of furnace operations" In 1852 the first pig iron was made. Erastus Snow went to England to study the great iron factories of that country and in 1853 became president of the newly incorporated Deseret Iron Company. The mining of precious metals, however, was discouraged by President Young, partly because he felt prosperous farms made better homes than the feverish, impermanent mining camps, and partly because he knew gold discoveries would draw hordes of "Gentiles," out of harmony with his ideals and plans, to his colony. In 1863 when General Conner brought his company into Utah, he allowed his men, many of whom were old California miners, to prospect, and he also actively aided them He himself staked the first claim in the State. Thus even during Young's lifetime many mines were opened. The early ore was sent to Wales for smelting, but in 1870 the Woodhull Brothers of the Little Cottonwood mine completed the first smelter. In 1871 the Walker brothers built the Pioneer Crushing and Amalgamating Mill with 15 stamps to work the silver ore of the Ophir mine, which they had located the previous year. The coming of the Union Pacific railway in 1869 greatly stimulated mining It also brought an influx of non-Mormons who were to increase steadily as the years went by. The Utah Central and the Utah Southern railways built extension lines to the Bingham, Little Cottonwood and American Fork mining districts Later the Utah Eastern passed up Parley's Canyon and helped in the development of the Park City mines. The *Deseret News*, pioneer newspaper of the Rocky mountains, was established at Salt Lake City in June 1850. The *Salt Lake Herald* (independent policy) and the *Salt Lake Tribune* (anti-Mormon) followed. The *Tribune* became the mouthpiece of the liberals

Six separate efforts, in 1849, 1856, 1862, 1872, 1882 and 1887, to gain Statehood were made by Utah. Each time a Constitutional Convention met, a Constitution was drawn up and a petition sent to the Federal Government. They were refused Statehood because of their polygamous practices. The U S Government had enacted legislation in 1862, 1882 and 1887 forbidding polygamy. Resistance was made by the Mormons which resulted in fines, imprisonment, and, in the case of President Taylor, exile Church property amounting to $100,000 was temporarily confiscated Finally in 1890 the church yielded and refused henceforth to sanction plural marriage. The final movement for Statehood came from the U S. Congress in 1893, when it passed the enabling act, one of the provisions of which was that the Constitution of the new State should forever prohibit polygamous marriages The Constitution was framed at a convention in 1895, submitted to the voters at the general election in November and approved The proclamation of admission was signed by the President on Jan 4, 1896 Utah came into the Union with a population of 207,905, property assessed at $97,942,000, 39 banks with deposits of $9,689,267, and 1,376 m. of railway in operation. Such had been its progress since the Mormons made the first settlement in 1847

UTAMARO (1754–1806), one of the best known of the Japanese designers of colour-prints. was born at Kawayoye As a painter, his landscapes and drawings of insects are most highly considered by Japanese critics; but his fame will always rest among Europeans on his designs for colour-prints, the subjects of which are almost entirely women—professional beauties and the like The colour-prints of Utamaro are distinguished by an extreme grace of line and of colour His composition is superb, and even in his lifetime he achieved such popularity among his contemporaries as to gain the title Ukiyo-ye Chūkō-no-so, "great master of the Popular School" His work had a considerable reputation with the Dutch who visited Nagasaki, and was imported into Europe before the end of the 18th century

A UTE INDIAN MAN

UTE, a Shoshonean tribe of western Colorado and eastern Utah which gave its name to the latter State, and, with the Aztecs, to the great Uto-Aztecan family of Indians. The name was pronounced *Yoo-tah*, as preserved in the name of the State Of the Utes, 1,900 remain

UTICA, a city of ancient Africa, 15½ m N W. of Carthage. The site of the town is covered with low-lying marsh lands It was important as a commercial centre, and is mentioned in the commercial treaty of 348 B C. between Rome and Carthage Agathocles easily captured it in 310. After the destruction of Carthage it received the rank of a *civitas libera* with territory After the battle of Thapsus in 46 Cato shut himself up in Utica for the final struggle against Caesar, and there committed suicide. Utica was the seat of a bishop from the 3rd century onwards But its harbour was beginning to silt It was captured by Gaiseric and the Vandals in 439, reconquered by the Byzantines in 534, and finally, in 698, it fell into the hands of the Arabs and was depopu-

lated Very little is left above the level of the ground In 1869 excavations revealed the fortifications, the acropolis, the quays of the commercial harbour and of the military harbour or Cothon; also the ruins of the amphitheatre, which was capable of holding 20,000 spectators, of the theatre, the baths, the reservoirs and the aqueduct which brought drinking water to the city.

BIBLIOGRAPHY —A Daux, *Recherches sur l'origine et l'emplacement des emporia phéniciens dans le Zeugis et le Byzacium* (1869), Ch. Tissot, *Géographie comparée de la province romaine d'Afrique* (1888), ii, pp 57 *et seq*

UTICA, a city of central New York, U S A, the county seat of Oneida county, on the Mohawk river and the State Barge canal, 85 m from Albany, with a municipal airport Pop. (1920) 94,156 (20% foreign-born white, including 1,376 from Wales), 1928 local estimate 109,000.

The city covers 22 sq m, at an altitude of 450 ft Also, it is the seat of a State hospital for the insane (1843) and the extensive State Masonic home (1893) There are 200 m of paved streets, and a park system embracing over 600 ac. The valuation for 1927 was $131,482,683 The water-supply (privately owned) comes from the Adirondacks Hydro-electric power is developed at Trenton falls (15 m. N) and the city is one of the loading centres of the system serving the eastern States There are two daily papers. the *Observer-Dispatch*, established in 1793, and the *Press* (1882) Weeklies are published in Welsh, German, Polish and Italian Utica has several musical organizations of long standing and a wide reputation A Welsh eisteddfod lasting through several days is held annually, under the auspices of the Cymreigyddion Society

Utica manufactures a third of the knitted underwear made in the country, also producing cotton cloth, ventilating and heating apparatus, cotton yarn, sheets and pillowcases and men's clothing. The output in 1925 was $77,553,719. The retail trade embraces a population of 350,000

The site of Utica was in the 22,000 ac manor granted by George II in 1734 to William Cosby and his associates During the Seven Years' War a palisaded fort was built here, at the ford of the Mohawk, and named after Col Peter Schuyler Later, when Ft Stanwix at Rome was renamed Ft Schuyler, the Utica fort was known by the name Old Ft Schuyler In 1792 Cosby's manor was put up for sale by the sheriff, and was bid in by Gen Philip Schuyler, Gen John Bradstreet, John Morin Scott and others, for £1,387 (about 15 cents an acre) After the close of the Revolution settlers began to come in, largely Palatinate Germans from the lower Mohawk. In 1786 the proprietors had the manor surveyed, and in 1788 an inn was built New settlers came, from New England, among whom in 1789 was Peter Smith (1768–1837), later a partner of John Jacob Astor, and father of Gerrit Smith, born here in 1797 In 1792 a bridge was built across the Mohawk In 1797 Oneida county was established and the village was incorporated under the name of Utica It was chartered as a city in 1832. By 1860 it had a population of 22,529, which grew to 33,914 in 1880 and 56,383 in 1900 In the next two decades it increased 32% and 26 5% respectively, and between 1910 and 1925 the area within the corporate limits was more than doubled

UTILITARIANISM, the form of ethical doctrine which teaches that conduct is morally good according as it promotes the greatest happiness of the greatest number of people (Lat. *utilis*, useful) The term "utilitarian" was noticed by J S. Mill, in a novel of Galt, but it was first suggested by Bentham

It is in a clerical work written against Hobbes, Bishop Cumberland's *De Legibus Naturae* (pub in 1672), that we find the beginnings of utilitarianism.

Another clergyman, John Gay, in a dissertation added to Law's translation of Archbishop King's *Origin of Evil* (pub in 1731) expanded Cumberland's doctrine Further advances along the same line of thought were made by Abraham Tucker in his *Light of Nature Pursued* (pub. 1768–74) Gay and Tucker supplied nearly all the important ideas of Paley's *Principles of Moral and Political Philosophy* (pub. in 1785), in which theological utilitarianism is summarized and comes to a close. Hume's *Inquiry concerning the Principles of Morals* (pub. in 1751), though utilitarian is very far from being theological. Hume, taking fo granted that benevolence is the supreme virtue, points out tha the essence of benevolence is to increase the happiness of others

Bentley, the founder of political utilitarianism, took up th greatest happiness principle not as an attractive topic of study but as a criterion to distinguish good laws from bad. Sir Joh Bowring tells us that when Bentham was casting about for suc a criterion "he met with Hume's *Essays* and found in them wha he sought" These opinions are developed in his *Principles o Morals and Legislation* (pub. in 1789) and in the *Deontolog* (published posthumously in 1834) Philosophically Bentham makes but little advance upon the theological utilitarians. Hi table of springs of actions shows the same mean-spirite omissions that we notice in his predecessors; he measures th quantity of pleasures by the coarsest and most mechanical tests and he sets up general pleasure as the criterion of moral goodness These principles of Bentham were the inspiration of the philosophic radicals of the early 19th century From Bentham th leadership in utilitarianism passed to James Mill, who made n characteristic addition to its doctrine, and from him to Joh Stuart Mill whose essay *Utilitarianism* (pub. in 1863) sums u in brief and perfect form the essential principles of his doctrine The last writer who, though not a political utilitarian, may b regarded as belonging to the school of Mill is Henry Sidgwick whose elaborate *Methods of Ethics* (1874) may be regarded a closing this line of thought.

Even before the appearance of Sidgwick's book utilitarianism had entered upon its third or evolutional phase, in which principle borrowed from biological science make their entrance into mora philosophy The main doctrine of evolutional or biological ethic is stated with admirable clearness in the third chapter of Darwin' *Descent of Man* (pub. in 1871) The most famous of the sys tematic exponents of evolutional utilitarianism is, of course, Her bert Spencer, in whose *Data of Ethics* (1879) the facts of morality are viewed in relation with his vast conception of the total proces of cosmic evolution. The best feature of the *Data of Ethics* is it anti-ascetic vindication of pleasure as man's natural guide t what is physiologically healthy and morally good Leslie Stephen with less brilliance but more attention to scientific method worked out in his *Science of Ethics* (1882) the conception of morality as a function of the social organism

UTILITY. In economics the utility of a good is not conceived to be its usefulness, as judged by any objective standard, but its importance to a consumer. Capacity to excite desire rather than to yield benefits or bestow happiness is the measure of a good's utility, in this technical sense, and only as the conduct of life is completely rational and guided by adequate foresight are the two capacities the same

The law or principle of *diminishing utility,* which serves in economics as a logical foundation for the laws of demand, is merely a general statement respecting an obvious aspect of the way in which men apportion their time and their means Summarized, it is that progressively diminishing importance is attached by a consumer to successive additional increments of a good. Diminishing utility has two aspects. absolute and relative One suit of clothes is more important than a second, and a second is more important than a third It is more important that in a cold climate one should have coal enough to keep one room warm during the winter than that a second, or a third or a fourth room should be heated. It cannot be said, however, that

all luxuries and particularly such as minister to the "desire for distinction," have different uses which can be ranked in an order of diminishing importance.

Marginal utility is the utility of the last increment (not necessarily last in point of time) which the consumer thinks worth acquiring. (*See* also ECONOMICS and VALUE) (A. Yo.)

UTMAN KHEL, a Pathan tribe who occupy the hills to the north of Peshawar in the North-West Frontier Province of India. They claim to be descendants of Baba Utman, who accompanied Mahmud of Ghazni in his expedition into India in 997. The Utman Khel are a tall, stout and fair race, but in dress and general customs follow the neighbouring peoples of Bajour.

UTO-AZTECAN FAMILY, perhaps the most numerous and important stock of North American Indians, is named after a representative northern and southern tribe, and it extended in a long irregular tract, broken only in Arizona, from Idaho to Tabasco, Mexico, and beyond as far as Panama in scattered populational islets The bond of union was linguistic and geographic, not racial or cultural. In customs there is little common to the lowly northern tribes and the barbarically advanced ones of southern Mexico.

The organization is as follows, tribes separately treated being asterisked:— I, Shoshonean sub-family. (*a*) Pueblo branch, *Hopi; (*b*) Plateau branch, comprising 1, *Ute, southern *Paiute, Chemehuevi, Kawaiisu; 2, *Shoshone, *Comanche, Gosiute, Panamint; 3, Bannock, northern *Paiute (Paviotso),*Mono; (*c*) Kern river branch, Tubatulabal; (*d*) southern California branch, comprising 1, Serrano; 2, *Gabrielino; 3, Luiseño, Cahuilla, Juaneño, Cupeño II Piman or Sonoran sub-family. *Pima, *Papago, Sobaipuri, *Tarahumare, Opata, Mayo, *Yaqui, Tepecano, Tepehuane, Cora, *Huichol, etc III. *Nahua sub-family, in which the *Toltec and *Aztec were most conspicuous (A. L. K.)

UTOPIA, an ideal commonwealth whose inhabitants exist under perfect conditions Hence *Utopian* is used to denote a visionary reform, which fails to recognize defects in human nature The word first occurs in Sir Thomas More's *Utopia,* published in Latin as *De optimo Reipublicae statu, deque nova insula Utopia* (Louvain, 1516) It was compounded by More (*q v*) from the Greek *οὐ*, not, and *τόπος*, a place, no-where.

The idea of a Utopia is, even in literature, far older than More's romance; it appears in the *Timaeus* of Plato and is fully developed in his *Republic.* The idealized description of Sparta in Plutarch's life of Lycurgus belongs to the same class of literary Utopias. A similar idea occurs in the Greek, and the mediaeval Norse, Celtic and Arab legends which describe an earthly paradise in the western or Atlantic ocean (*see* ATLANTIS) Few of these survived after the explorations of Columbus, Vasco da Gama and others in the 15th century; but in literature More's *Utopia* set a new fashion· the imaginary voyager arrives at the ideal state. In Bacon's *New Atlantis* (1624–29) science is the key to universal happiness; Tommaso Campanella's *Civitas Solis* (1623) portrays a communistic society; James Harrington's *Oceana* (1656), which had a profound influence upon political thought in America, is a treatise rather than a romance, and is founded on the ideas that property, especially in land, is the basis of political power, and that the executive should only be controlled for a short period by the same man or men With these may be compared the Christian Utopias, J. V. Andreae's *Christianopolis* and S Golt's *Nova Solyma* (1648). Bernard de Mandeville's *Fable of the Bees* is unique in that it describes the downfall of an ideal commonwealth. Other Utopias are the "Voyage en Salente" in Fénelon's *Télémaque* (1699), Vairasse's *Histoire des Sevarambes* (1716), Mercier's *L'An 2440* (1742); James Burgh's *Account of the Cessares* (1764); J. B. Say's *Olbie* (1800); Etienne Cabet's *Voyage en Icarie* (1848); Bulwer Lytton's *The Coming Race* (1871); Samuel Butler's *Erewhon* (1872) and *Erewhon Revisited* (1901); Edward Bellamy's *Looking Backward* (1888); William Morris's *News from Nowhere* (1890); H. G. Wells's *Anticipations* (1901), *A Modern Utopia* (1905) and *New Worlds for Old* (1908). Many Utopias, like the *Fable of the Bees* and *Erewhon,* are satires. Others are inspired by socialistic ideals; among these may be mentioned *Freiland, ein soziales Zukunftsbild* (1890) and *Reise nach Freiland* (1893), by the Austrian Theodor Hertzka (b Budapest, 1845), portraying a commune in Central Africa

UTRECHT, the smallest Netherlands province, has the Zuider Zee washing its very short northern frontier. The south-east polder now being drained will be in contact with Utrecht (*see* NETHERLANDS, *Impoldering*), but its present area is 526 sq m , and with a population of 384,574 (1926) it ranks third in the list of most densely-populated provinces This is also the position which it occupied at the beginning of the 20th century, but between 1900 and 1926 its average density increased from 470 per sq m to 707 per sq mile Utrecht city (*q v*) has over 151,000 inhabitants (fourth in the country) and Amersfoort nearly 36,000 The other settlements are relatively small The province falls entirely within the Rhine delta. (*See* NETHERLANDS, *Relief*) The southern limit of the Scandinavian ice passed diagonally through the province from north-west to south-east in the vicinity of Utrecht city, and the western part of the province consists of clay lands and, in the north-west, of low fen The sand and gravel eastern region is covered with bare heaths and patches of woods, and the occupations of the scanty population are chiefly those of buckwheat cultivation and peat-digging Amersfoort is here the only large town, but along the western edge of this tract there is a row of thriving villages, such as Amerongen, Driebergen, Doorn and Zeist The southern area is picturesque with more extensive woodlands and has long been popular for country seats Zeist provided a hunting-box for William III , and Doorn a retreat for ex-Kaiser Wilhelm II Venendaal, on the south-eastern border, is a market for the local bee-keeping industry Amersfoort, one of the chief seats of the Old Catholics, is now a thriving garrison town, with a variety of crops, including tobacco, growing on the sandy hills in its neighbourhood It retains the Koppelpoort spanning the Eem, a gateway which is probably the finest and least altered mediaeval entry to any town in the Netherlands Within the town the old ramparts are now laid out as leafy promenades Baarn, farther downstream, is a popular summer resort for Amsterdam citizens, and on the east side of the Eem are the typical peaceful fishing villages of Bunschoten and Spakenburg

At Maarsen, near Utrecht, is situated Zuylen castle, which is of some note. Rhenen was once the seat of an independent lordship, though afterwards joined to the bishopric of Utrecht The ancient church has a fine tower (1492–1531). Wijk-by-Duurstede, originally a Roman settlement, was of considerable commercial importance as early as the time of Charlemagne, but decayed owing to Norman raids in the 10th century The tower of the ruined castle of the bishops of Utrecht still stands

Ecclesiastical History.—The province represents the bulk of the ancient see, founded in 722 by St Willibrord The bishopric was weak compared with Holland, Gelderland and Brabant, and the middle ages saw local wars Holland's growth in the 14th century forced Gelderland and Brabant to relinquish their claims over the see. Later, in the 15th century, her supremacy passed to the dukes of Burgundy and, still later, to the emperor Charles V Notwithstanding the elevation of Utrecht to an archbishopric (1559), it was one of the seven provinces on the Protestant side which signed the Union of Utrecht (1579) against Spain The chapter of the see was secularized and the power of the members of the five ecclesiastic colleges was severely curtailed Under the vicariate of de la Torre (1651), trouble began with Rome, which claimed the right of appointing successors It started in 1702 when Codde, the nominee of the Dutch secular clergy, was accused by the Jesuits of Jansenism (*q v.*). Although innocent, he was deposed, and his chief opponent, de Kock, was appointed in his stead De Kock was expelled from the country by the States-General and the Church of Utrecht was without a head

In 1713 the French Government enforced the bull *Unigenitus*, and in the following years many refugee priests entered Holland, including Dominique Varlet who settled in Amsterdam in 1720 Steenoven, in 1723, was elected archbishop by the chapter of Utrecht and his subsequent consecration by Varlet led to a general excommunication by the pope. The Jansenist Church of Holland has continued as an independent body accepting the general councils, but rejecting *inter alia* the Vatican council and the infallibility

of the pope. Two suffragan sees were created. Haarlem (1742), Deventer (1757); and though, in the following century, the Church lost membership, yet it has recently attracted numbers of the less rigid Roman Catholics. At first the Jansenist church of Utrecht established close relations with the Old Catholic movement in Germany, but it subsequently viewed with strong disapproval the departures of the German members from Catholic tradition. The Jansenists refused to recognize the validity of Anglican orders, and in 1908 a singular offshoot of the Church of Utrecht was established in England when Dr. Gerard Gul (Jansenist archbishop of Utrecht) consecrated Arnold Harris Mathew, bishop of the Old Catholics in England. Meanwhile, in 1851, in Holland itself the Roman Catholic hierarchy had been restored, with Utrecht as the archiepiscopal see

For general statistics *see* NETHERLANDS.

UTRECHT, a city of Holland, capital of the province of Utrecht, on the Crooked Rhine, which here divides into the Old Rhine and the Vecht Pop (1927), 151,045 It is an important junction station 22 m S S E. of Amsterdam by rail It is a picturesque and interesting old town The line of the ancient ramparts, demolished in 1830, is now only marked by the Singel, or outer canal, which surrounds the oldest part of the city, with pleasant gardens and promenades laid out on the inside Two canals, the Oude and the Nieuwe Gracht, intersect the town from end to end Utrecht is the seat of a university, and of a Roman Catholic archbishopric. It is also the seat of the archbishop of the Dutch Old Catholics. The Domkerk, dedicated to St Martin, is a large Gothic building erected in 1254–1267 on the site of the original church founded by St Willibrord about 720 and completed by Bishop Adelbold about 1015 An open space forming the heart of the square in which the church stands separates the solitary western tower (14th century) from the choir and transept, the nave having been blown down by a violent hurricane in 1674 and never rebuilt. In the crypt are preserved the hearts of the German emperors Conrad II (1039) and Henry V. (1125). The Roman Catholic cathedral of St Catherine dates from 1524 and has been restored in modern times Other churches of very early foundation in Utrecht are the Pieterskerk and the Janskerk Attached to the Domkerk by fine old Gothic cloisters is the university, which was founded in 1634 and enlarged in 1894.

Connected with the university are a valuable library, occupying the palace built for Louis Bonaparte, king of Holland, in 1807, and containing upwards of 200,000 volumes and mss ; a museum of natural history; a botanic garden; an observatory, etc. The archiepiscopal museum (1872) contains examples of all branches of sacred art in the Netherlands In the Museum Kunstliefde is a small picture-gallery, chiefly remarkable for some pictures by Jan Scorel (1495–1562); the museum of antiquities contains a miscellaneous collection Other buildings of interest are the museum of industrial art; the so-called "Pope's house," built in 1517 by Adrian Floriszoon Boeyens, afterwards Pope Adrian VI., and a native of Utrecht, the royal mint of Holland, the Fleshers' Hall (1637); the home for the aged, occupying a 14th-century mansion, and the town hall (1830)

The country round about Utrecht is pretty and plentifully studded with country houses, especially on the road to Arnhem Close by, on the north-east, is the village of De Bilt, the seat of the Dutch meteorological institute Four miles north-west of Utrecht stands the 13th-century castle of Zuilen, which was carefully restored in 1752, and is still in excellent preservation Five miles east of Utrecht is the village of Zeist, the seat of a Moravian settlement established here in 1746 There are also a fine castle (1667) and grounds, a sanatorium for children and numerous modern villa residences At Ryzenburg, close by, is a Roman Catholic seminary, founded in connection with the establishment of the Roman Catholic hierarchy in 1853 and practically serving as an archiepiscopal palace.

History.—Utrecht (*i e., Oude Trecht* or Old Ford, rendered in Latin documents *Vetus Traiectum*) is a city of great antiquity. The place is mentioned in the itinerary of Antoninus, but its importance began when St. Willibrord (*q.v.*), the apostle of the Frisians, established his see there. The bishop's seat had to be fortified against the incursions of the heathen Frisians and Northmen, and the security thus afforded attracted population till, after the destruction of its rival Dorestad by the Normans in the 9th century, Utrecht became the chief commercial centre of the northern Netherlands. On the accession of Bishop Balderic (A.D. 918–976) to the see, Utrecht had just been sacked by the Northmen. He succeeded in driving the raiders away, rebuilt the walls, and during the 58 years of his episcopate the town grew and prospered. Its gradual acquisition of civic rights followed the same line of development as in the German episcopal cities Bishop Godebald (1122–1127) granted to the inhabitants of Utrecht and of Muiden, the neighbouring port on the Zuider Zee, their first privileges, which were confirmed (June 22, 1122) by the emperor Henry V. The magistrates, the *Schout* or high bailiff and his assessors, the *Schepenen* (*scabini, échevins*), were nominated by the burgrave from the order of knights. In 1196 we read for the first time of councillors as assessors of the magistrates, but these, who a little later were known as the *Raad* or council, were also nominated. As the 13th century advanced, the council, representing the wealthy and powerful gild of merchants, began to take a larger share in the government, and to restrict more and more the direct exercise of the episcopal authority.

The struggle between the town of Utrecht and its ecclesiastical sovereign reached its climax (1481–84) in the "groote vorlag," or great quarrel, between the citizens and Bishop David, the Bastard of Burgundy. With the aid of John, burgrave of Montfoort, who had been called in, and endowed with supreme power for the defence of the town, the Utrechters defeated all the efforts of their bishop, aided by the Hollanders and an aristocratic faction They only succumbed when the weight of the archduke Maximilian was thrown into the scale against them (1484). The struggle continued with intermissions till 1527 when Bishop Henry of Bavaria sold his temporal rights to the Emperor Charles V. Utrecht took a leading part in the revolt of the Netherlands. The union of the seven northern provinces, proclaimed at Utrecht in 1579, laid the foundation of Dutch independence (*see* NETHERLANDS) After the death of William the Silent, the Utrechters, jealous of the influence of their old enemies the Hollanders, elected a stadtholder of their own. The Roman Catholics had but little influence on the city, where the aristocrats inclined to the moderate (libertine) opinions advocated by the preacher Hubrecht Duifhuis, while the democrats were organized in the new church order introduced by the uncompromising Calvinist Petrus Dathenus (d 1581). After the advent of the earl of Leicester as governor-general of the Netherlands in 1585, the previous dominance of the aristocrats was broken and the ultra-Calvinistic Adolph, count of Nuenar, who was elected stadtholder, placed the people in power. The English governor-general made the town his headquarters during residence in the Netherlands, and took it under English protection. His withdrawal from the Netherlands was followed by the return of the aristocratic party to power From this time until the French Revolution, the democratic institutions of the city remained only a name.

UTRECHT, TREATY OF, the general name given to the important series of treaties which in 1713 and 1714 concluded the War of the Spanish Succession (*q v*).

The congress opened on Jan. 29, 1712 But it was not until July 10, 1712, that King Philip of Spain signed a renunciation of his rights to the succession of the crown of France. Then, England and France having concluded a truce, the pace was quickened and the main treaties were signed on April 11, 1713.

By the treaty between England and France Louis XIV. recognized the Protestant succession in England and undertook to give no further aid to the Stuarts. France ceded to England, Newfoundland, Nova Scotia or Acadia, the island of St. Kitts or St. Christopher, and the Hudson's bay territory, and promised to demolish the fortifications of Dunkirk.

The treaty between France and the United Provinces was mainly concerned with securing the barrier of fortresses. These arrangements were somewhat complicated and to a large extent provisional, as Austria and Bavaria, two countries deeply interested in the fate of the Netherlands, had not yet assented to

the terms of peace. By a commercial treaty concluded on the same day, France gave the Dutch privileges similar to those enjoyed by England. Other treaties concluded at the same time were between France and Savoy, France and Prussia, and France and Portugal By the first the duke of Savoy regained Savoy and Nice, and France undertook to obtain for him the island of Sicily and the title of king. By the second Prussia secured some small additions of territory, including part of Gelderland and Neuchâtel; in return France definitely and finally obtained the principality of Orange. The treaty between France and Portugal mainly concerned the Portuguese settlements in Brazil, her claim to these being recognized by France.

Other treaties were signed at Utrecht between Spain and the allies, Philip now concluding these as the recognized king of Spain. On July 13, 1713, a treaty was signed between England and Spain, which embodied certain commercial arrangements previously made between the two countries Spain ceded to England Gibraltar and Minorca, and promised to give up Sicily to Savoy She gave also to England the monopoly for 30 years of the lucrative slave trade with Spanish America, hitherto enjoyed by France. this was the famous Asiento Treaty. The peace between Spain and the United Provinces was signed on June 26, 1714, but the conclusion of that between Spain and Portugal was delayed until the following February The former was concerned mainly with commercial matters, Spain giving the United Provinces most-favoured-nation treatment.

The Treaty of Utrecht also provided compensation for the Emperor Charles VI as soon as he surrendered his claim to Spain. He was to receive Naples and Milan, and also the Spanish Netherlands, henceforward known as the Austrian Netherlands

But the general pacification was still incomplete, as France and the Empire continued at war It was not long, however, before Charles VI. realized that without allies he was no match for France Accordingly, his representative, Prince Eugène, met the French marshal Villars at Rastatt in Nov 1713, and here peace was made on March 7, 1714, Charles VI concluding the treaty without waiting for the assent of the States of the Empire This consent, however, was necessary, and a little later the representatives of some of the princes of the Empire met those of France at Baden, where, on Sept 7, 1714, the Treaty of Baden, the last of the treaties included in the general peace of Utrecht, was signed This dealt entirely with the question of the frontier between France and the Empire, which was restored as it was before the war except that France gained Landau

One other important matter was dealt with at Utrecht A second barrier treaty between England and the United Provinces was signed on Jan. 30 1713, and a third treaty signed at Antwerp on Nov. 15 1715 clinched the matter Seven fortresses were to be garrisoned by a total of 35,000 men, three-fifths of the cost being borne by the imperial government and the remainder by the United Provinces

The treaties were bitterly assailed by the Whigs, and after the accession of George I. four of its Tory authors, Bolingbroke, Oxford, Ormonde and Strafford, were impeached for concluding it, the charges brought against them being that they had corresponded with the queen's enemies and had betrayed the honour and interests of their own country.

BIBLIOGRAPHY.—The text of the treaty of Utrecht is published as the *Actes, mémoires et autres pièces authentiques concernant la paix d'Utrecht* (Utrecht, 1714–15); and by C. W. von Koch and F Schöll in the *Histoire abrégée des traités* (1817–18). As far as it concerns the party politics of England, there is much about the peace in Dean Swift's works. *See* also C. Giraud, *La Paix d'Utrecht* (1847), I. S Leadam *Political History of England 1702–1760* (1909); A W Ward in the *Cambridge Modern History*, vol v. (1908), and the *State Trials* for the proceedings against the impeached English ministers But perhaps the most valuable work on the whole peace is O. Weber's *Der Friede von Utrecht. Verhandlungen zwischen England, Frankreich, dem Kaiser und den Generalstaaten 1710–1713* (Gotha, 1891).

UTTOXETER, a market town of Staffordshire, England Pop. of urban district (1921) 5,363. The town lies on high ground near the river Dove.

Uttoxeter (*Wotocheshede, Uttokeshather, Utcesier, Uttoxater*) formed part of the estates of Algar, earl of Mercia; at Domesday it was held by the king; later it passed to the Ferrers family and in the 12th century Earl Robert de Ferrers constituted Uttoxeter a free borough. Uttoxeter, with the rest of the honour of Tutbury, escheated to the Crown in 1266; it was regranted to Edmund Crouchback, and belonged to the duchy of Lancaster until 1625.

In 1308 Thomas, earl of Lancaster, obtained the grant of a fair on the vigil, day and morrow of St. Mary Magdalene. The market was the greatest in that part of England for cattle and provisions; The church of St. Mary has a fine Decorated tower and spire; the rest of the fabric dates from 1828. Alleyn's grammar-school was founded in 1558 At Denstone, 5 m. N. of Uttoxeter, is St Chad's School

UXBRIDGE, a market town in Middlesex, England. Pop (1921) 3,394 Near the Grand Junction canal there are sawmills, and wharves for timber, coal and slates There are also flour mills, a brewery and engineering works. Uxbridge is said to date from Alfred the Great. but is not mentioned in Domesday. Here negotiations were begun, on Jan 30, 1645, between the commissioners of Charles I and the parliament, but were broken off on Feb 22 A part of the "Treaty House," in which they were carried on, remains In 1647 the parliamentary headquarters were in the town It remained a garrison town until 1689. It was granted a market by Henry II.

UXBRIDGE, a town of Worcester county, Massachusetts. Pop (1920) 5,384; 1928 local estimate 6,500. It is in a picturesque region of low hills and small lakes. The principal industry is the manufacture of woollen goods Uxbridge was divided from Mendon and incorporated as a town in 1727.

UXMAL, the ruins of an ancient Mayan capital city of the new empire about 50 m S of Merida, in Yucatan, Mexico; in 89° 42′ W and 20° 18′ N It was one of those frontier Mayan cities that did not rise to prominence until shortly before A D. 1000 when the League of Mayapan was formed with three cities, Mayapan, Chichen-Itza and Uxmal dominant in "the New empire" of the Mayas With the earlier fall of the Old empire in Guatemala and southern Mexico the Itza established themselves at Chichen (The mouths of the Wells), the Cocom made Mayapan their capital, and the Tutul Xiu, a kindred tribe, settled at Uxmal The period subsequent to the formation of the League of Mayapan constitutes the golden age of the New empire of the Mayas, when peace and plenty provided favourable opportunity for the development of trade and religion and science and art, particularly architecture. Great stone temples and colonnades elaborately carved and ornamented rose in every city; religion flourished; the sciences, especially astronomy and mathematics, were fostered; and a renaissance of culture held sway for over two centuries The buildings of this period at Uxmal surpassed those of the other cities in their grandeur and elegance. When the New empire crumbled under internal dissension and the conquest of the Aztec-Toltec imperialists from central Mexico, about the middle of the 15th century, Uxmal succumbed with the rest, and it is reasonably certain that only vagrant tribes lingered about the old ruins at the time of the Spanish conquest

The region of the Uxmal ruins, like most of Yucatan, is a dry grass savanna, in places rather heavily wooded as about Uxmal. The relief is negligible, the terrain for the most part being as level as a floor, though a range of low hills lies between Uxmal and Ticul, the railway station about 20 m. eastward. The water-supply of the city was furnished by "cenotes," or wells, within the city, or by pools some distance to the west, now partly filled up and vanished, but in the rainy season so marshy as to be the breeding-places of myriad mosquitoes that spread malaria, fever and disease. It may have been some of the mosquito-borne pestilences that destroyed the Mayan civilization.

The main ruins occupy an area not much over 160 ac., but outlying remnants indicate a residential district much larger, for which the central group, massive and extremely impressive, merely constituted the religious and civic nucleus The stone used in the structures is the pale, yellowish and reddish-grey limestone, obscurely marbled, which was probably obtained not far from the

city, though the quarry has not yet been definitely located. The body of the walls and the framework of the temples is generally of fragmental stone set in a whitish mortar of excellent composition made of lime burned in the neighbourhood The facings and ornaments are all cut exquisitely yet daringly, and in view of the fact that the Mayan artisans laboured without metal tools, the excellence of their work is amazing The faces and edges are graved and hewn with perfect precision and the joints are in many cases so perfect as to conceal the mortar Much plastering was done, and nearly all surfaces, and apparently even the intricate details of mouldings and sculptures were smoothed painstakingly by white plaster and finished in many colours

The walls are massive, averaging 3 ft in thickness, but in some ruins 9 ft, approximately vertical on the exterior to the full height, and to the spring of the arch inside. Few recesses or projections disturb the smoothness of the exterior walls, but elaborate ornamentation relieves the monotony Rigid mouldings divide the walls into upper and lower zones, the latter faced with smooth stone except for a narrow band of design near the base, and the former, a development of the entablature, compositely graven and bordered by a heavy band of mouldings at the top The shoe-shaped coping stones held the level cement roof The corners of the buildings were square or rounded No windows or other openings admitted air or light (or mosquitoes) The doorways, confined to the lower panel of the wall, were simply constructed and of medium to large size The jambs were faced with cut stone and the longer lintels were of zapote wood dressed square or partially so.

The buildings were generally long rectangular with one, or more usually two, ranges of rooms, and as a rule these buildings were arranged in groups of four forming a quadrangle. None of the buildings was over one storey in height, and nearly all were built on terraces or pyramids of varied ground plan and profile The rooms were high and spacious, with vaulted ceilings formed of the usual wedge-shaped arch built from horizontally laid stones corbelled and bevelled with the slope Stairways were numerous, wide, steep and well built of cut stone

Five principal buildings or groups of structures were the pyramid-temple of the Magician crowning a majestic pyramid 80 ft. high and 240 by 180 ft. at the base; the Nunnery quadrangle composed of four large rectangular buildings enclosing a court, all on a terrace 300 ft square and 15 ft above the level of the plain, and all divided into numerous small rooms probably occupied by the priesthood, the Governor's palace, an imposing structure set upon a triple terrace, and said to be the most important single unit of its kind in America; the House of the Turtles, a smaller structure distinguished by a frieze of sculptured turtles on the moulding; and the House of the Pigeons, a quadrangle like the Nunnery quadrangle, of which one building carries a peculiar roof-comb of colossal size perforated by hundreds of openings which make it appear like a great dove-cot, and which may have been occupied by statues like the roof-combs of Palenque Besides these a number of smaller or less important ruins or groups of ruins dot the locality and help to create a scene of ancient power, prosperity and culture, probably unsurpassed in Yucatan and certainly rivaled only by Mayapan and Chichen-Itza.

UZ, a land, the scene of the story of the book of Job Its precise location is uncertain, but the name in the Old Testament appears to be associated with three districts.

(1) *Northern Mesopotamia*, a district to which Uz, son of Aram, is commonly referred (Gen x 23).

(2) *Damascus* and the country lying to the south of it. Josephus (Antiq i. 6. 4.) commenting on Gen. x. 23, remarks that Uz founded Trachonitis and Damascus.

(3) *Edom.* In Gen xxxvi. 28, Uz appears in the genealogy of Seir in the land of Edom, and in Lam. iv. 21, Uz stands as a parallel to Edom.

The suggestion has been made that if the name is so widespread, the explanation may be that it is tribal rather than territorial The transcription of the name in the Greek version suggests the Arabic *Audh* a well known deity, and might well be a tribal designation. Lam. iv. 21 appears to be the sole passage, which gives a clear indication of locality, and it is emphatic for Edom.

See S. R. Driver and G. Buchanan Gray, ***The Book of Job*** (1921), p. xxvii. *seq.* (E. Ro.)

UZBEK or **UZBEG REPUBLIC,** an administrative unit of Russian Central Asia, created in 1924. Area 186,251 sq kilo.; pop (1926) 4,447,600 Afghanistan lies to the south, the Turkmen S.S.R. to the west, Kazakstan to the north, and the Kirghiz A.S S R and the Tadzhik A S S R. to the east. Its territory including the Autonomous Tadzhik S S R and the mountain Badakshan autonomous area (*q v*) includes the oasis of Khwarezm, Khorezm or Khiva, Samarkand and most of the former khanate of Bokhara, with the Ferghana valley

Physical Characteristics.—The region is an ancient centre of oasis cultivation dependent on irrigation from glacier fed streams which are fullest at the time of the melting snows and are thus peculiarly favourable to agriculture. Its life depends on the Syr Darya, Amu Darya and Zarafshan rivers, on the spongy loess soil, and on the clear sunshine and heat of summer which combine to give rich harvests of grain and fruit to the cultivator The climate is continental, with little rain or cloud, and with intense bright sunshine in the six summer months Extremes of temperature range between −25° C and 47 5° C or more, the contrast being greatest in the plains and least in the hill regions The severe winter prevents the growth of perennials, but annuals flourish in the summer heat Rainfall is always inadequate, but varies greatly from year to year

The Zarafshan feeds the oases of Samarkand and Bokhara, the former getting the first and freshest supplies It rises in a glacier in the Alai mountains of the Tadzhik A S S R and flows through a longitudinal valley with the Turkistan range to the north and the Hissar range to the south, its total length being 400 m. and its average gradient 21 feet per mile Formerly it reached the Amu Darya, probably near Charjui, but now 12 m of sand, the Sundukli desert which connects the Kyzyl Kum from the north, and the Trans-Caspian Kara Kum from the south, intervene and the river is lost in the creeping wind-blown sands which are slowly advancing on the little town of Kara Kul, the last settlement dependent on the "gold-strewer," as the Zarafshan is called.

The Kara Darya and the Naryn in the north-east unite near Namangan to form the Syr Darya and upon them depends the Ferghana valley with Andijan, Marghelan, Ferghana, Khokand and Khojent Tashkent lies to the north on the Chirchik tributary of the Syr Darya A short portion of the Amu Darya forms the southern boundary of Uzbekistan and receives the right bank Surkhan tributary; the river then flows north-west through the Turkmen S S.R. until it re-enters Uzbekistan and feeds the oasis of Khiva (*q v*) now suffering from difficulties caused by the increasing desiccation of the region and from the perpetual eastward shift of the river on its course to the Aral sea. Formerly the river entered the Caspian by the Sary-kamysh depression and the oasis was then much more prosperous Desert everywhere encroaches on the oases, in the north-east the famine steppe or Bak-pak-dala, with its salty dark grey clay soils, approaches close to Khojent. The Kara Darya and Naryn bring down vast quantities of sand which is deposited near their banks and especially on the banks of the Syr Darya, in the region where it cuts its way through the Khojent-Ajar ridge

Under the influence of the south-westerly winds this vast expanse of sand everywhere steadily encroaches on cultivated lands In the north-west the Kyzyl Kum is advancing towards the Kamimikh district, and the oasis of Khiva lies between the Kyzyl Kum and the Kara Kum deserts. Even in the fertile Ferghana valley there are stretches of rubble and stony, as well as of sandy, desert. The whole area is undergoing geological change; rivers have changed their courses and lakes their outlines, while in some cases they have dried up altogether. Traces of dried-up lakes and of river beds which were the main arteries of prosperous regions within the period of written history, are evident. Bokhara and

Khiva owe part of their decay to this gradual desiccation. Earthquakes occur, more especially on the line from Khojent to Vyernyi (Alma-Ata) in the Kazakstan A.S.S R. In some regions, especially in the Urta Chul district between the western slopes of the Hissar range and the Amu Darya, there is stony steppe land, and steppe surrounds some of the oases and thus lessens the advance of sand.

The juniper is common on the hill regions and poplars and willows grow by the streams. The Russian government established a plant testing station to select shrubs to plant by the railway and thus prevent it becoming sand-covered and at Marghelan there is a government forest station from which poplars and other young trees are distributed to cultivators, the quick growth of the poplar making it specially suitable for planting round orchards and fields The former prairie fauna of the steppe regions is giving way to the drought resisting plants of the semi-desert steppe, among these the *saxaul* scrub is particularly useful in a region deficient in fuel

Agriculture.—During the civil wars and disorders following the 1917 revolution the irrigation canals, which need constant cleaning and repairing, were neglected, and the sown area much diminished. This period was followed by a complete disorganization of the former system of water distribution, a disaster where every drop of water is precious Only in 1925 was order restored and a new system introduced, based largely on the confiscation of water rights from former wealthy owners, and the redistribution under government control of water and of land from the large estates. In a region where life was based on tribal and traditional systems, with recognition of the chieftain as owner and controller, this change, following on the disorders of civil war, has made life difficult, especially as most of the inhabitants are illiterate and therefore find new laws particularly difficult to understand However the age-long skill of the cultivators, primitive though their methods may be, and the great fertility of the region, have resulted in the revival of agriculture and in 1926–27 about 70% of the pre-war area was again under cultivation

The Russian government attaches particular importance to cotton cultivation for the supply of raw material to the cotton factories of the Moscow region. Efforts are therefore being made to discourage the growing of rice, which demands a great deal of water, only on the left bank of the Chirchik in the Tashkent area can rice be cultivated without loss of water to other crops Cotton from Uzbekistan, and especially from the Ferghana and Andijan district, supplied 40% of the requirements of the Russian cotton mills in 1926–27 The number of small cotton cleaning workshops has been reduced and larger centres now give a greater output, thus 47 centres gave $\frac{3}{4}$ of the output of 200 centres which existed in 1913. In 1926–27 a large cotton factory was built with 40,000 spindles and another is under construction which will have 60,000 These are the first textile factories in central Asia and their construction will, it is hoped, supply Siberia with cotton goods at cheaper rates than the European factories because of lessened transit costs In 1926 a cement factory was opened at Khilkov for the same reason The railway linking central Asia with the trans-Siberian line is being pressed forward rapidly, for this development of cotton growing has made the local grain supply insufficient and the republic will depend more and more on imported Siberian grain. Hydro-electric energy for the cotton industry is planned and a station at Boz Su to supply Tashkent is already working

The impact of industrialism on this region of immemorial tradition is already felt, especially among the women, some of whom have abandoned the veil and have formed co-operative clubs, especially in Tashkent and Samarkand Other products are wheat, lucerne, maize, sorghum, barley, melons, cucumbers, fruits, vines, oilseeds, millet and opium poppy The almond is common in the Ferghana valley In the small areas not dependent on irrigation, wheat and barley are the chief crops. In 1925 a government grant was made for the introduction of more modern agricultural implements, especially for cotton cultivation and for new irrigation schemes and the rapid increase of yield between 1925 and 1928 indicates that, granted settled conditions, agriculture should develop in a remarkable way in the next few years. Stock raising of sheep, goats, working cattle, horses, camels, asses, mules and pigs forms an important item among the nomad and semi-nomad tribes. It suffered even more severely than cultivation during the civil war, partly because of the commandeering of horses for army purposes and of the slaughter of sheep during the food shortage, but also because many herdsmen crossed the frontier during the troubled times Even by 1927 the number of animals was barely 70% of that in the pre-war period and the number of horses is still markedly below normal Silkworm breeding is an old and important occupation.

The republic has some mineral wealth, little developed as yet. Naphtha near Ferghana gives an annual output of about 28,000 tons and coal, formerly exploited by peasants in a primitive way, but now under government control, yielded 101,000 tons from the mountains near the town of Andijan This development is due to the efforts of the Soviet government to encourage local supply so as to leave the Donetz coal for the factories in European Russia. Ozokerite is worked in Ferghana and its output in 1926–27 exceeded that of 1913 Radioactive ores have been found at Tyuya Muyun in the Ferghana valley and are being exploited. Iron, silver, lead and copper are mined by the peasants for local use, but have little economic importance

Industry and Communications.—Peasant industries everywhere supply local needs and supplement income They include the making of clothing and of felt for the tents of the herdsmen, of leathern bottles and shoes, paper, woollen and silk goods (including carpets and shawls) and metal goods Dried fruits are an important export Brick-making is unnecessary, for the loess, owing to its lime content, hardens and loess mud huts are common

Many types of life are found within the republic There still exist some purely nomadic herdsmen seeking different pastures according to opportunity, but their numbers are rapidly diminishing; others are semi-nomads with fixed summer and winter quarters In the foothills there is some mixed farming with cattle raising and grain cultivation dependent on rain, while in the oases there is intensive grain and fruit cultivation under irrigation

City life, with ancient trading bazaars and more recent beginnings of factory industry, is well developed Tashkent has a population of over 300,000, Samarkand of over 100,000, while Namangan, Andijan and Khokand have between 60 and 70 thousand inhabitants Marghelan, Bokhara and Khojent are between 37,000 and 46,000 Khiva is much reduced and has less than 20,000 inhabitants For an account of the ancient importance and present conditions of these famous cities see the separate articles on them. It should be noted that all, with the exception of Khiva, are on the railway, a vital factor in their revival The two main lines are the Orenburg-Tashkent and the line from the Caspian which meet at Tashkent A branch goes along the Ferghana valley with a north and south loop from Khokand, and a branch from Bokhara goes south to Termez on the Amu Darya, with a loop which will ultimately reach Samarkand Air communication is an important development since the revolution and Tashkent, Samarkand, Termez and Diushambe are linked by regular air services and fortnightly services from Diushambe through Kulyab to Sarai on the Afghan frontier are planned There is no railway to Diushambe and the road is difficult, so that the value of this air link which brings Diushambe into touch with Tashkent and the railway by a six hours' flight cannot be overestimated In this region of sharp contrasts, the camel caravan still crosses the desert and depends on wells which yield somewhat salty water or on the rare fresh water springs

The Population diminished markedly during the civil war The most densely peopled regions are the Andijan and Ferghana districts and the Tashkent and Khiva oases The total population of the latter oasis is little more than that of Tashkent city.

Uzbegs form about 74%, and other nationalities include Tadzhiks, Russians, Ukrainians, Kazaks, Kirghiz, Arabs and Jews The latter are possibly descendants of Jewish prisoners brought here by Assyrian and Babylonian kings. They speak Persian, but retain their ancient customs and are known as Bukhara Jews, because of the numbers in that city The name Uzbeg dates back to the reign of Uzbeg Khan, a chief of the Golden Horde, who

died in 1340 and who introduced Islamism among his subjects; his coins have been found minted at all the towns of the Horde which struck money up to that date. Before the Mongol invasion, the Turks, of whom the Kazaks, Uzbegs, Turkmens and Osmanli are the four chief groups, occupied Dzungaria and the Mongolian desert. The great effect of the Mongol invasion was to push the Turks westward, and it was apparently Turkish tribes who adopted the name of Uzbeg from their Mongol ruler who introduced Islamism The term Uzbeg is used by 14th and 15th century writers to indicate Mohammedan as opposed to Shamanistic Turks.

Klaproth gives four divisions of the Uzbegs, the Naiman, Kipchak, Kungrad and Mangut The Kunkurats or Kungrads were driven from their original home near Lake Dalai Nor by the Mongols, and their name survives in the town of Kungrad on the Amu Darya delta The Kipchaks form an important element in Khokand, while Tatar Uzbegs predominate in Khwarezm, where they founded an independent principality but allowed the Sart and Turkmen cultivators to remain. In the 15th century Timur defeated the Uzbegs and sacked Samarkand, but the struggle between the Uzbegs and the Kalmucks in the early 16th century resulted in the former again occupying Samarkand

The Uzbeg (Jagatai Turkish) tongue, though closely related to Turki, seems to have had a separate origin and development Various indications connect it with the old Uighur dialect found in the *Kudatku Bilik* (A D 1070); an Uzbeg tribe in the Andijan district is called Uighur At the present time, mainly as a result of the long illiteracy of the general population, there are numerous Uzbeg dialects, the four chief being those of Bokhara-Samarkand, Ferghana, Tashkent and Khiva, others being those of the mountain Uzbegs, of the Kashka Darya and Surkhan, the Afghan and the Kashgar districts Their variety reacts to-day by adding to the difficulties of education

So much admixture of Mongol and Turk and original cultivators of the oases has gone to produce the Uzbeg, that the physical type is by no means uniform The different proportions of Tadzhik, Sart, Persian and Afghan blood, as of Mongolian and Turkish, have led travellers to give most diverse accounts of the physical type of the Uzbegs The Kuramas of the Chirchik (Tashkent district) seem to have much Kazak blood The name *Sart,* from old Turkish *to wander,* is found in the *Kudatku Bilik* in the sense of merchant as opposed to nomad and then indicated an Iranian people In later times it denominated the original Iranian cultivators and ultimately has been used loosely of the peasant cultivators in the oases; it has no strict ethnological significance. The Persian speaking Tadzhiks were the aboriginal cultivators of the fertile parts of Turkistan and are tall and dark, with straight noses and much facial hair. They form a striking contrast to their Mongol and Turkish neighbours and are specially numerous in the towns For the history of the struggle between Turk and Mongol and Persian in this region and the varying fortunes of the khanates *see* H. Howorth, *The History of the Mongols* (1876).

History.—One of the earliest records of relations with Russia is the sending of envoys by the Uzbegs of Khiva to Tsar Feodor (1584–1598). In the previous reign an English merchant Jenkinson travelled to Bokhara, Ivan IV (1533–1584) having granted an English company trading rights with Persia Khiva was for long a slave market where in the 18th century as many as 10,000 Russian and Persian slaves sold in its markets by Kazaks, Turkmens and Kalmucks were working in the fields and on the irrigation canals The Uzbegs became less hostile to the Russians after Peter the Great's campaign against their enemy, Persia, though a force which he sent against Khiva was annihilated.

In the 19th century Russian scientists and travellers visited the region, among whom was the famous Russian geographer Semenov, later called Semenov-Tian-Shansky. In 1847 Russian troops established a fort on the Sea of Aral at the mouth of the Syr Darya and in 1853 a steamer was launched in the hope, which was not fulfilled, owing to navigation difficulties, of establishing trading communication with Ferghana. In 1853 Ak Metchet (Perovsk) was captured and in 1864 Tashkent was occupied by the Russians, and two years later Khojent fell. In 1867 General Kaufmann was appointed governor of the newly created Turkistan province and in the next year Samarkand was captured. In 1870 the emir of Bukhara submitted to the Russians; since Bukhara is entirely dependent on Samarkand for its water supply a struggle would have been disastrous. Khiva, however, secure in her desert fastnesses, still defied the Russian power. A Russian expedition under General Perovsky in 1869 was compelled to retreat by the difficult winter conditions in the Ust Urt plateau desert, with a loss of 3,000 men and most of the transport animals. In 1873 a triple attack from Tashkent, Chikishliar and Orenburg was organized and the city was captured. Khiva and Bukhara remained nominally independent vassal states of Russia until the 1917 revolution.

Soviet Government.—After that year they declared themselves independent republics and treaties with the Soviet government in 1920 and 1921 were signed in which their independence was recognized. Their form of government, however, was not socialist and soviet in type and civil war, complicated by the intense religious feeling of these Sunnite Mohammedan peoples, broke out Finally in 1924, after prolonged civil fighting and disorder, the two republics disappeared and were merged in the Uzbeg S.S R The creation of the new republic does not, however, imply a unity of feeling among its subjects. The Uzbegs themselves are divided into about 80 tribes with varying branches that bear at least 150 different names The other races noted above complicate the problem and the difference of speech, custom and type of life will make amalgamation a slow and difficult process, and the difficulty is increased by the poor school provision.

The gulf between the materialist view of the Soviet government and the religious fanaticism of the Sunnite Mohammedans, especially of the town centres, will not be bridged quickly, though the first vigour of the Soviet attack on the Islamic faith has died down and many children in this region attend Mohammedan schools or *madrasas.* The encouragement of publication in the vernacular and of research in the institutes of Tashkent especially is producing a scientific and literary outlet for the more cultured Turkish peoples and the adoption of the Latin script in place of the more difficult Arabic makes for the increase of literacy, with an ultimate possibility of improving sanitary and social conditions

UZÈS, a town of southern France standing on a height above the Alzon Pop. (1926) 3,688 Uzès, the seat of an episcopal see from the 5th century to 1790, has a cathedral flanked by a 12th century round tower of five storeys. The Duché preserves a 12th century donjon; the main building, flanked by a Gothic chapel, is Renaissance in style.

UŽICE, the capital of the Užice department of Serbia, Yugoslavia. Pop. (1921) 4,893. Užice (meaning "the narrow places") is built in a narrow, lonely glen, 1,385 ft. above sea level, on a stream spanned by two mediaeval stone bridges. Though poor, it has a well-built school, in the entrance to which is a Roman altar stone, and also a girls' school where weaving is taught The surrounding heights produce excellent tobacco, and there are linen and cotton mills. Commerce is retarded by the bad roads.

In the 13th century Užice was the seat of St. Sava, the first archbishop and patron saint of Serbia.

UZZIAH, more correctly called Azariah, was seated on the throne of Judah in succession to his father Amaziah by popular choice at the age of sixteen (2 Kings xiv. 21 *sq.*, xv. 1–7). The records assign to him a reign of fifty-two years, covering roughly the first part of the 8th century B.C., but during part of this time his son Jotham, who succeeded him *c.* 740 B.C , acted as regent, because Uzziah had become a leper. He was for some years contemporary with Jeroboam II. of Israel, and both kingdoms flourished Uzziah repaired the walls of Jerusalem and recovered and rebuilt the port of Elath on the Gulf of Akaba The account of his military reorganization and successful campaigns in 2 Chronicles xxvi. is probably not without historic basis. The Chronicler explains his leprosy as a punishment for infringing priestly prerogatives. A certain Azriau of Yaudi appears in the inscriptions as leading a combination against Tiglath Pileser III. *c.* 739. It has been contended that the reference is to Azariah of Judah. Despite the striking coincidence of names, it seems probable that the leader was king of Y'di, a small independent kingdom mentioned in the Aramaic inscriptions found at Zenjirli. (W. L. W.)

V The history of this letter is identical with that of *U*, from which it was not differentiated till the 15th to 17th century. The letter passed out of Latin having a majuscule pointed form V and a minuscule rounded form u and doing duty for two sounds, the high rounded vowel (English *oo*) and the voiced labial spirant (English *v*). The consonantal sound was that most usually occurring when the letter was initial, in which position the majuscule form V would most generally be used Thus the pointed form V became identified with the consonant, the rounded form with the vowel A minuscule *v* and a majuscule *U* were then adapted as required. (B F. C A)

VAAL, a river of South Africa, chief affluent of the Orange (*q.v.*). It rises at an elevation of over 5,000 ft above the sea in the Drakenberg mountains, of the Transvaal, about 170 m in a direct line west of Delagoa bay. It flows in a general S W direction, with a markedly winding course, across the plateau of inner South Africa, joining the Orange in 29° 3′ S., 23° 36′ E The river valley is 500 m. long, the length of the river being 750 m.

The first considerable tributary is the Klip (80 m. long), which rises in the Drakenberg and flows N W, its junction with the Vaal being in 27° S, 29° 6′ E, 12 m. S W. of Standerton. From this point to the eastern frontier of the Cape the Vaal forms the boundary between the Orange Free State and the Transvaal. The river is usually shallow and is fordable at many places, known as *drifts* But after the heavy summer rains the stream attains a depth of 30 or more feet. At such times the banks, which are lined with willows and in places very steep, are inundated. As a rule little water is added to the Vaal by its tributaries On the north the basin of the Vaal is contracted by the Witwatersrand and the Magaliesberg ranges, and its tributaries are few.

The Mooi rises in the Witwatersrand west of the Klip and, after running almost due S 75 m., unites with the main stream about 90 m. below Vereeniging. In its course through Griqualand West, the Vaal flows in a wide rocky channel, with banks 30 ft high, through an alluvial plain rendered famous in 1867–70 by the discovery of diamonds in the bed of the river and along its banks The diamonds are washed out by the water and found amid debris of all kinds, frequently embedded in immense boulders The last affluent of the Vaal, the Riet river, rises in the Beyers Bergen S.E. of Reddersburg and flows N.W. 200 m through Orange Free State, being joined, a mile or two within the Cape frontier, by the Modder river (175 m.), which rises in the same district as the Riet but takes a more northerly course The united Riet-Modder joins the Vaal 18 m above the Orange confluence.

The name Vaal is a partial translation by the Dutch settlers of the Hottentot name of the river—Kai Gariep, properly Garib (yellow water) which refers to the clayey colour of the stream. The Transvaal is so named because the first white immigrants reached the country from the south by crossing the Vaal.

VAALPENS (dusty-bellies), a little-known nomadic people of South Africa, who lived in small groups in the Zoutpansberg and Waterberg districts of the Transvaal, especially along the Magalakwane river. The Vaalpens were so called by the Boers from the dusty look of their bodies, due, it is said, to their habit of crawling along the ground when stalking game. But their true colour was black. In height the men averaged about 4 ft., *i.e.*, somewhat less than the shortest Bushmen. The Vaalpens lived entirely by hunting and trapping game, and dwelt in holes, caves or rock-shelters. They wore capes of skins, and procured the few implements they needed in exchange for skins, ivory or ostrich feathers. Their speech was full of clicks.

VACARESCU, the name, according to tradition, of one of the oldest noble families in Walachia. The first member of historical importance was Ianache (b. 1654), the grand treasurer of Walachia, who was killed with his master, Prince Brancovan in Constantinople, 1714. His grandson through his son Stephan, also called Ianache (or "Enakitza the Ban," 1730–1796), started a line of Rumanian scholars and poets; he was the author of the first known Rumanian grammar in the vernacular, printed in 1787 While in exile in Nicopolis he wrote the contemporary history of the Turkish empire in two volumes (1740–99). He was also the first to attempt Rumanian versification. Greater as a poet is his son Alecu (Alexander), who died as a prisoner in Constantinople in 1798. In 1796 a collection of his poems appeared in Rumania His brother Nikolaes (d 1830) also wrote some poems, but they remained in ms until 1860, when they were published

By far the greatest member of the Vacarescu family in the male line was Iancu (1786–1863), the son of Alexander An ardent patriot, he sided with the national movement in 1821, and assisted in establishing the Rumanian theatre, translating many books and plays from German and French into Rumanian, notably the *Britannicus* of Corneille, a literary event of no small importance at the time He inaugurated modern Rumanian poetry. In 1830 appeared his first volume of verse. He died in 1863. A niece of Alexander is the gifted writer Elena Vacarescu (Hélène Vacaresco), maid-of-honour to the queen of Rumania, and Rumanian delegate to the League of Nations, who inherited the poetical talent of her family and has enriched Rumanian literature with her *Bard of the Dimbovitza*, and other poems and novels in Rumanian and in French, including *Chants d'Aurore*, which was crowned by the French academy, *L'Âme Sereine*, and *Rumanian Ballads*, which obtained the Prix Jules Favre at the French academy. (M. G.)

VACARIUS (1120–1200?), Italian civilian and canonist of the school of Bologna, the first known teacher of Roman law in England, was brought to Canterbury, possibly by Becket, together with a supply of books upon the civil law, to act as counsel (*causidicus*) to Archbishop Theobald in his struggle, which ended successfully in 1146, to obtain the transfer of the legateship from the bishop of Winchester to himself. We next hear of Vacarius as lecturing at Oxford, in 1149, to "crowds of rich and poor," and as preparing, for the use of the latter, a compendium, in nine books, of the Digest and Code of Justinian It became a leading text-book at Oxford, and its popular description as the *Liber pauperum* gave rise to the nickname *pauperistae* applied to Oxford students of law Nearly complete mss of this work are still in existence, notably in the cathedral libraries at Worcester and Prague and in the town library at Bruges Fragments of it are also preserved in the Bodleian and in several college libraries at Oxford Stephen suppressed the teaching of the civil law and ordered the books on it to be destroyed, but after Stephen's death it flourished again. The same year (1154) Roger de Pont l'Évêque, a colleague of Vacarius at Canterbury, was made archbishop of York, and took Vacarius with him as legal adviser and ecclesiastical judge He is last heard of in 1198. It is doubtless to the second half of the life of Vacarius that the composition must be attributed to two works the ms of which, formerly the property of the Cistercian abbey of Biddleston, is now in the Cambridge university library.

Bibliography —Most of the original authorities are textually set out and annotated by Prof T E. Holland in vol. ii of the *Oxford Historical Society's Collectanea* (1890) Wenck, in his *Magister Vacarius* (1820), prints the prologue, and a table of contents, of the *Liber pauperum*, from a ms. now lost. F. Maitland in the *Law Quarterly Review*, xiii., pp. 133, 270 (1897), gives a full account of the Cambridge mss., printing *in extenso* the *Summa de matrimonio*.

VACCINATION, the term originally devised for a method of protective inoculation against smallpox, consisting in the intentional transference to the human being of the eruptive disease of cattle called cow-pox (*vaccinia*). The discovery of vaccination is due to Dr. Edward Jenner (*q.v.*), whose investigations were

first published in 1798 in a pamphlet entitled *An Inquiry into the Causes and Effects of the Variolae Vaccinae, etc* His first case of vaccination (May 1796) was that of a boy, whom he inoculated in the arm with cow-pox matter taken from a sore on the hand of a dairymaid, who had become infected with the disease by milking cows suffering from cow-pox It was apparently in 1798 that he made his first attempt to carry on a strain of lymph from arm to arm.

In applying to cow-pox the term "variolae vaccinae," Jenner expressed his belief that this disease was small-pox of the cow

As the outcome of much experimental work it may be definitely stated that small-pox lymph, especially if obtained from the primary vesicle of a case of the inoculated form of the disease, by passage through the system of the calf becomes deprived of its power of causing a generalized eruption, while inducing at the site of inoculation a vesicle indistinguishable from a typical vaccine vesicle; and, more important still, that when transferred again to man, it has by such treatment completely lost its former variolous character Such being the case, it is usually considered that cow-pox, or rather that artificially inoculated form of the disease which we term *vaccinia,* is *variola* modified by transmission through the bovine animal

The cause of vaccinia is a filter passing virus (*q v*) more resistant to the germicidal effects of glycerine than ordinary microbes Advantage is taken of this fact, in the method devised by S Monckton Copeman, and now employed officially in England, on the Continent and in America, for ensuring the bacteriological purity of vaccine lymph

In 1889 an English Royal Commission on vaccination was appointed The evidence given was published at intervals in a series of Blue-books, and in August 1896 the final report made its appearance As regards the effect of vaccination in reducing the prevalence of, and mortality from, small-pox, the following conclusions were arrived at, with two dissentients "(1) That it diminishes the liability to be attacked by the disease (2) That it modifies the character of the disease and renders it (*a*) less fatal, and (*b*) of a milder or less severe type. (3) That the protection it affords against attacks of the disease is greatest during the years immediately succeeding the operation of vaccination. It is impossible to fix with precision the length of this period of highest protection Though not in all cases the same, if a period is to be fixed, it might, we think, fairly be said to cover in general a period of nine or ten years (4) That after the lapse of the period of highest protective potency, the efficacy of vaccination to protect against attack rapidly diminishes, but that it is still considerable in the next quinquennium, and possibly never altogether ceases. (5) That its power to modify the character of the disease is also greatest in the period in which its power to protect from attack is greatest, but that its power thus to modify the disease does not diminish as rapidly as its protective influence against attacks, and its efficacy, during the later periods of life, to modify the disease is still very considerable (6) That re-vaccination restores the protection which lapse of time has diminished, but the evidence shows that this protection again diminishes, and that, to ensure the highest degree of protection which vaccination can give, the operation should be at intervals repeated (7) That the beneficial effects of vaccination are most experienced by those in whose case it has been most thorough We think it may fairly be concluded that where the vaccine matter is inserted in three or four places, it is more effectual than when introduced into one or two places only, and that if the vaccination marks are of an area of half a square inch, they indicate a better state of protection than if their area be at all considerably below this." For the evidence, statistical or otherwise, on which these conclusions are based, the Reports of the Royal Commission should be consulted.

Efficient Vaccination.—The clinical activity and bacteriological purity of the lymph employed for vaccination; the skilful performance of the operation itself; the making of an adequate number of insertions of lymph over a sufficient area; the observance of strict asepsis, at the time of vaccination and until the vaccination wounds are soundly healed—all these are essential to "efficient vaccination " Certain principles are generally recognized, and for public vaccinators, whose work comes under government inspection, instructions on these several points are prescribed The lymph universally employed in Great Britain is glycerinated calf lymph, the use of which has entirely superseded, in public vaccinations, the arm-to-arm method Glycerinated lymph, under proper conditions, usually retains its potency for many weeks or months; but is liable to become gradually weakened, and even eventually to become inert

There exists no official definition of what constitutes a "successful vaccination." The standard long ago laid down by the Local Government Board—the production, namely, of a total area of vesiculation of not less than half a square inch, divided among four separate vesicles or groups of vesicles, not less than half an inch from one another—has for the most part proved easily attainable in practice, and should be aimed at in private as in public work

Alleged Injurious Effects.—In a certain small proportion of cases vaccination has been followed by various inflammatory complications, which are not peculiar to vaccination, but constitute the danger of any local lesion of the skin, however caused A few authenticated cases have been recorded in which there was reason to believe that syphilis was conveyed by arm-to-arm vaccination Tubercle in its various forms and leprosy have also been included in the list of possible complications of vaccination, though without any sufficient proof The employment of glycerinated calf lymph obviates these dangers for even if tubercle bacilli or the streptococcus of erysipelas were by chance present in the lymph material when collected, it has been found experimentally that they do not survive prolonged exposure to the action of a 50% solution of glycerine in water Leprosy and syphilis are not communicable to the calf In view of the frequency of various skin eruptions in infancy; it is to be expected that in a proportion of cases they will appear during the weeks following vaccination Eczema and impetigo in particular have, *post hoc,* been attributed to vaccination, but no direct connection has been proved to exist between the operation and the occurrence of these disorders Of a different order is the post-vaccinal encephalitis described by Turnbull and McIntosh at the British Medical Association meeting in July 1928 The condition has been noticed in some hundreds of cases and manifests itself on the average 10–14 days after vaccination as headache, delirium, paresis and ultimately coma and death in fatal cases.

Legislation.—Legislation making vaccination *compulsory* was first introduced in Bavaria (1807), Denmark (1810), Sweden (1814), Wurtemburg, Hesse and other German states (1818), Prussia (1835), the United Kingdom (1853), German empire (1874), Rumania (1874), Hungary (1876), Serbia (1881), Austria (1886). But in many cases there had been earlier provisions indirectly making it necessary In the same way, where there is no compulsory law there are government facilities and indirect pressure, apart from the early popularity of vaccination which made it the usual practice In the United States there is no federal law, but many of the separate states make their own compulsion either directly or indirectly, Massachusetts starting in 1809

The benefit of vaccination proved itself in the eyes of the world by its apparent success in stamping out small-pox; but there continue to be people, even of the highest competence, who regard this as a fallacious argument—*post hoc, ergo propter hoc* In addition they point to the dangers enumerated above as reasons for their opposition to the practice and insist that the diminution of small-pox is due to improved general hygiene and segregation

The cause of "anti-vaccination" has had many followers in England, and their persistence has had important effect in English legislation. Under the provisions of the Vaccination Act 1898, the Vaccination Order (1898) of the Local Government Board and the Vaccination Act 1907, numerous changes in connection with vaccination administration and with the performance of the operation were introduced, in addition to the supersession of arm-to-arm vaccination, by the use of glycerinated calf lymph. Thus, whereas by the Vaccination Acts of 1867 and 1871 the parent or person having the custody of any child was required to procure its vaccination within three months of birth, this period by the

act of 1898 was extended to six months. Again, parents were relieved of any penalty under the compulsory clauses of the Vaccination Acts who afforded proof that they had, within four months of the birth of a child, satisfied a stipendiary magistrate, or two justices in petty sessions, that they conscientiously believed that vaccination would be prejudicial to the health of the child. Moreover, the public vaccinator was now required to visit the homes of children for the purpose of offering vaccination with glycerinated calf lymph, "or such other lymph as may be issued by the Local Government Board" Much good has arisen from the substitution of domiciliary for stational vaccination.

There have naturally been some curious discussions before the magistrates as to what is "conscientious" or not, but the operation of the so-called "conscience clause" has tended to the more harmonious working of the Vaccination Acts, though at the cost of a high proportion of unvaccinated persons in some towns of England The act of 1907 repeals sec 2 of the 1898 act and substitutes for the certificate of a magistrate a statutory declaration before a commission for oaths. By the same act the penalty, 20 shillings, for failing to have a child vaccinated is abolished With slight variations the same holds good for Scotland

On July 31, 1928, there was published as a large Blue Book (Stationery Office, Cmd 3148) the report of the committee set up by the minister of health to inquire and report from time to time on various matters connected with vaccination The committee consisted of medical men, under the chairmanship of Sir Humphry Rolleston, and made several recommendations, the most important of which from the public point of view is that they consider "it is expedient now to make a trial of vaccination in one insertion in a manner calculated to produce as little discomfort as possible, and to urge strongly the necessity for re-vaccination in like manner at stated intervals"

VACCINE THERAPY. This consists in the introduction into the body of a suitable vaccine, in order to stimulate the tissue cells to elaborate a sufficiency of specific antibodies to resist the subsequent invasion of a particular micro-organism; or in the case of an already infected individual to prevent the further multiplication and diffusion of the invading bacterium—in other words, to establish a condition of active immunity

To Edward Jenner belongs the credit of exploiting the use of an attenuated virus for the production of an active immunity to smallpox, and originally the term "vaccine" was restricted to the virus of smallpox as altered by its passage through the bovine species, in which it gives rise to cow-pox or vaccinia Pasteur then applied the principle to the prophylaxis of bacterial infections and Almroth Wright expanded it to embrace not only the prevention but also the treatment of microbial disease Consequently, the word "vaccine" now includes suspensions of bacterial cells and emulsions of bacterial protoplasm, which when introduced into the human economy result in the formation of specific antibodies

In either case the plan adopted was to inject successive quantities of bacterial protoplasm derived from artificial cultures of the particular micro-organism under study In the initial stages of the process these cultures are usually modified by some physical agent, such as heat, in order to attenuate or destroy the virulence of the microbe For instance, Pasteur vaccinated sheep with cultures of the anthrax bacillus which had been attenuated by growth at a temperature (41° C) some degrees above the optimum, to protect them against the natural disease splenic fever; and Wright used cultures of *B typhosus*, killed by heating to 60° C for the protection of British soldiers in India against typhoid fever.

The success that attended this work of Wright, sufficiently notable in the later stages of the Boer War, reached its culmination during the World War, when first typhoid, and subsequently para-typhoid, fevers were eliminated from the British Army by the use of appropriate vaccines, and in consequence prophylactic vaccination against these diseases has established its position in preventive medicine.

Attempts have naturally been made in the direction of prophylaxis against many other infective diseases by the use of special vaccines, as, for example, cholera, plague, dysentery, cerebrospinal fever; tuberculosis, pneumonia, influenza and the common "cold", but although considerable success has been attained, the results have not presented the uniformity of those achieved in the prevention of typhoid and para-typhoid fever At the same time, it must be conceded that it is a difficult matter to arrange "mass" experiments in which the numbers of inoculated and uninoculated or "control" individuals are sufficiently large to permit of the application of statistical methods in the evaluation of the results obtained, particularly in view of the very brief "incubation" period of many of these diseases This difficulty becomes even greater when vaccines are employed in the treatment of individuals already incapacitated by bacterial infections, for here each case must be judged as a separate entity and accessory means of treatment to say nothing of the long arm of coincidence, are factors which cannot be ignored when attempting to form a just estimate of the value of vaccine therapy In the opinion, however, of those who have devoted themselves to the study and application of this type of medication no reasonable doubt exists as to the importance of what may be termed specific therapy

Types of Vaccines.—Vaccines belong to one of two main types—"stock" or heterogenous—that is to say prepared from a cultivation of the required species of microbe which has already been isolated from an infected individual and after identification stored in the laboratory, and "autogenous" prepared from the actual organism isolated from the particular patient under treatment Obviously "stock" vaccines must of necessity be utilised in the attempt to immunise the normal individual prior to exposure to infection by the corresponding microbe Stock vaccines also possess a distinct value in therapeutic medicine particularly in the case of certain chronic infections such as tuberculosis, but since bacteria exhibit so many biological variations presumably due to the operation of environmental factors, the employment of a number of different "strains" of the same species, thereby rendering the "stock" vaccine "polyvalent," for this purpose is advocated (*see* also SERUM THERAPY) In the treatment of acute diseases, however, "autogenous" vaccines are immeasurably superior even to polyvalent stock vaccines When the serum containing the specific immune antibody for a particular strain of micro-organism is available it may be combined with that germ during the process of manufacture and a "sensitised" vaccine—either stock or autogenous, as the case may be—results

Detoxicated Vaccine.—Another variety of vaccine, in which the bacterial protoplasm has been so modified as to remove its toxicity; as well as its infectivity, is known as "detoxicated" Pasteur's anthrax cultures incubated at an unsuitable temperature, and Raw's tubercle cultures grown for a long period of years upon artificial culture media, were detoxicated in this sense by purely biological methods Recent workers have attempted to effect the same object by treating the bacterial protoplasm with either mineral acids or alkalis These chemical methods, however, profoundly change the protoplasm of the organism, and the injection of the resulting vaccines into the animal economy is not as a rule followed by the production of any large amount of the "specific" antibodies as at present recognized That detoxicated vaccines of this type do subserve a useful purpose is beyond question, however, although the mechanism which is here brought into action is probably closely allied to that of protein shock (*see* IMMUNITY).

Mode of Preparation.—All the above varieties of vaccines are prepared on very similar lines. The selected organism is cultivated usually on a solid substratum, under optimum conditions for that particular period which will give the maximum development, and the resulting growth is emulsified in normal saline

solution. In the preparation of sensitized vaccines the appropriate anti-serum is added to the emulsion and the mixture is allowed to stand at 0° C for a period of about 12 hours. Next, the amount of bacterial protoplasm held in suspension per unit volume (1 c c) is measured, and several methods are available for the purpose Undoubtedly the most accurate method involves drying and weighing the mass of bacteria, but this is a lengthy process, and often the time factor is of paramount importance where therapeutic vaccines are concerned For this reason the plating methods ordinarily employed for the estimation of the number of bacteria suspended in fluids, such as water, are rarely resorted to, and other more rapid methods have been utilized Thus Sir Almroth Wright mixed equal volumes of the bacterial emulsion and blood from a normal individual, and by means of microscopical films estimated the ratio existing between the red cells and the bodies of the bacteria in the mixture This ratio having been ascertained, a simple calculation determines the number of bacteria in the unit volume, since the number of erythrocytes normally present in man is a remarkably constant factor (amounting to 5,000 million per cubic millimetre). Again, the bacteria may be counted by means of the ordinary haemocytometer, or the estimation may be made by comparing the suspension of bacteria with standard tubes containing opaque fluids corresponding to definite numbers of various organisms per cubic centimetre

In most instances the microbes contained in the emulsion are now altered by heat coagulation (by suspension in a water bath adjusted to the thermal death point of the particular organism) by autolysis, or by lysis due to the action of chemicals such as sodium fluoride or carbolic acid, so that their infectivity is destroyed; in the case of sensitized vaccines the microbes may, at the discretion of the bacteriologist, be left in the living state and unaltered—save for their combination with the corresponding antibody In the chemically detoxicated vaccines the solution of the bacterial protoplasm is effected at this stage by the addition of the requisite acid or alkali, and the vegetable protein is further purified by repeated precipitation and solution

Finally, the emulsion, is adjusted to some pre-determined standard by dilution or concentration, a small quantity of a preservative, such as tricresol or phenol, is added and the finished product stored in suitable receptacles

VACCINIUM, a genus of shrubs of the heath family (Ericaceae, *q.v*), comprising about 130 species found widely throughout the northern hemisphere, and extending to Madagascar and the Andes. They are erect or creeping shrubs, with deciduous or evergreen leaves. The small flowers bear much resemblance to those of the true heaths (*Erica*), from which they differ in having the ovary inferior. The fleshy berry-like fruits are usually edible. Four species occur in Great Britain: *V. Myrtillus,* the bilberry, blaeberry or whortleberry; *V. uliginosum,* the bog bilberry; *V. Vitis-Idaea,* the red whortleberry or cowberry; and *V. Oxycoccus,* the cranberry (*q v.*), all of which are found widely distributed throughout large areas in Europe, Asia and North America, being especially abundant in cool northern and mountainous regions.

In North America some 40 species occur, more abundant in the northern and mountainous parts of the continent. In the eastern States and adjacent Canada several species, commonly known as blueberry (*q.v.*), are prized for their fruits. In northern Canada the red whortleberry, commonly called mountain cranberry, is gathered for cooking purposes *V. macrocarpon,* the American cranberry, is extensively cultivated. Several species occur in the Rocky Mountain region and about 10 are found in the Pacific States, the latter including *V. occidentale,* the western blueberry; *V. parvifolium,* the red bilberry, and *V ovatum,* the California huckleberry.

VACUUM, an empty space Strictly speaking, for a space to be a vacuum it must contain no traces of gas of any kind, but even with the most refined modern means of exhaustion there will be a few million million gas molecules in a glass bulb five inches or so in diameter which has been rendered as empty as possible This represents, however, a pressure only a ten thousand-millionth of the atmospheric pressure It is customary to speak of a space in which the pressure has been reduced to a thousandth of an atmosphere or less as a vacuum, and to specify the pressure, while a space in which the pressure has been reduced to a lesser extent, however little below atmospheric pressure, is sometimes referred to as a partial vacuum. There is, however, no fixed rule in these matters, the term vacuum being in general applied to a space in which a low gaseous pressure prevails, and whether a given pressure is considered to be low or not generally depends upon the class of phenomenon or experiment under consideration

The study of gases at very low pressures has assumed enormous importance in the last fifty years both from the point of view of pure science and from the point of view of the electrical industry The study of the discharge of electricity in evacuated tubes which became so marked a feature of physical research at the end of last century, and has remained so since, led to the discovery of the electron and of X-rays, and to the host of important discoveries in atomic physics which is associated with the Cavendish Laboratory at Cambridge, and with such names as Lenard and Wien on the continent. On the other hand the manufacture of electric lamps of all kinds, of X-ray tubes and of thermionic valves has necessitated a profound study in the great industrial laboratories not only of the means of producing vacua and measuring low gaseous pressure, but also of the behaviour and influence of the gases occluded on metal and glass surfaces, and of many properties of the low pressure discharges. It would, perhaps, not be too much to say that the physics of the vacuum dominates the modern laboratory.

HISTORY

Guericke's Experiments.—The first experiments on vacua were made by Otto von Guericke (1602–1686) whose original plan was to fill a vessel with water, and then pump the water out with a water pump, so leaving an exhausted space. His earliest attempts were certainly carried out before 1652; Gerland suggests as early as 1632 to 1638. He filled a cask with water, and pumped out the water by means of a brass fire-squirt, adapted for the purpose. Naturally enough the cask proved not to be air-tight, and the air was heard to rush in through the pores and crevices. He then tried the same experiment with a large copper sphere in place of the cask, but after the pumping had proceeded for some time, the copper sphere collapsed "with a great noise, to the terror of all," a fact which, later, Guericke correctly attributed to the pressure of the air. These early experiments are described in Guericke's famous book *De Vacuo Spatio* (of which the full title is *Experimenta Nova [ut vocantur] Magdeburgica de Vacuo Spatio*), which was not, however, published until 1672 After these abortive attempts Guericke constructed several true air pumps, consisting simply of cylinder and piston with two valves, the whole pump being immersed in water to make the joints as far as possible airtight. These pumps are not described by Guericke, but an account of one of them was given, with Guericke's approval, by Caspar Schott in 1657, in his *Mechanica Hydraulico-Pneumatica.*

The cylinder is arranged at a slope, so that the lower end can be immersed in water, to seal the joints, and is provided with two valves, one in the side, opening outwards, and an internal valve at the lower end, opening inward. The receiver is connected to the lower end of the cylinder by a vertical pipe. Schott records the increasing difficulty of operating the pump as the exhaustion proceeds, and states that it is necessary to work for two or more hours to exhaust the receiver. With such a pump Guericke performed in 1654 several striking experiments before the Emperor Ferdinand III. at Regensburg, of which the most celebrated is the experiment of the Magdeburg hemispheres. Two copper hemispheres, about 22 inches in diameter, were laid together to form a sphere, a ring of leather soaked in wax and oil being placed between them to make an airtight joint. The air was exhausted through an opening which could be closed by a tap. It was then found that two teams, consisting of eight horses each, when pulling in opposite directions, were unable to drag the hemispheres apart

A description of one of the earliest improved pumps is given in *De Vacuo Spatio*. The cylinder is put vertically on a tripod, and the piston is pushed up and down from underneath by a lever and connecting rod. The top of the cylinder has two valves, a leather flap valve, and a plug valve. These valves are for alternative use, when the air pressure is no longer sufficient the valve is withdrawn and replaced by hand at the correct part of the stroke The spherical receiver is provided with a tap, which tap, as well as the connection between receiver and pump, is made air-tight by being covered with water held in the funnel-shaped bucket provided for the purpose This is reminiscent of the mercury seals in use to-day

It must be remembered that *this* pump was not constructed until after Boyle had published his account of the pump which we are about to describe, and that it embodied many features of Boyle's pump

Robert Boyle and His Contemporaries.—Robert Boyle, the first of the great English school of vacuum enthusiasts, learnt of Guericke's early experiments from "a book that I had heard of, but not perus'd, publish'd by the industrious Jesuit Schottus," and set about constructing an air pump, in which task he had the help of Robert Hooke The pump, which represented a great advance on Guericke's earlier efforts, is described in *New Experiments Physico-Mechanicall*, 1660 The piston was operated by a rack, and the operation of pumping was carried out with the help of a tap, controlling the passage to the receiver, and a hand-operated valve consisting of a peg ground to fit into a hole bored in the top of the cylinder The tap being open, the peg in place and the piston at its highest point, the piston was then fully withdrawn, and the tap closed. The valve was then opened by the withdrawal of the plug, and the piston raised, expelling the air. The valve was then closed, the tap opened, and the process repeated The receiver was very large, and objects could be introduced through a lid at the top, cemented into place. With this pump Boyle carried out a variety of curious experiments, especially on the effect of the reduced pressure on animal life. About this time the members of the Accademia del Cimento were performing experiments with what may be termed the earliest mercury pump, namely the Torricellian vacuum, which is produced by filling a long tube, closed at one end, with mercury and inverting the tube with its open end in a mercury cistern, when the mercury falls to the barometric height, leaving a vacuous space—a single stroke pump. The closed end of the tube was enlarged, to enable objects to be placed in it. These experiments are described in the *Saggi di Naturali Esperienze*, published by the Academy in 1666. The fact that smoke falls in a vacuum was demonstrated with an apparatus of this kind.

Improvements in the piston pump were rapidly made. In 1669 Boyle published an account of his "second engine," in which he immersed the cylinder in water, and provided an automatic arrangement for opening and closing the tap. In this pump a plate was provided, to which the bell jar, used as a receiver, was cemented, an arrangement which is used till this day for certain experiments. About the same time Denis Papin worked with Huygens on the subject, and published in 1674 an account of a pump provided with a plate for the receiver, and with a water gauge for indicating the pressure. In 1682 Boyle described a pump which Papin, who had worked as his assistant, made with him. It constituted a great advance in that it had two cylinders, the pistons being connected together by a cord passing over a pulley, so that the pressure which the outside air exerted on the one helped to raise the other—a great saving of labour The pump also had automatic valves of leather Another celebrated pump, made by Senguerd, employed a two-way tap, a device usually attributed to him, but actually employed earlier by Papin

Hauksbee's Pump.—In 1709 Francis Hauksbee published in his *Physico-Mechanical Experiments* an account of an improved pump which long remained a pattern. It was a two-cylinder pump, the pistons being raised and lowered by a pinion wheel working between the racks attached to the pistons. The receiver was placed on a plate at the top of the pump, and provided with a mercury gauge disposed so as to be well protected from chance blows The original pump is preserved in the collection of the Royal Society and may be compared with the picture published by Hauksbee in 1709. This type of pump, with certain improvements in the valves, persisted in use until the end of the nineteenth century In some pumps made towards the end of the century special devices were introduced to diminish the disadvantageous action of the dead space still left when the piston has advanced to the end of the cylinder. In the older pumps this space fills with air at atmospheric pressure, the devices in question arrange that it shall fill with air at low pressure only.

Oil Pumps.—A great advance in cylinder pumps took place about the beginning of the present century, when the so-called oil pumps were placed on the market, although an oil pump was actually made by Robert Gill as early as 1874. The fundamental point about these pumps, of which the "Geryk" pump, invented by Fleuss, will serve as an example, is that at every stroke all air is displaced from the dead space by oil. The piston-rod passes through a spring-controlled valve G seated in a partition halfway up the cylinder, both this valve and the piston D itself are covered by a layer of oil When the piston is raised it lifts towards the end of its stroke the valve G, and all the air and part of the oil on the piston pass through The valve cannot close until the piston has descended a short distance, which ensures the layer of oil on top of the piston being maintained These pumps were very widely employed in the electric lamp industry at one time, but have been superseded by more modern types. A special type of oil, of low vapour-pressure, has to be employed, and it is claimed that with carefully constructed two-cylinder pumps of this pattern vacua with pressures as low as 0002 mm of mercury have been attained

Mercury Pumps.—In the second half of the nineteenth century various types of mercury pump were introduced, which were used in all the early experiments on the discharge of electricity through gases at low pressure. The principle of all these pumps is to connect the receiver with a Torricellian vacuum created by the pump; the equalisation of pressure will then bring part of the air in the receiver into the Torricellian space The receiver which is being exhausted is then cut off from the vacuous space, and the vacuum recreated. This process can be carried out in various ways The simplest and earliest form of apparatus is that described by Geissler in 1862. This consists simply of a vessel connected by a flexible tube to an open reservoir of mercury; the vessel can by means of a two-way tap be placed in connection either with the outside air or with the space to be exhausted. The tap being turned so as to give passage to the air, the reservoir is raised until the vessel is full of mercury; the tap is then turned so that the vessel is cut off from the air and connected to the space to be exhausted, and the reservoir is lowered, so as to tend to create a Torricellian vacuum in the vessel, into which the air from the space to be exhausted rushes. This process can be repeated as often as desired, the fraction of air removed each time depending upon the relative volumes of space to be exhausted and the vessel.

A type of pump possessing many advantages over the Geis-

sler pump was devised by Töpler; it avoids all taps, the connections and disconnections being made by the mercury itself. An improved form of Topler pump is shown in fig 2, from which the working of the pump can easily be understood. V is a cylindrical

vessel connected by the tube T to the space to be exhausted. M is a mercury reservoir which must be of somewhat greater capacity than V. When the mercury levels are as in fig. 2, V contains gas at the same pressure as S. The reservoir M is then raised: the mercury rises in the tube Z, cutting off V from S, and fills the vessel V, driving the gas from it down the tube T. The gas being thus expelled, M is lowered again, and the vacuous space V is once more in connection with S. The process is repeated as often as may be required. A valve at C, consisting of a glass float, the top of which is ground to fit on a seating at O, serves to prevent the mercury ever passing over into the vessel S, while the inclined position of the cylindrical vessel V has, among other advantages, that of lessening the shock of the rising mercury against the top of the vessel. Pumps of Topler type were widely used for produc-

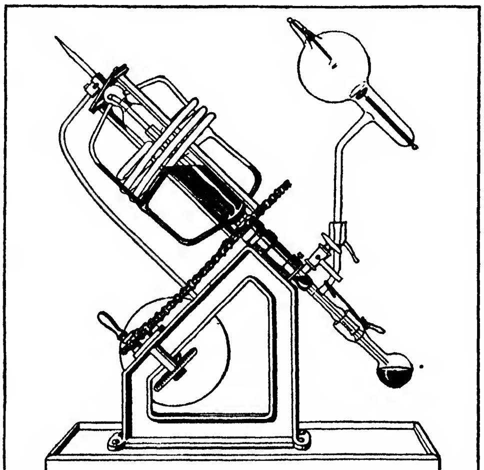
ing a vacuum in the researches of the first ten years or so of the present century, but with the coming of the Gaede rotary pump (*see* the part of this article devoted to MODERN METHODS AND TECHNIQUE) they became less and less popular. Pumping out with them was a tedious business. To-day they are only used when it is desired to collect the gases which are being pumped out; a purpose for which they are excellently adapted.

To avoid the tedious raising and lowering of the reservoir, a process which may have to be carried out for an hour or two to obtain the desired vacuum, automatic mercury pumps were devised. The earliest was that of Sprengel, which consists essentially of a narrow tube down which mercury flows from a reservoir: the top of the tube is connected to the space S to be exhausted. If the tube is of barometric height the pressure at the top will be zero, air will pass into it from S, and will be carried down as bubbles by the mercury, and discharged into a collecting vessel or into the air, as desired. This type of pump was much improved by Gimingham in 1877, and in this form used by Crookes

in his extensive investigations on electrical discharges in vacuum tubes. These pumps were not strictly automatic, in that the reservoir gradually emptied, and had to be refilled by hand. Devices were introduced by which the reservoir could be kept automatically refilled: a typical pump of this kind was that of Kahlbaum (1894), in which the flow of quicksilver was maintained by the help of a water-operated filter pump of ordinary type. The Sprengel type of pump, which came into very extensive use, like the widely known Topler type, was the subject of many modifications.

The passage from the old to the new vacuum technique may perhaps be said to be marked by Kaufmann's invention of a rotary mercury pump in 1905. In this pump, which needed a rough preliminary pump (or "fore pump," as it is called) to bring the pressure down to 2 cm. of mercury or so, the gas was trapped and driven out by mercury moving in two spiral glass tubes, rotating about an inclined axis (fig 3). This pump enjoyed a very short popularity, as it was speedily replaced by the Gaede rotary mercury pump, described under the heading MODERN METHODS AND TECHNIQUE.

Measurement of Low Pressures.—The first successful special device for measuring pressure too low to be correctly estimated by the ordinary U-tube manometer was the gauge invented by McLeod in 1874, and known by his name It consists in principle of a bulb B, some 250 cc. in capacity, provided with a fine calibrated vertical tube C (fig 4). The mercury surface can be adjusted to any desired height by the usual device of a mercury reservoir connected to the apparatus by a flexible tube The bulb B is connected to the space where the pressure to be measured prevails. The mercury surface is raised, cutting off a known volume of the gas, at very low pressure, in B, and then forcing it into the fine tube C. The pressure which the amount of gas present exerts in this confined space is then observed. To avoid error due to capillarity in measuring the pressure a side-tube D is



FROM MULLER POUILLET, "LEHRBUCH DER PHYSIK UND METEOROLOGIE" (VIEWEG & SOHN)

FIG 3.—KAUFMANN'S VACUUM PUMP, THE FIRST SUCCESSFUL ROTARY MERCURY PUMP

provided of exactly the same bore as C, and the difference of level in C and D measured Assuming Boyle's law, and knowing the volume of the bulb B and of the graduated tube C, it is easy to calculate the original pressure in B, which is the pressure required.

This gauge is still a standard instrument and receives further reference under the heading of MODERN METHODS AND TECHNIQUE, where the more recent methods for measuring minute pressures are discussed.

MODERN METHODS AND TECHNIQUE

It may be well to preface the description of modern work at low pressures with a note on the units used to express these pressures A pressure of 1 dyne per square centimetre is generally known as a microbar, a pressure of 1 million dynes per sq. cm being a bar This nomenclature, which has been widely adopted and is used by the meteorologists, who express their pressures in millibars, is used in the present article, but unfortunately some writers on high vacua (notably Dushman) use the term bar to denote a pressure of 1 dyne per sq cm and call a pressure of 1 million dynes per sq cm a megabar Some French writers call a pressure of 1 dyne per sq.cm. a barye The reader must, therefore, be on his guard

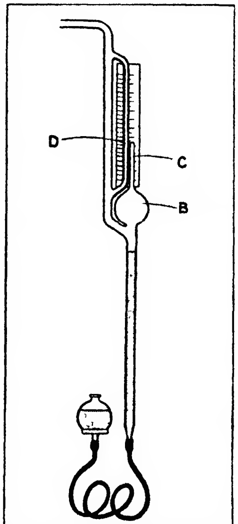


FIG 4—THE MCLEOD GAUGE FOR MEASURING LOW PRESSURES

The pressure conventionally taken as that of one atmosphere is 760 mm. of mercury at 0° C. latitude 45°, and sea level. Our bar, 10^6 dynes per sq cm, is almost exactly 750 mm of mercury at standard conditions For considerations of high vacua, it is often sufficiently accurate to take 1 bar as equivalent to 1 atmosphere, which is a great advantage of the unit

General Considerations at Very Low Pressures.—As a preliminary to the discussion of many features of modern high-vacuum technique, it is necessary to appreciate that the physical behaviour of gases at very low pressures is in certain respects quite different from that of gases at pressures above, say, a thousandth of an atmosphere The molecules of a gas at a given pressure travel, on the average, a certain distance between impacts with one another, this distance being known as the mean free path (*see* KINETIC THEORY OF MATTER) and the physical criterion which decides whether a gas behaves in what may be termed the normal way or in the low-pressure way is given by the length of the mean free path as compared with the linear dimensions of the vessels in which the gas is contained Taking oxygen as an example, the mean free path of the molecule at atmospheric pressure is about ·00001 cm, which is exceedingly small compared to even the finest capillary tubes used in gas manipulations The mean free path being inversely proportional to the pressure, it is ·01 cm at a pressure of ·76 mm of mercury, 1 cm at 0076 mm of mercury; and at a pressure of ·000076 mm. of mercury, which is easily attained with modern technique, the mean free path is a metre, which is large compared to the vessels generally used, especially compared to the diameter of connecting tubes. The thermal conductivity and the viscosity of gases, for example, which are independent of the pressure so long as the mean free path is much smaller than the dimensions of the vessel, vary markedly with the pressure at very low pressures, a fact which is utilized in the construction of certain low-pressure gauges described later. In general, the laws which gases obey when moving relative to the enclosing surfaces change completely at the very low pressures under consideration. the physical reason being that whereas at higher pressures the impacts of a gas molecule with the solid walls of the vessel are very infrequent compared to its impacts with other gas molecules, with high vacua a molecule makes very many more impacts with the walls than with other gas molecules. These considerations are of prime importance in connection with the so-called molecular pumps, and also lead to results on the passage of low-pressure gases through tubes which are essential in high vacuum technique.

At low pressures the difference of pressure between the two ends of a connecting tube is necessarily small, and for rapid pumping it is desirable that the gas shall pass easily through the tube under this minute difference. Knudsen, who has carried out classical investigations on the behaviour of gases at very low pressures, has dealt with this problem, and established the laws which govern the passage. The application of the formulae derived by him for the case when the pressure is sufficiently low for the mean free path to be large compared to the radius of the tube shows at once the necessity of using very wide connecting tubes in exhausting vessels at low pressures, a fact of prime importance in the design of pumps and pumping systems. To take an example, suppose that the gas in question is air at 15° C, and that the vessel to be exhausted has a volume of 2 litres. Let the connecting tube be 50 cm. long, and 5 mm. in diameter, which might be imagined, at first sight, to give ample freedom for the gas to pass. Let the pressure in the vessel at a given instant be 10 microbars and suppose the pump to maintain a pressure of ·1 microbar at the other end of the tube. The time required for the pressure in the vessel to fall to 2 microbar, twice that produced by the pump, is found from the formula to be over 5 minutes. Accordingly, whenever very low pressures are to be produced short wide tubes must be used for joining the pump to the system to be evacuated, and any taps which may form part of the connecting system must also be of large bore, for even with a tube only a centimetre or two long the time required for the fall of pressure specified in the example just taken will be a few minutes if the diameter is only 2 mm. Special large glass taps of very wide aperture are used in modern work.

One of the great troubles in producing very high vacua is to get rid of the vapours of any volatile liquids or soft solids which may be present, even in small quantities. The chief sources of such vapours are the mercury used in mercury pumps and the greases which must be used on taps to make them airtight. The vapour pressure of mercury is low, being a few ten-thousandths of a mm. of mercury at room temperatures, but such pressures cannot be tolerated in high vacuum work. To prevent the vapour arriving from the pump or from mercury surfaces of any kind which happen to be embodied in the apparatus, it is usual to insert "traps" between the mercury surfaces and the actual vessel in which the vacuum is required. Such traps may consist either of tubes which can be cooled by immersion in a cold liquid or of tubes coated on the inside with a metal having no great affinity for mercury, such as sodium or potassium. In the case of a condensation trap the temperature is best maintained well below 0° C, say at −78° C by solid carbon dioxide mixed with ether or alcohol, or, better still, at −180° C or so, by liquid air, since at very low pressures condensation is difficult to initiate.

As regards tap grease, there are special compositions, such as "Ramsay fat" (4 parts of pure unvulcanised rubber, 2 parts of vaseline, and 1 part of white paraffin) which have a very low vapour pressure, and should be used if some form of grease is inevitable. For some work the greased tap is replaced by a mercury seal, in which, by the lifting of a reservoir, a mercury level is raised so as to cut off communication between two tubes. A number of special cements and waxes are in use for joining together metal and glass parts of vacuum systems, such cements requiring low melting point combined with low vapour pressure. Sealing wax, which must be of best quality, has long been widely used for this purpose: a black cement called picein, similar in composition and appearance to Chatterton compound, is much used in Germany, while many American workers favour Khotinski cements, made of gum lac with a small percentage of a coal tar distillate. Whenever possible, the use of cements is avoided in high vacuum works. Glass parts are fused together, and metal parts soldered together, while recently a technique has been worked out, and is widely employed, which permits glass-to-metal joints to be made by fusion.

Both glass and metals contain large quantities of occluded gases and gases held at the surface by forces whose precise nature is undetermined, water vapour being particularly persistent in the case of glass. When a vessel is evacuated to low pressures, say to a ten-thousandth of a millimetre of mercury, the surface gases are liberated, slowly if the vessel is at atmospheric temperature, much more rapidly if it be strongly heated. Dunoyer quotes a case of a vessel of 9 litres capacity, which was evacuated down to a pressure of 1 microbar and sealed off. In 10 hours the pressure had risen to be nearly a hundred times as great, namely 95 microbars. If therefore a vessel be evacuated and sealed off without any special precautions, the vacuum will rapidly deteriorate. To get rid of the surface gases as far as possible tubes which are to be sealed once for all, such as X-ray tubes, are subjected to a prolonged baking in special ovens while being evacuated, the temperature being taken as high as is consistent with the safety of the glass. Metals heated in vacuo also give out gases, mainly water vapour and hydrogen. The behaviour of these occluded gases has been extensively studied in connection with the manufacture of electric lamps and thermionic valves, for example by Langmuir and his colleagues in the laboratories of the General Electric in America, and by Norman Campbell and his colleagues in the laboratories of the General Electric Company, Limited, in England.

Pumps.—The points which have just been reviewed demand consideration no matter what type of pump be used to produce the vacuum. Of recent years a large number of pumps of different types have been evolved for the rapid production of low vacua, which will now be described.

Modern pumps may be divided into two classes: those which rapidly produce a fairly high vacuum, but not a vacuum of the highest degree, say down to a hundredth of a millimetre of mercury, and those which produce a vacuum of the order of a millionth of a millimetre of mercury. Pumps of the former class are widely used to produce the preliminary vacuum required before the pumps of the second class can come into operation: they are therefore often called "preliminary" pumps, or "fore-pumps" (German *Vorpumpe*). The latter are called high-vacuum pumps.

Since rapidity of evacuation is one of the demands made on the modern pump it is necessary to arrive at some arbitrary definition of the speed of a pump which may be used to specify its performance. One suitable way of defining the speed is to say that it is the volume of gas removed per second, the volume being measured at the pressure prevailing in the vessel undergoing evacuation; it is tacitly assumed that the tubes connecting the pumping system to the vessel are so wide that they do not appreciably affect the performances. Another way is to define the speed as the ratio of the decrease of pressure per second per unit volume to the pressure prevailing in the vessel. Since Boyle's law may be taken to hold approximately over the range in question in these high vacuum measurements these two definitions come to the same thing.

If v be the volume measured at any instant at the pressure p prevailing in the vessel and V be the volume of the vessel, then, by definition,

$$\text{speed} = S = \frac{dv}{dt} = -\frac{V}{p}\frac{dp}{dt}.$$

If it be desired to express the speed in terms of the change of pressure produced in a given time the equation is integrated, giving:

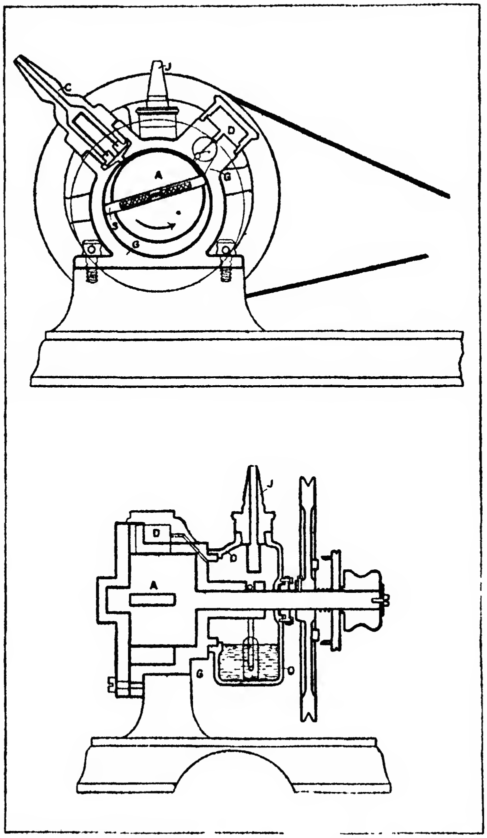
$$S = \frac{V}{t-t_0}\log\frac{p_0}{p}$$

where p_0 is the initial pressure at time t_0, p the pressure at a subsequent time t.

Even as so defined the speed of a pump differs at different pressures. It is expressed in cubic centimetres per second, the pressure at which it is measured being also specified. Thus, it is said that the speed of a certain Holweck pump is 2,500 cc. per second at ·001 mm. of mercury.

Preliminary Pumps.—While any type of piston pump, such as the Geryk, can be used to produce the fore-vacuum of a few millimetres of mercury with which most high-vacuum pumps will work (for some high-vacuum pumps the degree of vacuum produced by an ordinary water jet pump, the so-called filter pump,

suffices) the pumps in use as preliminary pumps at the present day are generally of the pattern in which the air is swept out by the help of vanes making an airtight contact between the outer casing and a revolving cylinder. As an example of such a pump we may take Gaede's rotary box pump (*Kapselpumpe*), which was the first to establish itself in the modern laboratory, although the design was closely adumbrated in the seventeenth century by Prince Rupert's "waterbolt" (*See* E. N. da C. Andrade, Journal of Scientific Instruments, vol. v., p. 78, 1928.) Gaede's box-pump is illustrated in vertical section in fig. 5, both a section along the shaft and one at right angles to the shaft being shown. A cylinder A, mounted eccentrically in the cylindrical boring of the casing G, carries two hardened steel plates (S) with rounded ends which



BY COURTESY OF G. LEYBOLD, KÖLN

FIG. 5.—A ROTARY BOX PUMP (GAEDE), USED TO PRODUCE A PRELIMINARY VACUUM, WHICH IS PERFECTED BY A PUMP OF THE HIGH VACUUM TYPE

are kept in close contact with the walls by centrifugal action when the shaft revolves. Air is taken in at C and forced through the valve D into the chamber O, which also serves as an oil chamber, lubricating the shaft by means of a loose ring. The chamber O is in free communication with the outside air by the tube J, through which the air is expelled. If C, instead of being connected to a vessel, is left free the pump acts as a very efficient blower, taking in air at C and delivering a jet at J. Many modifications of this pattern have been produced: the Trimount pump, for instance, has eight vanes of laminar construction, with a special device for maintaining them in contact with the walls. The pump made by the Central Scientific Company of America, called by them the Cenco Hyvac, has a single vane moving in a radial slot in the body of the pump, kept in contact with a rotating eccentric cylinder which has no vanes, the intake and outlet being close to the vane on either side. It is remarkably efficient.

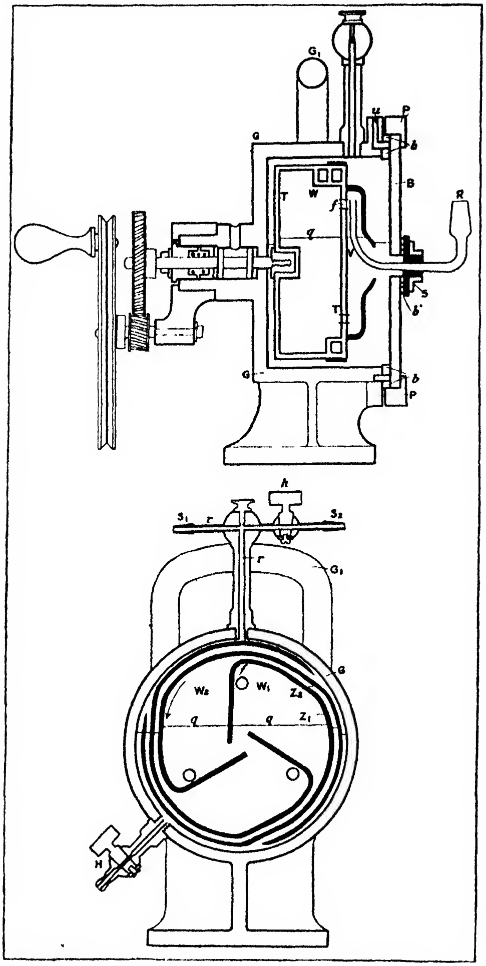
A good box-pump is very rapid. The pressure in a vessel of 10 litres can be reduced from atmospheric to less than 1 mm. of mercury in two minutes or so, and a final pressure of ·01 mm. of mercury can be attained with certainty. With some of the most recent rotary box pumps, which work immersed in oil, pressures as low as ·002 or even ·001 mm. of mercury have been attained, which is an astonishing performance. For rapid working two pumps are often connected in series, mounted on a common base and immersed in the same oil bath. Such an arrangement is widely used in lamp factories.

High Vacuum Pumps.—A revolution in high vacuum technique was brought about in 1905 when Gaede introduced his rotary mercury pump. In principle the pump, which is illustrated in fig. 6, is something like a gas meter run backwards. It consists of a porcelain drum W, rotating on an axis A, mounted in an iron vessel GG, the front of which is closed by a glass plate B, as shown in the upper figure. The drum is divided into two parts by a vertical wall T, the portion on the right of this wall enclosing a space V which communicates through the tube R with the vessel to be evacuated. The portion to the left of the wall is divided into three compartments by walls of the shape shown in the lower figure. The pump is filled with mercury up to the level *qq*. When the drum rotates in the direction of the arrow the compartment W_1, which communicates with V by the hole *f*, is filled with gas from the receiver while the gas in the compartment W_2, drawn from the receiver just before, is displaced by the mercury and ultimately passes into the space between the revolving drum and the casing. The action is continuous. It is, however, clearly necessary that the pressure prevailing in the space between drum and casing shall not exceed a few millimetres or so of mercury; the pump must therefore be run in connection with a fore-pump of the type described, which first reduces the pressure to a figure at which the rotary mercury pump can be put into operation, and subsequently removes, as long as necessary, the gases displaced by the mercury pump. The fore-pump is connected to the tube S_2, the other branch S_1 being connected to a rough mercury gauge.

With mercury pumps of this type a pressure as low as 10^{-5} mm. of mercury, as measured with the McLeod gauge, can be attained. There is, however, always the pressure of the mercury vapour itself, about ·001 mm. of mercury at ordinary room temperature, unless special precautions are taken to trap the vapour between pump and receiver. Further, the pump cannot deal with condensible vapours, such as water vapour, for the decrease of volume of the chamber during the expulsion of the gas leads to condensation of the saturated vapour in the drum. The pump needs a large mass of mercury. It has, however, the great advantage that it can be stopped without deterioration of the vacuum already attained, which cannot be done with other types of pump to be described. The speed is about 100 cc. per sec. over a wide range, but begins to fall off rapidly after a pressure of 10 microbars or so has been reached, being one quarter this value at ·1 microbar. This pump is still widely used in the laboratory.

In 1912 Gaede invented a pump working on an entirely different principle, the so-called molecular pump. This takes advantage of certain properties of low pressure gases demonstrated by Knudsen. If we consider a passage of rectangular cross-section, one wall of which (or two opposite walls) is moving in its own plane in the direction of the axis of the passage, then molecules striking the moving wall acquire a forward component of velocity equal to that of the wall. If the gas is at a pressure such that the mean free path is very small compared to the transverse dimension of the passage, this ordered velocity, imposed on top of the random velocities of the molecules, is, as we pass away from the surface, gradually dissipated into a chaotic velocity distribution by impact among the molecules. The motion is that considered in the ordinary treatment of viscous fluids, and a difference of pressure can

be maintained between the two ends of the passage which is proportional to the speed at which the wall is moving. As the pressure is diminished the viscosity remains independent of the pressure until this becomes so low that the mean free path is comparable with, or large compared to, the transverse dimensions



BY COURTESY OF G LEYBOLD, KOLN

FIG 6 —GAEDE'S ROTARY MERCURY PUMP

As the drum W rotates, the air is displaced from the chamber W_2 into the space between drums and casing G, and is drawn from the receiver into the chamber W, through opening f. The chamber W, moves into the position of chamber W_2, and the process is repeated

of the passage. (*See* KINETIC THEORY.) At very low pressures the experimental effects can be accounted for on the assumption that the molecules striking a stationary wall are thrown back in directions independent of the angle of incidence, the number of molecules streaming from the wall in a given direction obeying the same simple cosine law as governs the intensity of the light emitted from a glowing plate. As far as the direction of the "reflected" molecules is concerned, the gas behaves as if it were condensing on the wall and evaporating again. If the wall which the molecules strike is moving, the velocity of the wall must be added to that of the molecules (at any rate if the pressure is below ·001 mm. of mercury; at higher pressures the effect at the wall is somewhat complicated by the formation of a skin of gas, which has the effect of producing an apparent slip at the walls. (*See* Gaede, *Annalen der Physik,* 41, 289, 1913.) There will be effectively a convection of the molecules by the moving surface. Theoretical considerations on lines worked out by Knudsen and Gaede shows that with the low pressures contemplated the *ratio* of the pressures at the two ends of the passage is fixed by the speed of the wall, instead of the *difference* of the pressures, as at higher pressures.

Suppose now a deep and narrow groove cut in the periphery of a rotating cylinder, which fits closely into a casing, bored with two close holes communicating with groove Between the two holes a tongue projects from the casing into the groove, with which it makes a close fit. If the cylinder rotates quickly, the gas in the groove is between close moving walls, and molecules will be carried away from the side of the tongue from which the walls are receding, and carried to the side of the tongue which they are approaching. A vacuum will tend to be produced on the former side, so that of the two borings mentioned one will be the low pressure side and the other the high pressure side of the pump The two sides are in permanent communication by the groove, but molecules can only pass from one to the other by traversing practically the whole circumferential distance against the direction of the moving walls. With practicable speeds of rotation the ratio of the pressures at the two ends of the groove turns out to be sufficiently large to permit a very efficient high vacuum pump to be constructed on the principle of adding the velocity of the walls to the molecular velocity at low pressure

Gaede's molecular pump consists of a rotating cylinder with several circumferential grooves of the type just considered, into each of which projects a tongue connected with the housing The openings on either side of the tongues are connected from groove to groove so that the high pressure side of the one is joined to the low pressure side of the next, or, in other words, the separate pumps which the grooves virtually constitute are connected in series The high pressure side of the outermost grooves go to the fore vacuum; the low pressure side of the central groove is the point of lowest pressure, and goes to the vessel to be evacuated Special devices prevent the lubricating oil from penetrating into the grooves. A modified form of molecular pump, due to Holweck, is illustrated in fig. 7 In this pump the grooves are cut in the casing, the rotating part being a simple cylinder. There are two grooves of spiral form, leading from the central opening to the outer ends of the pump, where they communicate with the space leading by the tube to the fore-vacuum The grooves are deeper at the middle, where the pressure is lowest, than at the ends. The speed of the pump is high, being as great as 7,000 to 8,000 cc. per second at a pressure of ·001 mm for one size in which it is made, and the pressure produced is less than 10^{-6} mm of mercury.

A great advantage of the molecular type of pump is that it deals with condensible vapours, in particular with water vapour, as readily as with gases: a disadvantage is the expense necessitated by the mechanical difficulties of construction. The cheapness and simplicity of operation of the mercury vapour pump now to be described has rendered the use of the molecular pump a restricted one.

The action of the mercury vapour pumps depends upon the diffusion of the gas into a stream of vapour, and the condensation of the vapour to prevent it passing into the receiver: according as more stress is laid upon the diffusion or the condensation these pumps have been called diffusion pumps or condensation pumps A better name might be vapour-stream pumps, which is here suggested. Imagine a tube through which a stream of easily condensible vapour passes, for definiteness say mercury vapour, and let a side tube from a vessel containing gas lead into this tube at right angles. A certain amount of gas will diffuse into the mercury vapour stream, and a certain amount of mercury vapour will diffuse into the side tubes. If, however, the pressure of the gases is comparatively high, and the mean free path small compared to

FIG 7 —A MOLECULAR PUMP, DESIGNED BY HOLWECK

L is the opening of the intake tube, connected to A, B is the output tube, connected to the fore pump. The gas is carried by the rotation of the drum D along the spiral channels G G, beginning at M M and ending at N N, cut in the casing C, and delivered into the space O O

the size of the opening into the vapour tube, impacts will be very frequent, and the diffusion very small If the mean free path is large, the interchange of molecules takes place freely, and gas and vapour each behave as if the other was not there the flow depends upon the partial pressure of each molecular species. The speed at which the gas molecules diffuse into the vapour stream can be calculated from the kinetic theory of gases, and it can be shown that it attains a maximum when the mean free path of the mercury vapour is about the diameter of the opening through which the diffusion takes place Gaede's original pump was based upon such considerations Communication between gas and vapour stream took place through a slit of carefully calculated size The most favourable mean free path of the mercury vapour was obtained by adjusting the temperature The mercury vapour passing into the gas space through the slit was removed by condensation

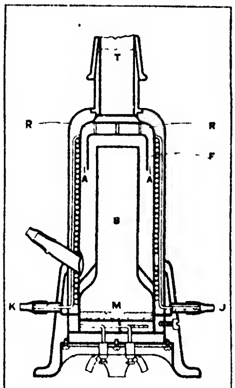

FIG 8 —LANGMUIR'S MERCURY VAPOUR PUMP

B the tube through which the vapour rises; F. the hood, hung on thin rods R R; A A. the annular space through which the gas diffuses into the vapour stream. The condensed mercury returns to M through small holes at the base of the tube (B). K and J are for the water supply to the cooling jacket. The heating is electrical

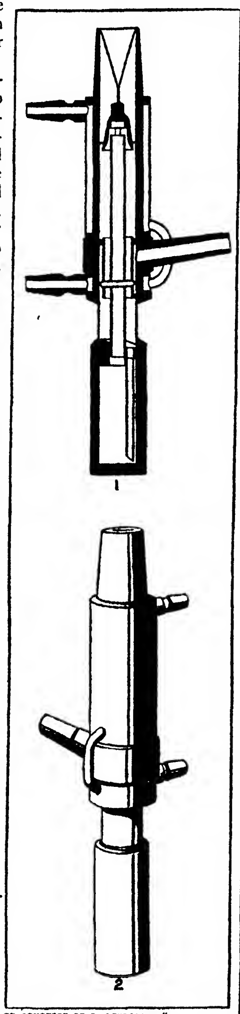
Shortly after Gaede's first account of his pump Langmuir devised a form of vapour-stream pump in which he insisted particularly upon the condensation, holding that his pump was essentially different in principle from Gaede's. In the form illustrated in fig. 8, a stream of vapour from heated mercury M passes vertically upwards through a tube B and is directed against a hood F, hung on thin rods R. The mercury vapour then rushes downwards and strikes the water-cooled walls of the cylindrical space, where it condenses. There is thus only a very small movement, by diffusion against the prevailing velocity of stream, of the mercury vapour upwards into the circular space A, through which the gas, entering by the wide tube T, diffuses into the mercury stream This method of condensation has obvious advantages, and has been widely adopted, but the pump is none the less a diffusion pump. A similar construction was afterwards adopted by Gaede, whose present one-stage diffusion pump is shown in fig 9 The mode of operation is clear from what has just been said.

Two stage and three stage mercury vapour pumps, in which the stages are arranged in series, so that the high pressure side of one is the low pressure side of another, are made for rapid work While, owing to the fact that at very low pressure it loses its jet form, the stream of mercury vapour in a diffusion pump exerts no such action as the steam jet does in an ordinary injector, at higher pressures the Bernoulli effect comes into operation and is, in fact, utilised in the preliminary stage or stages of a multiple stage pump, where, owing to the higher pressure the diffusion principle is less effective An interesting two-stage pump devised by Dunoyer, which works with a fore-vacuum pressure no lower than 25 mm of mercury or so, is illustrated in fig 10 The first stage operates on the principle of the steam injector, the rush of mercury vapour through the jet A taking the place of the rush of steam in the injector, and creating a low pressure in B Mercury vapour also passes through the holes T into the annular space C, and creates a high vacuum in D by diffusion and condensation in the same way as it does in the Langmuir pump

The mercury vapour pumps, on account of their simplicity and rapidity, and of the high vacua which they produce, have obtained a foremost place among the weapons of the worker with high vacua, and are to be found not only in nearly all physical laboratories, but also in the workshops of the makers of X-ray tubes, thermionic valves, and the like. They have the great advantage that the speed of pumping is constant down to the lowest pressures, and theoretically there is no limit to the degree of vacuum which can be produced, as there is with the molecular pump, where a given pressure ratio is established between high and low pressure side. Dozens of different modifications exist in one form there is no external heating, the vaporization of the mercury being produced by striking a mercury arc within the pump itself Some forms, like that of Dunoyer, work with relatively quite a high pressure as fore-vacuum, but it is usual to employ some form of rotary box pump as fore-pump. Pressures as low as a few millionths of a mm. of mercury have been produced with these pumps. The speed of a single-stage pump, with a fore-vacuum of 1 mm can

be as high as an evacuation of 10,000 cc. per second.

To prevent mercury vapour from the pump reaching the exhausted system, some form of trap is inserted between the two This may be a vessel of special form, offering a large surface to the vapour, cooled by liquid air, or vessels coated inside with an alkali metal, say sodium, may be used The alkali metals exert an extraordinary absorption for mercury vapour



BY COURTESY OF G. LEYBOLD, KÖLN

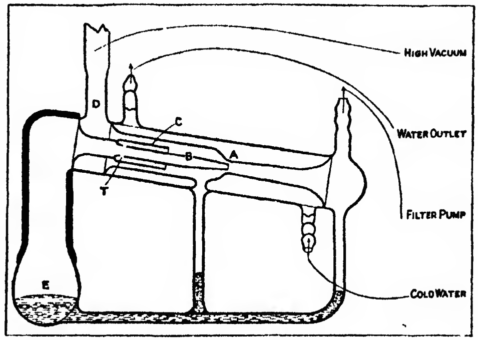
FIG 9.—A SINGLE-STAGE HIGH VACUUM MERCURY DIFFUSION PUMP, DESIGNED BY GAEDE

Vacuum Production by Absorbers and Discharge.—To remove residual gases and vapours from a space already exhausted by a pump and sealed off, use has been made of the strong absorption which purified charcoal exercises on gases when it is cooled. Sir James Dewar was the first to call attention to this technique The charcoal is prepared from cocoanut shell (originally from the fleshy part of the nut) by prolonged heating in vacuo A tube containing the charcoal is sealed onto the apparatus, and, after preliminary exhaustion has taken place, a vessel of liquid air is placed round the charcoal tube Very low pressures can be produced in this way, and before the invention of the molecular pump and of the mercury vapour pump the method was extensively used in the laboratory, and still finds employment in certain types of experiment A great deal of work was done on the absorbing power of charcoal for gases in connection with gas masks during the war.

For particular gases and vapours other absorbers are sometimes used Palladium black at low temperatures is particularly effective for hydrogen. The use of alkali metals for absorbing mercury vapour has received mention above. The liquid alloy of sodium and potassium is used for removing traces of oxygen, and other instances of substances used to take up residual gases by chemical action will be found in the standard treatises on high vacua.

For removing the residual gases from electric lamps, thermionic valves, and the like, an operation to which the term "clean up" is technically applied, processes of a chemical nature are widely employed. A minute amount of some substance known as a "getter," which combines vigorously with the gases, is introduced into the lamp, and the filament is then heated, when the clean up takes place. The process is described in the article ELECTRIC LAMPS AND VALVES, MANUFACTURE OF. The electric discharge in an evacuated lamp or similar vessel also leads to the disappearance of residual gases. The effect is a complicated one, which has been studied in detail by Norman Campbell and his co-workers in the laboratories of the General Electric Company, Limited.

Measurement of Low Pressures.—Pressures down to a millimetre of mercury or so can be measured by an ordinary mercury manometer, consisting of a U-tube of which one limb, closed at the upper end, is originally quite full of mercury When the other is connected to the vessel in which the pressure is to be measured the difference of level in the two limbs, which may be read with a cathetometer, indicates the excess pressure in the vessel above the vacuum in the closed limb Such manometers are commonly used for rough readings Lord Rayleigh (3rd Baron) devised a more sensitive mercury manometer, in which the two mercury levels are in contact with fine vertical pointers: the difference of pressure is measured by the angle through which it is necessary to tilt the manometer in order to restore the level when it is disturbed by the presence of gases on one side This gauge has been used to measure pressures from 1·5 mm to ·001 mm of mercury Shrader and Ryder have described another way of measuring very small movements of the mercury surface in a U-tube manometer A little float on the surface supports one end of a lever carrying a small mirror, and the tilt of the mirror is measured by a lamp and scale



FROM DUNOYER, VACUUM PRACTICE (BELL)

FIG 10.—A TWO-STAGE MERCURY VAPOUR PUMP, DESIGNED BY DUNOYER

The McLeod gauge, described in the first part of this article is still a standard instrument for the accurate measurement of pressures down to ·001 mm of mercury—or even lower, down to a hundredth of this value, with certain gases and suitable precautions The accuracy of the gauge depends upon the closeness with which the gas in question obeys Boyle's Law, which is assumed in the deduction of the pressure It is clear that the gauge cannot be used with condensable vapours, such as those of water or ammonia, which tend to liquefy on the walls; even with carbon dioxide the readings are not reliable. With such gases as hydrogen and nitrogen, on the other hand, the gauge works down to the limit of pressure just mentioned

A McLeod gauge cannot be used with gases, such as chlorine, which are chemically very active and attack mercury, so various types of membrane manometer have been devised. Very thin spiral glass tubes, working on the principle of the Bourdon gauge used for steam pressures, have been used for such gases, the movement being measured with mirror and scale: such gauges are not sensitive to pressures less than ·1 mm. of mercury or so. Scheele and Heuse have used the mechanical deformation of a very thin metal membrane to measure small pressures One side of the membrane is exposed to the gas or vapour, while on the other side the vessel is evacuated as thoroughly as possible by a high-vacuum pump. The very small movements produced are measured by an interference method, and results have been obtained down to ·0001 mm of mercury, but the instrument is troublesome to work with.

The exceedingly low pressures produced by modern technique have led to the construction of a whole class of new manometers, depending for their action on the anomalous behaviour of gases which begins to manifest itself as soon as the mean free path is

comparable with the linear dimensions of the vessel. The conductivity and the viscosity are properties which are independent of the pressure so long as the mean free path is small, but change rapidly with the pressure when the pressure is very small, becoming proportional to the pressure below a certain limit of pressure, depending upon the nature of the gas and the dimensions of the vessel. Again, at low pressures, the radiometer effect manifests itself; that is, there is a mechanical repulsion between a warm surface and a colder surface opposite it when gases at low pressure lie between them. (*See* RADIOMETER.) Further, with an apparatus of the type used by Foote, Meggers, and Mohler for measuring resonance potentials (*see* RESONANCE POTENTIAL), so long as, first, the pressure is low enough for the electrons to have a free path between the hot wire and the surrounding grid, and, secondly, the potential fall accelerating the electrons is well above the ionization voltage, the ionization produced between the grid and the surrounding cylinder is proportional to the pressure. All these effects have been utilised in the construction of special low pressure gauges.

Two types of viscosity gauges may be mentioned In one, devised by Langmuir and Dushman, a very light horizontal disc of mica hangs suspended by a quartz fibre directly above a second horizontal disc. This second disc is carried on a vertical shaft which can be set in rapid rotation by a rotating magnetic field established outside the glass vessel. The drag of the rotating disc on the suspended disc, which is proportional to the speed of rotation and to the pressure of the gas between the discs, is measured with the help of a mirror attached to the suspended disc. The effective viscosity depends not only upon the pressure but also upon the nature of the gas, so that the gauge requires special calibration On account of secondary effects it is not reliable below a certain low pressure, of the order of 5×10^{-4} microbars of mercury, and on account of the lack of proportionality of drag to pressure it cannot be used at pressures above ·02 mm. of mercury It has not found very wide employment

A much simpler form of viscosity gauge, due to Langmuir, consists merely of a vertical quartz fibre, rigidly fastened at the upper end to the top of the vessel. When the vessel is tapped the fibre is set into vibration, the amplitude of which decreases at a rate determined by the pressure of the residual gas in the vessel. The gauge can be used down to pressures of ·05 microbar.

The conductivity gauges, sometimes known as Pirani gauges after the deviser of the first model, or Pirani-Hale gauges since C. F. Hale introduced improvements, depend for the measurement of the conductivity upon the fact that the electrical resistance of a wire varies markedly with the temperature. The gauge is very similar to an electric lamp, consisting of a filament of pure platinum wire, which has a large temperature coefficient of resistance, enclosed in a glass bulb connected to the vacuum. The wire is put in one arm of a Wheatstone bridge, the current flowing through it raising its temperature by 100° C or so. The exact temperature at which it stands, and so its resistance, will depend upon the conductivity of the gas, which, for a given gas, measures the pressure. The change of resistance consequent upon the introduction of the gas may be measured, or, better still, as pointed out by Norman Campbell, the voltage change required to keep the filament at constant temperature, since calibration can then be carried out at one temperature.

The reading of a viscosity gauge or of a conductivity gauge depends upon the nature of the gas remaining in the vessel, since the physical properties in question are functions of the atomic weight as well as of the pressure. The magnitude of the radiometer effect is, however, independent of the nature of the gas, and the gauge constructed by Knudsen upon the radiometer principle is therefore often known as Knudsen's absolute manometer. If of two parallel strips one be maintained at an absolute temperature T_1, the other at an absolute temperature T_2 which is that of the rest of the vessel, then the repulsion between the two plates due to radiometric forces is $\frac{1}{2}p\ (\sqrt{T_1/T_2}-1)$ where p is the pressure of the gas (*see* RADIOMETER). This repulsion can be measured with various experimental dispositions A moving plate, of mica, glass, or metal, may be carried at one end of a short arm suspended from a torsion wire, with a small counterbalancing weight at the other end of the arm, and either a small part of the wall of the vessel, parallel to the plate, heated externally by a current of air, or by water, or the whole of the vessel heated, and the plate protected by an inner tube from molecules coming from all parts of the wall but that opposite one side of the plate. In another form electrically heated metal strips, introduced inside the vessel, are used as warm plates. The gauges are sensitive to pressures as low as a few times 10^{-8} mm of mercury The trouble with all the radiometer gauges is that it is difficult to be sure of the temperature of the cold plate, and the gauges all have to be calibrated by the introduction of measured minute quantities of gas into the highest possible vacuum

While the conductivity gauge is practically an electric lamp of ordinary filament type the ionization gauge of Dushman and Found is practically a thermionic valve (*q.v.*). The principle of its use has been already described The glass walls and metal parts must be carefully freed from gas by prolonged heating and pumping before the gauge is used With suitable conditions the desired proportionality between ionization and pressure is found to hold The calibration constant depends, of course, on the gas. This type of gauge has been much used in the technical laboratories attached to the great lamp companies. It can probably be used to measure pressures down to 10^{-4} microbars

It is perhaps, of interest to contrast the pressures produced by the pumps and measured by the gauges described with the highest attainable laboratory pressures, produced and measured by Bridgman The lowest pressures are certainly as low as 10^{-10} atmospheres (a ten-thousand-millionth of an atmosphere) Bridgman's highest pressures are 15,000 atmospheres which far exceed anything produced in the chamber of a gun during firing The range of pressures accessible in the laboratory is therefore from 1 to 150 million million Even at the lowest attainable pressure, however, there are more than a thousand million molecules present in every cubic centimetre

BIBLIOGRAPHY.—*Historical* The original sources for the most important early pumps are quoted in the text. For the general history of early air pumps *see* E. Gerland, F Traumuller, *Geschichte der physikalischen Experimentierkunst*, 1899, and E Gerland, *Geschichte der Physik*, 1913 A translation into German of Guericke's *De Vacuo Spatio* has been issued as Number 59 of Ostwald's *Klassiker der exacten Wissenschaften* The pumps in use round about the beginning of the present century are described in Winkelmann's *Handbuch der Physik*, vol i, part 2, 1908

VACUUM BRAKE, a form of brake utilizing the force exerted on a piston by the pressure of the atmosphere So long as a vacuum is maintained in the system the brake-blocks are kept off the wheels But when air is admitted, this presses against one side of the piston and applies the blocks (*See* BRAKE; *Railway Brakes and Motor Car Brakes*.)

VACUUM CLEANER. An appliance for extracting and removing dust from fabrics, such as carpets, upholstered seats, cushions, etc, by suction, designed for the primary purpose of carrying out this operation without the necessity of displacing the articles to be cleansed from the positions which they normally occupy when in use It is also used to remove dust from such surfaces as those of floors, shelves and walls, etc It was so named by its inventor, H C Booth, who made and patented the first successful appliance in the year 1901

A vacuum cleaner consists essentially of an air suction pump, or exhauster, connected by a pipe or tube or directly to a nozzle having a slot shaped orifice which is passed over the material being cleansed, the surrounding lip of the orifice being kept in close contact with the material An air filter which cleanses the air either before or after its entry into the exhauster serves at the same time as a chamber, or receptacle, for collecting the dust, which can be removed therefrom conveniently and without dispersal. In the light portable or domestic types, this filter is of cloth in the shape of a bag In operation, suction from the

air exhauster causes air to rush violently into the nozzle through the interstices of the fabric being cleansed and to carry away with it the imprisoned dust. The stream of dust-laden air passes from the nozzle to the filter, in which the dust is retained while the cleansed air is drawn on through the pump or filtered through the dust bag and delivered thence to the atmosphere.

In the first instance the vacuum cleaner was made in the form of a portable plant and consisted of a pump driven by a petrol or electric motor, mounted with the filter on a portable trolley, which was taken round periodically to houses, offices, etc, when cleaning was required A long flexible hose with the cleaning nozzle attached was led into the house from the plant which remained outside. Such cleaners for house to house work are now mounted in motor vans

Central Installations.—Shortly after the introduction of the portable type of machine, fixed installations of central plants were established in large buildings, such as hotels and theatres. These had a permanent system of pipes running from the plants to the various floors with branch pipes to different parts of the building At convenient positions in the pipe lines, valves, or nozzles with removable caps, were fitted, to which flexible hose with cleaning nozzles could be attached It is now common practice to equip large modern buildings with such central installations.

In both forms of plant the suction pump or exhauster is now either of the positive displacement or of the multi-stage fan type, depending upon circumstances and the class of work to be done, the former being more suitable for giving a higher degree of vacuum with less volumetric capacity than the latter.

If of the positive displacement type, it should be capable of drawing from 28 to 35 cu ft. of free air per minute per cleaning nozzle at work, while maintaining inside the nozzle a degree of vacuum equal to 5 in. of mercury. If of the multi-stage fan type, it should be capable of drawing from 50 to 70 cu ft. of free air per minute per cleaning nozzle at work, while maintaining inside the nozzle a degree of vacuum equal to 3 in. of mercury.

The filter is a chamber generally formed in two parts, an upper fixed part containing a filtering fabric of unbleached calico, linen or other suitable material usually made in the form of an inverted bag or cone, and a lower part, readily removable, into which falls, and is collected, the dust intercepted by the filtering material.

The cleaning nozzle for use on carpets or upholstery has a slot shaped orifice usually from $\frac{1}{2}$ in. to $\frac{3}{4}$ in. wide, and from 4 in. to 12 in. long, the rim of the orifice being formed with a continuous rounded lip so as to run smoothly over the fabric being cleansed and to ensure close contact therewith throughout its entire periphery. Other forms of nozzle are used for various purposes—those for removing dust from surfaces such as floors, or shelves, usually have felt or bristles mounted around the orifice.

The flexible hose to which the cleaning nozzle is attached is usually made of rubber, having a smooth bore and strengthened by embedded steel wire or strip which ensures sufficient strength combined with lightness and flexibility. If used with the positive displacement pump, it is generally of 1 in. internal diameter, or of $1\frac{1}{2}$ in. internal diameter if used with the multi-stage fan.

In central installations the diameter of the fixed iron pipes forming the mains which carry the dust-laden air to the filter is usually such as to allow an air velocity of between 40 ft. and 90 ft. per second.

Domestic Form.—The advantages of such a convenient and sanitary method of keeping homes free from accumulations of dust were widely appreciated and led in the course of a few years to the production of small cleaners in a variety of forms suitable for daily domestic use and driven by hand or by small electric motors which could be connected with the lighting circuit. Such machines are now common domestic appliances and have done much to displace the broom and duster, the employment of which is both inefficient and insanitary, owing to the unavoidable dispersal of dust in the atmosphere. It is well known that dust, when disturbed and caused to float about in the air, acts as a carrier of germs, and accumulations liable to be disturbed may be a considerable danger to health.

A bacteriological analysis of the dust in any public building gives a sufficient proof of this, and observations made over a series of years in a large printing works showed a marked improvement in the health of the workpeople after the installation and regular use of a vacuum cleaner.

During the World War many factories making high explosives were equipped with central installations of the vacuum cleaner for the purpose of minimizing the dangers of explosion and T N.T poisoning, and in one factory, fulminate of mercury was successfully dealt with.

Modified forms of the apparatus are now applied to many industrial processes in which the removal and conveying of dust or powdered material can be carried out economically and conveniently by pneumatic means. One of the more important recent developments is its application to the sooting or removal of fine ash from boiler casings, flues and economizer chambers, a laborious and unhealthy process when carried out by hand with brushes and shovels. In many cases the plant is arranged so that the operation can take place while the boilers are at work, thus rendering it unnecessary to close down, or for men to enter the casings or flues

In such a plant a positive acting pump is generally used, its capacity depending upon the number of tons of dust which it is required to remove per hour.

The air suction main leading therefrom passes to an air washer and thence to a cylindrical dust collecting chamber, provided with a dust discharge valve at its base, and usually mounted on a staging, so that it can be emptied into wagons or barges From this collecting chamber, a main pipe which conveys the dust-laden air is led to the boilers and economizers, etc, and branch pipes fitted with valves enter the boiler casings and flues, and terminate in one or more suction nozzles fixed at points where the dust accumulates. These nozzles are so designed as to admit a sufficient inrush of flue gases with the dust being sucked away in order to ensure its conveyance along the mains to the dust collecting chamber.

In other cases, where it is necessary to enter the flues for the purpose of cleaning, the operator uses a similar suction nozzle connected by a flexible metallic hose to a valve situated at a convenient point in the dust main, and in this manner one man can remove the dust, without inconvenience or disturbance at the rate of two tons per hour Cement dusts and arsenical powders have also been dealt with by similar plants.

Lampblack is collected by suction nozzles from rotating tables, and aluminium and bronze powders used in paints are transferred from the pulverizing stamps to collecting chambers. In these cases the filtration of the conveying air is carried out by means of fabric filters. (H. C. Bo.)

IN THE UNITED STATES

Some modern electric cleaners made in the United States clean and polish linoleum and varnished or waxed floors. One cleaner is equipped with a detachable handle for conversion into a portable unit for cleaning automobile upholstery, stair carpets, crevices and corners.

Types.—(1) "Built-in" or stationary type: a powerful motor usually placed in the basement of the building operates an exhaust fan or a suction pump from which metal pipes lead to valved inlets on each floor. A flexible hose of from 10 to 20 ft. in length may be attached to these inlets. Suction is applied to the floor or floor covering by means of an extension tube and a nozzle which is normally fitted with a universal joint for ease in handling. The dirt is separated from the air by means of a filter and either drops into a removable receptacle or is directed into a sewerage inlet.

(2) The portable electric type is now supplementing and supplanting many central installed systems. Two distinct types of portable electric vacuum cleaners are in use: the truck type and the light portable type. The truck type is placed on a truck platform which is mounted on three or four wheels. It employs motors of from $\frac{1}{4}$ to 1 h.p. which operate an exhaust fan or suction pump. A large flexible hose and nozzle is used similar to that of the

permanently installed systems. The light portable type is by far the most popular and represents 95% of all electric vacuum cleaners in use. Although of several distinct types, identified by varied cleaning principles, its main characteristics are lightness, from 10 to 20 lb. in weight, use of exhaust fan principles and use of floor nozzle. The latter is attached to a suction chamber, motor, exhaust fan and cloth bag to trap dust and sift air; and is mounted on small wheels guided by a handle, through which an electric cord runs to motor. The switch is usually in the handle These cleaners operate from house current at a cost which is generally less than 1 cent per hour. Motors are of from $\frac{1}{12}$ to $\frac{1}{4}$ horsepower. The attachments which are commonly sold at extra cost generally consist of a flexible hose about 8 ft in length, which may be connected to the intake of the suction chamber, various cleaning nozzles, a brush attachment and an extension tube which enables the operator to clean any type or contour of surface and without step-ladders reach any part of a room of normal height.

There are three main types of light portable electric vacuum cleaners. The first is the high vacuum type, characterized by simplicity and paucity of moving parts. Powerful suction is generated because the motor is used for producing suction only. High vacuum is effective in removing deeply embedded dirt. The broom action self-cleaning brush removes surface litter without injury to the nap of the floor covering The second is the carpet sweeper type which employs suction for removing embedded dirt and a revolving wheel driven brush for surface litter The revolutions of the brush are controlled by the speed at which the cleaner is moved across the surface of the floor covering The brush not being connected to the motor permits the full use of the power of the motor for generating suction The brush is removable for cleaning The third is the motor-driven brush and metal drum types which beat the floor covering and cause vibration to dislodge embedded dirt Surface litter is effectively removed by this type of cleaner and clinging dog or cat hairs or loose and cut nap are picked up by suction

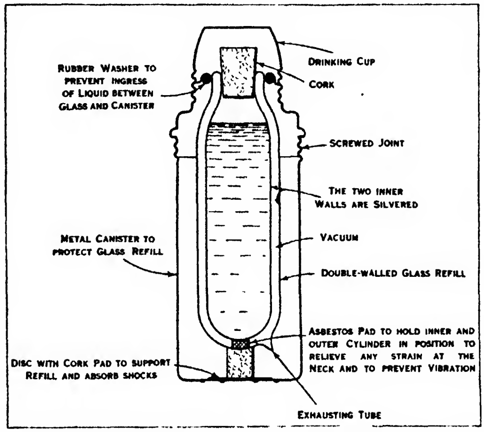
Small hand vacuum cleaners, frequently termed vacuum brushes, are sold in limited quantities. These are miniature electric cleaners and are of a pattern of all three types of portable electric cleaners explained above Larger portable electric cleaners which can be suspended by a strap from the shoulder of the operator or carried in one hand while he is using the cleaning nozzle, are designed and powered like the standard portable vacuum cleaners, but have no handle or large floor nozzle Non-electrical vacuum cleaners of current design are generally of the exhaust fan type A fly wheel weighing several pounds to which the fan is attached is actuated by a slip ratchet gear in mesh with one or two large driving wheels These wheels also support the cleaner. The speed at which the cleaner is moved determines the amount of suction generated which is never very great A carpet sweeper type revolving brush is generally used and is the chief cleaning agent. The dust is trapped in a cloth bag. These cleaners resemble electric vacuum cleaners in appearance.

History.—Hand power vacuum cleaners are the forerunners of all electric cleaners The "pump handle" portable tank type, using a set of two contracting diaphragms was first on the scene, followed by the suction carpet sweeper with a double bellows, operated by wheels in traction with the floor covering, which drew the dust into a cloth bag sifter

Large tank type vacuum cleaners mounted on horse-drawn wagons, or automobile trucks were the first power-driven vacuum cleaners to appear in America A motor supplied the power for both exhaust pump and fan types. This type employed flexible tubes, in sections, to reach from the street to the farthest corners of home, office building or hotel They are practically obsolete to-day. (F. War.)

VACUUM DISTILLATION: *see* Distillation.

VACUUM FLASK, a glass vessel with double walls, the space between which is evacuated. The only junction of the walls is at the neck of the vessel. It is also known as a Dewar vessel after its inventor Sir James Dewar (*q.v.*); "Thermos" flask is a proprietary name applied to a form protected by metal casing It was invented in the first place to preserve liquefied gases (*see* Liquefaction of Gases) by preventing the transference of heat from the surroundings to the liquid The approximate vacuum between the glass walls is practically a non-conductor of heat, and radiation is reduced to a minimum by silvering the glass The chief path by which heat can be communicated to the interior of the inner vessel is at the junction



BY COURTESY OF THERMOS (1925) LTD

VACUUM FLASK IN WHICH TRANSMISSION OF HEAT TO OR FROM THE CONTAINER IS PREVENTED BY THE VACUUM SPACE

of the walls at the vessel's neck, which is consequently made as small as possible. This thermal isolation applies equally in the opposite direction, a hot liquid remaining at a high temperature for several hours Where the flask is subjected to rough usage, metal has been substituted for glass, but the latter is the more efficient material

VACUUM-PUMP. This has an opposite effect to an air-compressor, that is, it withdraws air instead of forcing it in The smaller pumps are employed for scientific purposes, and for the exhaustion of incandescent lamp bulbs and Rontgen tubes. Large units serve factories carrying on certain chemical processes, and making foodstuffs, sauces, varnishes, etc A vacuum is largely used for boiling semi-liquids or liquids at a low temperature, the boiling point being determined by pressure. Condensed milk and milk powder are made by boiling off the water in a vacuum, while oil refining and sugar refining are also performed with the help of a vacuum.

The large pumps are built similarly to air-compressors, and driven by belt, steam, electric motor, or internal-combustion engine, and ranging in power requirement to more than 200 horse-power Small types such as the well-known Sprengel mercury pump are composed of tubes and bulbs mounted against a vertical frame or board But a mechanical pump, the Geryk, patented by Fleuss (and made by The Pulsometer Engineering Co. Ltd.) is extremely simple to use, and gives a very high vacuum, whether on a small or a large scale The single-cylinder type will give a vacuum of $\frac{1}{50}$ of a millimetre off perfect, while in an elaborated type, and under favourable conditions, a vacuum of $\frac{1}{1,000,000}$ mm. can be obtained. The piston of the small pumps is reciprocated by a lever, or a lever worked from a handwheel, while larger units derive their power from an electric motor. Rotary pumps are also made on a modified principle.

In the diagram the top of the piston and the underface of the head valve are seen to be of the same form, so that when they are in contact no air space exists between them. As the piston reaches the top of its stroke it over-runs the cylinder bore slightly, and is therefore in close contact with the head valve, expelling all air. The piston in rising to this position comes into

contact with the oil. The main valve is oil sealed with a special oil of low vapour tension *See* also VACUUM (F. H)

VACUUM TUBE: *see* THERMIONIC VALVE.

VÁCZ, a town of Hungary, 20 m N of Budapest, straggles along the left bank of an arm of the Danube at the foot of the Cserhát mountains, where the river takes its southward course On the hills around are large vineyards and the exportation of grapes is an important industry There are also spirit, soap and shoe factories while the working of wool is carried on The town is the see of a bishop and has numerous architectural remains and a museum of the Roman and mediaeval antiquities in which the district is so rich Pop (1923), 19,395.

VADE-MECUM, a Latin phrase meaning literally "come with me" (*vade,* imperative of *vadere,* to go or come; *cum,* with; *me,* abl of *ego,* I), and used in French, Spanish and English for something that a person is in the habit of constantly taking about with him.

VAGRANCY. The existing British law against vagrancy is the outcome of over three centuries of legislation. Stephen's *History of the Criminal Law,* dealing with vagrancy as a criminal offence, states that "when serfdom was breaking down and when the statutes of labourers provided what might be regarded as a kind of substitute for it, provisions as to vagrancy were practically punishments for desertion The labourer's wages were fixed, his place of residence was fixed; he must work where he happened to be. If he went elsewhere, he must be taken and sent back By degrees the order of ideas which this view of the subject represented died away The vagrant came to be regarded rather as a probable criminal than as a runaway slave."

The act of 1495 instructed local authorities to search for all "vagaboundes, idell and suspecte persones lyvyng suspeciously" and put them in the stocks for three days, giving them bread and water only, and then turn them out of the town In 1530 owing to the increase of vagrancy followed by crime and disorder whipping was allowed as an alternative to the stocks. In 1535 an even severer punishment for the sturdy vagabond was enacted. If brought a second time before a justice of the peace he might be marked by having the upper part of his right ear cut off and after this if convicted of wandering, loitering and idleness might be adjudged a felon and suffer death. Other drastic acts followed until 1597 when fortune tellers, tinkers, pedlars, jugglers, etc., were all treated as rogues and vagabonds and even players except such as "belonged to any baron of this realm or any other honourable person of greater degree." This law remained in force with amendments until orders in council in 1603 and 1662 empowered the authorities to transport sturdy beggars and idle and disorderly persons to English plantations beyond the seas. Branding ceased to be legal in 1713 In 1821 a select committee of the House of Commons dealing with the system of "passing" vagrants to their place of settlement recommended that the existing system should be abolished and long periods of imprisonment given instead.

As a result of the report, the existing legislation was in 1822 repealed "en bloc" and the new act to remain in force till 1824 reduced the powers of magistrates with regard to vagrants and also reduced the maximum term of detention from seven years transportation to two years imprisonment Finally the Vagrancy Act of 1824 repealed all former statutes and vagrancy offenders were liable to punishment either as "idle and disorderly persons" or as "rogues and vagabonds" or as "incorrigible rogues" Since 1824 legislation and regulations have both been based on reports made by the poor law commission, and under the poor law as reformed in 1834 it became the duty of the guardians to provide relief for destitute persons and to use a test to make sure that relief given from the public funds was not abused When workhouses were established vagrants applied for admission to them and in 1837 the poor law commissioners expressed the opinion that it was the intention of the Act of 1834 that all cases of destitution should be relieved irrespective of the fact that the applicant might belong to a distant parish

There have been many acts since that time, such for example, as the act of 1842 proscribing a task of work in return for food and lodging and the Poor Law Act of 1844 authorising the formation of districts in London and other large towns for the provision of temporary relief In 1848 when the poor law board took the place of the poor law commissioners the whole question of vagrancy was reported on by the inspectors to the new board and a minute of the poor law board urged uniformity in action, the refusal of relief to able bodied men not actually destitute, and the employment of police officers as assistant relieving officers for vagrants Under the act of 1864 every London union was required to provide casual wards

The "Casual."—Nearly all subsequent legislation deals with the treatment of the casual pauper and the regulations that should be enforced especially when the applicant for admission to a casual ward was an able bodied man A general order dated Dec 18 1882 prescribed the rules and regulations to be observed and pauper vagrancy decreased for two or three years, but increased again from 1885–1895 The number of vagrants in casual wards on Jan. 1, 1905 was 9,768 There followed the appointment of the departmental committee on vagrancy in 1906 Since then the number of vagrants has increased and it is estimated that there are no less than 12,000 many of them ex-service men who for one reason or another tramp from place to place and find temporary accommodation in the casual wards and lodging houses or sleep in the open. It is extremely difficult to say how many of these men are *bona fide* unemployed but not more than one-third could be placed in the class of "rogues and vagabonds." The recommendations of the committee on vagrancy of which the Rt Hon. J. L. Wharton was chairman were of a varied character some of which could not be carried into effect without legislation For example, it was suggested that the control of casual wards and the local relief of vagrants should be transferred to the police authority with a view to securing uniform treatment throughout the country. At present (1929) it is often necessary for tramps to apply for tickets at police stations before they can sleep in the casual ward, although the police have no final control Another recommendation was that of a detention colony and an indeterminate sentence, a detention colony, for example, such as Borstal for boys and the place of detention for an indefinite period instead of prison for a short term The committee recommended

that habitual vagrants should be sent to certified labour colonies for detention for not less than six months or more than three years. This recommendation would also require legislation The third recommendation which has passed into law is that of the establishment of labour exchanges the value of which for the unemployed tramp is that information can be obtained at a labour exchange as to where employment is likely to be found. The difficulty however which has not been overcome is that if a man is compelled without money to tramp the country he cannot stay long enough in one place to enable him to find employment. A considerable advance has been made in the direction of forming vagrancy committees for counties or larger areas, the object being to secure uniform treatment of tramps, to find work for those who are willing to work and to deal with the difficulty of women and children on the road Clearly what is required is a national system of dealing with the problem; and all boards of guardians, if still in existence, should be included in these committees. A number of counties have also adopted the suggestion of a way-ticket system. By a statutory order of Sept. 23, 1914 the supply of a midday meal for paupers discharged from the casual ward was legalised. The way-ticket system was by no means universally adopted and has not been a success.

The Metropolitan Asylums Board by unifying the London tramp wards has introduced uniformity in administration and generally speaking the London casual wards are clean and well kept. As a result of the report of the casual wards committee of the Metropolitan Asylums Board many helpable cases are now dealt with separately, the idea being to enable those who are really desirous of work to stay in a ward which is treated as a hostel A stay of a week or a fortnight often means that the man is able to find employment The implication is that the casual ward with its one or two nights detention does not assist the man to find employment, but that given a longer time a considerable number of men can be assisted to find work

Remedies.—The labour exchange should theoretically enable an unemployed man, likely to become a vagrant, to be transferred to some place where work is more abundant, but the labour exchanges are in many cases overworked and have a mass of local unemployment to deal with, most of it stagnant labour. If the occupants of casual wards could be given a chance there is no doubt that a percentage, small perhaps, but probably not less than 10% would be willing to work if suitable employment could be found. To obtain this fluidity of labour some arrangement is required to enable the man to travel from place to place and this entails the expenditure of money He also requires when he arrives at a new town some decent accommodation other than the casual ward. Vagrancy reform must be based upon effective individual dealing and proper classification since the vagrant may be either a genuine unemployed man, an ex-service man, an old and infirm person, a young boy, a married man with a wife and children or an habitual vagrant Various remedies might be suggested for the evil. In the first place it would be as well to set up another inter-departmental committee to consider what changes have taken place in the situation since the last committee of 1906 and what legislation is still required. Proper accommodation should be supplied in the shape of municipal lodging houses for genuine unemployed looking for work, and Labour Exchanges should supply the necessary information as to existing accommodation in their own districts. Every attempt should be made to induce the vagrant to call at the labour exchange for information and if he possessed a wayfarer's card it would be possible for the labour exchange to endorse it before he went "on the road." A training camp is required for the young man who has no real trade behind him. while for those who are seasonally unemployed some sort of a colony should be established in order that the man may not lose the habit of regular work.

On the punitive and deterrent side other remedies are required. If "sleeping out" and "loitering with intent" and begging for food or drink are treated as offences the vagrant can no longer be left to the poor law. He becomes a concern of the Home Office. Vagrancy offenders should then be subject to penal detention under an indeterminate sentence. Such men should not be allowed to become recidivists. Two things are quite obvious in dealing with this problem The first is that penal detention should not be resorted to where the only crime is poverty, the second, that where the social conduct of an individual calls for penal treatment he should not be allowed to contaminate others in the casual ward

Like all social problems vagrancy cannot be isolated from other important questions such as housing, poor law reform and unemployment. It is a symptom of a deeply rooted social evil which must be remedied by dealing with the other problems which lie at the root of the trouble (*See* also POOR LAW; CASUAL WARD, LABOUR COLONIES, UNEMPLOYMENT)

Ribton-Turner, *History of Vagrants and Vagrancy* (1887), *see* also *Reports, Evidence and Appendices of Departmental Committee on Vagrancy* (1906), a most valuable publication, as well as *The Vagrancy Problem* (1910), by W H. Dawson, who was a witness before the committee, and whose work quoted is full of first-hand information Two Board of Trade *Reports* on "Agencies and Methods for Dealing with the Unemployed" (1893 and 1904) will be found useful, as also Rev W Carlile and V W Carlile's *The Continental Outcast* (1906), Mary Higgs, *Down and Out. Studies in the Problems of Vagrancy*; "Royal Commission on the Poor Law," appendix to *Reports on Visit to Labour Colonies*, vol. xxxii (1919), *Ministry of Reconstruction Report on Transference of Function of Poor Law* (1918) (P. A.)

The United States.—Vagrancy laws in the United States began to appear after the economic depression of 1873 (New Jersey, 1876, Delaware, 1879; New York, 1884) and after the even greater depression of 1893 Owing to the unique nature of the problem in the United States these laws attempted to differentiate between the vagrant or loafer about town, and the tramp who roved "about from place to place" Both were "idle persons without visible means of support" only the tramp was more of a romantic adventurer In other connections he is known as a migratory worker or hobo He was a conspicuous figure in the building of railroads, prospecting and clearing the land during the strenuous drive against the frontier. With the passing of the frontier he continued in his rôle as tramp and migratory worker, but he now functions in only the seasonal industries and transient occupations The migratory worker, thanks to his facility in using the railroads. is more mobile than any type of vagrant so far developed In the main he is self-sustaining, and when he is not, his problem is as much a matter of unemployment as of vagrancy His labour market is elusive, harvesting, sheep shearing, lumbering, ice cutting and the like, and his fortunes are no less elusive However legitimate his function may be in the country's industrial set-up, he still leads a precarious, hand-to-mouth existence, moving from job to job, from State to State at the beck and call of his opportunities, and not infrequently of his moods. Most of his life the hobo lives in the open, especially in summer when if he is not at work or travelling to the next job he is basking in the "jungles," his roadside camps In winter when work is scarce he is frequently forced into some city for food and shelter, and it is then that he gets his rating as a vagrant.

The life of the hobo, and he is at present typical of the American variant of the genus vagrant, is divided between train riding, the job, the "jungle" and the "main stem," or the street of the homeless found in most cities In most of his contacts he is relatively isolated from women, so hobo life becomes a man's game. A population recruiting its new membership from young men and boys, it has little of the culture traits, jargon and sign language that some observers attribute to vagrants of the Old World. Since so many boys and young men are attracted into the class and since the promise of adventure generally proves a delusion there is naturally considerable unrest, which may explain the zeal with which hobos often turn to syndicalism. Manifestations of unrest, songs of protest, and rapid movement, especially of younger hobos, about the country, have all appeared with the passing of the frontier and the swing of the country from a rural to an industrial, city-building civilization. The hobo of the old school who lived his life in the open, tramping and working by turns, and carrying his bed wherever he went, is vanishing. Whereas the old-type hobo used to avoid the city, the present species of the undomesticated American is essentially urban, and only when necessity forces him does he venture into the country.

Most attempts in the large cities to cope with the problem of vagrancy have been partial and palliative Small cities at one time opened their jails for winter lodging but that has practically ceased since the World War. Other cities drive tramps out of town, and others have established wood yards to give the work test Numerous cities have municipal lodging houses and in addition private agencies, as the Salvation Army, maintain industrial shops and transient hotels In every large city during hard times, and often the year through, bread lines and soup kitchens may be found None of these efforts meets the problem in any comprehensive fashion; in fact no American city has as yet attempted any comprehensive programme Quite a contrast is the treatment afforded tramps who have invaded the Southern States during winter months They frequently find their way into chain camps and often have been leased to contractors in the mines and turpentine camps The brutal treatment so characteristic of Southern prison camps has failed, however, to prevent the annual southward movement of large numbers.

Jacob S Coxey who led "Coxey's army" of unemployed to Washington in 1894 demanded that the Government should put them to work building roads That proposal has often been made but only with transient success One of the earliest instances was in New York city in 1808 during a riot of unemployed sailors Attempts have been made by the Federal and State Governments, as well as by municipalities to conduct employment bureaux These have been partially successful but perhaps more important still are the moves toward public regulation of private employment agencies These agencies frequently corner jobs during hard times and charge unreasonable prices Since the World War the automobile has had a profound influence on vagabondage in the United States The old-time hobo still rides the railroad but a younger class, out for sport, follow the highways and ride automobiles This promises to add women to the tramp population There is evidence too that the automobile is making possible a tramp family In many towns of the South and West these families constitute a serious burden for charity agencies

VAI, a people of the Mandinga group, on the Guinea coast in Liberia and Sierra Leone, who are remarkable for their use of a syllabic script consisting of more than 159 signs invented in the first half of the 19th century by Momolu Doalu Bukere

See Migeod, *The Languages of West Africa* (1911)

VAIDA-VOEVOD, ALEXANDRE (1871–), Rumanian statesman, was born at Olpret (Transylvania) in 1871. He studied medicine in Vienna and practised for many years at Karlsbad (Karlovy Vary) At the age of 28 he joined the National Rumanian Party of Transylvania and from 1906–18 sat in the Hungarian parliament at Budapest, where he waged a permanent fight in defence of the Rumanians in Transylvania. On the collapse of the Central Powers in the autumn of 1918, Vaida-Voevod was instructed by the newly formed "Rumanian national committee," to voice their claims in the Hungarian parliament. Invoking the right of self-determination he denied the right of the Hungarian Government to speak in the name of the Rumanians of Transylvania and claimed that the latter should have their own representative at the Peace Conference. Soon after, the Rumanian national committee took administrative control of Transylvania and delegated Vaida-Voevod to represent the Rumanians of Transylvania and the Banat at the Peace Conference in Paris.

In 1919 Dr Vaida-Voevod was appointed prime minister and minister for foreign affairs of Rumania and in the latter capacity went to Paris and London early in the following year to negotiate with the French and British Governments the recognition of the union of Bessarabia with Rumania This he succeeded in doing in March 1920 when the rights of Rumania over Bessarabia were recognized by the Supreme Economic Council, and afterwards ratified by the Treaty of London (Oct 28, 1920). Dr. Vaida-Voevod resigned in the same year and afterwards sat in parliament as one of the leaders of the National Rumanian Party, but left that institution when his party decided to boycott the Liberal Government as unconstitutional

VAIL, THEODORE NEWTON (1845–1920), American capitalist, was born in Carroll county (O), on July 16, 1845 He became interested in telegraphy, and in 1868 he became station agent and telegraph operator on the Union Pacific Then he was appointed clerk in the railway mail service, and in 1873 was made assistant superintendent of railway mail service, rising in 1875 to general superintendent In 1878 he was made general manager of the American Bell Telephone Company In 1885 he resigned and was elected president of the newly organized American Telephone and Telegraph Co, which in 1900 acquired the American Bell Telephone Company. In 1887, because of ill-health, Vail retired In 1896 he installed an electric railway system in Buenos Aires, and later introduced telephone systems in South American cities.

In 1907 he was again induced to accept the presidency of the American Telephone and Telegraph Company When this company in 1910 bought control of the Western Union Telegraph Co, Vail was made president of the latter also, and introduced many changes, including "night letters" at reduced rates When in 1914, as the result of a threatened suit by the Government, the Western Union was again segregated Vail remained president of his old company After the taking over of the wires in Aug 1918 by the Government as a war measure, he was appointed adviser by the postmaster-general When the wires were returned in 1919 to private ownership he was elected chairman of the board of directors of the American Telephone and Telegraph Company He died in Baltimore on April 16, 1920.

See A B. Paine, *In One Man's Life* (1921)

VAILLANT, EDOUARD MARIE (1840–1915), French politician, was born in Vierzon (Cher) on Jan 28, 1840 He studied science, residing in Heidelberg, Tubingen, Vienna On his return to Paris he took part in the republic and socialist battle against the Second Empire, becoming a disciple and friend of Blanqui On March 18, 1871 he took part in the Commune Insurrection, and, on the 26th, was elected a member of the Commune He was a delegate on the executive Commission, and his work for public instruction displays his revolutionary audacity and his scientific knowledge

After the defeat of the Commune he fled to England and became associated with Karl Marx But, after having been a member of the general committee of the First International, after having participated in 1872 in the Congress at The Hague, he induced his friends to abandon this association because it seemed to him to be insufficiently revolutionary. He founded "The Revolutionary Commune" which published the manifesto in which these disciples of Blanqui declared themselves to be atheists, republicans, communists, revolutionaries, and partisans of class conflict.

Condemned to death by the War Council in 1872, Vaillant only returned to France in 1880 under amnesty He was a founder of the Socialist Revolutionary Party, and in 1884, he became a Municipal Councillor of Paris, becoming deputy in 1893 Under his direction, the Blanquist party made itself noticeable among the other socialist parties In Boulangisme (1889), he separated from other blanquists, who, through nationalism, were inclined to accept a plebiscitary dictator

In 1899, and again in 1905, Vaillant made himself the apostle of socialist unity in France. When in 1905, all the socialist parties united, he became a very close friend of Jaurès, and secured with him the majority in all socialist congresses until 1914. He advocated the eight-hour day, security and hygiene for workers, remedies against stoppage of work, and a struggle against war.

In August 1914, he considered that France was attacked and that it was the duty of the socialists to defend it, as in 1870 and

1871. He resumed the formulae of blanquist socialism and declared himself unreservedly in favour of national defence.

VAIRAGI: *see* RAMATS.

VAISHNAVITES (Bengal). Chaitanya, the founder of the great Vaishnava sect of Bengal, was the son of a high-caste Brahman of Nadiya, the famous Bengal seat of Sanskrit learning, where he was born in 1485, two years after the birth of Martin Luther, the German reformer Having married in due time, and a second time after the death of his first wife, he lived as a "householder" (*grihastha*) till the age of 24, when he renounced his family ties and set out as a religious mendicant (*vairagin*), visiting during the next six years the principal places of pilgrimage in northern India, and preaching with remarkable success his doctrine of Bhakti, or passionate devotion to Krishna, as the Supreme Deity. He subsequently made over to his principal disciples the task of consolidating his community, and passed the last twelve years of his life at Puri in Orissa, the great centre of the worship of Vishnu as Jagannatha, or "lord of the world," which he remodelled in accordance with his doctrine, causing the mystic songs of Jayadeva to be recited before the images in the morning and evening as part of the daily service; and, seeking to humanize divine adoration by bringing it into accord with the experience of human love To this end, music, dancing, singing-parties (*sankirtan*), theatricals—in short anything calculated to produce the desired impression—would prove welcome to him His doctrine of Bhakti distinguishes five grades of devotional feeling in the Bhaktas, or faithful adherents: viz, (*santi*) calm contemplation of the deity; (*dasya*) active servitude; (*sakhya*) friendship or personal regard, (*vatsalya*) tender affection as between parents and children, (*madhurya*) love or passionate attachment, like that which the Gopis felt for Krishna. Chaitanya promoted the celebration on an imposing scale of the great Puri festival of the Ratha-yatra, or "car-procession," in the month of Ashadha, when, amidst multitudes of pilgrims, the image of Krishna, together with those of his brother Balarama and his sister Subhadra, is drawn along, in a huge car, by the devotees This festival was, and is, attended by people from all parts of India, without distinction of caste or sex All classes, even Mohammedans, were admitted by Chaitanya as members of his sect The ordinary form of worship is very simple, consisting mainly of the constant repetition of names of Krishna, or Krishna and Radha, which of itself is considered sufficient to ensure future bliss The partaking of flesh food and spirituous liquor is strictly prohibited By the followers of this sect, also, an extravagant degree of reverence is habitually paid to their *gurus* or spiritual heads Indeed, Chaitanya himself, as well as his immediate disciples, have come to be regarded as complete or partial incarnations of the deity to whom adoration is due, as to Krishna himself; and their modern successors, the Gosains, share to the fullest extent in the devout attentions of the worshippers. Chaitanya's movement was directed against the vile practices of the Saktas (*q v*) then very prevalent in Bengal, but his own doctrine of divine, though all too human, love was by no means free from corruptive tendencies. Whilst in Chaitanya's creed, Krishna, in his relations to Radha, remains at least theoretically the chief partner, an almost inevitable step was taken by some minor sects in attaching the greater importance to the female element, and in this way making Krishna's love for his mistress the guiding sentiment.

VAISON-LA-ROMAINE, a town of south-eastern France, in the department of Vaucluse, 26 m. N.N E. of Avignon by road. Pop. (1926) 1,860. Vaison, under the name of *Vasio*, was one of the principal towns of the *Vocontii;* the number of Roman finds, including a fine statue of an athlete (the Diadumenos) in the British museum, proves its importance in Roman times. The bishopric established in the 3rd century was suppressed in 1791. The temporal power of the bishops passed in the 12th century to the counts of Toulouse. Subsequently Vaison came, together with the rest of Comtat-Venaissin, under the power of the popes The Ouvèze, a tributary of the Rhône, divides Vaison into two quarters—the Roman and early mediaeval town on the right bank, and the mediaeval town on the left bank.

VALAIS, a canton of south Switzerland. The region is the old *Vallis Poenina* (Upper Rhone valley) The former spelling, "Vallais," was officially replaced (early 19th century) by "Valais"

The modern canton includes the entire basin above St Maurice, but below this point it consists of the western part only; its lower limits are in the Lake of Geneva The total area is 2,020·7 sq m (exceeded only by the Grisons and Berne), of which, however, only 55 9% is reckoned as "productive"; forests cover 282 6 sq m and vineyards 12 2 sq. miles Its unproductive area includes the most considerable stretch of glaciers in Switzerland (*c* 375 sq m), together with about 5 sq m of lakes Poor as the canton is, it would be poorer were it not for its excellent wines—the area under vineyards is second only to Vaud (*q v*) and is increasing—and for its well organized tourist traffic Hotels have been built in nearly every tributary glen, and on the majority of the high pastures The striking beauty of the scenery of its high glens, and the accessibility (*see* below) of the most characteristic features, have made the canton unusually popular, chiefly with summer visitors The Upper Rhone occupies a north-east to south-west gorge-like trench from Gletsch to Brig; below this the valley widens and runs east to west to Leuk, onwards it resumes its original course, ever widening until Martigny is reached, where the remarkably sharp bend carries the feature to the north-west; between St Maurice and the lake is the only low land in the canton The lowest commune is St Gingolph (1,266 ft alt) The loftiest point is the Dufourspitze summit (15,217 ft) of Monte Rosa, but the highest mountain wholly within the canton is the Dom (14,942 ft) (*See* SWITZERLAND *Relief*.)

The chief railway line (about 75 m) through the canton is from St Gingolph, on the Lake of Geneva, to Brig, at the north mouth of the Simplon tunnel (1895–1905—12½ m long), from St Maurice onwards it forms part of the main through line from Lausanne towards Milan There are also several mountain railways, *e g*, from Visp up to Zermatt (thence a branch up to the Gornergrat), from Vernayaz (near Martigny) past Salvan towards Chamonix, and from Leuk to Leukerbad, near the Gemmi pass and noted for its mineral springs A new tunnel (1906–12) beneath the Lotschen pass, connects Kandersteg, in the Bernese Oberland, with Brig, thus opening up a new direct route from Paris to Italy, via Berne The lofty alpine barriers of Valais are, as a rule, accessible only by footpaths or mule paths, but there are excellent roads over the Great St Bernard pass (8,111 ft) and the Simplon pass (6,590 ft) to Italy, while at the head of the Rhone valley other excellently engineered roads give access to Uri over the Furka pass (7,992 ft) and to Berne over the Grimsel pass (7,159 ft)

In general, the boundaries of the canton run along the summit ridges of the surrounding mountains, but from an early date it has held a valuable part of the southern slope of the Simplon pass to below Gondo, as well as the rich Alpine pastures on the northern slopes between the Gemmi pass (7,641 ft) and Schwarenbach.

The estimated population in 1926 was 134,200; at the 1920 census the total was 128,246, of whom 84,340 were French-speaking, 40,105 German-speaking and 3,479 Italian-speaking, the most marked change during the 20th century being a decrease in the last total The linguistic frontier has shown much oscillation; at present the inhabitants above Leuk generally speak a dialect of German, while below Leuk a Savoyard patois (French dialect) is the prevailing tongue In general, the history of Valais (from 1810 to 1814 the French department of the Simplon) is a struggle between French and German elements. It is one of the last three admissions to the Confederation In 1920 there were 122,976 Catholics, 4,242 Protestants and 44 Jews

The canton forms the 4th century diocese of Sion (created *c* 580) and has St Théodule as its patron saint. Since 1513, its bishop has had no superior except the pope. Valais contains the three famous religious houses (all now held by Austin canons) of St Maurice, of the Great St Bernard, and of the Simplon The abbey of St. Maurice (4th century and the oldest Christian foundation among the Alps) has, since 1128, belonged to the Augustinians Since 1840 its abbot has borne the title of bishop of Bethlehem *in partibus*

Good wines, especially Muscat and Vin du Glacier, are produced in the canton, but the chief activity of the main valley below Brig is agriculture, rendered rather precarious in former days by extensive Rhone inundations. In the higher valleys the inhabitants are employed in pastoral occupations. The number of mountain pastures is greater, and they are better stocked in the more congenial Lower Valais than in Upper Valais (the line of division passing near Leuk). The capital is Sion (pop 6,950). The canton has no large towns. The average density of the population in 1920, 63 per sq m, was but little above that of Uri (*q v*). Of the larger settlements, Monthey (4,700)—near St. Maurice—with an electric railway up the Val d'Illiez to Champéry, and Brig (3,130) are the most important. Naters, near the latter town, has a prosperous colony of Italian workmen.

Valais is divided into 13 administrative districts, which comprise 171 communes The Cantonal Constitution was entirely remodelled in 1907. The legislature (*Grand Conseil*) is composed of 109 members elected by the people in the proportion of one for every 1,100 Swiss residents. The executive (*Conseil d'État*) is composed of five members Both councils hold office for four years The "obligatory referendum" prevails for all laws and financial resolutions passed by the *Grand Conseil*, while 4,000 electors (6,000 in the case of a revision of the Cantonal Constitution) have the right of "initiative" as to legislative projects; the latter initiative dates back to 1848. The canton provides two members of the Federal *Standerat* and six members of the Federal *Nationalrat*, elected by a popular vote. The principles of proportional representation are employed in communal elections.

History.—The Vallis Poenina was won by the Romans after a great fight at Octodurus (Martigny) in 57 B C, and was so thoroughly Romanized that the Celtic aboriginal inhabitants and the Teutonic Burgundian invaders (5th century) became Romance-speaking peoples. Valais formed part of the kingdom of Transjurane Burgundy (888), which fell to the empire in 1032, and later of the duchy of Burgundia Minor, which was held from the emperors by the house of Zahringen (extinct 1218). In 999 Rudolph III of Burgundy gave all temporal rights and privileges to the bishop of Sion, who was later styled "praefect and count of the Valais." About the middle of the 13th century we find independent communities or "tithings" (*dizains* or *Zehnten*) growing up, these, though seven in number, taking their name most probably from a very ancient division of the bishop's manors for administrative and judicial purposes In the same century the upper part of the valley was colonized by Germans from Hasli (Bern), who Teutonized it, though many Romance local names still remain. In 1354 the liberties of several of the seven "tithings" (Sion, Sierre, Leuk, Raron, Visp, Brieg and Conches) were confirmed by the emperor, Charles IV. A little later the influence of Savoy became predominant, and the count secured to his family the bishopric of Sion, of which he was already the suzerain His progress was resisted by the tithings, which in 1375–76 crushed the power of the house of La Tour-Châtillon, and in 1388 utterly defeated the forces of the bishop, the count and the nobles at Visp, this being a victory of the Teutonic over the Romance element in the land From 1384 the Morge stream (a little below Sion) was recognized as the boundary between Savoyard or Lower Valais and episcopal or Upper Valais In 1416–17 the *Zehnten* of the upper valley made an alliance with Lucerne, Uri and Unterwalden, with a view partly to the conquest of the Val d'Ossola, which was finally lost in 1422, and partly to the successful crushing of the power of the lords of Raron (1420). By the election of Walther von Supersax of Conches as bishop in 1457 the Teutonic element finally won the supremacy. On the outbreak of the Burgundian War, the bishop of Sion and the tithings made a treaty with Bern In November of the same year (1475) they seized all Lower or Savoyard Valais up to Martigny, and in 1476 (March), after the victory of Grandson, won St Maurice, Evian, Thonon and Monthey. The last three districts were given up in 1477, but won again in 1536, though finally by the treaty of Thonon in 1569 Monthey, Val d'Illiez and Bouveret alone were permanently annexed to the Valais, these conquests being maintained with the help of their old allies, Uri, Schwyz and Unterwalden. These districts (or Lower Valais) were ruled as subject lands by the bishop and tithings of Upper Valais. In 1790–91 Lower Valais rose in revolt; but it was not finally freed till 1798, when the whole of Valais became one of the cantons of the Helvetic republic. Such prolonged resistance, however, was offered to French rule that in 1802 Bonaparte declared Valais an independent State under the name of the "Rhodanic Republic." In 1810, for strategic reasons, he incorporated it with France as the "department of the Simplon," and it was not freed till the Austrians came in 1813 In 1815 a local assembly was created, in which each of the seven tithings of Upper, and each of the six of Lower Valais elected four members, the bishop being given four votes. This constitution was approved by the Federal Swiss diet, and the Valais was received as a full member of the Swiss Confederation. By the constitution of 1839, the local assembly was to be elected according to population (one member for every 1,000 inhabitants), and the bishop was given a seat instead of his four votes, while the clergy elected one deputy. By the 1844 constitution the clergy elected a second deputy. In 1844 there was civil war, and the Valais became a member of the Sonderbund It was the last canton to submit in the Sonderbund War (1847) By the constitution of 1848 all ecclesiastical exemptions from taxation were swept away, and the bishop lost his seat in the assembly. New constitutions were framed in 1852, 1875 and 1907. (*See* SWITZERLAND. *History*)

VALDEMAR I., king of Denmark (1131–1182), the son of Canute Lavard and the Russian princess Ingeborg, was born a week after his father's murder, and was brought up in the religious and relatively enlightened household of Asser Rig, whose sons Absalon and Esbjörn Snare, or "the Swift," were his playmates On the death of King Eric Lam in 1147 Valdemar came forward as one of the three pretenders to the Danish crown, Jutland falling to his portion (compact of Roskilde [1157]) Narrowly escaping assassination, at a banquet a few days later, at the hands of his rival, King Sweyn III, he succeeded only with the utmost difficulty in escaping to Jutland, but on Oct 23 utterly routed Sweyn at the great battle of Grathe Heath, near Viborg, Sweyn perishing in his flight from the field

Valdemar had no longer a competitor He was the sole male survivor of the ancient royal line, his valour and ability were universally recognized, and in Absalon, elected bishop of Roskilde in 1158, he possessed a minister of equal genius and patriotism. The first efforts of the new monarch were directed against the Wendish pirates who infested the Baltic and made not merely the political but even the commercial development of the Danish state impossible What the Northmen were to the Western powers in the 8th and 9th the Wends were to the Scandinavian lands in the 11th and 12th centuries At the beginning of the reign of Valdemar the whole of the Danish eastern coast lay wasted and depopulated. Arkona, the chief sanctuary, and Garz, the political capital of the Wends, in the island of Rügen, were captured in 1169 by a great expedition under the command of Valdemar and Absalon; the hideous colossal idol of Rügievit was chopped into firewood for the Danish caldrons, and the Wends were christened at the point of the sword

This triumph was only obtained, however, after a fierce struggle of ten years, in which the Danes were much hampered by the uncertain and selfish co-operation of their German allies, chief among whom was Henry the Lion, duke of Saxony and Bavaria, who appropriated the lion's share of the spoil For at the beginning of his reign Valdemar leaned largely upon the Germans and even went the length, against the advice of Absalon, of acknowledging the overlordship of the Emperor Frederick Barbarossa at the diet of Dôle, 1162. Very different was Valdemar's second conference with Barbarossa, on the banks of the Eider, in 1182, when the two monarchs met as equals in the presence of their respective armies and a double marriage was arranged between two of Valdemar's daughters and two of the emperor's sons.

The only serious domestic trouble during Valdemar's reign was the rebellion of the Scanian provinces, which objected to the establishment of a strong monarchy inimical to local pretensions and disturbances, and especially to the heavy taxes and tithes

necessary to support the new reign of law and order. The rising was ultimately suppressed by Absalon at the battle of Dysiaa, 1181 In the following year King Valdemar died

See *Danmarks Riges Historie*, vol. i., pp. 570–670 (Copenhagen, 1897–1905); Saxo, *Gesta Danorum*, books 10–16 (Strasbourg, 1886); L. Gresebrecht, *Wendische Geschichte aus den Jahren 780–1182* (Leipzig, 1843); and article DENMARK: *history*. (R. N. B.; X)

VALDEMAR II., king of Denmark (1170–1241), was the second son of Valdemar I and brother of Canute VI, whom he succeeded on Nov 12, 1202. Already during his brother's lifetime, as duke of Schleswig, Valdemar had successfully defended Denmark against German aggression In 1201 he assumed the offensive, conquered Holstein, together with Hamburg, and compelled Count Henry of Schwerin to acknowledge the over-lordship of the Danish crown. Immediately after his coronation, he hastened to his newly won territories, and was acknowledged lord of Northalbingia (the district lying between the Eider and the Elbe) at Lübeck, Otto IV, then in difficulties, voluntarily relinquishing all German territory north of the Elbe to Valdemar, who in return recognized Otto as German emperor Thus the three bishoprics of Lübeck, Ratzeburg and Schwerin, which hitherto had been fief of the *Reich*, now passed under Danish suzerainty. In 1208, when the Emperor Otto felt more secure upon his unstable throne, he would have attempted the recovery of the lost German territory but for the interposition of Pope Innocent III., who threatened to excommunicate any German prince who should attack Valdemar, the equally pious and astute Danish king having undertaken, at the bidding of the holy see, to lead a crusade against the heathen Estonians. Valdemar's position was further strengthened by the accession of Frederick II, who formally renounced all the German lands north of the Elbe and Elde, as well as the Wendish lands on the Baltic, in favour of Valdemar

Valdemar henceforth turned to the extension of the Danish empire over the eastern Baltic shores Here, however, he had already been forestalled by German colonists established in Gotland and at Riga. In 1206 Valdemar, urged by Archbishop Anders Suneson, had occupied the isle of Oesel on the Estonian coast. In 1210 Valdemar led a second expedition eastwards, this time directed against heathen Prussia and Samland, the chief result of which was the subjection of Mestwin, duke of Pomerania, the leading chieftain in those parts

In 1218 the German Bishop Albert of Riga was driven to appeal for assistance to King Valdemar Valdemar cheerfully undertook a new crusade "for the honour of the Blessed Virgin and the remission of my own sins." In 1218 he set sail for Estonia with one of the largest fleets ever seen in northern waters, including a Wendish contingent led by Prince Vitslav. Landing at Lyndantse (the modern Reval) in north Estonia, Valdemar at once received the submission of the inhabitants, but three days later was treacherously attacked in his camp and only saved from utter destruction by his own personal valour and the descent from heaven, at the critical moment, of a red banner with a white cross on it, the Dannebrog (Danes' Cloth), of which we now hear for the first time, and which henceforth was to precede the Danish armies to victory till its capture by the Ditmarshers, three hundred years later. This victory was followed by the foundation of Reval and the occupation of Harrien and Wirland, the northern districts of Estonia, by the Danes.

King Valdemar II was now, after the king of England, the most powerful potentate in the north of Europe The southwestern Baltic was a Danish sea, and Danish territory extended from the Elbe to lake Peipus. But this scattered and heterogeneous empire required a large standing army and a strong central government to hold it together It is doubtful whether even the genius of Valdemar would have proved equal to such a stupendous task. He never had the opportunity of attempting it. In May 1223 he was seized at midnight in his tent on the isle of Lyö, whither he had come to hunt, by his vassal and guest Count Henry of Schwerin, and conveyed with his son and many other valuable hostages to the inaccessible castle of Dannenberg-on-Elbe. In this dungeon he languished for two and a half years, and, despite all the efforts of Pope Honorius III. on his behalf, was ultimately forced to pay a heavy ransom, and surrender Northalbingia and all his Wendish conquests except Rugen.

On his release he tried to retrieve his position by force, but was defeated at Bornhöved (July 22, 1227), which deserves a place among the decisive battles of history, for it destroyed at once and for ever the Danish dominion of the Baltic, and established the independence of Lubeck, to the immense detriment in the future of all the Scandinavian states On the other hand Valdemar, by prudent diplomacy, contrived to retain the greater portion of Danish Estonia (compact of Stensby, 1238). With rare resignation Valdemar devoted the remainder of his life to the great work of domestic reform His noblest achievement in this respect is the codification of the Danish laws known as the *Jydske Lov* (Jutland Code), which he lived to see completed a few days before his death at Vordingborg on March 21, 1241 Valdemar was twice married, his first consort being Dragomir (Dagmar) of Bohemia, his second Berengaria of Portugal. All his four sons, Valdemar, Eric, Abel and Christopher became kings of Denmark.

See *Danmarks Riges Historie*, vol. i., pp. 736–849 (Copenhagen, 1897–1905). (R. N. B.; X.)

VALDEMAR IV., king of Denmark (*c.* 1320–1375), was the youngest son of Christopher II of Denmark Valdemar was brought up at the court of the German emperor, Louis of Bavaria, during those miserable years when Denmark was partitioned among Holstein counts and German *Ritter*, while Scania, "the bread-basket" of the monarchy, sought deliverance from anarchy under the protection of Magnus of Sweden Even the Hansa Towns, the hereditary enemies of Denmark, regarded the situation with disquietude "One would gladly have seen a single king in Denmark if only for peace sake," says the contemporary Lubeck chronicle, "for peace was not to be had either at sea or on land" The assassination at Randers of the detested Holstein tyrant Count Gerhard III (1340), who for nine years had held Jutland and Funen and dominated the rest of Denmark, first opened Valdemar's way to the throne, and on midsummer day 1340 he was elected king at a *Landsting* held at Viborg, after consenting to espouse Helveg, the sister of his most important confederate, Valdemar, duke of Schleswig

Valdemar could not have been more than 20 when he became the nominal king of Denmark, though, as a matter of fact, his territory was limited to the northernmost county of Jutland His precocious maturity is strikingly evident from the first An energy which never slackened, a doggedness which no adversity could crush, a fiery ambition coupled with the coolest calculation, and a diplomatic unscrupulousness which looked always to the end and never to the means, these were the salient qualities of the reconstructor of the dismembered Danish state First Valdemar aimed at the recovery of Zealand, which was actually partitioned among a score of Holstein mortgagees who ruled their portions despotically from their strong castles, and sucked the people dry The oppressed clergy and peasantry regarded Valdemar as their natural deliverer, but the work of redemption proved painfully slow

In Nov 1343 Valdemar obtained the town and castle of Copenhagen from King Magnus Smek of Sweden, by reconfirming in still more stringent terms the previous surrender of the rich Scanian provinces, and by the end of the following year he had recovered the whole of North Zealand In 1347 the remainder of Zealand was redeemed, and the southern isles, Laaland, Falster and Mon, also fell into the king's strenuous hands By this time, too, the whole of Jutland (except the province of Ribe) had fallen to him, county by county, as their respective holders were paid off. In 1349, at the *Landsting* of Ringsted, Valdemar proudly rendered an account of his stewardship to the Estates of Zealand, and the bishop of Roskilde congratulated him on having so miraculously delivered his people from foreign thraldom. In August 1346, he prudently rid himself of the distant and useless province of Estonia by selling it very advantageously.

In north German politics Valdemar interfered to protect his brother-in-law the Margrave Louis of Brandenburg against the

lords of Mecklenburg and the dukes of Pomerania, with such success that the emperor, Charles IV., at the conference of Bautzen, was reconciled to the Brandenburger and allowed Valdemar an annual charge of 16,000 silver marks on the city of Lübeck (1349). Some years later Valdemar even contemplated a descent on England in alliance with the French king John, but the chronic state of rebellion in western Denmark, which, fomented by the discontented Jutish magnates, lasted with short intervals from 1350 to 1360, and compelled Valdemar to renounce this fantastic design But he proved more than a match for his domestic rebels, especially after his great victory at Brobjaerg in Funen (1357) Finally, the compact of Kalundborg restored peace to the kingdom.

Valdemar now turned his eyes to the "kingdom of Scania." Valdemar had indeed pledged it solemnly and irrevocably to King Magnus of Sweden, who had held it for 20 years; but profiting by the difficulties of Magnus with his Norwegian subjects, after skilfully securing his own position by negotiations with Albert of Mecklenburg and the Hanseatic League, Valdemar suddenly and irresistibly invaded Scania, and by the end of 1361 all the old Danish lands, except North Holland, were recovered

By the recovery of Scania Valdemar had become the lord of the great herring-fishery market held every autumn from St. Bartholomew's day (Aug. 24) to St Denis' day (Oct. 9) on the hammer-shaped peninsula projecting from the S W corner of Scania containing the towns of Skanor and Falsterbo. This flourishing industry, which fully occupied 40,000 boats and 300,000 fishers assembled from all parts of Europe to catch and salt the favourite Lenten fare of the whole continent, was the property of the Danish crown, and the innumerable tolls and taxes imposed by the king on the frequenters of the market was one of his most certain and lucrative sources of revenue Foreign chapmen eagerly competed for special privileges of Skanör and Falsterbo, and the Hanseatic merchants in particular aimed at obtaining a monopoly there But Valdemar was by no means disposed to submit to their dictation, and political conjunctures now brought about actual hostilities between Valdemar and the Hansa, or at least that portion of it known as the Wendish Towns[1], whose commercial interests lay principally in the Baltic.

From time immemorial the isle of Gotland had been the staple of the Baltic trade, and its capital, Visby, whose burgesses were more than half German, the commercial intermediary between east and west, was the wealthiest city in northern Europe In July 1361 Valdemar set sail from Denmark at the head of a great fleet, defeated a peasant army before Visby, and a few days later the burgesses of Visby made a breach in their walls through which the Danish monarch passed in triumph. The conquest of Gotland at once led to a war between Valdemar and Sweden allied with the Hanseatic towns; but in the spring of 1362 Valdemar repulsed from the fortress of Helsingborg a large Hanseatic fleet provided with "shooting engines" (cannon) and commanded by Johan Wittenburg, the burgomaster of Lubeck In Sweden proper he was equally successful, and the general pacification which ensued in April 1365, very greatly in his favour, was cemented by the marriage of his daughter Margaret with Haakon VI of Norway.

Valdemar was now at the height of his power Every political rival had been quelled. With the papal see, since his visit to Avignon in 1364, he had been on the best of terms. His ecclesiastic patronage was immense, and throughout the land he had planted strong castles surely held by the royal bailiffs. But in the winter of 1367–68 a hostile league against him of all his neighbours threatened to destroy the fruits of a long and strenuous lifetime. The impulse came from the Hansa At a *Hansetag* held at Cologne on Nov. 11, 1367, three groups of the towns, seventy in number, concerted to attack Denmark, and in Jan. 1368 Valdemar's numerous domestic enemies, especially the Jutlanders and the Holstein counts, acceded to the league, with the object of partitioning the realm among them.

And now an astounding and still inexplicable thing happened. At Easter-tide 1368, on the very eve of this general attack, Valdemar departed for three years to Germany, leaving his realm in the capable hands of the earl-marshal Henning Podbusk. Valdemar's skilful diplomacy, reinforced by golden arguments, did indeed induce the dukes of Brunswick, Brandenburg and Pomerania to attack the confederates in the rear; but fortune was persistently unfriendly to the Danish king, and peace was finally concluded with the towns by Podbusk and the Danish Council of State at the congress of Stralsund, 1370. The conditions of peace were naturally humiliating for Valdemar, though, ultimately, he contrived to render illusory many of the inordinate privileges he was obliged to concede. He was also able, shortly before his death on Oct 24, 1375, to recover the greater part of Holstein from the rebels

[1]Rostock, Greifswald, Wismar and Stralsund.

VALDES, JUAN DE (*c.* 1500–1541), Spanish religious writer, younger of twin sons of Fernando de Valdes, hereditary regidor of Cuenca in Castile, was born about 1500 at Cuenca He has been confused with his twin-brother Alphonso (in the suite of Charles V. at his coronation in Aix-la-Chapelle, 1520; Latin secretary of state from 1524, died in 1532 at Vienna) Juan, who probably studied at the University of Alcala, first appears as the anonymous author of a politico-religious *Diálogo de Mercurio y Caron*, written and published about 1528 A passage in this work may have suggested Don Quixote's advice to Sancho Panza on appointment to his governorship. The *Diálogo* attacked the corruptions of the Roman Church; hence Valdes, in fear of the Spanish Inquisition, left Spain for Naples in 1530 In 1531 he removed to Rome, where his criticisms of papal policy were condoned, since in his *Diálogo* he had upheld the validity of Henry VIII's marriage with Catherine of Aragon. From the autumn of 1533 he made Naples his permanent residence, his name being Italianized as Valdesso and Val d'Esso

Valdes' house on the Chiaja was the centre of a literary and religious circle; his conversations and writings (circulated in manuscript) stimulated the desire for a spiritual reformation of the church His first production at Naples was a philological treatise, *Diálogo de la Lengua* (1533) His works entitle him to a foremost place among Spanish prose writers His friends urged him to seek distinction as a humanist, but his bent was towards problems of Biblical interpretation in their bearing on the devout life Vermigli (Peter Martyr) and Marcantonio Flaminio were leading spirits in his côterie, which included Vittoria Colonna and her sister-in-law, Giulia Gonzaga On Ochino, for whose sermons he furnished themes, his influence was great Carnesecchi, who had known Valdes at Rome as "a modest and well-bred courtier," found him at Naples (1540) "wholly intent upon the study of Holy Scripture," translating portions into Spanish from Hebrew and Greek, with comments and introductions To him Carnesecchi ascribes his own adoption of the Evangelical doctrine of justification by faith, and at the same time his rejection of the policy of the Lutheran schism Valdes died at Naples in May 1541.

His death scattered his band of associates Abandoning the hope of a regenerated Catholicism, Ochino and Vermigli left Italy Some of Valdes's writings were by degrees published, in Italian translations. They combine a delicate vein of semi-mystical spirituality with the personal charm attributed to their author in all contemporary notices. Llorente traces in Valdes the influence of Tauler; any such influence must have been at second hand The *Aviso* on the interpretation of Scripture, based on Tauler, was probably the work of Alphonso. Valdes was in relations with Fra Benedetto of Mantua, the anonymous author of *Del Benefizio di Gesù Cristo Crocefisso*, revised by Flaminio (reprinted by Babington, Cambridge, 1855). The suggestion that Valdes was unsound on the Trinity was first made in 1567 by the Transylvanian bishop, Francis Dávid (*see* article SOCINUS); it has been adopted by Sand (1684), Wallace (1850) and other anti-Trinitarian writers, and is countenanced by Bayle. But Valdes never treats of the Trinity (even when commenting on Matt. xxviii. 19), reserving it (in his *Latte Spirituale*) as a topic for advanced Christians; yet he explicitly affirms the consubstantiality of the Son, whom he unites in doxologies with the

Father and the Holy Spirit (*Opusc.* p. 145). Practical theology interested him more than speculative; his aim being the promotion of a healthy and personal piety.

The following is a list of his writings:—*Diálogo de Mercurio y Caron* (no date or place; 1528?); *Diálogo de la Lengua* (written, 1533; first printed, Madrid, 1737, reprinted, 1860, 1873); *Qual Maniera si devrebbe tenere a informare . . gli figliuoli de Christiani delle Cose della Religione* (no date or place; before 1545, as it was used by the Italian translator of Calvin's catechism, 1545), Eng trans. by J. T. Betts, 1882; *Trataditos* (Bonn, 1881, from a manuscript in the Palatine Library, Vienna; in English, by J. T. Betts, in *XVII. Opuscules*, 1882); *Alfabeto Christiano* (written about 1537, in Italian, Venice, 1545, in English, by B B. Wiffen, 1861), *Ciento i Diez Conçideraçiones;* all copies of the original edition suppressed by the Spanish Inquisition; in English, by Nicholas Ferrar (at the instance of George Herbert), Oxford, 1638 (another version by J. T Betts, 1865); *Seven Doctrinal Letters* (original published with the *Trataditos* from Vienna mss. in English, by J. T Betts, with the *Opuscules*); *Comentario Breve . . sobre la Epistola de San Pablo a los Romanos* (Venice, 1556; in English, by J T. Betts, 1883); *Comentario Breve . . . sobre la Primera Epistola de san Pablo a los Corintios*, Venice, 1557 (No 8), *El Evangelio de San Mateo* (1881, from Vienna ms, in English, by J T Betts, 1883), *El Salterio* (the Psalms from Hebrew into Spanish published with the *Trataditos* from Vienna manuscript).

Notices of Valdes in Sand (*Biblioth Antitrinitar*, 1684), Bayle and Wallace (*Antitrin Biog*, 1850) are inadequate Revival of interest in him is due to McCrie (*Hist Ref in Italy*, 1827, *Hist Ref in Spain*, 1829) *See* B. Wiffen's *Life* of Valdes prefixed to Betts's translation of the *Considerations*, 1865. E Boehmer, *Span. Reformers of Two Centuries* (1874), *Lives of J and A. de Valdes* (1882), and article in *Realencyklopadie fur prot Theol und Kirche* (1885) *See* also M. Young, *Aonio Paleario* (1860), K Benrath. *Bernardino Ochino* (1875), Menendez Pelayo, *Los Heterodoxos Españoles* (1880); G. Bonet-Maury, *Early Sources of Eng Unit. Chrst.* (trans E P. Hall, 1884). (A. Go ; X.)

VALDEZ, a town of Alaska, the terminus of the wagon road, and farthest north all year open port in North America, situated 61° 07′ N, 146° 16′ W Selected in 1898 by the U S War Department as a base for exploration, it became the terminus of the military telegraph, connecting with the cable to the United States A military post, Ft Liscum, was built nearby, where troops were stationed until 1922, when they were withdrawn. There was also the Valdez-Fairbanks road, used for mails With the building of the Copper river railroad from Cordova, and later the Government railroad from Seward, and diversion of traffic, the population dwindled from 1.500 to 466 in 1920.

VALDIVIA, a southern province of Chile Area, 11.843 sq m Pop (1920) was 237,538, including that of the additions made to its territory in 1928. The province is roughly mountainous in the E, is heavily forested and is traversed by numerous rivers There is a chain of lakes across its eastern side near the Andes, the largest of which are Villarica, Rinihue and Ranco The rivers are the Toltén on the northern boundary, the Valdivia or Calle-Calle, with its large tributaries in the central part of the province, and the Bueno The Valdivia (about 100 m. long) has its sources in the Andes and flows west to the Pacific Its largest tributary on the north is the Río Cruces. The Valdivia is the outlet for Lake Rinihue and is navigable for a long distance. Valdivia is one of the most recently settled provinces and has a large immigrant element, chiefly German. Its most important industry is that of clearing away the heavy forests and marketing the timber Stock-raising is an important industry, and wheat is grown on the cleared lands. Lumber, cattle, leather, flour and beer are exported. The capital is Valdivia, a flourishing city on the Valdivia river, 12 m above its port, Corral, near the mouth of the river. Pop. (1920) 26.854 It is a roughly built pioneer town, in which wood is the principal building material. The mean annual temperature is 52·6° F and its annual rainfall is 105 inches

VALDOSTA, a city of southern Georgia, U.S A., the capital of Lowndes county. Pop 10.783 in 1920 (51% negroes); estimated locally at over 17,000 in 1928. Valdosta is the seat of the Georgia State Woman's college (opened 1913) and a junior college for men, established in 1928 by Emory university (Atlanta). It has four large tobacco warehouses. Its wholesale business amounts to $15,000,000 annually; its retail trade to $22,500,000; and its manufacturing plants (including cotton, feed and lumber mills) have an output of $15,750,000. Valdosta was settled in 1859 and was chartered in 1901.

VALENCE, a town of France, on the Rhône. Pop. (1926) 26,414. *Valentia* was the capital of the Segalauni, and the seat of a celebrated school before the Roman conquest, a colony under Augustus, and an important town of *Viennensis Prima* under Valentinian. Its bishopric dates probably from the 4th century It was ravaged by the Alani and other barbarians, and fell successively under the power of the Burgundians, the Franks, the sovereigns of Arles, the emperors of Germany, the dukes of Valentinois, the counts of Toulouse and its own bishops To strengthen the hands of the bishops against the dukes of Valentinois the pope in 1275 united their bishopric with that of Die The citizens put themselves under the protection of the dauphin, and in 1456 had their rights and privileges confirmed by Louis XI, the bishops consenting to recognize the suzerainty of the dauphin Valence became the capital of the Protestants of the province in 1563 The town was fortified by Francis I It had become the seat of a celebrated university in the 15th century; but the revocation of the edict of Nantes crippled the prosperity of the town

The cathedral of St Apollinaris, with an interesting apse, was rebuilt in the 11th century in the Romanesque style of Auvergne and consecrated in 1095 by Urban II It was injured in the wars of religion, but restored in the 17th century. A curious 16th century house (Maison des Têtes) has a sculptured front with heads of Homer, Hippocrates, Aristotle, Pythagoras, etc

VALENCIA, the name of a maritime province of eastern Spain, and anciently of a kingdom Pop. (1920) 926,442; area, 4,150 sq miles. When the ancient kingdom of Valencia was incorporated into Aragon in 1238, it included the provinces of Castellon de la Plana (*q v*) and Alicante (*q.v*). It was bounded inland on the north by Catalonia, west by Aragon and New Castile, and south by Murcia. This region has an area of 8,830 sq m; its present population is about 2,000,000 For its history *see* VALENCIA (city) The inhabitants are of very mixed race, owing to the successive occupation of the country by Iberians, Greeks, Carthaginians, Romans, Visigoths and Moors. Their dialect resembles Catalan but is softer, and contains a larger percentage of Arabic words The elaborate irrigation-works and the system of intensive agriculture which have rendered the *huertas* or gardens of Valencia celebrated were initiated by the Moors, the fame of the Elche date-groves, the Alicante vineyards and the Valencia orange plantations, was also originally due to them With the decline of the caliphate of Cordova early in the 11th century, Valencia became an independent kingdom, which passed successively into the power of the Almoravides and Almohades In 1609, 200,000 Moriscos, or Moors who outwardly professed Christianity, were banished from the country In 1833 Valencia was divided into the three provinces already named

The coast is skirted by considerable stretches of sand-dune, and by a series of these the lagoon called the Albufera (*q v*) de Valencia is separated from the Mediterranean The principal rivers are the Guadalaviar or Turia and the Jucar (*q v*) Irrigation disputes are settled by the peasants' Tribunal de las Aguas which meets weekly in front of Valencia cathedral

The *vegas* (cultivated plains) have an exceptionally fine, almost sub-tropical climate. In their low-lying portions rice is the favourite crop; elsewhere wheat, maize and all kinds of fruit; the mulberry is cultivated for silk; and wine and oil are produced Esparto grass is grown in the less fertile areas The fishing industry is considerable, and there are manufactures of silk, carpets and tapestry, woollen, hemp and linen fabrics, glass, pottery and leather; there are also iron foundries, distilleries, cooperages and oil refineries. The coast railway from Barcelona traverses the province. Valencia, the capital and principal seaport, and the towns of Alcira, Requena, Sueca, Játiva, Carcagente, Cullera, Utiel, Onteniente, Sagunto and Gandía, are described in separate articles. Other towns of more than 7,000 inhabitants are Algemesí (11,590), Catarroja (8,308), Oliva (8,995), Liria (9,557), Tabernes de Valldigna (9,563), and Torrente (9,952).

VALENCIA, capital of the Spanish province of Valencia, on the Guadalaviar or Turia, 3 m. from the Mediterranean sea, and 304 m by rail E S E of Madrid Pop. (1877) 143 856;

(1920) 251,258. The earliest mention of Valencia (*Valentia*) is by Livy (*Epit* lv), according to whom Junius Brutus settled the soldiers of Viriathus here in 138 B C., and invested the town with the *jus Latinum*. It sided with Sertorius (*c* 77 B C.), and was accordingly taken and partially destroyed by Pompey in 75 B.C.; but it must have recovered speedily, as it is mentioned by Pliny (iii. 4) as a colony in the region of the Edetani, and by Mela as an important place. It was taken by the Visigoths in A.D 413, and by the Moors in 714 An independent Moorish kingdom of Valencia was established in 1021, and extended from Almería to the Ebro estuary The Almoravides occupied the city in 1094, but it was retaken within a few months by the Christians under the Cid (*q v.*), from whom it is sometimes called Valencia del Cid The Moors recovered possession in 1101 and the kingdom was re-established in 1146. After 1172 it became tributary to Aragon, and in 1238 James I of Aragon added it to his dominions The first Spanish printing-press is said to have been set up here in 1474 Towards the close of the 15th century Valencia was annexed to Castile. In the 16th and 17th centuries it became the seat of a considerable school of painting In the War of Succession Valencia sided with the house of Austria In 1808 an abortive attempt to capture it was made by the French; they succeeded, however, in 1812, and held it till 1813

Valencia is the seat of an archbishop, a court of appeal, a university, a captain-general and an army corps. All round it stretches Huerta de Valencia, an alluvial plain with groves of oranges, lemons and mulberries The climate is mild and very dry; rain hardly ever falls. The white houses, often Moorish in architecture, and the multitude of domes and towers give to Valencia an oriental appearance. Until 1871 it was enclosed by a Roman wall rebuilt in 1356 by Pedro IV , two picturesque gateways with machicolated towers still remain The cathedral (La Seo), begun in 1262, possesses examples of 15th century sculpture and metal-work, as well as of the Valencian school of painting. The campanile (el Miguelete), an isolated octagonal Gothic tower, is 152 ft in height

Valencia university was formed about 1500 It began to decline in 1600 but was reorganized after 1848, and resumed its place as one of the leading universities. There is a provincial museum, with paintings by Velazquez, Ribera, Dürer; Juanes, Bosco, Goya and many modern artists

The principal manufacture is silk The town is also celebrated for its coloured tiles or "azulejos," its oranges and onions Linen, woollen and esparto fabrics, hats, fans, leather, paper, cigars, glass and pottery are also manufactured, and there are foundries and printing-works Corn, rice, silk, saffron, oranges, raisins, almonds, figs and other fruits are exported, and iron, hardware, timber, manure, grain and colonial produce are imported

The port of Villanueva del Grao is 3 m. E. by N. of Valencia. Spanish and British coasters chiefly call here.

BY COURTESY OF LEE

A CHARACTERISTIC HOME OF THE LOWER CLASS OF VENEZUELA, NEAR VALENCIA, SHOWING A CRUDE RICE HULLER IN THE CENTRE

VALENCIA, a city of Venezuela. Pop. (1927), 36,800. There are railway communications and also a steamboat service on Lake Valencia The lake is 1,348 ft. above the sea, is about 30 m. long and has an area of 216 sq m The city is beautifully situated in a large fertile valley between parallel ranges of the Maritime Andes, about 1,625 ft above sea-level, and in the midst of rich plantations and luxuriant tropical vegetation.

Valencia was founded in 1555 by Alonzo Diaz Moreno, being 12 years older than Caracas. It was occupied for a time in 1561 by Aguirre and his band of outlaws. At the beginning of the War of Independence it was made the capital of Venezuela, and the patriot congress was in session there on March 26, 1812, when Caracas was destroyed by an earthquake. In 1830 Valencia was the scene of the Constituent Congress, again in 1856 it was the meeting place of the celebrated National Convention and served the same purpose in 1870.

VALENCIA or **VALENTIA,** an island, county Kerry, Ireland, forming the southern horn of Dingle Bay. It is 7 m. long and 3 broad. It forms with the mainland a fine natural harbour, land-locked with narrow entrances, and a depth of about 40 ft. at low tide. At its north end is the Valencia Harbour station, while across the strait is Knightstown, on the island. The harbour is used by fishing vessels From Valencia the "Great Eastern" laid the cable to Newfoundland in 1866. On the island is a meteorological station. Its name is Spanish; the Irish called it Dairbhre, the oak forest.

VALENCIA DE ALCÁNTARA, a town of western Spain, in the province of Cáceres Pop (1920), 12,024 From the 16th century to the 18th Valencia was a celebrated border fortress; it was captured by the Portuguese in 1664 and 1698. Valencia de Alcántara is an important custom-house between Spain and Portugal, and has a flourishing trade in farm produce, and in phosphates from the mines. A Roman aqueduct still brings water to the main street; the courtyards and windows of many houses are Moorish in style.

VALENCIENNES, a town of northern France. Pop. (1926) 35,969. Valenciennes is said to owe its name and foundation to one of the three Roman emperors named Valentinian In the middle ages it was the seat of a countship which in the 11th century was united to that of Hainaut. In the 16th century Valenciennes became the stronghold of Protestantism in Hainaut, but was conquered by the Spaniards. In 1656 the Spaniards under Condé made a successful defence against the French under Turenne, but in 1677 Louis XIV. took the town and Vauban constructed the citadel. Valenciennes, which then became the capital of Hainaut, has since always belonged to France In 1793, after 43 days' bombardment, the garrison surrendered to the allied forces In 1815 it defended itself successfully The Scheldt here divides into two branches, one of which flows through the town, while the other, canalized and forming a port, skirts it on the west The Tour de la Dodenne (13th and 15th centuries) and the citadel (17th century) are the chief remains of the old fortifications. The town hall is early 17th century, with a 19th century façade The museum contains a good collection of paintings.

Valenciennes is the centre of the rich Anzin coal-field. There are important foundries, forges, rolling-mills, wire-works and machine shops. There is also an extensive beetroot cultivation, with attendant sugar-works and distilleries, and glass, starch, chemicals and soap are produced Hosiery, trimmings and handkerchiefs are manufactured and cotton weaving and printing are carried on, though little of the famous lace is now made.

VALENCY, in chemistry, is the power which atoms possess of combining with a definite number of other atoms, and is usually expressed numerically by the number of hydrogen atoms which an atom can combine with or replace.

When towards the middle of the 19th century the relative weights of atoms and molecules became accurately known, especially through the reintroduction by Cannizzaro in 1858 of Avogadro's principle (1811) of the relation between the molecular weight and the density of a gas, it was clear that the number of atoms with which a given atom could combine varied with the nature of that atom: that, for example, a chlorine atom could combine with one hydrogen atom, an oxygen atom with two, a nitrogen atom with three, and a carbon atom with four, as in the compounds HCl, H_2O, H_3N, H_4C. These characteristic combining powers were shown to extend to more complicated compounds: two of the four hydrogen atoms in methane, CH_4, could be replaced by one oxygen atom, or all four by two, or three by one nitrogen atom, as in H_2CO, CO_2, HCN. Thus it appeared that every atom could combine with or replace a definite number of other atoms of a specified kind, and hydrogen, as it was the lightest atom, and was never found to combine with more than one atom of another element, was selected as the standard. The term,

valency, introduced in 1868, is now adopted to express both the power of combination in general, and its numerical value.

As the examination of the valency of elements was extended, there was much dispute as to whether or not it was constant in value for any one element. It soon became evident that the valency of many elements was variable: for a time it was maintained that the variations were always by two units, so that elements could be divided into those of odd and those of even valency; but before long it was recognised that while this was true of many elements, there were others of which the valency must be admitted to vary by single units at a time, unless very improbable assumptions were made as to the structure of some of their compounds.

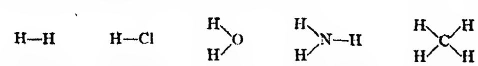
The discovery of the periodic classification of the elements through the work of Newlands, Mendeleyev and Lothar Meyer (1864–1869) brought to light a new regularity in the valencies of the elements (*see* PERIODIC LAW) Mendeleyev pointed out that all the elements of a periodic group had the same valency, and that this changed by one unit as we pass from one group to the next. In particular, the highest valency of an element, as shown in its highest oxide, is equal to the ordinal number of the group to which it belongs. On the other hand, the valency in the hydrides seems to rise with that in the oxides from one to four, and then to fall by steps of one unit to unity again This is illustrated by the following table, giving the two "short periods" of the periodic classification

Periodic Group	I	II	III	IV	V	VI	VII
	Li Na	Be Mg	B Al	C Si	N P	O S	F Cl
Highest oxide	Li_2O Na_2O	BeO MgO	B_2O_3 Al_2O_3	CO_2 SiO_2	N_2O_5 P_2O_5	SO_3	Cl_2O_7
Hydride	NaH	MgH_2		CH_4	NH_3	OH_2	ClH
Valency in oxide	1	2	3	4	5	6	7
Valency in hydride	1	2	3	4	3	2	1

Thus the mysterious periodicity of properties revealed by the table was most clearly exemplified in the valency

Earlier Theories.—All discussions of valency in the 19th century were handicapped by the absence of any satisfactory theory of its cause Berzelius, in the earlier part of the century, had assumed that atoms were electrically charged, and were held together in the molecule by the attraction of opposite charges This view was supported by the phenomena of electrolysis, and especially by the work of Davy and Faraday Its validity as a general theory of valency was, however, destroyed about 1840 by the discovery that under some conditions "electropositive" could be replaced by "electronegative" atoms without any fundamental modification of the properties of the molecule; thus part of the hydrogen in acetic acid can be replaced by chlorine, and the product resembles the original acid in many ways, and obviously must have a similar structure. The attempts of Berzelius to stretch his theory to explain such phenomena led to its falling into discredit, and it was replaced by what ultimately became the theory of structural chemistry.

In this new theory no assumptions were made as to the nature of the forces connecting the atoms in a molecule, and hence no opposition in character between the atoms was required. Every atom was regarded as having a certain number of units of combining power, and every atomic link as involving the utilization of one of these units by each of the atoms concerned. Double and triple links, in which each of two atoms used up two or three of these units in combining with one another, were also recognized. The valency of an atom in the numerical sense was the number of such units which it possessed. On paper, the links were represented by lines, giving such formulae as



Hydrogen Hydrogen chloride Water Ammonia Methane

Methyl alcohol Formaldehyde Carbon dioxide Prussic acid

This theory had an astounding success in its application to organic chemistry. It was found possible to determine from the reactions of a substance the order in which the constituent atoms were linked in the molecule, and thus to assign to the vast hordes of organic compounds "structural formulae" which accounted for their existence and to a large extent also for their properties For an account of further extensions of this theory. which made it possible to determine the actual positions in space of the various atoms and groups in a molecule, *see* STEREOCHEMISTRY In consequence of these triumphs the older theory was disregarded, and chemists failed to realise that the views of Berzelius were quite satisfactory if their application was limited to the oppositely charged radicals in a salt.

The electrical theory again became prominent in and after 1887, with the rise of the Arrhenius theory of salt solutions which showed that when a salt is dissolved in water it is very largely broken up into oppositely charged ions (sodium chloride, for example, into positive sodium and negative chlorine ions) which have to a great extent the properties of free molecules. On the other hand atoms forming part of a complex radical do not separate in this way; thus potassium chlorate, $KClO_3$, breaks up in solution into potassium, K^+, and chlorate, ClO_3^-, ions, but the latter do not dissociate further into chlorine and oxygen. This made it clear that two kinds of links can be formed between atoms in a molecule, one of which is broken on solution in water (and other similar solvents) with the formation of ions, while the other is not To the first kind the theory of Berzelius, that the atoms are held together by their electrical charges, obviously applies: the work of Faraday and of Arrhenius shows that such atoms actually exist in solution with electrical charges, and further support is given by the observation that solvents of high dielectric capacity promote ionization, since such solvents would weaken the attraction between charged atoms The final confirmation of the theory has been given in recent years through the investigation of crystal structure, mainly by W. H. and W L Bragg and by Rubens, who have shown that with many salts (including sodium chloride itself), the ions are present as such in the solid crystal

It still remained to explain the second kind of linkage (non-ionized), and especially two of its peculiarities: (1) the fact that in many compounds the valency of an element is the same whether it is expressed in ionized or in non-ionized links, and (2) the relation between this numerical value and the position of the element in the periodic table This was the state of opinion towards the end of the 19th century.

Werner's Theory.—In 1893, an entirely new theory of valency was put forward by Alfred Werner, which was subject to quite different laws, and dealt primarily with a different—and previously somewhat neglected—class of compounds It had already become recognised that there were many substances, some of them quite stable, the structure of which could not be explained on the current theory of valency Most of these were formed by the combination of molecules which appeared to be already saturated, and so to have used up all their combining power; and often, though not always, the component molecules could easily be separated again Such substances were known as "molecular compounds" and were disregarded in the current theories of molecular structure, it being supposed that molecules retained the power of combining loosely with one another, in virtue of some force inferior to true valency. The most conspicuous examples are the compounds which many salts form with "water of crystallization," and those which many substances form with ammonia (*see* AMMINES). All attempts to formulate these on the accepted theories of valency had proved unsatisfactory. Werner collected an immense number of examples of such compounds, and showed that it was possible to formulate them on a new principle, to which he gave the name of co-ordination. The essence of this principle was that the combining powers of an atom depended not on the nature but on the number of the atoms or groups to which

it was attached. This number, which he called the co-ordination number, and which determined the formula of the compound and, in the new sense, the valency of the central atom, did not, as did the ordinary valencies, change from one atom to the next, but was most frequently six, sometimes four, and less often had other values. Thus platinic chloride, $PtCl_4$, forms a series of addition compounds with ammonia, and also with potassium chloride. Werner showed that in all of these the platinum has six groups—chlorine atoms or ammonia molecules—attached to it by links which are not ionized in solution, while any further atoms in the molecule are ionized, and are presumably attached by weaker links in the "outer sphere" of the platinum, outside the co-ordination complex. This is shown by the following formulae, in which the atoms enclosed in square brackets are those which are found not to ionize:

$[Pt(NH_3)_6]Cl_4$ $\quad$ $[Pt(NH_3)_5Cl]Cl_3$ $\quad$ $[Pt(NH_3)_2Cl_4]$ $\quad$ $K_2[PtCl_6]$

It will be seen that in the series of transformations the platinum atom always retains a group of six atoms or molecules attached to it by non-ionized links In its application to addition compounds of this kind, Werner was able to show that his theory was quite satisfactory. He subsequently extended it to the whole of chemistry; but in this he was not followed by the majority of chemists. In particular the complicated relations of the great mass of compounds of carbon—some hundreds of thousands of substances—were found to be adequately explained by the older structural theory Indeed Werner's theory, even in its application to inorganic compounds, was not regarded very seriously by chemists until, in 1911, he was able by its means to predict the occurrence of optical activity (*see* STEREOCHEMISTRY) in certain structures, and to verify his predictions by experiment It then became recognised that the theory in its original sphere—that of inorganic chemistry—had strong claims to be accepted

The doctrine of atomic linkage was thus brought into the very unsatisfactory state that two apparently incompatible theories held the field. Each was successful in explaining the behaviour of one class of compounds, but neither could be extended to cover the whole ground It was evident that the true theory still remained to be discovered, and that when it was discovered the structural theory and the theory of co-ordination would be seen to be two imperfect aspects of one truth

The position which chemistry had reached at the beginning of the present century was therefore this. It appeared that the links which hold together the atoms in a molecule can be of three kinds. (1) Polar or ionized links, between the oppositely charged ions of a salt (2) Non-polar non-ionized links, which can exist between atoms of a similar or even identical character, and are peculiarly common among the compounds of carbon. (3) The co-ordinated links of Werner, which are not ionized, are capable of uniting apparently saturated atoms, and occur mainly in inorganic compounds

There was the further peculiarity that an atom was found to be in general capable of forming the same number of links of the first and of the second kind, and that this number depended on its position in the periodic table The number of links of the third kind which it could form had no relation to its periodic group, and was usually six, sometimes four, while other numbers were comparatively rare

Atomic Structure and Valency.—These important, but obviously not final, conclusions were the result of the chemical investigation of the structures of molecules. Their further development, and their combination into one uniform system, were rendered possible only by the increase of our knowledge of the physical structure of the atom (*q.v.*). Of this it is enough to say here that mainly through the work of J. J. Thomson, Rutherford, Moseley, and Bohr, it was shown that every atom consists of a minute positively charged nucleus, surrounded by a number of negative electrons which are arranged in groups, revolving at greater or smaller distances from the nucleus. The number of electrons (which is also the number of positive charges on the nucleus) is also the ordinal number (from 1 for hydrogen to 92 for uranium) of the element in the natural series (the periodic classification) which agrees in almost every case with the order of the atomic weights; this is known as the atomic number (*q v.*).

As it thus appears that every atom contains one electron more than that of the preceding element, the periodic table acquires a new meaning. The regular recurrence of a definite set of properties after a definite number of places suggests that the number of electrons so added form a new and complete group, and that, for example, lithium (3) and sodium (11) resemble one another because the eight extra electrons of the latter are grouped together, leaving a similar arrangement of the chemically active electrons in both atoms. It may further be assumed that since certain elements—the inert gases such as helium and argon—have practically no power of chemical combination, the stability of the electronic groups in the atoms of these gases is already so great that it cannot be improved by interaction with other atoms; and that other elements combine to form molecules because by so doing they can rearrange their electrons in a more stable manner The atomic numbers of the inert gases (helium 2, neon 10, argon 18, krypton 36, xenon 54, radon 86) will thus give the total number of electrons in a series of stable groups, and their differences (2, 8, 8, 18, 18, 32) the sizes of individual groups We may suppose that other elements tend by combination to acquire electronic groups of these or similar sizes

The first attempts to work out a theory of valency along these lines were published in 1916 by Kossel in Germany and by G N Lewis in America Kossel dealt with polar or ionized links and Lewis with non-ionized

Kossel's Theory.—Kossel pointed out that the element next after an inert gas (and so with one electron more) is always a strong univalent metal, forming an ion with one positive charge, whilst the element one place before an inert gas forms an ion with one negative charge In the same way an element two places after an inert gas gives an ion with two positive, and that two places before it an ion with two negative charges If we write down for a series of elements the atomic number, the charge on the ion, and the number of electrons in the ion (obtained by subtracting the positive or adding the negative charges), we find the same resultant number for an inert gas and for its neighbours on both sides, thus

Element	O	Cl	Ne	Na	Mg	Al
Atomic number	8	9	10	11	12	13
Ion	O^{--}	Cl	Ne	Na^{+}	Mg^{++}	Al^{+++}
Electrons in ion	10	10	10	10	10	10

It is evident that the guiding principle is the stability of the $10(=2+8)$ electrons If an atom has a few more than this, it loses the excess. if a few less, it makes up the defect The force holding the atoms together in the resulting molecule is the electrostatic attraction of the oppositely charged atoms, and when the compound is dissolved in a medium of high dielectric constant such as water, this force is weakened, and the thermal agitation is sufficient to separate the charged atoms or ions from one another The valency is the number of electrons which the atom gains or loses in forming the ion, and is (at any rate in such elements as these) the difference between its atomic number and that of the neighbouring inert gas Since the inert gases form Group O in the periodic table, this gives us the relation between the periodic group and the valency which, as was pointed out above, is found to hold for the hydrides of the elements.

It is an essential characteristic of the compounds with which Kossel's theory deals that the two combining atoms should be of opposite character: that they should stand in the series on opposite sides of an inert gas, so that one has an excess and the other a defect of electrons. But, as we have seen, there are many compounds in which we do not find this opposition, and cannot say which of the atoms is positive and which negative; as in the compounds of carbon with hydrogen and oxygen, or more striking still, in the compounds of the elements with themselves which occur in the polyatomic molecules of the free elements, as H_2, N_2, O_2, P_4, etc. Such compounds are further distinguished by the fact that they do not ionize in solution It is evident that the linkage

in such molecules must be due to some different physical mechanism from that established by Kossel in ionized molecules.

Theory of Lewis.—The solution of this problem was given by Lewis in the same year in which Kossel's paper appeared. He suggested that it was possible for electrons to be shared between two atoms in such a way that they formed part of the constitution of both. As he accepted the static atom, he did not discuss how the sharing took place. Even now, though we know that the electrons are in motion, and have some knowledge of how they move round the nucleus of an isolated atom, very little has been discovered about the dynamics of the shared electron; we may, however, assume that as in the isolated atom the electron moves round one nucleus, so an electron which is shared between two atoms revolves round the nuclei of both. But for our present purpose it is enough to assume that the sharing is in some way possible, without inquiring more closely into its mechanism. This assumption makes possible a kind of link which is not broken in solution by ionization, and does not involve any opposition of character between the linked atoms; it further explains why this form of link is peculiarly common amongst atoms a few places before an inert gas, since they can remedy their defect of electrons by using some of them twice over. We can also explain by its means the remarkable fact that the valency of an atom has normally the same value in its non-ionized compounds as in its salts. For example, chlorine forms a univalent negative ion, because it is one electron short of the stable number of argon. This defect also enables it to form a single covalency (non-ionized link) as in methyl chloride, $CH_3—Cl$, because by sharing a single electron belonging to the carbon it can complete its stable number. Both the covalency and the electrovalency of such a negative atom are equal to the number of electrons needed to make up the inert-gas number, and hence equal to the number of places in the periodic table by which the element is removed from the next following inert gas. On the other hand, a metal like aluminium, as it has three loosely attached electrons, can lose these by ionization and form a trivalent positive ion Al^{+++}. . . For the same reason it can share three electrons with other atoms or groups, as in $Al(CH_3)_3$, but it cannot share more without disturbing the arrangements of its inner electrons (the core of the atom). The covalency of such a metal is, like its electrovalency, the number of electrons which it has in excess of an inert gas.

One other point is to be noticed about the covalency. A fundamental principle in all theories of valency other than that of co-ordination is that when two atoms form a link, whether covalent or electrovalent, each of the two uses up a unit of combining power. Thus sodium has one such unit, and so has chlorine. When they combine, neither has any power of further combination. So too, hydrogen has one unit, and carbon four: when four atoms of hydrogen combine with one of carbon to form methane, the hydrogen loses its power of further combination as well as the carbon, and a saturated molecule is produced. When the linkage is ionized the explanation is simple. Every such link involves the migration of an electron from one atom to the other, so that the metal loses one loosely attached electron, and at the same time the other atom fills up one of its gaps. If the same is to hold for the covalent link, we must suppose that when atom A combines with atom B, not only does A share one of B's electrons, but at the same time B shares one of A's: the covalent link must consist of two shared electrons, so that its formation involves the addition of one electron to each of the atoms concerned. This was pointed out by Lewis in 1916, as a necessary result of the simple laws of valency. Later work has shown that an unstable linking of hydrogen to another atom by means of a single shared electron is possible in a few compounds; but it is clear that the two-electron link is the almost invariable form of the covalency.

Co-ordinate Valency.—Thus the physical theory of atomic structure has provided an explanation of the mechanism both of electrovalencies and of covalencies. The explanation of the third form of attachment, the co-ordinate link, is almost equally simple: it was suggested by Lewis in 1916, although he did not develop the idea in detail. It is clear from the behaviour of Werner's compounds that the co-ordinate link is of the nature of a covalency. As we have seen, the units of the co-ordination complex do not ionize, while other groups in the molecule outside the complex do so. The occurrence of optical activity (*see* STEREOCHEMISTRY) dependent on the position of the groups composing the complex, and independent of the ionized groups outside it, is further evidence of the same thing. We may therefore conclude that the co-ordinated atoms or radicals are attached to the central atom by covalencies, that is, by pairs of shared electrons. Where these groups have a valency of one in the ordinary sense (univalent radicals or groups such as chlorine or NO_2) this needs no further explanation: the difficulty is to explain the replacement of such radicals by complete molecules like water or ammonia. In ammonia the nitrogen has increased its valency electrons from the original five to eight by combining with three hydrogen atoms. It thus has a complete valency group of eight electrons ("octet"), of which six are shared with the three hydrogen atoms, while the other two are not shared, and form what is called (in America) a "lone pair." All that is necessary to explain the co-ordination is to suppose that the nitrogen shares this lone pair with the platinum, thus forming a covalency differing from that previously discussed only in this, that the two shared electrons both come from the same atom. This explanation of the co-ordinate link of Werner satisfies all requirements. It explains why the link is not ionized, since it is in fact a covalency. It explains why it is often more easily broken than an ordinary covalency, since the nitrogen or other atom forming it can recall the two electrons which it has lent. It explains why the co-ordination number of an element can remain constant through a whole series of compounds, in spite of variations in the electrovalency, that is, in the electrical charge of the complex, for the co-ordination number is the number of pairs of shared electrons required to make up a stable valency group for the central atom. It accounts for the fact that while the valency in the ordinary sense changes by one unit as we go from one atom to the next, the co-ordination number is usually six or four independently of the periodic group to which the element belongs: the ordinary valency depends on the number of electrons which the atom originally had (the atomic number), whilst the co-ordination number depends only on the stable size of the valency group, which for most atoms is 12 or 8. We can also account on this theory for the remarkable change in the electrovalency which, as we have seen, accompanies the replacement of, say, an ammonia molecule in the complex by a chlorine atom, the electrovalency increasing by one if it is negative, and diminishing by one if it is positive, as is shown in the change from $[Pt(NH_3)_6]Cl_4$ to $[Pt(NH_3)_5Cl]Cl_3$. For when the ammonia molecule is removed, it takes with it the pair of electrons which formed its co-ordinate link to the central atom, when a neutral chlorine atom takes its place, it only offers one electron for the link, and so another electron must be introduced from outside, which gives the complex a negative charge; or, to put it in another way, if the chlorine is to take the place of the nitrogen and provide both electrons for the link, it must already have a complete octet, and so must be not a neutral chlorine atom (which has only seven valency electrons), but a negatively charged chlorine ion.

In this way we can now see that the theory of Werner is only one aspect of a physical process of which the older structural theory is another. The co-ordinate link and the ordinary covalency are of the same kind, consisting of pairs of shared electrons, but the manner in which they arise is different.

The electronic theory thus accounts for all the various kinds of linkage which can arise between atoms by the redistribution of their valency electrons. The cause of this redistribution is the possibility of producing a more stable arrangement of the electrons.

Octet Theory.—So far, it has been assumed that the stable forms attained are in general those which occur in the inert gases. The physicists have shown (*see* ATOMIC STRUCTURE) that the electrons of an isolated atom arrange themselves in groups or shells, and the outermost group contains eight electrons in all the inert gases except helium, which has a single group of two. Hence in the majority of molecules, and in nearly all those hitherto discussed, the result of the combination is to give an outer group

of eight electrons to all the atoms concerned except those of hydrogen, which have two. This is the basis of the octet theory, originally proposed by Lewis, and developed in great detail by Irving Langmuir. But if the largest valency group possible is eight, and every covalency consists of two electrons, the highest covalency possible for any atom must be four. The existence of such bodies as sulphur hexafluoride SF_6, a very stable gas, and of the co-ordination compounds already mentioned, shows that a covalency of six is possible, and hence a valency group of twelve; and we know of atoms which exert a covalency of eight, and so must have a valency group of 16 electrons, such as osmium in the octafluoride OsF_8 This seems to open up almost infinite possibilities of combination; but it is found that it is not every atom which can form these large groups The size of the valency group of an element is limited according to the position which it occupies in the periodic table, but the limitation does not depend on the (vertical) periodic group to which it belongs, as does that of the ordinary valency, it is determined by the (horizontal) period For hydrogen it is four (covalency two; one of the two links must of course be co-ordinate); for the elements of the first short period (lithium to fluorine) it is eight (covalency, four); for those of the second short and the first long periods (sodium to chlorine, and potassium to bromine) it is 12 (covalency, six), whilst for the heavier elements it is 16, corresponding to a covalency of eight This refers to the maximum size possible, which is not always reached

The electrons surrounding an atom in a molecule can thus be divided into two parts, the valency group, including the shared electrons, and the inner groups, the electrons of which are all unshared, and which may be called the core; and changes of valency may either be due to changes in the size or the utilization (extent of sharing) of the valency group, or to changes in the size of the core In many elements, including all those of the first two periods, the core cannot be changed by chemical means: it consists of a series of complete electronic groups, which are too stable to be affected by chemical forces. (These are the elements included in the Abridged Classification in the article PERIODIC LAW) With these, a change of valency can only occur through the valency group being completed, or, if it is already complete, being more fully shared Thus boron, with three valency electrons, can form three covalencies as in the fluoride BF_3, sharing each of its electrons with a fluorine atom, and receiving one electron in return from each Though this only gives it six valency electrons, it cannot combine with a fourth (neutral) fluorine atom, because it has no more valency electrons to offer But with a fluorine ion (which has a complete octet) it can form a co-ordinate link, if the ion shares a pair of its electrons with the boron:

$$\begin{array}{c} F \\ \ddot{} \\ F{:}\,B \\ \ddot{F} \end{array} \quad + \quad F' \quad = \left[\begin{array}{c} F \\ \ddot{} \\ F{:}\,B.\,F \\ \ddot{F} \end{array}\right]$$

We thus get the four-covalent complex BF_4^- which, however, necessarily has the negative charge given it by the fluorine ion, and so appears as the anion of a salt such as $K[BF_4]$. In this way the boron changes its valency from three to five (four covalencies and one electrovalency). In the same way the nitrogen of ammonia, though it has a complete octet, only shares six of these electrons. It can, however, increase its valency by sharing the other pair with a hydrogen ion·

$$\begin{array}{c} H \\ \ddot{} \\ H{:}\,N{:} \\ \ddot{H} \end{array} \quad + \quad H^+ \; = \left[\begin{array}{c} H \\ \ddot{} \\ H{:}\,N{:}\,H \\ \ddot{H} \end{array}\right]^+$$

The complex now has the positive charge of the hydrogen ion, and so forms the ammonium cation, as in $[NH_4]Cl$. In this way a trivalent element can increase its valency to five, its covalency rising to four, while the complex acquires one unit of charge, that is, one electrovalency. Further changes of the same kind are possible with the heavier elements, the valency group of which is not limited to eight Thus silicon, with four valency electrons, can form the tetrafluoride SiF_4, with a complete and fully shared octet It is, however, able to hold a valency group of twelve, and can obtain this by forming two co-ordinate links with two fluorine ions:

$$\begin{array}{c} F \\ \ddot{} \\ F{:}\,Si\,{:}F \\ \ddot{F} \end{array} \; + \; 2F^- \; \longrightarrow \left[\begin{array}{c} F \\ \ddot{} \\ F{:}\,Si\,{:}F \\ F{:} \quad\; {:}F \\ \ddot{F} \end{array}\right]$$

acquiring at the same time two negative charges. We thus get the anion of the silicofluorides (such as $K_2[SiF_6]$) in which the valency of the silicon has risen from four to eight (six covalencies and two electrovalencies) The same thing can happen without the production of an electrovalency, if an atom shares a lone pair of its electrons with, say, an oxygen atom, which needs two to make up its octet. For example, chlorine completes its octet by combining with a hydroxyl (H–O–) group in hypochlorous acid H–O–Cl In this molecule the chlorine has three lone pairs, so that it can form co-ordinate links with as many as three oxygen atoms, giving the series

$HClO$	$HClO_2$	$HClO_3$	$HClO_4$
Hypochlorous acid	Chlorous acid	Chloric acid	Perchloric acid

If, as is commonly done, we regard this link to the oxygen as equivalent to two valencies (in the older structural formulae it was necessarily written as a double link), the chlorine here appears with the valencies of 1, 3, 5 and 7.

It will be observed that all these changes of valency in which the core of the atom is unaffected, occur by two units at a time; and this is the main cause of the belief held in the early days of the theory of valency that the various valencies of an atom were either all even or all odd

Transitional Elements.—The elements commonly called transitional, those which are enclosed in frames in the Bohr classification (*see* ATOMIC STRUCTURE) and are relegated to table 2 in the article PERIODIC LAW, have in the outermost (valency) group of the isolated atom one or two electrons, and in the next group, which forms the outermost group of the core, not the stable numbers 2, 8 or 18, but some number intermediate between 8 and 18 A group of this size does not hold its electrons very firmly, and one or two of them can be detached by chemical action. Thus iron (26), in which the successive groups of the free atom are 2, 8, 14, 2, can lose its two outermost electrons in the usual way to form the bivalent cation Fe^{++}=2, 8, 14. But by more energetic treatment a third electron can be detached from this ferrous ion leaving the trivalent ferric ion Fe^{+++}=2, 8, 13 In this particular element the process in nearly all the compounds stops here, but with others it goes further· thus manganese [(25)=2, 8, 13, 2] can have valencies of 2, 3, 4, 5, 6 and 7. In the last of these states the core is reduced to 18=2, 8, 8, the stable arrangement of argon. Thus the transitional elements show valencies varying by single units, often over a wide range, the limit being that in which the core is reduced to the size of the preceding inert gas, or in other words, the highest valency being that corresponding to the periodic group to which the element belongs.

Copper and gold, though not strictly transitional elements, have many of the properties of such elements. They have the outer electronic groups 18, 1. The single electron of the outermost group is readily detached to give the univalent cuprous and aurous ions. But the 18 group, though it is normally very stable, is less so when the positive charge on the nucleus is barely sufficient to neutralize it, or in other words when its electrons are moving in a very weak electric field. Hence, in copper one, and in gold two, of these 18 electrons can be detached from the group, giving the cupric and auric compounds, such as $CuCl_2$ and $AuCl_3$, with the respective groups 17 and 16. Silver, which has a similar structure, might be expected to behave in the same way; but for some reason which is not understood the 18 group in silver is more stable and cannot be broken down; hence silver is almost invariably univalent. In the elements following these three in the table, from zinc, cadmium and mercury onwards, the increased charge on the nucleus holds the 18 group so firmly that its electrons cannot be removed. (N. V. S.)

VALENS, East Roman emperor from 364 to 378, owed his elevation in the 36th year of his age to his brother, Valentinian, who chose him to be his associate in the empire. Valens had been attached to Julian's bodyguard, but he did not inherit the military ability of his father, Gratian of Pannonia. A revolt headed by Procopius in the second year of his reign was quelled by the ability of his generals. In the year 366 Valens at one stroke reduced the taxes of the empire by one-fourth, a very popular measure, though one of questionable policy in the face of the threatening attitude of the Goths on the lower Danube Before venturing on a campaign against them, Valens received baptism from Eudoxus, the Arian bishop of Constantinople. After some small successes over the Goths, won by his generals (367–369), Valens concluded a peace with them, which lasted six years, on a general understanding that the Danube was to be the boundary between Goths and Romans On his return to Constantinople in 369–370 Valens began to persecute his orthodox and Catholic subjects, but he lacked the energy to carry out his edicts.

In the years 371 to 377 Valens was in Asia Minor, most of the time at the Syrian Antioch Though anxious to avoid an Eastern war, because of danger nearer home from the Goths, he was compelled to take the field against Shapur II Valens crossed the Euphrates in 373, and drove back the king of Persia to the farther bank of the Tigris But the Roman success was by no means decisive, and no definite understanding as to boundaries was come to with Persia. Valens returned to Antioch, where in the winter of 373–374 he instituted a persecution of magicians. Between 374 and 377 we read of grievous complaints of injustice and extortion perpetrated under legal forms Although preparations were made for following up the war with Persia and securing the frontier, a truce was patched up, rather to the disadvantage of the empire, Armenia and the adjacent country being half conquered and annexed by Shapur The armies of Rome, in fact, were wanted in another quarter The Huns, of whom we now hear for the first time, were beginning in 376 to press the Goths from the north, and the latter asked leave of the emperor to cross the Danube into Roman territory. This they were allowed to do, on the condition that they came unarmed, and their children were transported to Asia as hostages The conditions, however, were not observed by the imperial generals Accordingly, the enraged Goths, under their chief Fritigern, streamed across the Balkans into Thrace and the country round Adrianople, plundering, burning and slaughtering as they went They were driven back for a time, but returned in the spring of 378 in greater force, with a contingent of Huns and Alans; and penetrated to the neighbourhood of Adrianople Valens left Constantinople in May 378 with a strong and well-officered army Without awaiting the arrival of his nephew Gratian, emperor of the West, who had just won a great victory over the Alamanni, Valens attacked the enemy at once The battle, which was fought on confined ground in a valley, was decided by a cavalry charge of the Alans and Sarmatians, which threw the Roman infantry into confusion and hemmed it in so closely that the men could scarcely draw their swords. The slaughter, which continued till the complete destruction of the Roman army, was one of the greatest recorded in antiquity. Valens perished either on the field or, as some said, in a cottage fired by the enemy From the battle of Adrianople the Goths permanently established themselves south of the Danube

See Ammianus Marcellinus, bks. 26–31; E Gibbon, *The Decline and Fall of the Roman Empire* (ed Bury, London, 1909), chs 25–26; Hodgkin, *Italy and Her Invaders* (1880; 2nd ed, 1892–99), vol. i; F. Runkel, *Die Schlacht bei Adrianopel* (Berlin, 1903).

VALENTINE or VALENTINUS, the name of a considerable number of saints. The most celebrated are the two martyrs whose festivals fall on Feb. 14, the one, a Roman priest, the other, bishop of Terni (Interamna). The *Passion* of the former is part of the legend of SS Marius and Martha and their companions; that of the latter has no better historical foundation; so that no argument can be drawn from either account to establish the differentiation of the two saints. It would appear from the two accounts that both belonged to the same period, *i.e.,* to the reign of the emperor Claudius (Gothicus); that both died on the same day; and that both were buried on the Via Flaminia, but at different distances from Rome The *Martyrologium Hieronymianum* mentions only one Valentinus: "Interamnae miliario LXIIII. via Flaminia natale Valentini." The St Valentinus who is spoken of as the apostle of Rhaetia, and venerated in Passau as its first bishop, flourished in the 5th century. For the observances connected with St. Valentine's Eve and Day, *see* John Brand's *Popular Antiquities* (edited by W. C. Hazlitt, vol ii. pp. 606–11, London, 1905), W. Hone's *Every-Day Book,* and Chamber's *Book of Days* The association of the lovers' festival with St. Valentine seems to arise from the fact that the feast of the saint falls in early spring, and is purely accidental

See *Acta Sanctorum,* February, ii. 753, 756, and January, i. 1094, G B de Rossi, *Bullettino di archeologia cristiana* (1871), p 101 and (1878), p. 59.

VALENTINE AND ORSON, a romance attached to the Carolingian cycle It is the story of twin brothers, abandoned in the woods in infancy Valentine is brought up as a knight at the court of Pippin, while Orson grows up in a bear's den to be a wild man of the woods, until he is overcome and tamed by Valentine, whose servant and comrade he becomes The two eventually rescue their mother Bellisant from the power of a giant There are versions of the tale, which appears to rest on a lost French original, in French, English, German, Icelandic, Dutch and Italian. In the older versions Orson is described as the "nameless" one

The French romance was printed at Lyons in 1489. *The Historye of the two Valyannte Brethren· Valentyne and Orson* . . . by Henry Watson (*c.* 1550) is the earliest known English version A ballad on the subject was printed in Percy's *Reliques* For a detailed bibliography of the English, French, German, Dutch and Italian forms of the tale, *see* W Seelman, "Valentin und Namelos" (Norden and Leipzig, 1884), in vol. iv of *Niederdeutsche Denkmaler.*

VALENTINIAN I., Roman emperor of the West from A D. 364 to 375, was born at Cibalis, in Pannonia He had been an officer of the guard under Julian and Jovian, and had risen high in the imperial service He was chosen emperor in his forty-third year by the officers of the army at Nicaea in Bithynia in 364, and shortly afterwards named his brother Valens (*q v*) colleague with him in the empire. As emperor of the West, Valentinian took Italy, Illyricum, Spain, the Gauls, Britain and Africa, leaving to Valens the eastern half of the Balkan Peninsula, Greece, Egypt, Syria and Asia Minor as far as Persia During the short reign of Valentinian there were wars in Africa, in Germany and in Britain, and Rome came into collision with the Burgundians, Saxons and Alamanni The emperor's chief work was guarding the frontiers and establishing military positions Milan was at first his headquarters for settling the affairs of northern Italy; next year (365) he was at Paris, and then at Reims, to direct the operations of his generals against the Alamanni who were driven back to the German bank of the Rhine, and checked for a while by a chain of military posts and fortresses At the close of 367, however, they suddenly crossed the Rhine, and sacked Moguntiacum (Mainz) Valentinian attacked them at Solicinium (Sulz in the Neckar valley or Schwetzingen) with a large army, and defeated them with considerable loss on his own part. Later, in 374, he made peace with their king, Macrianus The next three years he spent at Trier, which he chiefly made his headquarters, organizing the defence of the Rhine frontier

During his reign the coasts of Gaul were harassed by the Saxon pirates, with whom the Picts and Scots of northern Britain joined hands, and ravaged the island from the wall of Antoninus to the shores of Kent. In 368 Theodosius was sent to drive back the invaders, in this he was completely successful, and established a new British province, called Valentia In Africa the Moorish prince, Firmus, raised the standard of revolt against Count Romanus, the military governor The services of Theodosius were again requisitioned He landed in Africa with a small band of veterans, and Firmus, to avoid being taken prisoner, committed suicide. In 374 the Quadi, a German tribe in what is now Moravia and Hungary, resenting the erection of Roman forts to the north of the Danube, and further exasperated by the treacherous murder of their king, Gabinius, crossed the river and laid waste the province of Pannonia. The emperor, in April of the following year,

entered Illyricum with a powerful army, but during an audience to an embassy from the Quadi at Brigetio on the Danube (near Pressburg) died in a fit of apoplexy.

Valentinian's general administration seems to have been thoroughly honest and able, in some respects beneficent If he was hard and exacting in the matter of taxes, he spent them in the defence and improvement of his dominions. Though himself a plain and almost illiterate soldier, he was a founder of schools, and he also provided medical attendance for the poor of Rome, by appointing a physician for each of the fourteen districts of the city He was an orthodox Catholic, but he permitted absolute religious freedom to all his subjects The great blot on his memory is his cruelty, which at times was frightful

See Ammianus Marcellinus xxv–xxx; Gibbon, *Decline and Fall*, chap 25; T. Hodgkin, *Italy and her Invaders*, bk 1 chap 3, H Richter, *Das westromische Reich* (1865), pp 240–268

VALENTINIAN II., son of the above, an infant of four in 375 with his half-brother Gratian (*q.v.*) a lad of about seventeen, became the emperors of the West They made Milan their home; and the empire was nominally divided between them, Gratian taking the trans-Alpine provinces, whilst Italy, Illyricum in part, and Africa were to be under the rule of Valentinian, or rather of his mother, Justina In 387 Magnus Maximus (*q v.*), who had in 383 overthrown Gratian and made himself master of the northern provinces, crossed the Alps and threatened Milan The emperor and his mother fled to Theodosius, the emperor of the East Valentinian was restored in 388 by Theodosius Four years later he was murdered at Vienne in Gaul, probably at the instigation of his Frankish general Arbogast

See Gibbon, *Decline and Fall*, chap. 27, H Richter, *Das weströmische Reich unter den Kaisern Gratian, Valentinian II. und Maximus* (1865), pp 577–650, and O Seek, *Untergang des antiken Welt*, Vol 5 (1897–1921).

VALENTINIAN III., emperor of the West from 425 to 455, the son of Constantius and Placidia He was only six years of age when he ascended the throne, and during his minority the conduct of affairs was in the hands of his mother His reign is marked by the dismemberment of the Western Empire, the conquest of the province of Africa by the Vandals in 439; the loss of great portions of Spain and Gaul, in which the barbarians had established themselves, and the ravaging of Sicily and of the western coasts of the Mediterranean by the fleets of Genseric As a set-off against these calamities there was the great victory of Aetius over Attila in 451 near Châlons, and his successful campaigns against the Visigoths in southern Gaul (426, 429, 436), and against various invaders on the Rhine and Danube (428–31) Ravenna was Valentinian's usual residence; but he fled to Rome on the approach of Attila, who ravaged North Italy in 452 In 454 Aetius was treacherously murdered by Valentinian. Next year, however, the emperor himself was assassinated by two of the barbarian followers of Aëtius He was self-indulgent, incompetent, and vindictive.

Our chief original sources for the reign of Valentinian III are Jordanes, Prosper's *Chronicles*, written in the 6th century, and the poet Apollinaris Sidonius *See* also Gibbon, *Decline and Fall*, chaps 33–35 and pp. 24 and 25 (ed London, 1909); J. B Bury, *Later Roman Empire*, bk. ii. chaps 6–8, E A Freeman, "Tyrants of Britain, Gaul and Spain" (*Eng Hist. Review*, January 1886), and "Aetius and Boniface" (*ibid*, July 1887).

VALENTINUS, pope for thirty or forty days in 827, in succession to Eugenius II. (824–27) He was a Roman by birth, and, according to the *Liber Pontificalis*, was first made a deacon by Paschal I. (817–24). Nothing further is known of his history. His successor was Gregory IV (827–44)

VALENTINUS and **THE VALENTINIANS.** Valentinus, the most prominent leader of the Gnostic movement, was born, according to Epiphanius (*Haer.* 31, 2), near the coast in Lower Egypt, and was brought up and educated in Alexandria Valentinus came to Rome (*c.* 135–160) during the episcopate of Hyginus, flourished under Pius and stayed till the time of Anicetus. According to Irenaeus iii. 3, 4, Polycarp, during his sojourn in Rome under the episcopate of Anicetus, converted a few adherents of the Valentinian sect. Tertullian (*Adv. Valentin.* cap. 4) declares that Valentinus came to Rome as an adherent of the orthodox Church, and was a candidate for the bishopric of Rome, but he abandoned the Church because a confessor was preferred to him for this office. The credibility of this statement may be questioned Great uncertainty attaches to the residence of Valentinus in Cyprus, recorded by Epiphanius (*loc. cit.*), who places it after his stay in Rome, adding that it was here that he definitely accomplished his secession from the Church. But it seems to be clear that Valentinus did not, like Marcion, break with the Church from the very beginning, but endeavoured to maintain his standing within it.

Justin's *Syntagma*, which treats of Valentinus, is unfortunately lost. Irenaeus, *Adversus Haereses*, i. 11, 1–3, as in every other article where named, has preserved what is obviously an older document, possibly from Justin, dealing with Valentinus's own teaching and that of two of his disciples The sketch which he gives is the best guide for the original form of Valentinianism For Valentinus himself we have also to consider the fragments of his writings preserved by Clement of Alexandria The best edition of and commentary on them is Hilgenfeld's *Ketzergeschichte des Urchristentums* (pp. 293–307). Irenaeus also gives a detailed account of the two chief schools following Valentinus, the school of Ptolemaeus (i. 1–10), and Marcus and the Marcosians (i 13–21). For his account of the Ptolemaeans, Irenaeus seems to have used various writings and expositions of the school, especially prominent being a collection of Scripture proofs which may have once had a separate literary existence (i. 1, 3; 3, 1–5 [6]; 8, 2–4). To this is appended in a somewhat disconnected fashion a commentary on the prologue to the fourth Gospel (i 8, 5) Irenaeus himself twice prefaces his remarks by saying he is indebted to other authorities for his exposition (i. 2, 3–4, 7, 2–5) *Excerpta ex Theodoto* which are to be found in the works of Clement and may be looked upon as a collection made by the author with a view to the unfinished eighth book of his *Stromateis*. The lost *Syntagma* of Hippolytus, which can be partially reconstructed from Philaster (*Haereses*) and from pseudo-Tertullian (*Adversus Valentinianos*), seems to furnish us with valuable information as to the earlier doctrines of the sect, and in his second treatise against heretics, the so-called *Philosophumena* (6, 29 *seq*), Hippolytus gives a homogeneous and continuous exposition of a later Valentinian system, possibly connected with the school of Ptolemaeus Important, too, are Hippolytus' references to an Italic and an Anatolian branch of the Valentinian sect (6, 35) Tertullian gives at the beginning of his treatise against the Valentinians a few separate notices of the life and disciples of Valentinus, but his further argument is closely dependent upon Irenaeus' exposition of the Ptolemaean system, which he embellishes in his usual fashion with bitterly sarcastic comments Epiphanius deals with Valentinus and his school in sections 31–36 of his work. He has preserved a valuable letter of Ptolemaeus to Flora, which is of the highest importance for the understanding of Gnosticism

Valentinus is the only one of the Gnostics who had a whole series of disciples who are known by name—indeed, in the accounts of the Church Fathers his own system and views are almost entirely obscured by the accounts of those of his disciples The most important disciples are the two dealt with at length by Irenaeus, Ptolemaeus and Marcus, who both seem to have had a numerous following. Also, there was Herakleon, of whose commentary on the gospel of St. John extensive fragments are preserved by Origen. Ptolemaeus and Herakleon are counted by Hippolytus (6, 35) among the Italic branch of Valentinianism. There was also the Anatolian branch, as representative of which Hippolytus mentions Axionicus, who is also referred to by Tertullian as having actually been taught in Antioch. The *Excerpta ex Theodoto* in Clement are also, according to the superscription, fragments from the Anatolian Gnosticism. It is, however, an error when Hippolytus speaks of Bardesanes as representative of this branch, for he had an entirely distinct position. Valentinianism was based on primitive gnosticism (*q v.*), with the doctrines of which Valentinus may have become acquainted in Egypt. The mother goddess stands at the centre of the system. The main doctrines are outlined below.

(1) Valentinus has a system of thirty aeons, but the quite shadowy plurality of ten and twelve aeons (the *Dekas* and the *Dodekas*) of the Valentinian system we may at once set aside as mere fantastical accretions We have left only a group of eight celestial beings, the so-called Ogdoas, and of these eight figures four again are peculiar to this system.

(2) The first pair of aeons, *Bythos* and *Sige*, is an original innovation of the Valentinian school, and clearly betrays a monistic tendency. According to Irenaeus's account of the "Gnostics" (i 29), their theory was that *Sophia* casts herself into the primal substratum of matter (*Bythos*) to be found outside the celestial world of aeons But in the Valentinian system matter is not originally and irretrievably separated from the higher celestial world but the latter originally exists for itself alone; the fall or disturbance is accomplished within the celestial world, and the material world first comes into existence through the fall

(3) There remain a double pair of aeons, the Father and Truth, the *Anthropos* and the *Ekklesia* With the celestial Primal Man—of whom the myth originally relates that he has sunk into matter and then raised himself up from it again—is associated the community of the faithful and the redeemed who are to share the same fate with him

(4) In the true Valentinian system the so-called *Christos* is the son of the fallen Aeon, who is thus conceived as an individual *Sophia*, who in a frenzy of love had sought to draw near to the unattainable *Bythos*, brings forth, through her longing for that higher being, an aeon who is higher and purer than herself, and at once rises into the celestial worlds Among the Gnostics of Irenaeus we find a kindred conception but with a slight difference. Here *Christos* and *Sophia* appear as brother and sister, *Christos* representing the higher and *Sophia* the lower element In the enigmatic figure of *Christos* we again find hidden the original conception of the Primal Man, who sinks down into matter but rises again (In the later Valentinian systems this origin of the *Christos* is entirely obscured, and Christ, together with the Holy Spirit, becomes a later offspring of the celestial world of aeons, this may be looked upon as an approximation to the Christian dogma)

(5) A figure entirely peculiar to Valentinian Gnosticism is that of *Horos* (the Limiter) The name is perhaps an echo of the Egyptian *Horus* The peculiar task of *Horos* is to separate the fallen aeons from the upper world of aeons He becomes a kind of world-creative power, who in this capacity helps to construct an ordered world out of *Sophia* and her passions He is also called, curiously enough, *Stauros* (cross), and we frequently meet with references to the figure of *Stauros* But we must not be in too great a hurry to assume that this is a Christian figure. A Platonic conception may have been at work here The cross can also stand for the wondrous aeon on whom depends the ordering and life of the world, and thus *Horos-Stauros* appears here as the first redeemer of *Sophia* from her passions, and as the orderer of the creation of the world which now begins The figure of *Horos-Stauros* was often assimilated to that of the Christian Redeemer.

(6) The dualism of the two separate worlds of light and darkness was thus overcome This derivation of the material world from the passions of the fallen *Sophia* is, however, affected by an older theory according to which the son of *Sophia*, whom she forms on the model of the *Christos* who has disappeared in the higher heavens, becomes the *Demiourgos*, who with his angels now appears as the real world-creative power These two conceptions had now to be combined at all costs And it is interesting to observe here what efforts were made to give the *Demiourgos* a better position. According to the older conception, he was an imperfect, ignorant, half-evil and malicious offspring of his mother, who has already been deprived of any particle of light (Irenaeus i 29, 30) In the Valentinian systems he appears as the fruit of *Sophia's* repentance and conversion He is no longer called *Jaldabaoth*, but has been assigned the better name, drawn from the philosophy of Plato, of *Demiourgos* The *Demiourgos* of the Gnostic corresponded to the God of the Old Testament, which again suggests a compromise with the Christian faith

(7) With the doctrine of the creation of the world is connected the subject of the creation of man. We fortunately know, from a fragment preserved by Clement, that Valentinus here preserved the old Gnostic myth practically unaltered in his system According to it, the world-creating angels—not one, but many—create man, but the seed of the spirit comes into their creature without their knowledge, by the agency of a higher celestial aeon, and they are then terrified by the faculty of speech by which their creature rises above them, and try to destroy him A definite Valentinian idea is here added in that of the threefold nature of man, who is represented as at once spiritual, psychical and material. In accordance with this there also arise three classes of men, the *pneumatici*, the *psychici* and the *hylici* (ὕλη, matter) All the other Gnostic systems recognize only a dual division, the children of light and the children of darkness That the Valentinians should have placed the *psychici* between the *pneumatici* and *hylici* signifies a certain recognition of the Christian Church and its adherents who are not treated as outcasts.

(8) At the centre of the whole Valentinian system naturally stands the idea of redemption, and so we find here developed particularly clearly the myth of the heavenly marriage already known from Irenaeus i 30 to be Gnostic Redemption is essentially accomplished through the union of the heavenly *Soter* with the fallen *Sophia* This myth of the redeemer is of significance for the practical piety of the Valentinian Gnostics It is the chief idea of their pious practices mystically to repeat the experience of this celestial union of the *Soter* with *Sophia* In this respect, consequently, the myth underwent yet wider development Just as the *Soter* is the bridegroom of *Sophia*, so the heavenly angels, who sometimes appear as the sons of the *Soter* and *Sophia*, sometimes as the escort of the *Soter*, are the males betrothed to the souls of the Gnostics which are looked upon as feminine Thus every Gnostic had his angel standing in the presence of God and the object of a pious life was to bring about and experience this inner union with the celestial abstract personage This leads us straight to the sacramental ideas of this branch of Gnosticism

(9) With this celestial *Soter* of the Valentinians and the redemption of *Sophia* is connected the figure of Jesus of Nazareth and the historical redemption connected with his name The *Soter*, the bridegroom of Sophia, and the earthly Jesus answer to each other as in some way identical Here again we recognize the artificial compromise between Gnosticism and Christianity

(10) The Valentinians laid down that even the Redeemer has a threefold nature, from his mother, Sophia, he derived his nature as a *pneumaticos*, in the world of the Demiourgos he was united with the Christos, and finally a wonderful bodily nature was formed for him from celestial elements, which was yet not of earthly material As such he was miraculously born of the Virgin The compromises with the Catholic Church are here obvious Also, there was the idea that upon this Jesus, so constituted, yet another celestial nature, the Christos or the Soter, has descended at his baptism

The first survey of these confused speculations, these myths gathered together and preserved from the ancient world, this marshalling together of the most varied traditions, and above all, these artificial attempts at compromise, makes us inclined to doubt whether it was possible for any true piety to coexist with all this Yet such piety existed, indeed we have here a set of regular mystics It is not, indeed, a purely spiritual and mystical piety, but a mysticism much distorted and over-grown with sacramental additions and a mysterious cult But all this is not without an inner value and an attractive atmosphere. In a letter in Clement ii 20, 114, Valentinus sets forth that the soul of man is like an inn, which is inhabited by many evil spirits "But when the Father, who alone is good, looks down and around him, then the soul is hallowed and lies in full light, and so he who has such a heart as this is to be called happy, for he shall behold God "

But with this mysticism is connected the mystery and cult of the sacrament The lofty spirituality of the Gnostic degenerates over and over again into a distinctly material and sensual attitude, in which all kinds of efforts are made actually to assimilate to oneself the divine through external means

The chief sacrament of the Valentinians seems to have been that of the bridal chamber. Just as the apostle Paul represented his Christianity as a living, dying and rising again with Christ, so the first concern of the pious Valentinian was the experience of the divine marriage feast of Sophia. As Sophia was united with the Soter, her bridegroom, so the faithful would experience a union with their angel in heaven Through a fortunate chance, a liturgical formula which was used at this sacrament appears to be preserved It runs. "I will confer my favour upon thee, for the father of all sees thine angel ever before his face . . we must now become as one, receive now this grace from me and through me, deck thyself as a bride who awaits her bridegroom, that thou mayest become as I am, and I as thou art Let the seed of light descend into thy bridal chamber; receive the bridegroom and give place to him, and open thine arms to embrace him Behold, grace has descended upon thee"

Besides this the Gnostics already practised baptism, using the same form in all essentials as that of the Christian Church The name given to baptism was *apolytrosis* (liberation) In one of the formulae occur the words. "I would enjoy thy name, Saviour of Truth" The concluding formula of the baptismal ceremony is "Peace over all upon whom the Name rests" (Irenaeus i 21, 3) This name pronounced at baptism over the faithful has above all the significance that the name will protect the soul in its ascent through the heavens, conduct it safely through all hostile powers to the lower heavens, and procure it access to Horos, who frightens back the lower souls by his magic word

Here and there a reaction took place against the absurdity of this sacramental superstition Thus Irenaeus (i 21, 4) tells us of certain Gnostics who would admit no external holy practices as efficacious A pure piety breathes in the words of the Gnostics preserved in *excerpta ex Theodoto*, 78, 2 "But not baptism alone sets us free, but knowledge (*gnosis*) who we were, what we have become, where we were, whither we have sunk, whither we hasten, whence we are redeemed, what is birth and what rebirth"

We have seen that Valentinian Gnosticism affected the nearest approach of all the Gnostic sects to the Catholic Church Valentinus's own life indicates that he for a long time sought to remain within the official Church, and had at first no idea of founding a community of his own

And yet this reconciliation of Gnosticism was a fruitless and henceforward a purposeless undertaking Oriental dualism and wildly intemperate Oriental mythology had grown into so radical and essential a part of Gnosticism that they could not be separated from it to make way for a purer and more spiritual view of religion. And at a time when the prevailing tendency of Christianity was a struggle out of the darkness of Oriental mythology and eschatology into clearness, and an effort towards union with the lucid simplicity of the Hellenic spirit, these Gnostics, for all their efforts, and even the most noble of them, had come too late They are not the men of a forward movement, but they are, and remain, in spite of all clearer insight, the rear-guard of piety

Akademie* (1909).

VALENZUELA, FERNANDO DE (1630–1692), Spanish royal favourite and minister, was born at Naples on Jan 19, 1630 He obtained a footing in the palace by his marriage with Maria de Uceda, lady-in-waiting to Mariana, Philip IV.'s second wife. When he was appointed introducer of ambassadors (Oct. 12, 1671), it became notorious that whoever had a petition to present must apply to him He became popularly known as the *duende*, the fairy or brownie of the palace, and was believed to be the lover of the queen Dismissed (1675) from court by intrigue, he was made marquis of Villa Sierra by the queen and ambassador to Venice He exchanged the embassy for the governorship of Granada, organized a counter-intrigue and returned to court. The queen-regent appointed him prime-minister and made him a grandee, to the profound indignation of the other grandees At the palace revolution of Jan 1678, Valenzuela fled to the Escorial, was captured, degraded from the grandeeship, exiled to the Philippines and his property confiscated. He died in Mexico on Feb 7, 1692.

See *Documentos inéditos para la Historia de España*, vol. lxvii. (1842, etc.).

VALERA Y ALCALÁ GALIANO, JUAN (1824–1905), Spanish novelist, entered diplomacy in 1847 and became unpaid attaché to the Spanish embassy at Naples under the famous duke de Rivas. He held various other diplomatic posts until 1858 when he returned to Spain and entered the House of Deputies, taking his place with the Liberal opposition On the flight of Isabella II in 1868 he was elected deputy for Montilla in the province of Cordova, became under-secretary of state for foreign affairs, and was one of the deputation who offered the crown to Amadeus of Savoy in the Pitti Palace at Florence Though he always called himself a Moderate Liberal, Valera invariably voted for what are considered Radical measures in Spain, and a speech delivered by him in Feb. 1863 against the temporal power of the pope created a profound sensation However, though a member of the revolutionary party, he steadily opposed organic constitutional changes, and therefore he retired from public life during the period of republican government After the Bourbon restoration he acted as minister at Lisbon (1881–83), at Washington (1885), at Brussels (1886) and as ambassador at Vienna (1893–95), retiring from the diplomatic service on March 5, 1896 During his last ten years he took no active part in politics

Valera's *Poesías* (1858) are imitative exercises rather than original poetry His criticism in the *Estudios críticos sobre literatura* (1864), in the *Disertaciones y juicios literarios* (1878) and in the *Nuevos estudios críticos* (1888) show penetration and taste, but also an excessive amiability He said a hundred incisive, wise, witty, subtle and suggestive things concerning the mysticism of St Theresa, the art of novel-writing, *Faust*, the Inquisition, *Don Quixote*, Shakespeare, the psychology of love in literature; but, to do himself justice, it was an almost indispensable condition that he should deal with the past In the presence of a living author Valera was disarmed

When in his 50th year, he published *Pepita Jiménez* (1874) a recital of the fall of Luis de Vargas, a seminarist who conceived himself to be a mystic and a potential saint, and whose aspirations dissolve at the first contact with reality It is easy to point out blemishes: the story is not well constructed, and it has pauses during which the writer's fantasy plays at pleasure over a hundred subjects not very germane to the matter; but its characters are as real as any in fiction, the love story is told with the most refined subtlety and malicious truth, while page upon page is written in such Spanish as would do credit to the best writers of the 16th and 17th centuries A second novel, *Las ilusiones del Doctor Faustino* (1875), was received with marked disfavour, and has the faults of over-refinement and of cruelty; yet in keen analysis and in humour it surpasses *Pepita Jiménez*. The *Comendador Mendoza* (1877) is more pathetic and of a profounder significance, and if *Doña Luz* (1879) repeats the situation and the general idea already used in *Pepita Jiménez* it strikes a deeper and more tragic note, which came as a surprise to those familiar only with the lighter side of Valera's genius Besides these elaborate psychological studies, Valera issued a volume of *Cuentos* (1887), some of these short tales and dialogues being marvels of art and of insight.

At the close of the 19th century Valera was recognized as the most eminent man of letters in Spain. He had not Pereda's force nor his energetic realism; he had not the copious invention nor the reforming purpose of Pérez Galdós; yet he was as realistic as the former and as innovating as the latter. And, for all his cosmopolitan spirit, he fortunately remained intensely and incorrigibly Spanish. His aristocratic scepticism, his strange elusiveness, his incomparable charm are his own; his humour, his flashing irony, his urbanity are eminently the gifts of his land and race. He is by no means an impersonal artist; in almost every story there is at least one character who talks and thinks

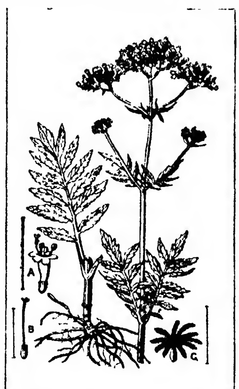
and subtilizes and refines as Valera himself wrote in his most brilliant essays. This may be a fault in art, but, if so, it is a fault which many great artists have committed (J F-K)

VALERIA, VIA, an ancient highroad of Italy, the continuation north-eastwards of the Via Tiburtina (*q.v.*) It probably owed its origin to M Valerius Messalla, censor in 154 B C It ran first up the Anio valley past Varia (*q v.*), and then, abandoning it at the 36th mile, where the Via Sublacensis diverged, ascended to Carsioli (*q.v.*), and then again to the lofty pass of Monte Bove (4,003 ft), whence it descended again to the valley occupied by the Lago di Fucino (*q v*) The difficult route from Cerfennia, the easternmost point of Marsian territory, to the valley of the Aternus (mod. Pescara)—a drop of nearly 1,000 ft , involving too the crossing of the main ridge of the Apennines (3,675 ft) by the Mons Imeus (mod Forca Caruso)—was not made into a highroad until the reign of Claudius, who also constructed a road, the Via Claudia Nova, connecting the Via Salaria which it left at Foruli (mod. Civitatomassa, near Amiternum) with the Via Valeria near the modern Popoli This road was continued south to Aesernia From Popoli the road followed the valley of the Aternus to its mouth, and there joined the coast-road at Pescara The modern railway from Rome to Castellammare Adriatico follows closely the line of the Via Valeria

See R. Gardner in *Papers of the British School at Rome*, ix , 75–106

VALERIAN, a genus of herbaceous perennial plants of the natural order Valerianaceae. Two species—*Valeriana officinalis* and *V dioica*—are indigenous in Britain, while a third, *V pyrenaica*, is naturalized in some parts The valerians have opposite leaves and small flowers, usually white or reddish, and arranged in terminal cymes The limb of the calyx is remarkable for being at first inrolled and afterwards expanding in the form of a feathery pappus which aids in the dissemination of the fruit. The genus comprises about 150 species, which are widely distributed in the temperate parts of the world In medicine the root of *V officinalis* is intended when valerian is mentioned

Valerian is cultivated in England, but to a much greater extent in Saxony, in Holland and in the United States The dried root or rhizome consists of a short central erect portion, about the thickness of the little finger, surrounded by numerous rootlets about $\frac{1}{10}$ of an inch in diameter, the whole being of a dull brown colour. When first taken from the ground it has no distinctive smell; but on drying it acquires a powerful odour of valerianic acid This odour, now regarded as intolerable, was in the 16th century considered to be fragrant, the root being placed among clothes as a perfume (Turner, *Herbal*, 1568, part iii p 76), just as *V. celtica* and other species are still used in the East



VALERIAN (VALERIANA OFFICINALIS), ONE-THIRD NATURAL SIZE
A. flower; B. flower after removal of corolla; C. fruit crowned by the feathery pappus (A, B, & C enlarged)

The red valerian of gardens is *Centranthus ruber*, also belonging to the Valerianaceae; but Greek valerian is *Polemonium coeruleum*, belonging to the family Polemoniaceae. Cats are nearly as fond of the smell of this plant as of the true valerian, and will frequently roll on the plant and injure it.

The chief constituent of valerian is a volatile oil, which is present in the dried root to the extent of 1–2%, plants growing on dry or stony soil being said to yield the largest quantity. The oil is of complex composition, containing valerianic (valeric), formic and acetic acids combined with a terpene, $C_{10}H_{16}$; the alcohol known as borneol; and pinene Valerian acts medicinally entirely in virtue of its volatile oil, which exerts the actions typical of its class. The special use of this drug, like that of others which contain an offensive volatile oil—such as asafoetida—is in hysteria

VALERIANUS, PUBLIUS LICINIUS, Roman emperor from A D. 253 to 260. He was of noble family, and in 238 was *princeps senatus* In 251, when Decius revived the censorship with practically supreme civil authority, Valerian filled the post Gallus, the successor of Decius, summoned him from the upper Rhine in 253 when threatened by the rebellion of Aemilianus The soldiers, however, proclaimed Valerian emperor, and marching slowly towards Rome he found both his rivals dead, slain by their own soldiers Trouble on the frontiers east and west was complicated by something near national bankruptcy Valerian left his son, Gallienus in charge of the wars in Europe; and took the offensive against the Goths, recaptured Antioch and marched to relieve Edessa He was defeated and taken prisoner, and disappears from history (258)

See Trebellius Pollio, *Life of Valerian* (frags); Aurelius Victor. *Caesares*, 32 , Eutropius ix 6; Ammianus Marcellinus xxiii 5; Zosimus i. 27; Gibbon, *Decline and Fall*, chap 10, H Schiller, *Geschichte der romischen Kaiserzeit* (1883–86) 1 pt 2

VALERIC ACID or **VALERIANIC ACID,** an organic acid belonging to the fatty acid series ($C_nH_{2n+1}\cdot CO_2H$) It exists in four different forms, all having the same formula, $C_4H_9\,CO_2H$ (*See* ISOMERISM.) One of these contains an asymmetric carbon atom and consequently occurs in two optically active modifications and one optically inactive modification. Ordinary valeric acid (baldrianic acid) is a mixture of *iso*valeric acid or *iso*propylacetic acid $(CH_3)_2CH\cdot CH_2\,CO_2H$, and optically active methylethylacetic acid $(CH_3)(C_2H_5)CH\,CO_2H$, both of which occur free or as esters in the vegetable and animal kingdoms, chiefly in the roots of *Angelica archangelica* and *Valeriana officinalis* It may be extracted by boiling with water or soda A similar product is obtained by oxidizing fermentation amyl alcohol with chromic acid Isovaleric acid is an oily liquid having the odour of stale cheese and boiling at 174° C, its salts are usually greasy to the touch Potassium permanganate oxidizes it to β hydroxisovaleric acid $(CH_3)_2\,C(OH)\,CH_2\cdot CO_2H$, whilst nitric acid gives, among other products, dinitropropane, $(CH_3)_2C(NO_2)_2$ The acid has been synthesized as has also the inactive form of methylethylacetic acid; this modification is split into its optical antipodes by crystallization of its brucine salt Normal valeric acid or propylacetic acid, $CH_3\,CH_2\cdot CH_2\,CO_2H$, is a liquid boiling at 186° The remaining isomeride, pivalic or trimethylacetic acid, $(CH_3)_3C\,CO_2H$, melts at 35° and boils at 163°; it is prepared by oxidizing pinacolin (*See* KETONES)

VALERIUS FLACCUS, GAIUS, Roman poet, flourished under Vespasian and Titus He has been identified on insufficient grounds with a poet friend of Martial (i 61 76), a native of Padua His work, the *Argonautica*, dedicated to Vespasian on his setting out for Britain, was written during the siege, or shortly after the capture of Jerusalem by Titus (70) It is an epic in eight books on the Quest of the Golden Fleece and is not wholly extant Part is borrowed from Apollonius of Rhodes

The *Argonautica* was unknown till the first four and a half books were discovered by Poggio at St Gall in 1417. The *editio princeps* was published at Bologna (1474) Recent editions by G Thilo (1863), with critical notes; C Schenkl (1871), with bibliography, E Bahrens (1875), with critical introduction; P Langen (1896), with Latin notes, and short introductions on the style and language, Caesar Giarratano (1904) , *see* also J Peters, *De V F. Vita et Carmine* (1890); W C. Summers, *Study of the Argonautica* (1894).

VALERIUS MAXIMUS, Latin writer, flourished in the reign of Tiberius His family was poor, and he owed everything to Sextus Pompeius (consul A D 14), proconsul of Asia and a kind of minor Maecenas, whom he accompanied to the East in 27. He intimates that his work is intended as a commonplace book of historical anecdotes for use in the schools of rhetoric The stories are loosely and irregularly arranged, and are from Roman history, but each section includes extracts from the annals of other peoples, principally the Greeks The work reproduces the general feeling of the empire, that the Romans of the day are degenerate compared with their ancestors, but still vastly superior to the rest of the world

The author's chief sources are Cicero, Livy, Sallust and Pom-

peius Trogus. In spite of his confusions, contradictions and anachronisms, the excerpts are apt illustrations. Valerius often used sources now lost, and affords us some glimpses of the much debated and very imperfectly recorded reign of Tiberius Modern criticism will hardly regard as flattery his description of Tiberius, once so misunderstood, as *salutaris princeps.* He reveals the transition from classical to silver Latin It is an instructive lesson to compare minutely a passage of Valerius with its counterpart in Cicero or Livy The tenth book of the ms, the *Liber de Praenominibus,* is much later The collection was used as a schoolbook, and was very popular in the middle ages

One complete epitome, probably of the 4th or 5th century, bearing the name of Julius Paris, has come down to us; also a portion of another by Januarius Nepotianus Editions by C Halm (1865) and C Kempf (1888), contain the epitomes of Paris and Nepotianus

VALÉRY, PAUL (1871–), French poet, was born at Cette on Oct 30, 1871 He first became known as the author of several apocalyptic poems of remarkable beauty and form, which appeared in such reviews as *L'Ermitage, Le Centaure,* etc., and were issued later in a collection entitled *Album de Vers anciens* (1920). From 1900 to 1917 Valéry lived in strict retirement and published nothing During this period, however, his ideas matured, and he accumulated material later given to the public in *Cahier B, Rhumbs* and *Analecta* It was not until 1917 that he published his first great poem *La Jeune Parque,* dedicated to André Gide. Then came *Aurore* (1917), *Le Cimitière marin* (1920), *Le Platane, L'Ebauche d'un Serpent,* etc., which appeared in a collection entitled *Les Charmes* (1922). Valéry has also written critical essays (on Stendhal, Poe, etc) and philosophical treatises (*Introduction à la méthode de Léonard de Vinci, Soirée avec M. Teste*) of which some have been collected under the title *Variétés* (1924), *Eupalinos* and *Ame et la Danse* (1923), two Platonic dialogues.

Valéry initiated a new movement in French poetry. Influenced by Mallarmé, especially in his sense of verbal music, he believes with the symbolists that pure poetry must have value in itself apart from any reference to the accidents of being Interested in philosophy and mathematics he is a poet-mathematician trying to set his subtle analysis to music Valéry has been a member of the Académie française since 1926

See H A. L. Fisher, *Paul Valéry* (1927), R Fernandat, *P Valéry* (1927), P Soudav, *P. Valery* (1927), *Hommys des Louvain étrangers à Paul Valéry* (Maestricht, 1928), containing appreciations by R M. Rilke, R Kayser, T. Shuge Moon, P. Ziffer, E. Cecchi, and others

VALHALLA, according to the heathen Scandinavians the abode where the souls of those who had fallen in battle (Old Norse *Valholl, i e,* "hall of the slain") are received by the god Odin, and fight and feast in his service. (*See* TEUTONIC PEOPLES.)

VALJEVO, a town in western Serbia, Yugoslavia, lying in a pine clad valley 627 ft above sea level Pop (1921) 9,768 Valjevo is a prosperous little town, lit by electricity. It forms the headquarters of the western division of the Serbian army and is the most important strategic point in this part of the country. Besides being the centre of the plum growing and distillery industries, Valjevo has a considerable trade in cattle, the pastures watered by the Kolubra being famous The best nut trees in Serbia flourish here. It was at Valjevo that the standard of revolt against the Turks was raised in 1804, and during the second rising in 1815 Prince Milosh captured the town.

VALKYRIES, generally represented in Northern mythology as divine maidens who, sent by Odin, ride through the air to determine the course of battles and to select brave warriors for Valhalla (*q.v*). Beings with the same name (*waelcyrgean*) were in England associated with witches

(*See* TEUTONIC PEOPLES)

VALLA, LORENZO or **LAURENTIUS** (*c.* 1406–1457), Italian humanist, was born at Rome about 1406, his father, Luca delle Vallea, being an advocate. He was educated at Rome, became a priest in 1431, and wandered from one university to another lecturing. About 1435 he became private secretary to Alphonso V of Aragon, who ever afterwards protected him, and later helped him to open a school at Naples Valla by now had achieved a great reputation by the *De Voluptate* and the *De Elegantiis Linguae Latinae* The first is a remarkable dialogue presenting in turn the Stoic, Epicurean and Christian ethical systems Christianity is allowed to prevail, but Epicurus is very favourably treated. The *De Elegantiis* is a scientific analysis of the rules of Latin grammar and style In 1439 appeared his famous exposure of the Donation of Constantine (*q.v*), followed by other attacks on spurious documents He was compelled to appear before an inquisitory tribunal composed of his enemies, and he escaped only by the special intervention of Alphonso He was not, however, silenced; he ridiculed the Latin of the Vulgate and accused St. Augustine of heresy In 1444 he visited Rome, but in this city also his enemies were numerous and powerful, and he saved his life only by flying in disguise to Barcelona, whence he returned to Naples After the death of Eugenius IV in 1447 he went again to Rome, where he was welcomed by the new pope, Nicholas V., who made him an apostolic secretary, and this entrance of Valla into the Roman Curia has been justly called "the triumph of humanism over orthodoxy and tradition" Valla also enjoyed the favour of Pope Calixtus III His most famous dispute was with Poggio (*q v.*) He died in Rome on Aug 1, 1457.

Over Valla's private life, the most obscene language was employed He appears as a vain, jealous and quarrelsome man, but an elegant humanist, an acute critic and a venomous writer, who had committed himself to a violent polemic against the temporal power of Rome In him posterity honours the man who initiated a bold criticism, which he applied to language, to historical documents and to ethical opinions Luther had a high opinion of him, and Cardinal Bellarmine calls him *praecursor Lutheri,* while Sir Richard Jebb says that his *De Elegantiis* "marked the highest level that had yet been reached in the critical study of Latin"

Collected, but not quite complete, editions of Valla's works were published at Basle in 1540 and at Venice in 1592 *seq*, and *De Elegantiis* was reprinted nearly 60 times between 1471 and 1536 For detailed accounts of Valla's life and work *see* G Voigt, *Die Wiederbelebung des classischen Alterthums* (1880–81), J A Symonds, *Renaissance in Italy* (1897–99), G Mancini, *Vita di Lorenzo Valla* (Florence, 1891), M. von Wolff, *Lorenzo Valla* (Leipzig, 1893), J Burckhardt, *Kultur der Renaissance* (1860), J Vahlen, *Laurentius Valla* (1870), L. Pastor, *Geschichte der Päpste*, Band ii Eng trans by F I Antrobus (1892), the article in Herzog-Hauck's *Realencyklopadie,* Band xx. (Leipzig, 1908), and J E Sandys, *Hist of Class Schol* ii (1908), pp 66–70

VALLABHACHARS, a numerous sect in western and central India in which the emotional and erotic elements are allowed free scope, aided by vernacular dialects in prayers and hymns of praise

Vallabha, the son of a Telinga Brahman, lived at Gokula near Mathura, and set up a shrine with an image of Krishna Gopala Vallabha went subsequently to reside at Benares, where he died In the doctrine of this Vaishnava prophet, if the human soul is identical with God, the practice of austerities must be discarded as directed against God, and it is rather by a free indulgence of the natural appetites and the pleasures of life that man's love for God will best be shown The followers of this creed direct their worship chiefly to Gopal Lal, the boyish Krishna of Vrindavana, whose image is sedulously attended like a revered living person eight times a day—from its early rising from its couch to its retiring to repose at night The sectarial mark of the adherents consists of two red perpendicular lines, meeting in a semicircle at the root of the nose, and having a round red spot painted between them Their principal doctrinal authority is the Bhagavata-purana, as commented upon by Vallabha himself, the author of several other Sanskrit works highly esteemed by his followers Children are solemnly admitted to full membership at the early age of four, and even two years, when a rosary, or necklace, of 108 beads of basil (tulsi) wood is passed round their necks, and they are taught the use of the octo-syllabic formula *Sri-Krishnah saranam mama,* "Holy Krishna is my refuge." Their spiritual heads, the Gosains, also called Maharajas, adorn themselves in splendid garments, and allow themselves to be habitually regaled by their adherents with choice kinds of food; and as the living representatives of the "lord of the Gopis" himself, claim and receive in their own persons all acts of attachment

and worship due to the deity, even, it is alleged, to the extent of complete self-surrender. In the final judgment of the famous libel case of the Bombay Maharajas, before the Supreme Court of Bombay, in January 1862, these improprieties were severely commented upon.

A modern offshoot of Vallabha's creed, formed with the avowed object of purging it of its objectionable features, was started, in the early years of the 19th century, by Sahajananda, a Brahman of the Oudh country, who subsequently assumed the name of Svami Narayana. Having entered on his missionary labours at Ahmadabad, and afterwards removed to Jetalpur, where he had a meeting with Bishop Heber, he subsequently settled at the village of Wartal, to the north-west of Baroda, and erected a temple to Lakshmi-Narayana, which, with another at Ahmadabad, form the two chief centres of the sect, each being presided over by a Maharaja

VALLADOLID, a Mexican town Pop (1920) 6,840 It is situated in a healthy and fertile part of Yucatan, and is a resort for invalids. It has old churches, a Jesuits' college, town hall, hospital and aqueduct It was founded in 1544, soon after the conquest, as a great ecclesiastical centre, but these plans were not realized and its fine buildings have fallen into decay The inhabitants, chiefly Mayas, have frequently revolted against their rulers

VALLADOLID, an inland province of Spain, one of the eight into which Old Castile was divided in 1833 Pop. (1920) 280,931, area, 2,922 sq miles

The province belongs to the basin of the river Duero (Douro) It is for the most part flat and exceedingly fertile, the only part that can be called hilly being in the north-west, where the low Montes de Torozos occur Valladolid shares with the Tierra de Campos in Palencia the title of granary of the Peninsula

Besides wheat, maize, barley and oats, the province produces hemp, flax, various fruits, red and white wine, oil and madder Honey, wax and silk are also produced The woollen fabrics of Valladolid were once highly esteemed, but this industry has now greatly declined, although in the larger towns there are still linen and cloth factories, besides iron foundries, tanneries, saw-mills and flour-mills Trade is facilitated by the Canal de Castilla, which connects Valladolid, on the Pisuerga, with Alar del Rey, in Palencia, also on that river *See* PALENCIA (province) Valladolid is traversed from north to south by the northern railway from Madrid to France Apart from the capital Valladolid (*q v*), Medina del Campo (9,624) and Nava del Rey (5,221) are the only towns with more than 5,000 inhabitants

VALLADOLID, the capital of the Spanish province of Valladolid, 2,228 ft above sea-level, at the confluence of the river Pisuerga with the Esgueva Pop (1920) 76,791 Valladolid is sometimes identified with the ancient Pintia of Ptolemy Its Roman origin is uncertain The present name is undoubtedly Moorish. Valladolid was recovered from the Moors in the 10th century, but is first named by Sancho II of Leon in 1072 The cortes of Castile frequently met here in the following centuries, and in the beginning of the 15th century John II made it his principal residence After the removal of the capital to Madrid by Philip II. in 1560 it began rapidly to decay Columbus died (1506) and Philip II was born (1527) at Valladolid

Valladolid is an archbishopric, and the seat of an army corps, a court of appeal and a university. It is connected by numerous railways with every province of Spain The granite cathedral was begun in 1585 by Juan de Herrera in the Renaissance style The interior contains pictures by Luca Giordano (1632–1705) and the celebrated silver monstrance wrought by Juan de Arphe Other buildings are the church of Santa Maria la Antigua (1200); the church of San Pablo (1286); San Gregorio (15th century); and San Benito (end of the 14th century). The Plateresque college of Santa Cruz, built by Enrique de Egas in 1479–92, contains three pictures by Rubens, and some remarkable wooden statues by Alonso Berruguete (d. 1581), Gregorio Hernandez (1566–1636) and others. The university, originally founded at Palencia early in the 13th century, was transferred to Valladolid before 1250. The house in which Cervantes lived (1603–6) has been preserved by the Hispanic Society of America The principal industries are the manufacture of linen, silk and woollen fabrics, pottery, gold and silver work, flour, wine, beer, chocolate, leather, ironware

VALLANDIGHAM, CLEMENT LAIRD (1820–1871), American politician, was born in New Lisbon, Ohio, on July 29, 1820. He was duly admitted to the bar in 1842 Elected to the Ohio house of representatives in 1845, he became one of the extremists of the state rights Democrats of his section From 1858 to 1863 he was in the lower house of Congress, where he was noted for his strong opposition to the principles and policies of the growing Republican party, his belief that the South had been grievously wronged by the North, his leadership of the peace democrats or "copperheads," who were opposed to the prosecution of the war, and his bitter attacks upon the Lincoln administration, which, he said, was destroying the Constitution and would end by destroying civil liberty in the North In 1863 he made violent speeches in Ohio against the administration, and for these he was arrested by the military authorities, tried by military commission and sentenced to imprisonment President Lincoln commuted this sentence to banishment, and Vallandigham was sent into the Confederate lines, whence he made his way to Canada While in exile he was elected supreme commander of the Knights of the Golden Circle in Ohio and received the Democratic nomination for governor of Ohio, but was defeated In 1864 he returned to Ohio, took active part in the campaign of that year, wrote part of the national Democratic platform at Chicago, and assisted to nominate McClellan for the presidency After the war he denounced the reconstruction policy of the Republicans as unconstitutional and tyrannical, but in 1870, seeing the uselessness of further opposition, he advised his party to accept the situation and adopt new issues Vallandigham was an able lawyer and a popular politician He died in Lebanon, Ohio, on June 17, 1871

See J. L. Vallandigham, *Life of Clement L Vallandigham* (Baltimore, 1872), J F Rhodes, *History of the United States from the Compromise of 1850* (1839–1906); H van Fossan, "Clement L. Vallandigham," in *Ohio Archaeological and Historical Quarterly*, vol. xxiii, p. 256–267 (1914).

VALLE, PIETRO DELLA (1586–1652), Italian traveller in the East, came of a noble Roman family, and was born on April 11, 1586, in the family palace built by Cardinal Andrea. He served against the Moors of Barbary, but also became a member of the Roman academy of the Umoristi, and acquired some reputation as a versifier and rhetorician The idea of travelling in the East was suggested by a disappointment in love, as an alternative to suicide, and was ripened to a fixed purpose by a visit to the learned Mario Schipano, professor of medicine in Naples, to whom the record of Pietro's travels was addressed in the form of very elaborate letters, based on a full diary Before leaving Naples he took a vow of pilgrimage to the Holy Land, and, sailing from Venice in 1614, reached Constantinople, where he remained for more than a year, and acquired a good knowledge of Turkish and a little Arabic In September 1615 he sailed for Alexandria with a suite of nine persons From Alexandria he went on to Cairo, and, after an excursion to Mount Sinai, left Cairo for the Holy Land in March 1616, in time to assist at the Easter celebrations at Jerusalem Having visited the holy sites, he journeyed by Damascus to Aleppo, and thence to Baghdad, where he married a Syrian Christian named Maani, a native of Mardin, who died in 1621 He now desired to visit Persia; but, as that country was then at war with Turkey, he had to leave Baghdad by stealth in Jan 1617 Accompanied by his wife he proceeded by Hamadan to Isfahan, and joined Shah Abbas in a campaign in northern Persia, in the summer of 1618 Here he was well received at court On his return to Isfahan he began to think of returning by India rather than Turkey, but the state of his health, and the war between Persia and the Portuguese at Ormuz, created difficulties

In Oct. 1621 he started from Isfahan, and visiting Persepolis and Shiraz, made his way to the coast; but it was not till Jan 1623, that he found passage for Surat on the English ship "Whale" In India he remained till Nov. 1624, his headquarters being Surat and Goa. He was at Muscat in Jan. 1625, and at Basra in March In May he started by the desert route for Aleppo, and took ship at Alexandretta on a French vessel Touching at Cyprus he reached Rome on March 28, 1626 and was received with much

honour by Pope Urban VIII., who appointed him a gentleman of his bedchamber. He died at Rome on April 21, 1652.

In Pietro della Valle's lifetime there were printed—(1) a *Funeral Oration on his Wife Maani*, whose remains he brought with him to Rome and buried there (1627); (2) an *Account of Shah Abbas*, printed at Venice in 1628, but not published, (3) the first part of the letter describing his *Travels* (Turkey, 1650). The *Travels* in Persia (2 parts) were published by his sons in 1658, and the third part (India) in 1663 An English translation appeared in 1665 (fol.). Of the Italian text the edition of Brighton, 1843 (2 vols 8vo.), is more esteemed than the other reprints. It contains a sketch of the prolix, with a tendency to the rhetorical; but he is exact, and very instructive, so that his work still possesses high value.

VALLE-INCLÁN, RAMON DEL (1869–), Spanish novelist and poet, was born at Puebla de Caramiñal (Pontevedra) A subtle artificer in his verse—*Aromas de legenda* (1907), *Cuento de Abril* (1910), *Cara de plata* (1923)—he writes a refined and delicate prose in the *Memorias del marqués de Bradomín* (*Sonatas de primavera, de estio, de otoño* and *de invierno* [1902–1907]), while his *Guerra Carlista* is an impressive historical work.

VALLEJO, a city of Solano county, California, U S.A., on San Pablo bay at the mouth of the Napa river, 25 m. N E. of San Francisco. It is served by the Southern Pacific and electric railways, by steamboats to points on San Francisco bay, and for freight by ocean-going vessels. Pop. (1920) 21,107 (83% native white); (1928 local estimate) 28,000. The city has a large trade in agricultural products. There are flour mills and other industries, with an aggregate output valued at $22,000,000 annually. The harbour can accommodate the largest ocean-going ships. Opposite the city is Mare island, headquarters of the Pacific Squadron of the United States navy, with a navy yard (established 1854), two stone drydocks and a lighthouse, a total enlisted personnel of about 3,000, and employing 4,000 workmen. Vallejo was settled about 1849. It was named after Gen. Mariano Guadalupe Vallejo, a prominent Mexican leader. Through his efforts it became the State capital for a brief period, the legislature meeting here in 1851, 1852 and 1853. In the struggle for the terminus of the Central Pacific railway (1869–72) it was a formidable, though unsuccessful, rival of Oakland. In 1900 the population was 7,965; in 1920, 11,340; and in the next decade it increased 86%.

VALLÈS, JULES (1832–1885), French journalist, and author, was born at Puys, France, on June 10, 1832. Coming to Paris, he joined the staff of the *Figaro,* and became a constant contributor to the other leading journals. He was in Paris during the siege of 1870, and after the capitulation was a member of the Commune and founded *Le Cri du Peuple*. He took a conspicuous part in the fighting in the Paris streets, but finally made his escape to London, whence he contributed anonymously to the French press. In 1878 he began in the *Siècle* the serial publication of his principal work, *Jacques Vingtras,* a long autobiographical romance. He died in Paris on Feb. 14, 1885.

VALLETTA or VALETTA, the capital of Malta (since 1570). Pop. (1921) 48,240. The nucleus of the city is built on a ridge of rock (Mount Sceberras) which runs like a tongue into the middle of a bay, which it thus divides into two harbours, the Grand Harbour to the east and the Marsamuschetto to the west, which are subdivided again by three other peninsulas into creeks. On two of these peninsulas on the east side of the Grand Harbour, and at their base, are built the aggregate of towns called the Three Cities—Vittoriosa, Conspicua and Senglea. (*See* MALTA.) On the main promontory, with Valletta, stands the suburb Floriana; Fort St Elmo, with a lighthouse, stands on the extremity of the promontory; the suburb Sliema lies on the point which encloses the Marsamuschetto harbour; Fort Ricasoli is on the opposite point enclosing the east, Grand, or Great Harbour. The streets of Valletta, paved with stone, run along and across the ridge, and end on each side towards the water in steep flights of steps. There are several fine public buildings, as the governor's palace, the new opera-house, the public library and museum of Maltese antiquities, and the *auberges* or lodges of the Knights of Malta (especially the Auberge de Castile) which are now used for military offices, club-rooms, and other purposes. Roman Catholic churches in Valletta are very numerous; the cathedral of S. Giovanni, dating from 1576, is famous for its rich inlaid marbles, its Brussels tapestries, its roof painted by Matteo Preti (1661–1699), the picture by Michael Angelo da Caravaggio of the beheading of John the Baptist, numerous memorials of the knights and other relics.

The governor's palace was formerly that of the grand master of the Maltese Order, and it also contains relics of the knights, tapestries, armour, etc. The British government built here a naval hospital, military prison and other necessary institutions. Since the British occupation Valletta has been a naval and military station of the first importance. The dock and victualling yards are spread over the shores on both sides of those arms of the great harbour known as "Dockyard" and "French" creeks, the dockyard being partly on the former, but principally on the latter creek. The large transit trade and the local trade of the island centre in Valletta. The influx of winter visitors adds to the wealth of the city.

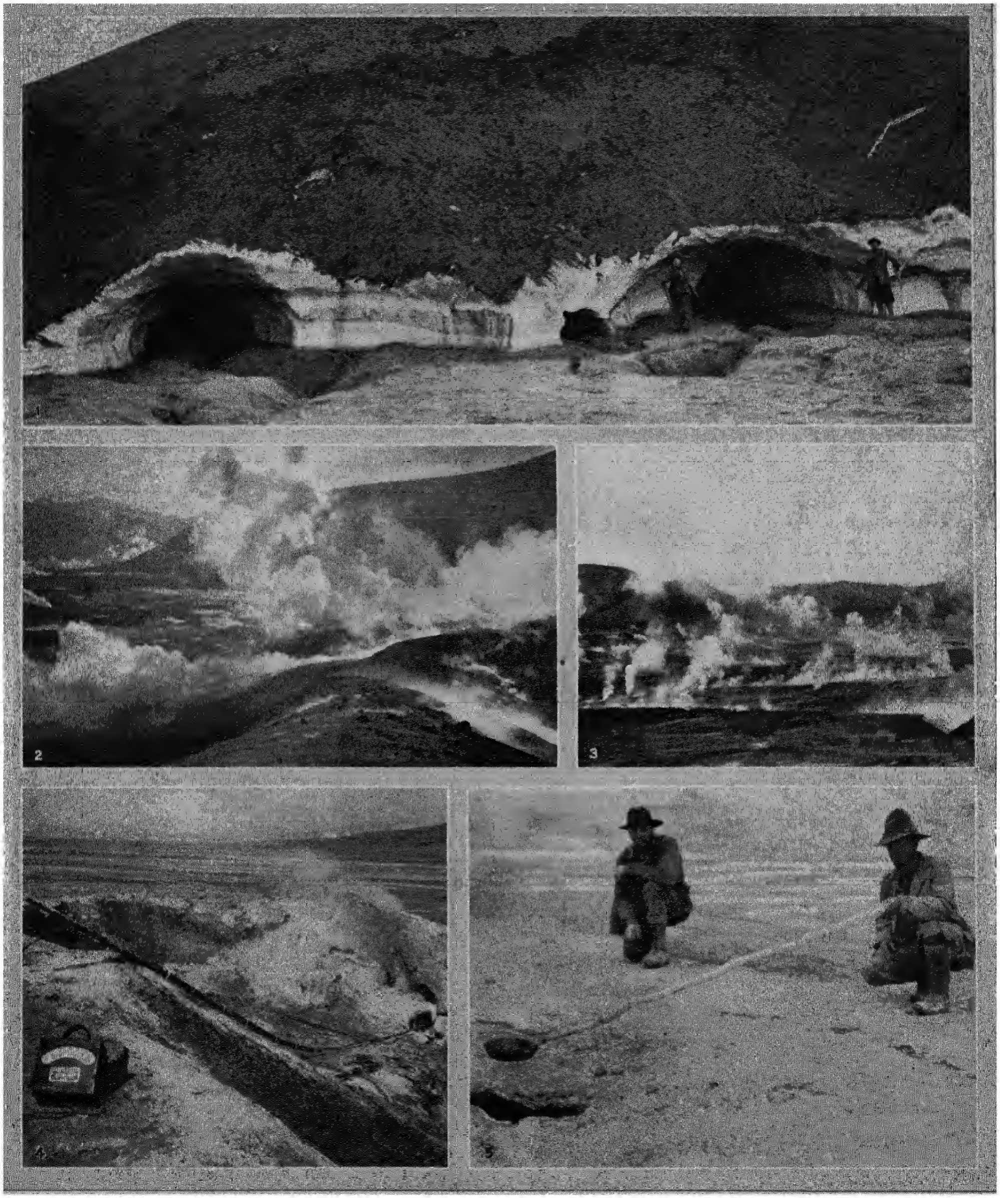
VALLEY CITY, a city of North Dakota, U S.A., on Federal highway 10. Pop. 4,695 in 1925 (State census). It is the seat of a State teachers' college (established 1890). The city was incorporated in 1881.

VALLEYFIELD, town and port of entry, Beauharnais county, Quebec, Canada, 25 m. S.W. of Montreal, at the foot of Lake St. Francis—an expansion of the river St. Lawrence—and at the head of the Beauharnais canal. Pop (1921) 9,215. It is the see of a Roman Catholic bishop, and contains a college.

VALLEY FORGE, a valley about 20 m north-west of Philadelphia, Pa., U S A., where the Revolutionary Army of about 10,000 men under George Washington spent the winter of 1777–78 Their sufferings there from cold, starvation and sickness made the place one of hallowed historic associations for Americans. The army received little food or clothing, and erected its own crude huts. On Dec. 23, 1777, Washington wrote: "We have this day no less than 2,873 men in camp unfit for duty because they are barefooted and otherwise naked. . . . Numbers are still obliged to sit all night by fires" There were many desertions and occasional symptoms of mutiny, but for the most part the soldiers bore their sufferings with heroic fortitude In Feb. 1778, Baron Steuben reached camp and began the drilling and reorganization of the army which resulted in a marked improvement in its efficiency. Parts of the grounds, including Washington's headquarters, are preserved in Valley Forge Park of 475 acres. The state has also erected a fine equestrian statue of General Anthony Wayne, and a number of granite markers which indicate the situation of the camps of the different brigades.

VALLEY OF TEN THOUSAND SMOKES, a volcanic region in Alaska, which came into being at the time of the eruption of Mt. Katmai on the Alaskan peninsula on June 6, 1912. An ancient trail led through the valley, so that it was well-known to have been rich in plant and animal life, a favourite hunting-ground of the natives. One of the first events in the Katmai eruption was the bursting forth of a new volcano, Nova Rupta, in the floor of one arm of the valley. Probably from this vent, and other smaller ones, issued the great flow of incandescent sand which filled the floor of the valley, 17m. in length and 4m. in width, utterly consuming everything in its path until it reached the lower end of the valley, where the trees were merely turned to charcoal. At the time of its discovery not ten thousand but millions of jets of steam were issuing from the floor of the valley from vents ranging in size from a tiny crack to pits or craters 150ft. in diameter. In temperature they ranged up to 1,200° F., hot enough to melt zinc and to set ablaze a stick held in the steam. Immediately following the hot sand flow Mt. Katmai exploded. Its three-peaked snow-covered crown was blown to atoms, leaving a crater 3m. wide, containing a lake 3,700ft below the crater rim. Five cu.m. of ash were thrown out, covering Kodiak island, 100m. away, with a blanket a foot deep. Acid rains fell in Cordova, 360m. distant, while the fumes tarnished brass in Victoria, B.C., 1,500m. away. The haze was noted in Virginia and at the Bureau of Standards in Washington, D.C. The dust from Katmai thrown into the higher layers of atmosphere robbed the North Temperate Zone of 10% of the sun's heat in the summer of 1912. Because Katmai

VALLEY OF TEN THOUSAND SMOKES



VARIED SCENERY IN VALLEY OF TEN THOUSAND SMOKES

1. Ash covered snowdrift near intense heat of fumaroles (crevice in volcanic cone) making an ideal temporary refrigerator
2. Looking across a corner of the Valley of Ten Thousand Smokes from the rim of Novarupta
3. Lines of fumaroles across the valley, illustrating that the smokes spring largely from fissures traversing the floor
4. Apparatus for measuring temperature of a fumarole. This one was found to be 572°F.
5. Frying bacon over a fumarole. Clear steam rushes forth with sufficient pressure to lift frying pan into the air

is located in a region almost uninhabited, not a human being lost his life, though this eruption was one of the largest ever known.

The Valley of Ten Thousand Smokes and its neighbouring wonders were discovered by Robert F. Griggs, director of the National Geographic Society's expeditions of 1915–16–17–18–19. This region proved to be so stupendous a volcanic laboratory as well as so rich in scenic value that in Sept. 1918 President Wilson set aside the whole district, comprising more than a million acres as the Katmai National Monument. (L. T. G.)

VALLOMBROSA, a summer resort of Tuscany, Italy, in the province of Florence, reached by road (9 m.) from the station of S. Ellero (which is 16 m. S.E. of Florence) and 328 ft. above sea-level, on the north-west slope of the Prato Magno chain. The former monastery was suppressed in 1866. A number of hotels have been built. Similar summer resorts are situated among the woods above the Casentino or upper valley of the Arno to the east, such as Camaldoli, Badia di Prataglia, etc. Camaldoli was the original headquarters of the Camaldulensian order, now partly occupied by an hotel. Five hours' journey to the south of the last on foot and 7½ m. to the east of Bibbiena by road is the monastery of La Verna, 3,660 ft. above sea-level, founded by St. Francis in 1215 on an isolated limestone peak. Here he received the stigmata in 1224. The small Church of the Angels, erected by him, and the Chiesa Maggiore (begun in 1348) contain some fine terra-cotta reliefs by the della Robbia family.

VALLOMBROSIANS, an order of monks under the Benedictine rule, founded by St. John Gualbert, who, about 1030, withdrew to Vallombrosa, a shady dale on the side of a mountain in the Apennines, 10 m. from Florence, and for some years led a completely solitary life. Disciples, however, gathered around him, and he formed them into an order in which the cenobitical and the eremitical lives should be combined. The Benedictine rule was the basis of the life, but every element of Benedictine life was eliminated that could interrupt the attention of the mind to God—even manual labour. The Vallombrosians spread in Italy and France, but they never had more than sixty houses.

See the *Catholic Encyclopaedia,* art. "Vallombrosians"; and Max Heimbucher, *Orden u. Kongregationen* (1907), I. § 44.

VALMY, a small village on the main road between Verdun and Paris, just west of Ste Menehould, famous for the French victory of Sept. 20, 1792. Eastward of Valmy lies, roughly north and south, the long barrier of the forest of Argonne. Dumouriez, with the belated assistance of Kellermann, was attempting to hold this in September against the advance of the duke of Brunswick's German troops. Heavy and continuous rains had made the chalky and clayey soil a greater obstacle even than the thick undergrowth and wild country, but the French revolutionary troops were unable to hold the forest. In their previous conflicts with Austrian or Prussian troops they had met continuous, immediate and shameful defeat; and their morale was going from bad to worse. The duke's forces broke through easily, not by the main road it is true, but to the north by a pass known as the Cross in the Woods. In great haste, on the 19th, Dumouriez was able to withdraw under the cover of darkness the forces guarding the northern portions of the Argonne, which would otherwise have been cut off, and to complete his junction with Kellermann. By the morning of Sept. 20 his army was on the flank of Brunswick's advance and was facing towards Paris, with its back to the Argonne. It consisted chiefly of troops of the *ancien régime,* disorganized by the defection of their officers, and young and wholly untrained volunteers.

Dysentery, the long detour necessitated by his holding a northern pass, and the general badness of the Prussian communications forced Brunswick to attempt immediately to clear Dumouriez's force off his flank and make safe his sources of supplies. As soon as the heavy mist lifted on the morning of Sept. 20, therefore, he commenced an attack on the French by heavy artillery preparation. The French line was drawn up on a slight elevation, of which the most prominent feature was the famous mill of Valmy. Between them and the Prussians was a shallow depression of about a half to three-quarters of a mile in breadth; the Prussians were drawn up on the opposite undulation. The French artillery, which was less heavy in metal than the German, was the sole important arm which had not been disorganized, and was able to reply effectively to the Prussian cannonade. Early in the afternoon, however, the Prussian guns did tremendous damage by a lucky shot which struck the French ammunition reserves near the mill, blowing them up with a tremendous report and great damage. A German mercenary brigade in the French service broke, and the effect on the whole sorely-tried French line was such that Brunswick decided that the right moment had come for a general attack, and gave the signal.

The Prussians advanced *en échelon* under a severe fire, but steadily, some two-thirds of the intervening distance. The shaky ranks of the French were rallied by Kellermann, and were more or less prepared to meet the attack, when the Prussians hesitated, and, still apparently without disorder, retreated to their original position. Some mystery surrounds this, the central event of the battle: it seems probable that the Prussian advance was impeded by unsuspected thick mud at the foot of the hill, as well as by the accurate French gunnery—the support of their own guns necessarily ceasing as they approached the French lines. The cannonade continued till nightfall. Brunswick, having failed to defeat his enemy, realized that his position was strategically untenable and, after a few days, retreated. (*See* FRENCH REVOLUTIONARY WARS.)

VALOIS, COUNTS AND DUKES OF. The French countship of Valois (*pagus Vadensis*) takes its name from Vez (Latin *Vadum*), its early capital, a town in the department of the Oise. From the 10th to the 12th century it was owned by the counts of Vermandois and of Vexin, but on the death of Eleanor, sister and heiress of Count Raoul V. (d. 1167), it was united to the crown by King Philip Augustus. Soon detached from the royal domain, Valois was the property of Blanche of Castile, widow of Louis VIII., from 1240 to 1252, and of Jean Tristan, a younger son of Louis IX., from 1268 to 1270. In 1285 Philip III. gave the county to his son Charles (d. 1325), whose son and successor, Philip, count of Valois, became king of France as Philip VI. in 1328. Sixteen years later Valois was granted to Philip's son, Philip, duke of Orleans; then passing with the duchy of Orleans in 1392 to Louis (d. 1407), a son of Charles V., it was erected into a duchy in 1406, and remained the property of the dukes of Orleans until Duke Louis became king of France as Louis XII. in 1498, when it was united with the royal domain. After this the duchy of Valois was held by Jeanne, countess of Taillebourg (d. 1520), from 1516 to 1517, and by Marie, countess of Vendôme, from 1530 until her death in 1546; it was given to Catherine de' Medici, the widow of Henry II., in 1562, and in 1582 to her daughter, Margaret of Valois, the wife of Henry of Navarre. In 1630 Louis XIII. granted Valois to his brother Gaston, duke of Orleans, and the duchy formed part of the lands and titles of the dukes of Orleans until the Revolution.

The house of Valois, a branch of the great Capetian family, is thus descended from Charles, a son of Philip III., and has been divided into several lines, three of which have reigned in France. These are: (1) the direct line (reigned 1328–1498) beginning with Philip VI.; (2) the Orleans branch (reigned 1498–1515), descended from Louis, duke of Orleans, a son of Charles V.; (3) the Angoulême branch (reigned 1515–1589) descendants of John, another son of the same duke.

VALOIS, CHARLES DE (1671–1747), son of Adrien de Valois, was a distinguished numismatist, and formed a fine collection of medals, chiefly Roman. He became a pupil (1705), and associate (1714), and finally a *pensionnaire* (1722) of the Académie des Inscriptions et Belles Lettres. He published *Histoire des Amphictyons,* and collected a number of critical observations, anecdotes, and Latin poems of his father in *Velesiana* (1694). His *Éloge* by Fréret is in the *Mémoires de l'Académie des Inscriptions,* vol. xxi. p. 234 (1747).

VALOIS, anciently a district of Picardy, part of the government of the Ile de France, bounded on the north by Soissonnais, on the east by Champagne, on the south by the Ile de France proper, and on the west by Beauvaisis. It included the towns of Crépy (capital), Morienval, Pierrefonds, Compiègne, Verberie, Pont-Sainte-Maxence, Senlis, Chantilly, Villers-Cotterets. Under

the Roman domination it belonged to the Suessiones but it is now a small area in the departments of the Oise and the Aisne

At first governed by its own independent counts, Valois, in 1214, was joined to the kingdom of France by Philip Augustus. It has given its name to three lines of the second branch of the Capetian kings (*See* VALOIS, COUNTS AND DUKES OF.)

For history see A Poilleux, *Le Duché de Valois, pendant le XVe et XVIe siècle* (1843)

VALONA (Albanian, *Vliona*), a seaport of Albania Pop. (1924) about 10,000, of whom 65% are Muslims, 30% Orthodox, and 5% Roman Catholics Valona occupies an eminence near the gulf of Valona and is almost surrounded by mountains The port is the best on the Albanian coast, with good anchorage and shelter, being protected by the island of Saseno (the ancient *Saso*) It is a port of call for steamers, and the cable and telegraph line to Otranto, in Italy, has an important station here The town is about 1½ m from the sea, and has a pleasant appearance with its minarets and its palace, surrounded by gardens and olive groves, but there are malarial marshes along the coast.

Valonia, a material largely used by tanners, is the pericarp of an acorn obtained in the neighbouring oak woods, and derives its name from Valona The surrounding district is mainly agricultural and pastoral, producing oats, maize, cotton a little rice, olives, cattle sheep, hides, skins and butter, all of which are exported, together with bitumen from the mine at Selenitsa At Smoktina there are steam saw mills, while in the town itself there are motor repairing works, and an oil refinery

Valona played an important part in the wars between the Normans and the Byzantines during the 11th and 12th centuries In 1464 it was taken by the Turks captured by the Venetians in 1690 but restored to Turkey in 1691 In 1851 it suffered severely from an earthquake During the Balkan Wars (1912–13) Valona was bombarded by the Greek fleet in 1912 and in the same year Ismail Bey and 83 Albanian notables met at Valona, and hoisting the old flag of Skanderbeg (*q v*), proclaimed the independence of Albania In the following year the International Commission of Control sat at Valona and appointed Prince William of Wied king of Albania After his flight, a few months later, Valona was seized by the insurgents At the outbreak of the World War in 1914 the Italians seized Saseno, which had been ceded to Albania, and occupied the town itself, which they held until 1920

VALPARAISO, formerly a province of Chile, now a *departamento* in the province of Aconcagua, on the Pacific coast The valleys, when irrigated are fertile That of the Aconcagua, to the north is sometimes called the "garden of Chile" The largest city is Valparaiso, and the principal other town is Quillota

VALPARAISO, a city and seaport of Chile, capital of the province of Aconcagua, on a broad open bay of the Pacific in lat 33° 0′ 2″ S, long 71° 41′ 15″ W, about 70m N W of Santiago Pop. (1902), 142,282, (1920 census) 182 422 The almost semicircular Bay of Valparaiso is slightly over 3m across from Punta Angeles to Punta Gruesa, and the city stands on the south side, on the slopes of a spur of barren hills projecting into the Pacific and forming a rocky peninsula terminating in Punta Angeles This point affords good shelter from southerly and westerly storms, but the bay is open to those from the north The extreme points of the bay are strongly fortified The city occupies a narrow strip of beach around the head of the bay, and extends up the steep slopes and valleys of the enclosing hills, which have an altitude of 1,000 to 1,400ft The city's civic improvements are striking and beautiful The Chilean naval academy buildings and fine residences are located on heights overlooking the bay. Improved roads connect the upper and lower city There are numerous inclined passenger elevators The suburban resort, Viña del Mar, is noted for its buildings, amusements, and society.

Valparaiso is pre-eminently commercial Its trade, which is the largest and most important on the Pacific coast of South America, makes it a terminal and port of call for several regular lines of steamers, affording frequent communication with Europe and the United States. The transcontinental railway line between Valparaiso and Buenos Aires (the Andean tunnel was opened in April 1910) adds to the traffic of the port, through the transhipment of passengers and freight to escape the long and dangerous voyage by way of the Straits of Magellan. A railway of 117m. to Santiago, electrified in 1924–25, relieves port congestion Harbour improvements. begun in 1912, represent an outlay of several million pounds The great depth of the water retards progress, but two breakwaters, in process of construction, from opposite shores of the bay, have attained sufficient length to protect shipping Eventually 220 ac of water space will offer protection In 1923 vessels began to dock at modern piers; a mile of semi-circular stone sea-wall, scores of new warehouses and modern cargo-handling machinery serve annual imports of 700,000 and exports of 400 000 tons

Two cable lines give telegraphic communication with Europe and the United States—a west coast line running to Panama, and a land line across the Andes to Buenos Aires in connection with the cable to Europe from that port There are a wireless telegraph station in regular communication with the islands of Juan Fernandez, State telegraph lines communicating with all parts of the republic, and an efficient telephone service From Valparaiso good highways are gradually extending inland and to the capital.

Valparaiso was founded in 1536 by Juan de Saavedra, who named it after his birthplace near Cuenca, Spain The port and town were of but little note during the colonial period, for free commercial intercourse with the colony was forbidden In 1819, near the end of the war with Spain, its population barely reached 5,000 In 1578 it was captured by Sir Francis Drake, and in 1596 by Sir John Hawkins In 1600 it was sacked by the Dutch under Van Noort On March 31, 1866, it was bombarded by a Spanish fleet under the command of Admiral Nuñez, when a large part of the town was laid in ruins, and on Aug 28, 1891, after the victory of the congressional troops over Balmaceda's forces in the vicinity, it was partially sacked by the Chileans themselves Valparaiso suffered much from the earthquakes of 1731, 1822, 1839, 1873 and 1908 That of 1908 caused the destruction of a large part of the city. Its modernization may be said to date from the earthquakes of 1906–07 From ashes and débris streets were widened and paved, better business structures arose and modern sewerage was provided

VALPARAISO, a city of Indiana, U S A, 40 m S E of Chicago It is served by the Grand Trunk, the Nickel Plate and the Pennsylvania railways. Pop (1920) 6,518 (91% native white), estimated locally at nearly 12 000 in 1928 It is the seat of Valparaiso university, established in 1873 as a revival of a Methodist college (1859–69), and since 1925 under Lutheran auspices It was settled about 1835 and chartered as a city in 1865

VALS (Vals-les-Bains), a town of south-western France Pop (1926) 2,867 Vals is situated on the Volane amongst volcanic mountains It is celebrated for its numerous cold mineral springs impregnated in most cases with sodium bicarbonate They are used chiefly for drinking but also as baths, and are efficacious in maladies of the digestion, liver and kidneys, and for gravel and gout Great quantities of bottles are exported

VALTELLINA (Ger *Veltlin*; the name comes from the former capital, Teglio, near Tresenda), properly the name of the upper valley of Adda, in north Italy Historically and officially, it also comprises the Italian Liro or San Giacomo valley.

Pop (1921) 131,184 To-day the whole valley belongs to the kingdom of Italy, except the side valley of Poschiavo (Puschlav), which belongs to the Swiss canton of the Grisons (Graubunden). The chief town is Sondrio (7,172), other important places being Tirano (5,870), Chiavenna (4,592) and Morbegno (3,603). Near Bormio there are some frequented mineral springs (sulphur and lime), known in Pliny's time, and efficacious in diseases of the skin. There are several other baths in the side valleys, such as Santa Caterina (chalybeate), Masino and Le Prese (sulphur).

The highest points in the ranges enclosing the valley are the Piz Zupo (13,131 ft.) in the Bernina group and the Grau Zebru (Konigsspitze) (12,655 ft.) in the Ortler district; the Monte della Disgrazia (12,067 ft) is the highest peak comprised entirely within the water-basin of the valley. Four well-marked Alpine passes are traversed by good roads—the Stelvio pass (9,055 ft., the highest carriage-road in Europe) from Bormio to Spondigna

in the Adige valley; the Bernina pass (7,645 ft.) from Tirano to Samaden in the Upper Engadine; and the Aprica pass (3,875 ft) from Tirano to the Val Camonica and the Lake of Iseo; while from near the top of the Stelvio a fourth road leads over the Umbrail pass (8,242 ft, the highest in Switzerland) to the Swiss valley of Münster, which is reached at the village of Santa Maria The main valley is traversed from end to end by a magnificent carriage-road constructed by the Austrian Government in 1820–25 A railway runs from Colico, on the Lake of Como, past Sondrio to Tirano, a distance of 42 m, while there is another from Colico to Chiavenna (16½ m).

The population is wholly Italian-speaking and Roman Catholic, the valley being in the diocese of Como The shrine of the Madonna of Tirano (founded 1520) attracts large numbers of pilgrims. The valley, particularly in its lower portion, is extremely fertile; and of late years vigorous measures have been taken to prevent the damage caused by the frequent inundations of the Adda. Chestnuts, vines, mulberry trees and fig trees abound; and there are many picturesquely situated churches, castles and villages The chief articles exported are wine and honey. Large quantities of honey are annually sent abroad The Valtellina has now become important for its hydroelectric plants

History.—After the defeat of the Lombards (774) the Valtellina was given (775) by Charlemagne to the abbey of St Denis near Paris, which never seems to have exercised its rights In 824 Lothair I, confirming an earlier donation (803) made by Charlemagne, gave the churches of Poschiavo and Bormio to the bishop of Como Bormio was in 1205 won by the men of Como, who in 1006 had received one-half of Valtellina from the emperor, and by 1214 they were masters of the entire valley They retained Bormio till 1300, when it freed itself, but in 1336 it belonged to the bishop of Chur In 1335 the Visconti of Milan became lords of Como, and therefore of Valtellina As early as 1360 the men of Rhaetia made incursions into Valtellina on the pretext that it had formed part of ancient Rhaetia This idea was confirmed in 1404, when, in return for kind treatment received during his exile, Mastino Visconti (son of Barnabò) gave to the bishop of Chur his share of the Milanese, including Poschiavo, Bormio and Valtellina Relying on this donation, the men of the Three Leagues of Rhaetia (best known by the name of Graubunden) invaded the valley in 1486–87, Poschiavo becoming in 1486 permanently a member (not a subject land) of the *Gotteshausbund* In 1512 Chiavenna, Bormio and Valtellina were also seized and harshly ruled Mastino Visconti's donation was solemnly confirmed in 1516 by the emperor Maximilian I In 1530 the bishop of Chur was forced to sell to the Three Leagues his title to these two districts At the time of the Reformation Poschiavo became Protestant. The other two districts clung to the old faith and came under the influence of Carlo Borromeo Valtellina was extremely important to the Habsburgs as affording the direct route between their possessions of the Milanese and Tirol Hence a great struggle took place between Austria and Spain on one side and France and Venice on the other The religious conflicts in Graubünden led to reprisals in the "subject land" of Valtellina In 1620 (July 19–Aug 4) the Spanish and Catholic faction (headed by the Planta family) massacred from 350 to 600 Protestants in the valley, according to different accounts (*Veltliner Mord* or *Sacro Macello*). For the next 20 years the valley was the scene of great strife, being held by the Spaniards (1621–23, 1629–31, 1637–39), by the French (1624–27, 1635–37) and by the pope (1623, 1627) At length George Jenatsch, a former pastor, who had been the active and unscrupulous leader of the Protestant party, became a Catholic (1635) in order to free the land from the French by aid of the Spaniards (1637), who finally (1639) gave it back to its old masters on condition that the Protestants were excluded from the valley In this way the local struggles of Valtellina came to be mixed up with the Thirty Years' War In 1797 Bormio and Valtellina were annexed to the Cisalpine republic, in 1805 to the Napoleonic kingdom of Italy and in 1815 (despite the remonstrances of the Rhetian leagues) to the kingdom of Lombardo-Venetia, held by the emperor of Austria In 1859 they became, like the rest of Lombardy, part of the kingdom of united Italy Poschiavo followed the fortunes of the "Gotteshausbund" It became (after 1798) part of the canton Rhetia of the Helvetic republic, and in 1803 of the canton of the Graubunden or Grisons, which was then first received a full member of the Swiss Confederation (*See* SWITZERLAND)

VALUATION AND VALUERS. A valuation or appraisement, under English law, need not be stamped where it is made (1) for, and for the information of, one party only, and is not obligatory as between parties, (2) in pursuance of the order of a court of admiralty or on appeal therefrom, (3) of property of a deceased person for the information of an executor, or other person required to deliver an affidavit of the estate of such deceased person, or (4) of any property for the purpose of ascertaining the legacy or succession or account duty payable in respect thereof Any other valuation or appraisement must be stamped Who makes an appraisement or valuation chargeable with stamp duty must, within 14 days after, write it out in words and figures showing the full amount upon duly stamped material If he omits to do so, or in any other manner discloses the amount, he becomes liable to a fine Any person who receives from an appraiser, or who pays for the making of, any such appraisement or valuation not so written out and stamped, becomes liable to a fine

Where a contract has been made for the sale of property at a valuation, a valuation made in accordance with its terms will be conclusive as between the parties, in the absence of fraud, collusion or mistake Where there has been an agreement to sell goods on the terms that the price is to be fixed by the valuation of a third party and such third party cannot or does not make such valuation, the agreement is avoided, but if the goods or any part thereof have been delivered to and appropriated by the buyer he must pay a reasonable price therefor Where the third party is prevented from making the valuation by the fault of the seller or buyer, the party not in fault may maintain an action for damages against the party in fault Where the fixing of a value by valuers is not of the essence of an agreement, but is wholly subsidiary to it, the courts will, if justice require it, ascertain the value in order to carry the agreement into effect Where an agreement had been entered into for the sale of a house at a fixed price and of the fixtures and furniture therein at a valuation by a person named by both parties, and he undertook the valuation but was refused permission by the vendor to enter the premises for that purpose, the vendor was ordered to allow the entry so that the valuation might proceed

A person who exercises the calling of an appraiser or who, for or in expectation of any fee or reward, makes any valuation or appraisement chargeable with stamp duty, must (unless he is licensed as an auctioneer or house agent) have an appraiser's licence, upon which a duty is charged and which continues in force from the day of its date until the following 5th of July By default in this respect a liability to a penalty is incurred Moreover, an unlicensed appraiser cannot recover remuneration A valuer is liable to the person who has employed him for the consequences of negligence or want of due care and skill on his part If his services are thereby rendered worthless he will not be able to recover anything by way of remuneration (*See* AUCTION, ESTATE AGENTS) (X)

United States.—The American law conforms substantially to the English as stated above, save that there are no American stamp duties in reference to valuation There are, however, at least three additional fields in which valuation has assumed considerable importance in the United States One is a matter of private law, the other two, of constitutional law The first is the common legislative attempt to control stock-watering by providing that corporate stock shall be issued only in return for full par value in money or property, and giving creditors various civil remedies against directors or against those who receive stock without making adequate return This raises immediately the question of valuation of property exchanged for stock. In substantial effect these statutes have proved inadequate to their purposes They leave no legitimate machinery for promoters to procure the profits which the courts themselves view as proper and necessary, hence there is persistent pressure to devise means of evasion. And

the courts show a distinct tendency to support valuations of the property arrived at "in good faith," which in practice regularly means some substantial addition to provable tangible assets, by way of the anticipated profits from their use And transfer of the stock to a bona fide purchaser is held to wipe out the creditors' claims against the stock Furthermore, the introduction of no-par stock makes possible in many States to-day the complete disregard of the older regulations The second field is valuation for purposes of taxation Here the common practice is for the assessors to undervalue realty, so that tax valuation of realty is not admissible as evidence of value in a suit for any other purpose. And such undervaluation becomes a constitutional right of the tax-payer, in so far as he is entitled not to have his holdings valued at their true worth, if other holdings of like character are undervalued by the assessors A more difficult problem is met in the apportionment of the intangible going value of an interstate enterprise, for taxation by the several States in which the enterprise is operated In the field of communication and transportation agencies, which have been chiefly concerned, the courts have in general worked out the permissible divisions by taking the total tax base of the enterprise (*e g*, gross income or value of outstanding securities, etc) and permitting any one State to reach its due proportion as calculated by the ratio of tangible assets (*e g*, miles of track) or traffic (ton-miles, car-miles, etc.) inside the State to total tangible assets or total traffic. The more recent cases show a definite trend toward nicer approximation to measurement of business actually done in the taxing State. In the case of interstate business enterprises, the combined effects of the interstate commerce clause and of interlocking corporate structure produce a technical chaos incapable of brief exposition The third field is valuation for purposes of determining the rates chargeable by public utilities. On the one hand, such utilities as gas, railroad, water and telephone companies are subject to rate regulation by the government to prevent excessive charges On the other they are private property, in the sense that rates may not be put so low as to be confiscatory. "A fair return on fair value" is the legal formula applied It is clear, however, that value itself, in the market, depends wholly on the return from the assets, so that reference to market value to determine the "fair value" on which a fair return is to be allowed involves reasoning in a circle This the courts have never expressly recognized, but in their actual decisions they have introduced other more stable factors by requiring any rate-regulating commission to "consider" certain phases of cost in determining the fair value. The emphasis has been strong on the reproduction cost of plant and equipment. Originally, this seems to have been influenced by a desire to avoid the padded original costs of early corporate exploitation, more recently, it is a reflection of rising costs of reproduction. The valuers, in the first instance, are of course the railroad or public utility commissions of the States It is clear that market value is by no means always the measure of value which is sought in legal valuation. (K. N. L.)

VALUE. In economics, use is made of three closely related conceptions of value. *exchange value, subjective value* and *imputed price*.

Exchange Value, or value in exchange This denotes the relative importance which the community, as a whole, manifesting its preferences through the process of the market, attaches to a particular good (commodity or service) in comparison with other goods. It is often defined in the older treatises on political economy as "power in exchange." The exchange value of a particular "good" is measured or expressed by the quantity of other goods for which a unit of that good can be exchanged, or, preferably, as a ratio of exchange. Any one good, of course, really has many different specific exchange values, corresponding to the various ratios at which it can be exchanged for different commodities and services. The notion of the general exchange value of a good rests upon an inclusive view of all of its different specific exchange values. The money price of a good is conceived of as one of its specific exchange values or, in other connections, as its general exchange value expressed in terms of money, which thus serves as a "common denominator of values." Because the direct barter of goods for goods is uncommon, the exchange values of different goods have to be inferred from their money prices. Indeed, the conception of exchange value is derived from the conception of price by making abstraction of the use of money as an instrument of purchase and sale This abstraction has been found useful in economics because, first, some aspects of important economic problems are seen more clearly when values are looked upon as though they were determined by the direct comparison of goods with goods without the intervention of money, and second, because it is often desirable to eliminate the effects which changes in the value of money have upon the money prices of different goods. With the development of statistical technique, however, it has been found possible to take separate account of general changes of prices and of relative changes in the prices which are paid for particular goods. For this and other reasons the conception of exchange value has lost some of the importance which it once had in economics Economic analysis now commonly deals, more directly and realistically, with money prices.

Subjective Value.—This denotes the relative importance which an individual consumer attaches to a particular good, in comparison with other goods. It relates always to specific quantities or specific increments or decrements of goods. Even an indivisible good, an automobile for example, is a compound of various qualities, such as size, power, comfort and appearance, and buyers have a certain range of choice within which these qualities may be had in larger or smaller measure and combined in different proportions So far as a consumer chooses rationally rather than impulsively he apportions his outlays so that he would gain nothing by buying more of one thing and less of another. Thus he brings his monthly or annual outlays for different purposes to or towards a common boundary or margin (his "margin of consumption") where the importance which he attaches to what he gets for the final or marginal pound or dollar which he spends, say for food, is equal to the importance of what he gets for the marginal pound or dollar spent for clothing or other object

Imputed Price.—This is an estimate of the amount of money for which a given article or a given quantum of goods could be sold or bought When we say that the value of a work of art, a house, or a stock of goods is so many pounds or dollars, we are using the word value in the sense of imputed price. The "valuation" or appraisal of goods for purposes of taxation or of formal transfer is an imputation of price A nation's wealth can be expressed in terms of its money value only by imputing prices to the various items of which it is composed Value, in this sense, is not the price would could be got at a forced sale or the price which would have to be paid by buyers in order to induce holders to part with their goods *en bloc* It is, instead, an estimate of the price which could be obtained in due course, with no sudden accelerating of either supply or demand. Statements to the effect that the price of a commodity is above or below its value generally mean only that because of a temporary excess of supply or demand or because buyers or sellers lack knowledge of facts which, if known, would affect their offers, the present price is out of line with the probable future price.

Theories of Value.—That the exchange value of a good is determined by the amount of labour required to produce it was at one time a fairly common belief. Adopted and restated by Adam Smith and his successors, this doctrine was later taken over by Karl Marx and other socialists and put into a form in which labour is held to be the sole source or cause of value In its best form, as set forth by Ricardo, the labour theory of value was to the effect that, allowing for temporary fluctuations of supply and demand, the exchange values of different commodities tend to be *proportional* to the respective quantities of labour required to produce them. The rent of land was held to be without influence on the value of its produce, for the reason that the value had to be high enough to cover the labour costs incurred under the most unfavourable conditions of cultivation, where no rent is or can be paid. Capital was regarded as stored up labour, and interest or necessary profit on capital was disregarded on the arbitrary assumption that its amount would be roughly proportionate to the total amount of labour employed in producing a commodity.

Apart from the circumstance that other costs than labour are not adequately brought into the reckoning, the labour theory of value encounters two difficulties. First, different kinds of work call for different kinds and degrees of ability and training, and differ in respect of attractiveness. Different kinds of labour can be fused into a "quantity" of labour only by grading them or weighting them in accordance with the different values which their respective products command in the market, and this procedure leads to circular reasoning Second, so far as there is, in fact, any systematic relation between quantities of labour and the values of products, it is a result of the circumstance that labour is apportioned to different tasks only in such proportion and degree as its different products are valuable Similar difficulties are encountered in any attempts to find a simple relation between values and "real costs."

Dissatisfied with explanations of values in terms of costs, some economists, taking note of the circumstance that values must necessarily be related to the choices and preferences of consumers, sought to find the determinant of value in marginal utility (*i.e*, the utility or importance to the buyer of the least important or "marginal" part of his current consumption of any commodity) Subjective values are proportionate to marginal utilities and exchange values must be proportionate to subjective values If they were not, the consumer would alter his budget by buying more of one thing and less of another Each consumer thus adjusts his purchases so as to bring his own valuations into line with the values which obtain in the market, but the values which obtain in the market are the resultants of the aggregate demand of consumers for different products This aggregate demand determines what and how much shall be produced and what the values of different uses of labour and of other productive agents shall be Such, in brief outline, is the marginal utility theory of value It illuminates some aspects of the problem, but it is quite as one-sided and incomplete as a cost-of-production theory of value is That consumers' preferences determine what shall be produced and what costs of production shall be incurred is no more true than that the relative costs of producing different things determine how far consumers can follow their preferences

Displacement Costs.—The costs which are most directly and systematically related to values are displacement costs Labour displaces other uses of time, saving displaces present consumption, any one use of labour or capital or natural resources displaces other uses, and in general, the production of one good displaces the production of other goods The production of some goods can be increased with a progressively smaller sacrifice of other possible products. Other goods can be had in larger quantities only by sacrificing progressively larger amounts of alternative products As the amounts of a given good which have to be sacrificed in order that other goods may be acquired change, consumers will alter their budgets, but how far they will go will depend upon the relative importance to them of the uses of the increments of goods which they acquire and of the increments which they sacrifice Out of the play of forces such as these, and especially out of the relation between the preferences of consumers on the one hand and the technical conditions which determine the displacement costs of production on the other hand, there emerges a tendency—never fully effective because of continuous changes in the structure of demand and in the conditions of supply—towards the establishing of a system of exchange values which would bring production and consumption fully into equilibrium.

See also ECONOMICS and PRICE. (A Yo)

VALUE, THEORY OF. Until recently there has been no general theory of value Value has long been a fundamental notion of political economy and various theories of its nature have been developed, but it is only in the last decades that it has been universally recognized as one of the great philosophical topics. Its discovery has been held by some to be "the greatest philosophical achievement of the 19th century," and its development as a special field of psychological and philosophical study has gone so far that a special name has been created for it, namely *Axiology*

The development of such a theory requires the consideration of the following problems: (1) What is the nature of values? (definition); (2) What are the fundamental values and how are they to be classified? (3) How may we determine the relative values of things and what is the ultimate standard of value? (4) Are values merely subjective, satisfying merely subjective desires, or are they objective, in some sense other than objects of desire, and giving some law or norm to desire? (5) What is the relation of values to things or of value to existence and reality?

The History of the Value Notion.—A brief sketch of the history of the idea of value in philosophy will help to make clear the meaning of these problems The Greeks did not have the term value as now understood, but in the light of subsequent developments we may see that they had the notion, and were aware of these problems Plato conceived the good or value as the culmination of the world of ideas and the constructive principle of the world which organizes all its forms or laws Aristotle, in proposing to view all things teleologically, and to make the relation of a thing to its end or value essential to its very being, affirmed, not only the objective reality of value qualities, but also their supremacy over all the other attributes of things Neither Plato nor Aristotle developed this line of reflection fully, nor did succeeding philosophers investigate the subtle and perplexing problems involved in it Plato himself called this the most difficult question of all science Nevertheless, the general principle enunciated by Greek philosophy continued to be the rule throughout the middle ages, and the objectivity of value the key to all their thinking

The modern developments of the subject proceed directly from Kant who here, as elsewhere, represents a crisis in philosophic thought The classical conception of the objectivity of the good or value had been abandoned by modern empirical thought If the so-called "secondary" qualities, such as colour, taste, sound, etc are made dependent upon the percipient subject, all the more must the "tertiary" qualities, such as beauty, goodness, etc be made dependent upon human desire and feeling This extrusion of all values from the objective world seemed to Kant to be the necessary consequence of the assumptions of "science" But he could not accept it as the whole story of values By a well-known line of reasoning which cannot be repeated here, he restored their objectivity in a new form Though not "existent" in the same sense as physical things, their reality must be postulated and acknowledged, if life and action are to be possible They have, in his terms, "validity" and "practical reality" With this an entirely new line of thought was set in motion, raising new problems of fact and value, value and validity, value and existence A large part of modern axiology or general theory of value has developed under the inspiration of Neo-Kantianism But it is to R H Lotze (1817–81) more than any other man perhaps except Nietzsche, that the popularity of the term value is due, and certainly he more than any other is responsible for the prevalence of the idea of value as an ultimate notion in philosophy Albrecht Ritschl (1822–89), Lotze's theological colleague at Gottingen, made the value notion central in the discussions of religion and theology and furnished modernist tendencies in theology with a large part of their inspiration and much of their terminology He agrees with Kant that the objects of religion are objects of faith as distinct from knowledge in the scientific sense, but he develops much further the notion that they are matters of value judgment as distinct from theoretical judgment, although equally capable of certainty and validity It is mainly to Ritschl that is due the current distinction between judgments of value and judgments of fact, and the subordination of judgments of fact to judgments of value From Ritschl s position it was easy to pass to that of W Windelband (1848–1915) who, together with H Rickert and Hugo Munsterberg (1863–1916) developed the Neo-Kantian axiology to which reference has been made

The chief stimulus to the development of the general theory of value as a distinct field of psychological and philosophical study, came, however, from the work of A Meinong (1853–1920) and C. von Ehrenfels (1850–) A fresh analysis of value in the economic sense had been undertaken by the Austrian economists, Boehm Bauwerk and Von Wieser, which resulted, among other things, in raising many problems of psychological and even philosophical importance Under their influence, Meinong and Von

Ehrenfels investigated values other than economic, and first undertook a systematic study of the entire field of value The more philosophical developments of the subject are largely due to Meinong Starting with the psychological concept of the economists he gradually came to the view of values as objective and independent of their being experienced At this point the problems of the two modern movements described tended to coalesce No history of value theory would, however, be complete that did not note the influence of Nietzsche, with his "transvaluation of all values," and the Pragmatic movement in philosophy, for which knowledge is subordinated to practice and truth becomes a form of value

The Nature of Value.—The fundamental problem of a general theory of value is the question of the nature of all determinations of value, in other words of so defining it as to include all the forms of value. The immediate and natural answer to this question is to say that value is a determination or quality of an object which involves *any sort of appreciation or interest* Such appreciation, however, involves feeling and ultimately desires or tendencies underlying the feeling. Therefore value *is* the feeling Value and feeling of value are the same thing. This is the psychological notion of value and the theory of value developed on this basis the *psychological theory of value* For many this seems to tell the whole story The economic theory of value made its first scientific steps by abandoning the notion of value, whether in use or exchange, as an objective quality inherent in the thing, and conceiving it as the function of the relation of the object to satisfaction of desire Following this lead, the general theory of value was in the first place a psychological theory of value Even in economic theory, however, it is realized that this is only part of the story Back of desire and feeling lie certain biological tendencies or instincts presupposed by the desire and its satisfaction So that value becomes, in the words of Orestano, "a biological phenomenon appearing in psychological form." A theory of value that shall be not merely a theory of *price* must relate the *instrumental* values of economics to life. Unless we consider these tendencies merely in their aspect of determinants of price, we must have a quite different notion of value to include them. If this is true of the limited field of economic goods or values, it is all the more true of the *intrinsic* values which a more general theory of value recognizes Psychological theories of value thus tend to become biological theories in the broader sense of the term. Value is defined in terms of survival and enhancement of life, and the biological tendencies are graded according to some standard of value-for-life It is at this point, however, that the specifically philosophical theories of value arise. We wish to explain and ultimately validate these values by carrying them back to life. But in this it is already assumed that life and its continuance have value. If values get their significance from their teleological relation to life and its enhancement, then surely life must get its significance from "absolute" values which it embodies; otherwise life and its relative values lose all genuine meaning From a more ultimate point of view a knowledge of value is presupposed in any concept of a valuable life. As the result of reflections of this type, two main positions have emerged in the general philosophical theory of value. Either value is conceived of as a "logically primitive" concept, and therefore as ultimately indefinable, as are certain other ultimate concepts in philosophy, or else it is conceived of as function of the coherent organization of life or experience as a whole.

It may be said without hesitation that value theory is to-day predominantly philosophical rather than psychological. This does not mean, however, that the psychological study of the processes of valuation is not an important part of the general theory. The psychological question is what goes on in consciousness when we value, and while an answer to this question will neither tell us what value ultimately is, nor afford us a standard of value which will enable us to form a system or scale of values, it nevertheless throws light on many questions. The most important contributions here are, perhaps, the studies of the mutations or transvaluations of values The popular interest aroused by Nietzsche in his *Genealogy of Morals* has found a scientific echo in the study of the phenomena, causes and laws of the mutations of values. A notable feature of modern value theory is the interpretation of history as a value science, or part of a philosophy of values.

Classes and Standards of Value.—It is generally admitted that distinct species of value exist, although there is no complete agreement as to what they are or how they are to be classified. It is clear, however, that there are sciences which deal with values and special sciences have been developed to deal with special classes of value. Thus economic value has long been recognized as a fundamental notion of political economy, which ever since Adam Smith divided it into value in use and value in exchange has been defined thus: the former as the utility of objects for human purposes and the latter the power to induce or compel people to pay other valuables for the use of them That ethics also deals with values is generally agreed, although there is dispute as to just what these values are and how they are related. It is now generally recognized that ethical value is not identical with pleasure or happiness, although pleasure is one of the values Aesthetic values are also generally, although not universally, admitted, many pragmatists holding that, since valuation is always judgmental, and the aesthetic "has no logical function, it must be denied the name of value." From the philosophical standpoint, the most important group of values distinguished is perhaps the logical or theoretical values Several schools of thought hold that logic is the science of cognitive values and that truth is a positive and error a negative value Indeed this view is quite generally implied although it is not always explicitly avowed "Religious values" are quite commonly talked about, although whether they constitute a special group or represent rather a fusion of, or a reaction to, the other values is a matter of dispute It may be argued that they do not constitute a distinct class, because there is no specific biological tendency or instinct to which they correspond, or that they represent merely the reaction on the fate of the other values in the universe But the tendency to recognize the value of the "holy" as a distinct type, as developed by the Neo-Kantians, is very strong, and has recently found expression in a much read book, *The Holy*, by Rudolf Otto. Some writers speak of distinct classes of social and political values, but the general tendency, perhaps, is to view these as sub-forms of the ethical

Despite such differences of opinion, incidental to any developing theory, there is substantial agreement as to the existence of these four outstanding classes of values There is, unfortunately, not the same consensus of opinion regarding their relations, *i e*, the ordering of these values in a system or in a scale of relative value and importance. There are in general three accepted ways of classifying them. There is the psychological which, assuming values to be the functions of interests or desire, divides them according to modes of this interest and tends to become ultimately biological and genetic, the outstanding classes being connected with some fundamental "instinct" or tendency. A more historical mode of classification accepts as units those values, or groups of values, which have acquired an institutional form, such as economic, moral, cognitive, political, aesthetic, religious. A third, which has been called the axiological, accepts in the main the trinity or tetrad of the good, the beautiful and the true, to which it adds the higher unity of God. Such classifications or systems of value all have their uses, but it is generally felt that the first two are not sufficient. A large body of opinion, accepting the "axiological" classification, holds that while the economic values are clearly instrumental and relative to the others, the other groups are intrinsic and absolute, and as such ultimately co-ordinate. Others hold that they may be put in relations of subordination in a comprehensive scale of values. There are, however, some things that may be said with a certain degree of assurance. The ethical, aesthetic and logical values are self-sufficient and co-ordinate in the sense that they are irreducible the one to the other. All attempts at such reduction, whether, for instance, of the aesthetic to the ethical, of the ethical to the logical or the logical to the ethical, have proved unsatisfactory. On the other hand, it seems clear that they are all intimately related. No intrinsic value can stand alone This is equally true whether we consider the question from the standpoint of the realization of values in the individual life or from the more objective point of view of their logical relations.

It is impossible to define any one type of value alone or apart from the others. The ancient view that values are subsumable under the heads of goodness, beauty and truth, "a threefold cord, not lightly broken," is in general strengthened rather than weakened by modern value theory.

The idea that these ultimate values are co-ordinate in the sense described does not, however, as might at first appear, exclude the notion of an ultimate standard of value in the light of which some hierarchical principle or scale of value might be developed, and the classes of values be subordinated to each other. On the general question of the commensurability of value as such, there is a large measure of agreement For the opinion, held by a few, that they are incommensurable, there is indeed something to be said It may be objected that an economic satisfaction and an aesthetic experience are of such different inner qualitative content that it is absurd to compare them with each other The fact remains that we do actually compare them constantly We compare values not only within the same class, as when we choose one economic good rather than another; we also choose between types and classes The standpoint of the incommensurability of values can be admitted only in the sense that the different values cannot be expressed in quantitative units and measured in this sense But there are few that hold this idea at the present day For the merely psychological or biological theories, the standard of value is found in such conceptions as intensity of feeling, the strength of the desire, or ultimately in the importance for life of the biological tendencies presupposed For the more philosophical theories, on the other hand, that recognize the limitations of these notions of value, a different conception of the ultimate standard is also necessary In general such a standard is found in the notion of *inclusiveness,* in some functional conception such as the totality of life or experience, that value being highest which contributes most to the coherent functioning and organization of experience as a whole Such a standard may be formulated in terms that seem to avoid metaphysical implications, but in general it may be said that the highness or lowness of an experience of value is held to be determined by its metaphysical content From this point of view a very common table or scale of values is that which puts the economic values as the lowest and the religious (in the broadest sense) as the highest, the ethical, the logical and the aesthetic being arranged in various ways in between The standard here employed is, in the last analysis, some form of the principle of inclusiveness, the different values being arranged either in accord with the degree of integration of our interests or tendencies, or in accord with the range of the metaphysical content to which they correspond

Logical or Theoretical Values—Validity.—The inclusion of logical or theoretical values in the general theory of value is undoubtedly the main reason for the outstanding place which axiology has in present day thought. Such an inclusion obviously involves a radical revision of our entire notion of values and of the relation of value to fact and truth It is pointed out by the value philosophers that for an ultimate analysis, logic is also a science of values The Pragmatists insist that theoretical values "presuppose purposes, selections, choices," and that "judgments are acts which do not differ in kind from those which are openly practical" The Neo-Kantian axiologists point out that the desire for truth and rationality, the demand for logical consistency or validity, is itself a craving for what *ought to be* and that here too we are moved by an ideal and directed by a norm, as surely as in the realms of ethical and aesthetic values. In either case validity becomes a form of value and logical rules instruments of the will to truth. The development of this notion involves difficult problems which cannot be gone into here Whether the "value" of truth is relative or absolute, whether truth is the ultimate value upon which all the others in some way depend, or merely subordinate and instrumental to the other values; or, finally, in some way co-ordinate with them—all these are debated questions which, as we have seen, in turn affect the problems both of classification and order of values. In any case, the notion of validity as a form of value has brought about in many quarters a radical revision of our notion of the relation of value to fact and truth Against purely intellectualistic or "scientific" views it is contended, not only that every fact is ultimately an evaluation, but also that the logical impulse ought not to have the primacy over the other demands of our nature, and that no philosophical system can be adequate which fails to do justice to all our values. Philosophic system tends to become, from this point of view, a system of values, or at least to presuppose such a system

Value and Reality.—Whatever differences of opinion there may be among the various theories of value, there is substantial agreement that values are not subjective in the sense that they are merely matters of opinion and exist only for the persons who appreciate or feel them Even for the psychological-biological theory, while they are dependent upon interest (desire and feeling), they are independent of judgment and opinion The "objectivity" thus universally accorded values is indeed given different meanings, but in any case it is now generally agreed that values cannot be denied existence or reality in any world that can exist for man They must, it would seem, exist in several senses

Values "exist" (1) in the sense that they are operative and effective in and on human minds and in human action, and find embodiment in the objective institutions of society. They are "real" in the sense that they are valid, that is they claim to be true ideals as opposed to false ideals or fictions They must, however, be real in a still more ultimate sense (metaphysical), in that they are part of the nature of things, and not something merely added to existences For values to be real in either of the first two senses they must be real in the third For both must be so related to real existence that they constitute the key to the nature of the real Otherwise they become false ideals and futile fictions The question of just how values may be said to exist (to be part of the nature of things) is a difficult and debated question that cannot be gone into here It is possible, however, to state a general proposition to which almost all theories of value would subscribe Values are not mere subjective incidents, more or less gratuitously superadded to fact, but are inherent in the structure of reality. Reality in its fullness contains and exhibits values, and they can be extruded from it only by a process of abstraction that is relative to restricted purposes (of special sciences) and which is never quite successful This reinstatement of the objective reality of values (in its essentials the Greek notion) is partly due to developments within value theory itself and partly to a larger movement in philosophy as a whole In any case, it is now widely felt that in the answer to the problems of value is to be found the key to the philosophical interpretation of reality as a whole

Bibliography—The lit. of the subject is extensive and scattered, some of the most important contrib. being found in art and journ. and in general works in philosophy The only works in English expressly devoted to the theory of values are W M Urban *Valuation, Its Nature and Laws* (1909); and R B Perry *General Theory of Value* (1926) Refs to the more extensive liter will be found in an art by W M Urban, written in prep for the Sixth Inter Congress of Philosophy, entitled *Value Theory and Aesthetics*, and pub. in the *Monist* for Oct, 1926 Important works in general philosophy in which the value notion is central are Hugo Munsterberg *Eternal Values* (1909), B Bosanquet *The Principle of Individuality and Value* (1912), and the *Value and Destiny of the Individual* (1913) (rep the idealistic point of view), S Alexander *Space, Time and Deity* (rep the realistic and naturalistic point of view); and W. R. Sorley *Moral Values and the Idea of God* (1919) The Ger. and Fr. lit is even more extensive Only a few of hist. import and of recent pub can be noted Among these are Ch V. Ehrenfels *System der Werttheorie* (1897), A Meinong *Zur Grundlegung der Allgemeinen Werttheorie* (1923); G Simmel *Philosophie des Geldes* (1900), H Rickert, *System der Philosophie*, 1921; W Stern *Wertphilosophie* (1924), C Berguer *La Notion de Valeur* (1908), C Bouglé *L'Évolution des Valeurs* (1922). (W M U)

VALVES (MECHANICAL) are devices for controlling the flow of air, gases, or liquids They vary from the small air-valve in the automobile tyre to huge valves for controlling the flow of large volumes of water in such engineering developments as the locks of the Panama Canal

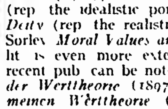


Fig. 1

One of the simplest types is the valve shown in fig 1 This is made in all sizes up to about 10 ft in diameter in water-pipes and is known as the butterfly-valve This valve is similar to the

damper used in stove-pipes. Another simple type is the flap-valve which is used as a check-valve in hand-pump pistons, to allow water to pass through the plunger on the down stroke and to prevent its return on the lift stroke. A similar valve (fig 2) is also used between steam boilers and the pump or other method of supplying the boiler with water When the water pressure is withdrawn, the steam pressure in the boiler forces the valve to its seat and retains the water in the boiler In another form of check valve the stem guides the valve to its seat

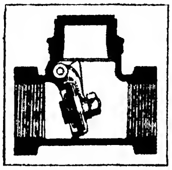

FIG 2

It is but a step from this to the globe-valve in fig 3 where the valve is closed by screwing down on the valve stem This type of valve is probably used more largely than any other in controlling water and steam. The valve seat in fig. 3 is usually separate from the valve stem In most cases the seat can be easily removed when worn and replaced In some designs of simple globe valves, the seat can also be replaced when worn.

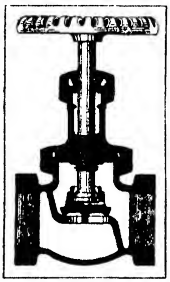

FIG 3

In a later design of globe-valve, which has replaced the valve in fig 3 to a considerable extent the valve acts as a gate in the line of flow, and does not compel the liquid or gas to take such a circuitous route as in the globe-valve Gate-valves are made with both straight and angular seats When the angular seat is used, the gate acts as a taper wedge between the seats When the seats are parallel, the wedging action is secured by a tapered piece on the valve stem being forced between the two discs The valve openings in both types are usually round, as when placed in a pipe line and forming part of it In exceptional cases, however, the valves are rectangular, as in some of the gates of the intakes of the Panama Canal locks

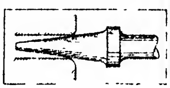

FIG. 4

A valve used largely in high pressure work and for securing fine adjustments of the opening, as in spraying or atomizing, is known as the needle-valve (fig 4) The area of the opening can be varied very slightly as the needle is moved in its seat By varying the angle of the needle point, the opening per unit of movement can be varied between wide limits This type of valve is used in spraying fuel into Diesel engine cylinders

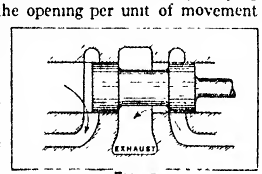

FIG 5

Valves for admitting steam or gas to engines are either sliding, rotary or poppet The slide-valve is among the oldest types used for this purpose, but has largely disappeared, owing to the power required to move them under high pressure. The old steam engine D-valve admits steam first to one end of the cylinder and then the other, the exhaust taking place in the central cavity This type of valve has now been largely supplanted by the piston-valve, particularly in locomotive use. A piston-valve (fig. 5) acts in the same way as the D-valve, the difference being that the valve is balanced by the steam at each end or in the centre In some cases, the admission of the steam takes place at the centre of the valve and the exhaust from each end.

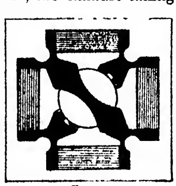

FIG. 6

Rocking- or rotary-valves are also used for similar purposes. Such valves admit steam in one position and block its flow when turned so as to close the port Valves of this kind were used on steam engines of the Corlis type Similar valves are also used to direct the flow of air, water, or gas in one or more directions at will. They are frequently known as three-way or four-way valves A four-way valve is shown in fig 6. When moved from one position to another, the flow is directed into any of the pipes shown. The simplest form of rotary-valve is the plug cock in fig. 7 (For gasolene engines of the poppet and sleeve types *see* MOTOR CAR, *Valves*)

Safety-valves, for relieving the pressure of boilers, pressure tanks, or pipe lines, may be said to be check-valves held to their seats by weights or springs set so as to open when the desired blowing-off pressure has been reached. Safety-valves are made in a variety of forms, the older type having a lever with a weight placed at the proper point to give the desired pressure. Loaded valves have springs over the valve seat instead of the lever. (F H C)

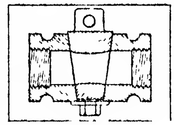

FIG 7

VALVES or PISTONS, in music, are mechanical contrivances applied to wind instruments in order to establish a connection between the main tubing and certain supplementary lengths required for the purpose of lowering the pitch Various devices have been tried from the days of ancient Greece and Rome to produce this effect, the earliest being the additional tubes inserted into the lateral holes of the aulos and tibia (*qq v*) in order to prolong the bore and deepen the pitch of each individual hole; these tubes were stopped by the fingers in the same manner as the holes This device enabled the performer to change the mode or key in which he was playing, just as did the crooks—or coils of tubing inserted between the mouthpiece and the main tube in the trumpet and horn, and between the slide and the bell joint in the trombone—many centuries later

But the resourcefulness of the ancients did not stop there The tibiae found at Pompeii had sliding bands of silver, one covering each lateral hole in the pipe; in the band were holes (sometimes one large and one small, probably for semitone and tone) corresponding with those on the pipe By turning the band the holes could be closed, as by keys, when not required By fixing the ὅλοι in the holes of the bands, the bore was lengthened instantly at will, and just as easily shortened again by withdrawing them; this method was more effective than the use of the crooks, and foreshadowed the valves of eighteen centuries later The crooks, or coils of tubing inserted between the mouthpiece and the main tube in the trumpet and horn, and between the slide and the bell joint in the trombone, formed an important step in this direction

Although the same principle underlies all these methods, *i e*, the lengthening of the main column of air by the addition of other lengths of tubing, the valve itself constitutes a radical difference, for the adjustment of crooks demands time and the use of both hands. The action of the valve being as instantaneous as that of the key, the instrument to which it was applied was at once placed on a different basis, becoming a chromatic instrument capable of the most delicate modulations from key to key

The slide had already accomplished this desirable result, but as its application was limited to instruments of which the greater part of the bore was cylindrical, *i e*, the trumpet and trombone, its influence on concerted musical composition could not be far-reaching In fact it is doubtful whether the chromatic possibilities of the slide were fully realized until the end of the 18th century, when, key mechanism having made some advance, it was being applied successfully to the transverse flute, and to the clarinet and oboe families

In 1760 Kólbel, a Bohemian horn-player engaged in the St. Petersburg Imperial Orchestra, turned his attention to this method of extending the compass of brass instruments His experiments, followed up by Anton Weidinger of Vienna at the beginning of the 19th century, produced a trumpet with five keys and a complete chromatic compass. Halliday followed with the keyed bugle in 1810. Halary applied the principle of the keyed bugle to the bass horn in 1817, and produced the ophicleide—an ideal chromatic bass as far as technical possibilities are concerned. The horn had become a chromatic instrument through Hampel's discovery of

bouché sounds, but the defects in intonation and timbre still remained. Such were the conditions when the successful application of the valve to brass wind instruments by Heinrich Stölzel of Silesia brought about an entire revolution in the design and construction of these instruments. Further efforts to perfect the key system as applied to the brass wind were abandoned in favour of valves, and the short space of two decades witnessed the rise of the Flügel-horns, the tubas, the saxhorns and the cornet-à-pistons; the trombone, French horn and trumpet having led the van

Although the valves of brass wind instruments vary in form and detail according to the makers, the general principles governing their action are the same for all types The piston, placed on some branch of the main tube, must be so constructed that on being depressed it closes the natural windways through the main bore and opens others into the additional piston length. The piston, seated on a spring, instantly regains its normal position when the finger is removed The length of tubing attached to each valve is calculated on the basis of the length of the main column, to give for the first piston a tone, for the second a semitone, for the third a tone and a half, and for the fourth two tones

There was, however, a difficulty at first In the early valved instruments it was found that the intonation of the notes yielded by the combined pistons was seriously inaccurate, an increase in the length of the additional tubing being required to give the right results, and it took many years before the instrument-makers succeeded in satisfactorily overcoming this defect and producing the perfected instruments of the present day

Although the accredited inventor and patentee of valves applied to musical instruments was Heinrich Stolzel, of Pless in Silesia, the actual inventor was really one Blumel, also a Silesian, who sold his rights to Stolzel in 1815.

VÁMBERY, ARMIN (1832–1913), Hungarian Orientalist and traveller, was born of humble parentage at Duna-Szerdahely, a village on the island of Shutt, in the Danube, on March 19, 1832 He was educated at the village school until the age of 12, and owing to congenital lameness had to walk with crutches At an early age he showed remarkable aptitude for acquiring languages, but straitened circumstances compelled him to earn his own living After being for a short time apprentice to a ladies' tailor, he became tutor to an innkeeper's son He next entered the untergymnasium of St Georgen, and proceeded thence to Pressburg Meanwhile he supported himself by teaching on a very small scale, but his progress was such that at 16 he had a good knowledge of Hungarian, Latin, French and German, and was rapidly acquiring English and the Scandinavian languages, and also Russian, Serbian and other Slavonic tongues At the age of 20 he set up as teacher of European languages in Constantinople, and shortly afterwards became a tutor in the house of Pasha Hussein Daim Under the influence of his friend and instructor, the Mollah Ahmed Effendi, he became, nominally at least, a full Osmanli, and entering the Turkish service, was afterwards secretary to Fuad Pasha After spending six years in Constantinople, where he published a *Turkish-German Dictionary* (1858) and various linguistic works, and where he acquired some 20 Oriental languages and dialects, he visited Tehran; and then, disguised as a dervish, joined a band of pilgrims from Mecca, and spent several months with them in rough and squalid travel through the deserts of Asia He succeeded in maintaining his disguise, and on arriving at Khiva went safely through two audiences of the khan Passing Bokhara, they reached Samarkand, where the emir, whose suspicions were aroused, kept him in audience for a full half-hour; but he stood the test so well that the emir was not only pleased with "Resid Effendi" (Vámbéry's assumed name), but gave him handsome presents. He then reluctantly turned back by way of Herat, where he took leave of the dervishes, and returned with a caravan to Tehran, and subsequently, in March 1864, through Trebizond and Erzerúm to Constantinople By the advice of Prokesch-Osten and Eötvös, he paid a visit in the following June to London; there his daring adventures and linguistic triumphs made him the lion of the day In the same year he published his *Travels and Adventures in Central Asia.* In connection with this work it must be remembered that Vámbéry could write down but a few furtive notes while with the dervishes, and dared not take a single sketch, but the weird scenes, with their misery and suffering, were so strongly impressed on his memory that his book is convincing by its simplicity, directness and evidence of heroic endurance Vámbéry also called the attention of politicians to the movements of Russia in Central Asia From London he went to Paris; then returning to Hungary, he was appointed professor of Oriental languages in the University of Budapest there he settled down, contributing largely to periodicals, and publishing a number of books He died at Budapest on Sept 15, 1913

His travels have been translated into many languages, and his autobiography, *Arminius Vámbéry, his Life and Adventures* (1883; 9th ed, 1914), was written in English Amongst the best known of his works, besides those alluded to, are *Wanderings and Adventures in Persia* (1867), *Sketches of Central Asia* (1868), *History of Bokhara* (1873), *Manners in Oriental Countries* (1876); *Primitive Civilization of the Turko-Tatar People* (1879); *Origin of the Magyars* (1882); *The Turkish People* (1885), *Hungary* (1887), with Heilprin, and *Western Culture in Eastern Lands* (1906)

VAMPIRE, a term originally applied to bloodsucking ghosts, now transferred to bloodsucking bats inhabiting South America. In its original meaning a vampire is supposed to be the soul of a dead man which quits the dead body at night to suck the blood of living persons Hence, when the grave is opened, the corpse is found to be fresh. To put a stop to his ravages the commonest method is to drive a stake through the body. The belief in vampires is still prevalent among Slavonic peoples.

HEAD OF VAMPIRE (DESMODUS RUFUS), A SMALL BAT OF CENTRAL AMERICA

The blood-sucking bats comprise two species (*Desmodus rufus* and *Diphylla ecaudata*) from the forest of tropical America Their attacks upon men and warm-blooded animals were noticed by early writers, but for many years the bats themselves were not identified and the large frugivorous *Glossophaga soricana* and *Vampyrus spectrum* were mistaken for the true sanguivorous species *D rufus* is the more abundant species, it is a small bat, about 3 in in length with reddish-brown fur, and peculiar teeth (*see* fig) adapted to its mode of feeding They are said to be able to pierce the skin and suck blood without awakening their victim. The oesophagus is very narrow, as is the pyloric division of the stomach, while the cardiac part is produced into a large diverticulum. *D ecaudata* is less abundant, confined to Brazil, and differs in the details of the teeth

VAN. (1) The chief town of a vilayet of the same name in Asiatic Turkey, altitude, 5,400 ft. Pop. (1927) 22,549 It is situated about a mile from the eastern shore of Lake Van, and built along the south side of the citadel rock, an isolated rocky ridge 1,300 yd long, rising 360 ft. out of a plain which extends up to the sharply defined rocky mass of the Varak range, 8 m distant On the gently sloping ground east of the citadel are the Gardens, covering an area of 5 m by 3, and containing several suburbs and detached houses, along central avenues fringed with trees, and having channels of running water by the sides for irrigation.

The town itself is a poor place with flat-roofed mud houses, narrow winding streets, and surrounded by a ruinous mud wall, but it still contains the business quarter, the government offices and the principal bazaars Water comes from *karez* or underground channels and streams from Varak, fed from the Sikhe Lake, an ancient reservoir which preserves the snow waters on the summit of the mountain For the southern quarter there is the Shemiram Canal, also of very ancient construction, which derives its supply from a large spring 19 m distant, near Meshingird The climate is generally healthy, extremely cold in winter, with 2 to 3 ft of snow from December to March, while the summer heat is not excessive The Persian trade of Van has declined, European goods, with which the bazaars are fairly well supplied, come from Trebizond through Erzerum. There is a fair local trade in wheat and agricultural produce, also sheep and cattle, wool, hides and furs for export.

The cuneiform inscriptions of Van are very numerous, the town

having been the capital of the Vannic kingdom of the Assyrian period, for which *see* URARTU.

In the sixth century B.C. Van passed into the hands of the Persians, and shortly before it fell to Alexander the Great it was rebuilt, according to Armenian historians, by a native prince called Van. In 149 B.C. Valarsaces or Vagharshag, the first Armenian king of the Arsacidae, rebuilt the town, and a colony of Jews was settled in it by Tigranes (94–56 B.C.). In the middle of the 4th century A.D. it was taken by Sapor (Shapur) II., and became the capital of an autonomous province of the Sassanian Empire, until it fell into the hands of the Arabs (*c.* 640), under whom it regained its autonomy. About 908 the governor of Van or Vaspuragan was crowned king by the caliph Moktadir, and in 1021 his descendant Senekherim was persuaded by Basil II. to exchange his kingdom for the viceroyalty of the Sebasteian theme. After having formed part of the possessions of the Seljuks, Mongols, Tatars and Persians, Van passed in 1514, after the defeat of Shah Ismail by Selim I. at the battle of Kalderan, to the Osmanlis, who only occupied the town in 1543. In 1636 it was taken by the Persians, but soon recovered. In 1845 the town was held for a time by the Kurd chief Khan Mahmud.

(2) The vilayet of Van lies along the Persian frontier between the vilayets of Bayazid and Hekkiari. The mineral wealth of the vilayet has never been fully explored, but is believed to be great.

(3) LAKE VAN, called Arsissa Palus and also Thospitis from its Armenian names, is roughly rectangular 55 m. long and 40 broad, with a long north-eastern arm which increases the greatest length to 80 m. It stands about 5,260 ft. above sea-level. It is without an outlet, and its greatest depth is along the southern shore. It has constant steady fluctuations, rising and falling some 8 ft. in a periodic movement of five years. In the middle of the 19th century a sudden rise submerged several places on the banks, including Arjish Kale, and the waters did not again subside. The north-eastern arm is much shallower than the rest. The water is bitter and undrinkable, being largely impregnated with carbonate and sulphate of soda with some borax. The salts are evaporated in pans, and called *perek*, being sold for washing purposes. There is, however, good water along the coast from springs and streams.

The lake has been navigated from the earliest times, and about 80 sailing boats, carrying about 20 tons burden, now ply on it, chiefly with wheat and firewood. Severe storms make navigation dangerous in winter. The southern shore is fringed by a steep range of mountains, with several thriving villages along the coast. The hills have now been almost denuded of trees. At the south-eastern corner is the island of Akhtamar with its ancient church, erected (*c.* 928) by Gagig, first king of the Ardzrunian dynasty. The Catholicos of Akhtamar was one of the highest offices in the Armenian Church, and dated from 1113. Large numbers of *darekh*, a kind of herring, exist in the lake, and are caught in nets from boats or when they enter the shallow lagoons in the spring and summer. Either fresh or salted they form an important article of diet of the poorer people.

VANADINITE, a mineral consisting of lead chloro-vanadate, (PbCl) $Pb_4(VO_4)_3$, crystallizing in the hexagonal system and isomorphous with pyromorphite and mimetite (*q.v.*). The crystals are usually six-sided prisms terminated by the basal planes, but are sometimes modified by numerous pyramidal planes which exhibit parallel hemihedrism. Rounded crystals and groups also occur. The colour is usually light brown or yellow, but crystals from Arizona are brilliant scarlet. Owing to isomorphous replacement of the vanadium by phosphorus and arsenic, the specific gravity varies from 6.6 to 7.2; a variety containing much arsenic is called *endlichite*. The mineral is one of secondary formation in veins of lead ore. In New Mexico and Arizona it has been mined as a source of vanadium for the manufacture of vanadium-steel. Several occurrences are known in South Africa.

VANADIUM, a metallic chemical element belonging to a family which also includes columbium (*q.v.*) and tantalum (*q.v.*). Although one of the rarer elements, vanadium (symbol V, atomic number 23, atomic weight 51), is fairly widely distributed, and since its application in the production of special steels (*q.v.*), several of its minerals have been extensively exploited.

Occurrence.—Patronite, native vanadium sulphide, which is an important source of the metal, occurs in Peru associated with iron pyrites in coal deposits. Carnotite, potassium uranyl vanadate, $K_2O,2UO_2,V_2O_5,3H_2O$, is found in Colorado and Utah and is extensively worked for vanadium, radium and uranium. Vanadinite $[Pb\{3Pb_3(VO_4)_2\}]Cl_2$, isomorphous with pyromorphite and mimetite, occurs as deep red crystals in Arizona, New Mexico, South East Africa and Northern Rhodesia. Other vanadium minerals are descloizite, a lead zinc vanadate found in New Mexico and Arizona, and roscoelite, a micaceous mineral in which aluminium is partially replaced by vanadium; the latter occurs in Colorado and is an important source of the metal. Mottramite, a basic vanadate of lead and copper, is found in Cheshire. In addition to these minerals in which it is a major constituent, vanadium occurs in numerous rocks and deposits. Many iron ores such as the minette of Lorraine and the German and Swedish iron ores contain as much as 0.3 to 0.7% of vanadium pentoxide.

A new metal was first observed in vanadinite by M. Del Rio (1801). Subsequently N. G. Sefstrom (1830) isolated its compounds from the slag of Taberg iron and having noticed the beautiful colours which they displayed in solution, he called the new metal vanadium, in allusion to Vanadis, a name sometimes given to Freya, the Scandinavian goddess of beauty. F. Wohler (1830) showed that vanadium was identical with Del Rio's erythronium and a more extended study of the metal and its compounds was made by J. J. Berzelius (1831). In 1868 H. E. Roscoe proved that the supposed vanadium obtained by the earlier investigators was chiefly the nitride or oxide of the element and by a brilliant application of the principle of isomorphism, he showed that vanadium was a member, together with phosphorus and arsenic, of Group V. of the periodic classification.

Extraction of Vanadium Oxide from its Minerals.—Patronite is roasted and fused with sodium carbonate, the sodium vanadate thus formed is extracted with water, and the addition of ammonium chloride then precipitates ammonium vanadate. On ignition this salt leaves vanadium pentoxide. The vanadium when dissolved as vanadate may also be precipitated as calcium or ferrous vanadate. The native vanadates, carnotite, mottramite, etc., are extracted with concentrated hydrochloric acid; the acid extract and washings are evaporated with ammonium chloride, when ammonium metavanadate separates. (For further details of separation consult special treatises indicated in the bibliography.)

Metallic Vanadium.—The metal was first obtained by Roscoe on passing hydrogen over the heated dichloride. It is also prepared by reducing the pentoxide with "mischmetall," a mixture of the rare-earth metals. It has been prepared by the aluminium reduction method from vanadium trioxide and by the electrolysis of sodium vanadate in hydrochloric acid.

Vanadium is a silvery white metal with specific gravity 5.5 to 5.89; its melting point is 1,710° C. The fusibility is diminished by the presence of vanadium carbide or oxide. Vanadium is stable in air and is unacted on by bromine water, aqueous alkalis, hydrochloric acid or cold sulphuric acid. It is dissolved by hydrofluoric acid or hot sulphur acid to green solutions. Molten potash or potassium nitrate attacks the metal forming potassium vanadate. Its alloy with aluminium containing up to 10% of vanadium is malleable. Cuprovanadium is an alloy employed in copper castings and bronzes.

Ferrovanadium.—The greater part—about 90%—of the vanadium extracted is used in form of ferrovanadium alloys containing 25 to 30% of vanadium. Such alloys are produced by the "thermite" process on iron vanadate, by the reduction of this compound with carbon in the electric furnace, or by electrolysis of vanadium pentoxide dissolved either in fused ferrosilicon or in a molten mixture of iron fluoride and calcium carbide. When vanadium is added to steel it effects the removal of oxygen and nitrogen carrying these into the slag, and the portion which remains in the metal increases the tensile strength, toughness and elastic limit of the steel. These improvements are effected by comparatively small amounts ranging from 0.05 to 0.5%.

Compounds of Vanadium.—Vanadium salts are used as catalysts in a variety of chemical operations. A trace of vanadic acid accelerates the oxidation of cane sugar by nitric acid. (*See* MESOXALIC ACID and OXALIC ACID.) A very small amount of vanadyl sulphate promotes the development of aniline black Vanadium pentoxide has been utilised as a catalyst in bringing about the combination of sulphur dioxide and oxygen to sulphur trioxide, and in the aerial oxidation of naphthalene to phthalic anhydride, benzene to maleic anhydride and benzoquinone, toluene to benzaldehyde, and anthracene to anthraquinone Vanadium resinate and linoleate have been employed as driers for linseed oil and other drying oils, the action being more rapid than that induced by lead or manganese salts Ammonium vanadate has been used in leather dyeing and other vanadium salts have been employed in photography and chemotherapy, where vanadium arsenate and salicylate have produced beneficial effects, the latter as a substitute for salvarsan

Vanadium exhibits five stages of valency, each stage giving rise to characteristic colours. An acid solution of vanadium pentoxide, V_2O_5, is yellow to orange, mild reducing agents convert to the V_2O_4 stage which is characterised by a deep blue colour Further reduction of $VOCl_2$ leads to a green solution, now containing hydrated trichloride, VCl_3, corresponding with the V_2O_3 stage Drastic reduction gives rise to a lavender solution of VCl_2 corresponding with the VO stage A lower oxide, V_2O, is described but is unimportant

Vanadium pentoxide, V_2O_5, made by igniting ammonium metavanadate, NH_4VO_3, crystallises in yellowish-red prisms sparingly soluble in water but dissolving in aqueous alkalis to vanadates and in acids to vanadic salts such as $(VO)_2(SO_4)_3$ Metavanadic acid, HVO_3, is obtained as a brown powder by boiling copper vanadate with nitric acid, and when produced from this vanadate by digestion with ammonium chloride it separates in gold spangles known as "vanadium bronze" and employed as a pigment Vanadic acid and its oxide V_2O_5 enter into many complex combinations—polyvanadates, phosphovanadates, arsenovanadates, molybdovanadates and tungstovanadates. Vanadyl chloride, $VOCl_3$, a yellow liquid boiling at 127° C, is prepared by passing chlorine over heated vanadic oxide, but when carbon or sulphur is present vanadium tetrachloride, VCl_4, is also obtained as a reddish-brown liquid boiling at 154° C Vanadium tetroxide, V_2O_4, is a blue infusible substance obtained by mild reduction of the pentoxide, it dissolves in acids to yield blue vanadyl salts such as $VOSO_4$ and $VOCl_2$ and in aqueous caustic alkalis to brown solutions of the alkali vanadates (also termed hypovanadates); the potassium salt is $K_2V_4O_9.7H_2O$

Vanadium trioxide, V_2O_3, a black infusible powder produced by reducing the heated pentoxide in hydrogen, dissolves slowly in hydrochloric acid to yield vanadium trichloride, the green solution of which is more readily prepared by reducing vanadic oxide with magnesium and hydrochloric acid Anhydrous vanadium trichloride, VCl_3, prepared by heating vanadium pentoxide in chlorine and sulphur chloride, forms bluish-red crystals resembling anhydrous chromic chloride

Vanadium trisulphate, $V_2(SO_4)_3$, a crystalline yellow powder, combines with sulphates of ammonium, potassium, rubidium and caesium to form vanadium alums (*See* ALUMS) Vanadous oxide, VO, a grey powder having metallic lustre and metallic conductivity, is obtained by reducing the higher oxides with potassium It was erroneously regarded as a metal by Berzelius and shown to be an oxide by Roscoe The corresponding vanadous chloride, VCl_2, produced by reducing the tetrachloride with hydrogen, forms light green crystals dissolving readily to a lavender solution

Vanadium acetylacetone, $V\{CH(CO{\cdot}CH_3)_2\}_3$, obtained by the interaction of vanadium trichloride, acetylacetone and aqueous sodium carbonate, crystallises from chloroform in dark brown tabular prisms melting at 185–190° C, and on exposure to moist air undergoes oxidation to bluish-green vanadyl acetylacetone, $VO\{CH(CO{\cdot}CH_3)_2\}_2$, also prepared by dissolving vanadyl hydroxide, $VO(OH)_2$, in alcoholic acetylacetone (G T Morgan and H. W Moss, 1913)

Vanadium forms three sulphides, V_2S_5, V_2S_3 and VS, the most stable of which is the trisulphide The nitride, VN, produced by direct combination of its constituents, forms a metallic powder formerly confused with the metal itself The carbide, VC, an electric furnace product, forms hard silvery white crystals melting at 2750° C.

VANADIUM STEEL. The desirability of adding vanadium to certain steels has been known since 1896, but it was too rare to be used until 1905 when a rich deposit was discovered in Peru Since then many minor localities have been worked, so that while ferrovanadium is still expensive, owing to the difficulty with which it is reduced and refined, there is ample raw material for present use Vanadium has a great chemical affinity for oxygen and nitrogen dissolved in steel, to avoid waste it is only added to dead-melted steel, in the ladle after all other quieting additions have been made Even so, much of it slags off the residual analysis being usually 0 15 to 0 25% It is sometimes thought that its chief action is as a cleanser, allowing the iron, carbon, manganese and chromium to exhibit their inherent virtues, however, since in high-speed steel (*q v*) it is present from 0 5 to 2 0% with undoubted advantage, it is probable that even the modicum present in ordinary steels has the definite advantage of forming finely dispersed carbides, greatly refining the grain (as seen under the microscope) and increasing the elastic limit and resistance to shock or impact

Chromium-vanadium steels are now widely used for axle forgings, clash gears and springs, where strength, hardness, impact and fatigue resistance are a requisite The Society of Automotive Engineers' standards include several alloys with carbon from 0 15 to 0 55%, manganese from 0 50 to 0 80% (even higher with higher carbon), chromium from 0 80 to 1 10% and vanadium from 0 15 to 0 25% These low alloys will give about the same properties after heat treatment as the nickel-chromium steels (*q v*) Case-hardened articles made of the lower carbon contents have intense surface hardness and wear resistance, to intensify the skin hardness such steels are frequently quenched from a cyanide bath, and the vanadium is said to prevent the usual embrittlement caused by nitrogen

Carbon-vanadium steels are mostly used in the annealed state for locomotive castings or forgings and are preferred over other alloys which must be heat treated, because subsequent heating at shops unequipped for precise work will not seriously reduce their strength Locomotive frames of cast steel containing 0 20% vanadium have an elastic limit 25% above that of a similarly annealed plain carbon casting without any loss in ductility Locomotive side rods, driving axles and large shafting for electrical machinery or reciprocating engines are frequently forged of carbon-vanadium steels, made in the acid open-hearth furnace Before machining they are usually air cooled from just above the critical range to refine the grain, and then annealed at just below the critical range to relieve all internal strains (*See* IRON AND STEEL) (E E T)

VAN BEERS, JAN (1821–1888), Belgian poet, usually called "the elder" to distinguish him from his son, Jan van Beers, the painter, was born at Antwerp on Feb 22, 1821 Van Beers started life as a teacher of Dutch language and literature, first at Malines, then at Lierre, and in 1860 was appointed a professor of both at the Athenaeum (high school) in Antwerp where he had also been a sub-librarian in the communal library Van Beers's historical poems, the principal of which is, perhaps, *Jakob Van Maerlant* (Amsterdam, 1860), helped the Flemish revival in Belgium He is best known, however as the writer of ballads and songs. Among the best are *De Blinde* ("Blind"), *De Zieke Jongeling* ("Young and Doomed"), *Bij 't Kerkportaal* ("At the Church Porch") Van Beers's poetry, full of glow and pathos, simple yet forcible, is somewhat akin to that of Longfellow In 1884 his poems were collected in a volume; Van Beers died at Antwerp on Nov 14, 1888

VANBRUGH, SIR JOHN (1664–1726), British dramatist and architect, was born in the parish of St. Nicolas Acons in the City of London, and christened on Jan 24, 1664. His father was a sugar baker, and his grandfather, Gillis van Brugg, came to England from Ghent in James I.'s reign. The Vanbrughs left London during the Plague and went to Chester After a few years at the King's School, Chester, John at nineteen was sent to France to study the arts, after two years' absence he returned to take up a commission in the regiment soon to be known as the 13th Foot. In the early autumn of 1690 Vanbrugh was arrested at Calais on a charge of espionage, on the information of a lady. He was imprisoned at Vincennes, but on Feb 1, 1692, by a *lettre de cachet,* he was removed to the Bastille His enforced leisure was responsible for the first draft of the *Provok'd Wife.* For a time after his return he resumed his commission

The production of Cibber's *Love's Last Shift* at the Theatre Royal in January 1696 kindled afresh his attachment to the comic muse He thought it would be interesting to develop the situation upon which Cibber had rung down the curtain, and the result was *The Relapse,* "got, conceived and born in six weeks' space." It was given on Boxing Day 1696, with Cibber as Foppington, one of the three parts borrowed from the preceding comedy. The Sir Novelty Fashion of Cibber was developed in this play into Lord Foppington, who has been pronounced "the best fop ever brought upon the stage" Foppington, Tunbelly Clumsy and Miss Hoyden are as fine a trio of comic characters as any play can show *Aesop* at Drury Lane followed This ran for a week only, but the success of *The Relapse* was so triumphant that Montague, afterwards Lord Halifax, asked at once for the *Provok'd Wife* for the theatre in Lincoln's Inn Fields, and it was produced at that theatre in May 1697 Sir John Brute, the husband, is Vanbrugh's masterpiece, and as usual the servants' characters are well drawn The play was a complete triumph, and Brute was one of Garrick's great parts Vanbrugh was fiercely attacked by Jeremy Collier for immorality in 1698, and wrote nothing more for the stage until 1700, when an adaptation of the *Pilgrim* of Beaumont and Fletcher was produced at Drury Lane. In this play, in the part of Alinda, Anne Oldfield scored her first success. Two years later appeared *The False Friend,* a version of Le Sage's *Traitre puni* Other adaptations from the French were *A Country House,* from Dancourt's *Maison de campagne; Confederacy* (1705), from the same author's *Bourgeoises à la mode; Squire Trelooby* (1704), a version of Molière's *Monsieur de Pourceaugnac;* and *The Mistake* (1705), from Molière's *Dépit amoureux* As a dramatist Vanbrugh is less polished than Congreve, and less remorseless than Wycherley He was not primarily a man of letters, and, as Cibber said, his dialogue is "common conversation committed to paper" No one would trouble to defend his dramatic morality, but his worst efforts are less repulsive than Wycherley, because there is less ruthless realism and more fun in his attitude His plays are farce, very often, rather than strict comedy, and warmed with humour

Collier's attack and the resulting movement must have been responsible in part for "Van" turning his attention to architecture The demand for splendid country seats in the new Palladian style was steadily increasing, and his reputation as a modern wit was an introduction in itself In 1702 he was entered as comptroller of the Royal Works (now the Board of Works, where several of his designs may still be seen). In 1703 he wrote to ask his friend Jacob Tonson to procure him a "Palladio," and in the same year he was a commissioner at Greenwich. In the meantime, Vanbrugh had been appointed architect to the earl of Carlisle, and the result, completed in 1714, was the Corinthian mansion of Castle Howard. The work is an extension of the Palladian plan introduced by Inigo Jones, with the addition of immense corridors in segmental colonnades leading from the main entrance to the wing blocks From a scenic artist's point of view, it is a magnificent (and certainly his best) piece of work. The earl procured for Vanbrugh a high place in the College of Arms. In March 1704 he was actually promoted Clarenceux, though he not only knew nothing of heraldry but had openly ridiculed that grave science in *Aesop* His next work was to prepare designs for Kneller Hall near Hounslow. But the success of Castle Howard now caused him to entertain the rash project of building a theatre in the Haymarket, from his own design, for the acting of his own plays. Congreve joined in the venture. The magnitude of Vanbrugh's architectural ideas grew as the work went on, and with the ideas the structure grew till a theatre meant for the delicate *bijouterie* work of polite comedy seemed growing to the proportions of the Roman Colosseum When at length the time came to test the acoustics of the pile, it was found to be sadly defective What changes were made to rectify the errors of structure does not appear. The theatre was opened to the public with an Italian opera, which was followed by three of Molière's comedies, and these by the *Confederacy,* Vanbrugh's masterpiece.

Vanbrugh at last withdrew from the disastrous speculation; Congreve had already withdrawn. But a man to whom Fortune had been so kind as she had been to Vanbrugh could hardly be depressed by any of her passing frowns Queen Anne at once sent him abroad on an important state errand, and afterwards he was commissioned to build Blenheim Upon the merits and demerits of this famous "hollowed quarry" there has been much conflict of opinion. Blenheim Palace is probably the largest domestic building in England, and consists of three blocks, the centre containing the private living rooms, one wing the stables, and the other the kitchens and storehouses It is planned on a colossal scale Vanbrugh considered a building and the parts of a building as simply so much material for effect, without regard to their reasonable use and the necessary limitations of design Personal comfort was sacrificed to perspective Windows were to adorn the elevation, not to light the interior, and, as Voltaire said, if the rooms had only been as wide as the walls were thick, the château would have been convenient enough. After Blenheim and Castle Howard, his next largest palace was probably Fleurs, near Kelso. Blenheim, however, was a source of great sorrow to the kindly dramatist. Though parliament had voted for the building of it, no provision had been made for the supplies The queen while she lived paid them, and then Vanbrugh was left to the meanness of the duke of Marlborough, and afterwards to the insolence of the "wicked woman," who did her best to embitter his life. Besides Castle Howard and Blenheim, he built many other country mansions, such as Grimsthorpe and Duncombe Hall in Yorkshire, Eastbury in Dorsetshire.

In January 1719 Vanbrugh married Henrietta Maria, daughter of Colonel Yarborough of Heslington, and four years afterwards, at the accession of George I, he was knighted He afterwards wrote again for the stage, and the unfinished fragment of the *Journey to London* (completed by Cibber as *The Provok'd Husband* in 1728) shows that his powers remained to the last as fine as ever. His married life was mostly spent at Blackheath, very probably in "Bastile House" on Maze Hill, repaired in 1904 and now known as Vanbrugh Castle His wife died there at a great age in 1776, but "Van" himself died on March 26, 1726 in his modest town house in Whitehall The site is occupied to-day by the War Office The famous epitaph, "Lie heavy on him, earth," is attributed to Abel Evans

Vanbrugh's works were edited in 2 vols., 1893, by W. C. Ward (portraits) *Select Plays* were issued in the Mermaid Series (ed. A. E. H. Swaen) in 1896 *See* G H. Lovegrove's ***Life, Works and Influence of Sir John Vanbrugh*** (1902), Max Dametz's ***Vanbrughs Leben und Werke*** (1898), and ***Swift's Works*** (Bohn), xi. 80 sq ***The Complete Works of Sir John Vanbrugh*** (Plays and Letters) edited by B. Dobree and G. Webb (Nonesuch Press, 1928), with introduction by B. Dobree.

VAN BUREN, MARTIN (1782–1862), 8th president of the United States, was born at Kinderhook, N Y, on Dec. 5, 1782, of Dutch descent. His father was a farmer and tavern-keeper. His education was limited to that which could be obtained in the common schools and at Kinderhook academy. In 1796 he began the study of law, completing his preparation in 1802 at New York, where he studied under William Peter Van Ness (1778–1826), an eminent lawyer and later Aaron Burr's second in the duel with Alexander Hamilton. In 1803 he was admitted to the bar and continued in active and successful practice for 25 years His prac-

tice made him financially independent, and paved the way for his entrance into politics. New York politics after 1800, the year of the election of Jefferson and the downfall of the Federalists, were peculiarly bitter and personal. The Republicans were divided into three factions, followers respectively of George Clinton (and later of his nephew, De Witt Clinton), Robert R. Livingston and Aaron Burr; and such Federalist control as there was from time to time after 1799, depended upon coalition with one or other of these groups. Van Buren, who early allied himself with the Clintonians, served as surrogate of Columbia county from 1808 to 1813 In 1812 he entered the State senate, in which his career covered two terms (1812–20) In 1815 he became attorney general, an office which he held, still as a member of the senate, until 1819, when he was displaced to make room for a Federalist. He had already, in 1808, removed from Kinderhook to Hudson, and in 1816 he took up his residence in Albany, where he continued to reside until he entered Jackson's cabinet in 1829 As a member of the State senate he supported the War of 1812 He was chosen to draft the resolution of thanks voted by the legislature to Gen Andrew Jackson after the battle of New Orleans He broke with De Witt Clinton in 1813, but nevertheless favoured, in 1817, Clinton's plan for the Erie canal. His attitude towards slavery at the moment was shown by his vote, in Jan 1820, for a resolution opposing the admission of Missouri as a slave State It is at this point that Van Buren's connection began with so-called "machine politics," a connection which has made his name odious to some historians of the period He was a leading member of the "Albany regency," a group of politicians who for more than a generation controlled the politics of New York and powerfully influenced those of the nation, and who did more than any other agency to make the "spoils system" a recognized procedure in national, State and local affairs Van Buren did not originate the system, for it was already well developed when he entered public life; but the nickname of "Little Magician" which presently attached to him testifies to the skill with which he exploited it

In 1821 he was elected to the U S Senate in which his course was not altogether consistent, though in this respect he is not to be judged more harshly than some of his associates He at first favoured internal improvements, and in 1824 proposed a constitutional amendment to authorize such undertakings, but the next year took ground against them He voted for the tariff of 1824, then gradually abandoned the protectionist position He early recognized the availability of Andrew Jackson, however, as a presidential candidate, and after the election sought to bring the Crawford and Jackson followers together, at the same time strengthening his control as a party leader in the Senate Always notably courteous in his treatment of opponents, he showed no bitterness either towards J Q Adams or Henry Clay, and voted for Clay's confirmation as secretary of State notwithstanding the "corrupt bargain" charge, at the same time he opposed internal improvements and declined to support the proposal for a Panama Congress In the debate on the "tariff of abominations" in 1828 he took no part, but voted for the measure in obedience to instructions from the New York legislature—an action which was cited against him as late as the presidential campaign of 1844 Van Buren was not an orator, but his more important speeches show careful preparation and his opinions carried weight; and the oft-repeated charge that he refrained from declaring himself on crucial questions is hardly borne out by an examination of his senatorial career. In 1827 he was re-elected to the Senate and became one of the recognized managers of the Jackson campaign.

In 1828 Van Buren was elected governor of New York for the term beginning Jan 1, 1829, and resigned his seat in the Senate. But on March 5 he was appointed by President Jackson secretary of State and he resigned the governorship. As secretary of State he took care to keep on good terms with the "kitchen cabinet," the group of politicians who acted as Jackson's advisers, and won the lasting regard of Jackson by his courtesies to Mrs. John H. Eaton, wife of the secretary of War, with whom the wives of the cabinet officers had refused to associate. He did not oppose Jackson in the matter of removals from office, but was not himself an active "spoilsman," and protested strongly against the appointment of Samuel Swartwout (1783–1856), who was later a defaulter to a large amount as collector of the port of New York He skilfully avoided entanglement in the Jackson-Calhoun imbroglio. In the controversy with the Bank of the United States he sided with Jackson After the breach between Jackson and Calhoun, Van Buren was clearly the most prominent candidate for the vice presidency Jackson, in Dec 1829, had already made known his own wish that Van Buren should receive the nomination. In April 1831 Van Buren resigned and in August he was appointed minister to England, arriving in London in September He was cordially received, but in February learned that his nomination had been rejected by the Senate on Jan 25 The rejection was in fact the work of Calhoun, the vice president, when the vote was taken enough of the majority refrained from voting to produce a tie and give Calhoun his longed-for "vengeance" No greater impetus than this could have been given to Van Buren's candidacy for the vice presidency In May the Democratic convention, the first held by that party, nominated him for vice president on the Jackson ticket No platform was adopted, the widespread popularity of Jackson being relied upon to win success at the polls Van Buren's declarations during the campaign were vague regarding the tariff and unfavourable to the United States bank and to nullification, but he had already somewhat placated the South by denying the right of Congress to abolish slavery in the District of Columbia without the consent of the slave States In the election he received 189 electoral votes, while Jackson received 219 for president Jackson now determined to make Van Buren president in 1836 In May 1835 Van Buren was unanimously nominated by the Democratic convention at Baltimore. He expressed himself plainly during the canvass on the questions of slavery and the bank In the election Van Buren received 170 electoral votes against 73 for William Henry Harrison, his principal opponent; but the popular vote showed a plurality of less than 25,000 in a total vote of about 1,500,000 The election was in fact a victory for Jackson rather than for Van Buren

The details of Van Buren's administration belong to the history of the United States (*see* UNITED STATES) He took over all but one of Jackson's cabinet, and met with statesmanlike firmness the commercial crisis of 1837. No exhibition of ability or courage, however, nor yet the most skilful manipulation of the political machinery of the party could prevent continued hostility to him and to the methods for which he was widely believed to stand Nevertheless, he was unanimously renominated by the Democrats in 1840 Charged with being "a Northern man with Southern principles," his nomination obviously failed to arouse enthusiasm or even inspire confidence Yet the election of Harrison, the Whig candidate, was less of a revolution than many affected to think On the expiration of his term Van Buren retired to his estate at Kinderhook, but he did not withdraw from politics or cease to be a figure of national importance He confidently expected to be nominated for president in 1844 but in the Democratic convention, though he had a majority of the votes, he did not have the two-thirds which the rule of the convention required, and after eight ballots his name was withdrawn In 1848 he was again nominated, first by the "Barnburners" faction of the Democrats, then by the Free Soilers, with whom the "Barnburners" coalesced, but no electoral vote was won by the party In the election of 1860 he voted for the fusion ticket in New York which was opposed to Abraham Lincoln, but he could not approve of President Buchanan's course in dealing with secession, and later supported Lincoln He died in Kinderhook on July 24, 1862 His memoirs, to 1834, remain unpublished, but an *Inquiry into the Origin and Course of Political Parties in the United States* was compiled from it by his sons and published in 1867.

The best biography of Van Buren is by Edward M. Shepard, in the "American Statesmen Series" (rev ed, Boston, 1889) The life by George Bancroft (1889) is highly eulogistic. Von Holst's *United States*, MacDonald's *Jacksonian Democracy*, Garrison's *Westward Extension* and T. C. Smith's *Parties and Slavery* (the last three in the "American Nation Series") give much attention to Van Buren's public career The Van Buren mss are in the Library of Congress *See* also James Schouler, "The Calhoun, Jackson and Van Buren Papers," Mass Hist Soc. Proc, 2nd ser, vol xviii, p 459–465 (Boston, 1905); "Correspondence Between George Bancroft and Martin Van Buren,"

Steiner, "Taney's Letters to Van Buren in 1860," *Maryland Hist Mag*, vol x, p. 15–24 (Baltimore, 1915), and "Autobiography of Martin Van Buren," Amer. Hist. Assoc. Ann. Rep., 1918, vol. 2, p. 7–808 (1920), Denis Tilden Lynch, *Martin Van Buren* (1929).

VAN BUREN, a city of western Arkansas, U.S A, 5 m N.E of Fort Smith, on Arkansas river and Federal highway 64, the county seat of Crawford county, served by the Frisco and the Missouri Pacific railways Pop. (1920) 5,224 (89% native white) Van Buren is on the edge of the coal and gas fields of western Arkansas, in a farming and fruit-growing region It ships great quantities of canteloupes, peaches, strawberries, early vegetables, cotton and other agricultural products. The city was founded in 1838 and incorporated in 1842

VANCOUVER, GEORGE (*c.* 1758–1798), English navigator, was born in 1758 He entered the navy at the age of 13, and accompanied James Cook in his second (1772–74) and third (1776–80) voyages of discovery. After serving for several years in the West Indies, both under Rodney (his commander in the action of April 12, 1782) and under Alan Gardner (1786–89), Vancouver, on Gardner's recommendation, was appointed to command an expedition to the north-west coast of America, to take over from the Spaniards the territory they had seized (and subsequently relinquished) in that region, to explore the coast from 30° N round to Cook's River (or Inlet), to search for an eastward passage to the great lakes, and to ascertain the true character of Juan de Fuca Strait. Vancouver, accompanied by Lieutenant Broughton, left Falmouth on April 1, 1791 and proceeded by way of the Cape of Good Hope to Australia, where he carefully surveyed part of the south-west coast, especially King George's Sound, whose value as a harbour he pointed out He next made for Dusky Bay, New Zealand (which he was the first properly to explore), and thence sailing north-east, discovered Oparo islet (27° 36′ S; 144° 12′ W), and on Dec 30 reached Tahiti, where he was again joined by Broughton, who meanwhile had discovered Chatham island After staying about three weeks at Tahiti and several weeks at the Hawaiian islands, Vancouver on April 18, 1792, sighted the west coast of North America (California, then known as New Albion) in 39° 27′ N He examined the coast up to 52° 18′ N with minute care, surveying all inlets, discovering the Gulf of Georgia, and circumnavigating Vancouver island.

After another visit (Feb–March 1793) to the Hawaiian islands, in whose races and affairs he took great interest, Vancouver resumed his exploration of the American coast in April, surveying north to 56° N, and south (past the Spanish Californian settlements) to 35° N During a fresh stay at the Hawaiian islands (Jan–March 1794) Vancouver accepted their submission to Great Britain, but his annexation seems never to have been officially ratified Quitting the group again in March 1794, Vancouver sailed, by Chernigov island and Kodiak island, to Cook's inlet, which was now proved to be no river After a fresh survey of much of the coast north of San Francisco, Vancouver set out homewards via Cape Horn and St Helena in Oct 1794. On the way he made a careful examination of Cape St Lucas, the southern point of Lower California, the Galapagos islands and some other points He reached the Thames on Oct 20, and immediately set about the preparation of his narrative; but he died at Petersham in Surrey on May 10, 1798, before he had completed his task. His brother John, assisted by Captain Puget, published the complete record in 1798

See *A Voyage of Discovery to the North Pacific Ocean and round the World . . in 1790–95 . . under Captain George Vancouver*, 3 vols (1798), with an atlas of maps and plates.

VANCOUVER, British Columbia, fourth city of Canada and its chief port, situated on the south side of Burrard inlet, had a population in the city proper of 117,217, including about 10,000 Orientals, in 1921 The growth of the city dates from the coming of the Canadian Pacific railway in 1885, and the increasing Oriental trade and the shipping of wheat to Europe by way of the Panama Canal have revolutionized the status of the port in recent years. In 1912 there were no shipments of grain or flour, but in 1926, 45,229,906 bu. of wheat were exported. In 1912, 9,382 vessels entered, and in 1926, 19,767, the largest tonnage of any Canadian port. The wheat storage capacity of the port is now very large, and the whole crop of Alberta can be handled. The export trade is particularly active when the Great Lake ports are closed by ice Timber, canned and salt fish, flour, and apples are other important articles of export There were 498 industrial establishments in 1926, including a number of foundries, fish canning and curing and oil works, shingle, saw, paper, and pulp mills, sugar refineries, breweries and shipbuilding yards

The harbour is one of the finest natural harbours in the world, and large improvements, including three new piers, have been made in recent years The port is a terminus of the Canadian Pacific and Canadian National railway systems, and of the British Columbia electric railway company's line The Pacific Great Eastern line, serving the country north of Howe Sound, is designed also to terminate at Vancouver. Fifty steamship lines run to Japan, China, Australasia, Honolulu, San Francisco, Alaska, etc Industrial development is also proceeding rapidly, especially on Granville Island, a large block of reclaimed land near the business district South Vancouver is a separate municipality, mainly industrial, with a population of 32,267 in 1921 North Vancouver on the north shore of Burrard inlet, nearly 2 m from the centre of the city, had a population of 7,652 in 1921, and is connected by bridge and railway with Vancouver proper. Point Grey, with a population of 13,736, is a growing residential suburb to the south and west of Vancouver, and contains the University of British Columbia, which has absorbed the British Columbia branch of McGill university The still newer municipality of West Vancouver adjoins North Vancouver

VANCOUVER, a city of south-western Washington, U S A, at the head of deep-water navigation on the Columbia river (here crossed by the Interstate highway bridge, 3,531 ft long), 8 m N of Portland; the county seat of Clark county It is on Federal highways 99 and 830, has a large airport, the Portland base of the Pacific coast airmail service; and is served by the Great Northern, the Northern Pacific, the Spokane, Portland and Seattle and the Union Pacific railways, electric trolley and motor-stage lines and ocean and river steamers The population was 12,637 in 1920 (86% native white) and was estimated locally at 17,500 in 1928 It is the trading centre for large lumber operations, and for one of the most diversified agricultural districts of the State, noted for its prunes, filberts, walnuts, small fruits, poultry and dairy products The traffic of the port is growing rapidly, and in 1927 included 87,733,033 ft. of logs rafted in to the city's mills and 72,770,000 ft of lumber shipped out The manufactures (valued at $5,973,728 in 1925) are chiefly lumber and lumber products, paper, dried and canned fruits, fruit juices and syrups, dairy products, furs, logging machinery and linen twines and fabrics The State schools for the deaf and the blind are within the city limits Adjoining it on the east is Vancouver Barracks, one of the principal U S army posts on the coast (established 1849) Its polo and flying fields adjoin the commercial aviation field Vancouver is the oldest city of Washington It was founded in 1825 by Dr. John McLoughlin, chief factor of the Hudson's Bay Company, who built a stockade (Ft. Vancouver) on a site now included in the military reservation, and it was one of the company's important trading posts until 1846, when it was taken over by the United States The village became the county seat in 1854 and was chartered as a city in 1889

VANCOUVER ISLAND, the largest of an archipelago of innumerable islands which fringes the Pacific coast of Canada, being at the same time the largest island on the west coast of North America. It forms part of British Columbia. Pop. (1921), 116,730. It extends from 48° 20′ to 51° N and from 123° to 128° 30′ W, and is thus 285 m. long and from 40 to 80 m. wide, with an area of about 20,000 sq m. It is bounded on the south by the Strait of Juan de Fuca, and is separated from the mainland of the province by the Strait of Georgia and Queen Charlotte sound A partially submerged range of mountains, which has been termed the Vancouver range, runs parallel to the coast of

British Columbia, a portion of this range forms Vancouver island, and it again rises above the level of the sea farther north, forming the Queen Charlotte islands. The coast-line is generally precipitous. The west coast is much broken by bays and inlets—the transverse valleys of the sunken range—which penetrate far inland Among these may be mentioned the Alberni canal, which is 20 m long with a fine harbour at its head, and the city of Port Alberni (pop in 1921, 1,056), served by the Esquimalt and Nanaimo railway. Nootka sound, 6 m wide, and sending three arms inland, as well as Clayoquot, Esperanza, Kyuquot and Quatsino sounds, also penetrate deeply into the island The general height of the mountain-range on Vancouver island is from 2,000 to 3,000 ft ; Victoria peak is 7,484 ft high.

There are extensive beds of coal, especially on the east coast, which are mined at Nanaimo, Connox, Ladysmith and other points, and there are large iron deposits Copper is also mined at Tyee, and smelted at Ladysmith The island is covered with dense forests, which yield immense supplies of magnificent timber, constituting with the coal-field and fisheries the chief resources of the island. There are some level tracts on the south-east coast, as well as in the narrow, well-watered valleys of the interior, which afford excellent agricultural land on which cereals of all kinds, as well as all the fruits of the temperate zone, flourish, and which are also suitable for raising sheep and cattle. The climate of Vancouver island, especially in the south, is wonderfully mild for the latitude

VANDALS, a term used by early writers only as a collective designation for a group of Teutonic tribes including, according to Pliny, the Burgundians and the Goths The Vandals as a separate people figure in the earliest legends both of the Goths and the Lombards, and first came into contact with the Romans during the Marcomannic War In the time of Aurelian they invaded Pannonia, and during the reign of Probus we find them fighting in Dacia In the time of Constantine I, according to Jordanes, they suffered a great defeat at the hands of Geberich, king of the Goths, their own king Visimar being killed, and the survivors were allowed by the Romans to settle in Pannonia

Invasions.—In A D 406 they moved westward, according to some writers at the instigation of Stilicho, who is himself said to have been of Vandal origin, and crossing the Rhine at Mainz proceeded towards Gaul

Owing to defeat at the hands of the Franks the Vandals could not settle in Gaul and in 409 their king Gunderic led them across the Pyrenees They appear to have settled in Spain in two detachments One, the Asdingian Vandals, occupied Galicia, the other, the Silingian, Andalusia The Silingian Vandals were well-nigh exterminated during the next 20 years but their Asdingian brethren marched across Spain and took possession of Andalusia In 428 or 429 the whole nation set sail for Africa, upon an invitation received by their king from Bonifacius, count of Africa, who had fallen into disgrace with the court of Ravenna Gunderic was now dead, and supreme power was in the hands of his bastard brother Gaiseric who was for 50 years the terror of Constantinople and Rome Probably in the month of May 428, he assembled all his people on the shore of Andalusia, and numbering the males among them from the greybeard down to the newborn infant found them to amount to 80,000 souls The nation was transported to Africa in ships supplied by Bonifacius Although he soon returned to the Imperial allegiance only three cities of Roman Africa—Carthage, Hippo and Cirta—remained untaken by the Vandals by May 430 At length (Jan. 30, 435) peace was made between the emperor Valentinian III and Gaiseric. The emperor was to retain Carthage and the small but rich proconsular province in which it was situated, while Hippo and the other six provinces of Africa were abandoned to the Vandal. Gaiseric observed this treaty no longer than suited his purpose On Oct. 19, 439, he suddenly attacked and took Carthage. The Vandal occupation of this great city, the third among the cities of the Roman empire, lasted for 94 years. Gaiseric seems to have counted the years of his sovereignty from the date of its capture. Henceforward he made of Carthage a pirate's stronghold, whence he issued forth, like the Barbary pirates of a later day, to attack, as he himself said, "the dwellings of the men with whom God is angry," leaving the question who those men might be to the decision of the elements Almost alone among the Teutonic invaders of the empire he set himself to form a powerful fleet, and was probably for 30 years the leading maritime power in the Mediterranean. Gaiseric's celebrated expedition against Rome (455), undertaken in response to the call of Eudocia widow of Valentinian, was only the greatest of his marauding exploits He took the city without difficulty, and for 14 days, in a calm and business-like manner, emptied it of all its movable wealth. Eudocia and her two daughters were carried into captivity.

Empire and Defeat.—There does not seem to be in the story of the capture of Rome by the Vandals any justification for the charge of wilful and objectless destruction of public buildings which is implied in the word "vandalism" It is probable that this charge grew out of the fierce persecution which was carried on by Gaiseric and his son against the Catholic Christians The bishops were almost universally banished, and the congregations were forbidden to elect their successors, so that the greater part of the churches of Africa remained "widowed" for a whole generation In 476, at the very close of Gaiseric's life, by a treaty concluded with the Eastern emperor, the bishops were permitted to return There was then a short lull in the persecution, but on the death of Gaiseric (477) and the accession of Hunneric it broke out again with greater violence than ever

On the death of Hunneric (484) he was succeeded by his cousin Gunthamund, Gaiseric having established seniority among his own descendants as the law of succession to his throne Gunthamund (484–96) and his brother Thrasamund (496–523), though Arians, abated some of the rigour of the persecution, and maintained the external credit of the monarchy On the death of Thrasamund, Hilderic (523–31), the son of Hunneric and Eudocia, at length succeeded to the throne He adhered to the creed of his mother rather than to that of his father; and, in spite of a solemn oath sworn to his predecessor that he would not restore the Catholic churches to their owners, he at once proceeded to do so and to recall the bishops Hilderic, elderly, Catholic and timid, was very unpopular with his subjects, and after a reign of eight years he was thrust into prison by his cousin Gelimer (531–534).

The wrongs of Hilderic, a Catholic, with the blood of the emperor Theodosius in his veins, afforded to Justinian a long-coveted pretext for overthrowing the Vandal dominion A great expedition under the command of Belisarius reached Africa in the beginning of Sept 533 A large force of Vandals was then occupied in Sardinia under Gelimer's brother Tzazo, and the landing of Belisarius was entirely unopposed He marched rapidly towards Carthage and on Sept 13, defeated Gelimer at Ad Decimum, 10 m from Carthage Next day he entered Carthage and ate the feast prepared in Gelimer's palace for its lord Belisarius, however, was too late to save the life of Hilderic, who had been slain by his rival's orders as soon as the news came of the landing of the imperial army On the return of Tzazo from Sardinia a force was collected considerably larger than the imperial army, but the Vandals were defeated and Gelimer took to flight He took refuge in a mountain fortress called Pappua on the Numidian frontier, and there, after enduring great hardships in the squalid dwellings of the Moors, surrendered to his pursuers in March 534. The well-known stories of his laughter when he was introduced to Belisarius, and his chant, "Vanitas vanitatum," when he walked before the triumphal car of his conqueror through the streets of Constantinople, probably point to an intellect disordered by his reverses and hardships The Vandals who were carried captive to Constantinople were enlisted in five squadrons of cavalry and sent to serve against the Parthians under the title "Justiniani Vandali." Four hundred escaped to Africa and took part in a mutiny of the imperial troops, which was with difficulty quelled by Belisarius (536). After this the Vandals disappeared from history The overthrow of their kingdom undoubtedly rendered easier the spread of Saracen conquest along the northern shore of Africa in the following century. (F G M B, T H)

Schmidt, *Geschichte der Wandalen* (Leipzig, 1901).

VANDAMME, DOMINIQUE RENÉ, Count (1770–1830), French soldier, was born at Cassel, near Dunkirk, on Nov. 5, 1770. He enlisted in the army in 1786, served in Martinique in 1788 and on returning to France entered into the Revolutionary movement, raising a company of light infantry. He was rapidly promoted and after Hondschoote he was made general of brigade, serving in the Low Countries (1794), on the Rhine (1795) and in Germany (1796). In 1799 he was promoted general of division, and served in Holland, Germany and Switzerland. He was a devoted servant of Napoleon In 1805, for his leadership at Austerlitz, he was given the Grand Eagle of the Legion of Honour, and in 1806–07 he commanded a small corps of the *Grande Armée* which reduced the Silesian fortresses In 1808 he was made count of Unebourg In 1809 he served in the Eckmuhl campaign, but in 1812, while commanding the Westphalian contingent he quarrelled with King Jerome Bonaparte and returned to France. He returned to the army in 1813, but his corps, sent against the line of retreat of the Allies at the battle of Dresden, was surrendered at Kulm (*See* Napoleonic Campaigns) At the end of the war he was forbidden to enter Paris When Napoleon returned Vandamme joined him and was made a peer of France and placed at the head of the III corps in the Army of the North (*See* Waterloo Campaign) The Restoration first imprisoned and then exiled him. He died at Cassel on July 15, 1830.

VANDERBILT, CORNELIUS (1794–1877), American capitalist, was born near Stapleton, Staten island (N Y), on May 27, 1794. At the age of 16 he bought a sailboat, in which he carried farm produce and passengers between Staten island and New York, in 1813 carrying supplies to fortifications in New York harbour and the adjacent waters, and in 1817–29 he was a captain on a steam ferry between New York and New Brunswick. He developed an extensive carrying trade along the coast in a fleet which became so large as to win for him the popular designation of "Commodore " In 1849 he got from the Nicaraguan Government a charter for a route across the isthmus In 1855–61 he operated a freight and passenger line between New York and Havre. In 1857–62 he sold his steamships and turned his attention to railways In 1857 he became a director, and in 1863 president, of the New York and Harlem Railway.

He then acquired a controlling interest in the Hudson River Railway, of which he became president in 1865; and in 1868 he became president of the New York Central (between Albany and Buffalo), which in 1869 he combined with the Hudson River Road, under the name of the New York Central and Hudson River Railroad. His acquisition of the Lake Shore and Michigan Southern Railway in 1873 established a through line between New York and Chicago At the time of his death (in New York city on Jan. 4, 1877) he controlled the New York Central and Hudson River, the Lake Shore and Michigan Southern, the Harlem, and the Canada Southern railways, and had holdings in many others. He endowed Vanderbilt university.

His eldest son, William Henry Vanderbilt (1821–1885), was born in New Brunswick (N J.), on May 8, 1821. He was a clerk in a New York banking house from 1839 to 1842. In 1860 he was appointed receiver of the Staten Island Railway, of which he was elected president in 1862, and which he brought into connection with New York by means of a line of ferry-boats. He became vice president of the Hudson River Railway in 1865, vice president of the New York Central and Hudson River Railroad in 1869, and president in June 1877, succeeding his father as president of the Lake Shore and Michigan Southern, the Canada Southern, and the Michigan Central railways. He died in New York City on Dec. 8, 1885.

William Henry's eldest son, Cornelius (1843–1899), became assistant treasurer of the Harlem Railway in 1865, and treasurer in 1867; in 1877, after the death of his grandfather, he was elected first vice president of the New York Central, and in 1878 became treasurer of the Michigan Central and vice president and treasurer of the Canada Southern. In 1883 he became chairman of the boards of directors of those two systems.

See W. A. Croffut, *The Vanderbilts and the Story of their Fortune* (Chicago, Ill, 1886), D. W Cross, "The Railroad Men of America," in *Magazine of Western History*, vol viii. (Cleveland, Ohio, 1888), and Burton J Hendrick, "The Vanderbilt Fortune," in *McClure's Magazine*, vol. xxxii. (1908-1909).

VANDERGRIFT, a borough of Westmoreland county, Pennsylvania, U S.A , on the Kiskimminetas river and the Pennsylvania railroad, 20 m N E of Pittsburgh. Pop (1920) 9,531 (85% native white). It is in a farming and coal-mining region, which also has gas wells; and the borough manufactures sheet iron, tin plate and other commodities.

VANDERLYN, JOHN (1776–1852), American artist, was born in Kingston (N.Y.), on Oct 15, 1776. He was employed by a print-seller in New York, and was first instructed in art by Archibald Robinson (1765–1835), a Scotsman who was afterwards one of the directors of the American Academy. He copied some of Gilbert Stuart's portraits, including one of Aaron Burr, who placed him under Gilbert Stuart as a pupil. In 1796 Vanderlyn went to Paris, and in 1805 to Rome, where he painted his picture of "Marius amid the Ruins of Carthage," which was shown in Paris, and obtained a gold medal there. This success caused him to remain in Paris for seven years, during which time he prospered greatly. In 1812 he showed a nude "Ariadne" (engraved by Durand, and now in the Pennsylvania Academy), which increased his fame When Aaron Burr fled to Paris, Vanderlyn was for a time his only support Vanderlyn returned to America in 1815, but did not meet with success, he worked very slowly, and neither his portraits nor various panorama which he exhibited brought him any considerable financial return In 1842, through friendly influences, he was commissioned by Congress to paint "The Landing of Columbus" for one of the panels in the rotunda of the Capitol at Washington Going to Paris, he employed to assist him a French artist, who, it is said, did most of the work He died at Kingston (N Y), on Sept. 23, 1852.

VAN DER STAPPEN, CHARLES (1843–1910), Belgian sculptor, was born in Brussels, September 1843 His first contribution to the Brussels Salon was "The Faun's Toilet" of 1869, and after this he soon became recognized as the leader, along with Paul de Vigne, of the new Belgian school of sculpture which, while remaining true to life, drew inspiration from Greek art and the Italian renaissance. Examples of Van der Stappen's decorative sculpture are seen in the decoration on the Palais des Postes, Brussels (1872), the pediment "Orchestration" for the Conservatoire de Musique, and the noble bronze group, "The Teaching of Art," on the façade of the Palace of Fine Arts, Brussels. He also executed the statues for the Alhambra Theatre and the caryatides for the house of the architect M de Curté (1874) His best-known monuments are those to "Alexandre Gendebien" (1874) and "Baron Coppens," at Sheel (1875).

See *Charles van der Stappen*, by Camille Lemonnier; *Les Artistes belges contemporains* (1896) by E L de Taeye; *The Renaissance of Sculpture in Belgium*, by O G. Destrée (London, 1895); *Charles van der Stappen*, by A. Goffin (1911).

VANDERVELDE, EMILE (1866–) Belgian statesman, was born on Jan. 25, 1866 at Ixelles near Brussels. He studied law at Brussels university and in 1885 took his doctorate in social science. In the following year he joined the Belgian Labour Party and soon became its acknowledged leader. He first entered parliament in 1894 as Socialist member for the Charleroi constituency, but after 1900 was returned continuously by Brussels. In the chamber he achieved both influence and prestige and played a prominent part in the struggle to attain universal suffrage, a struggle which resulted in more than one national general strike. On the outbreak of the World War, Vandervelde devoted himself to the problems of national defence, the liberation of his invaded country, and in Aug. 1914 was summoned to join the Government

as minister of state, later becoming member of the cabinet At the time of peace negotiations and the signing of the Versailles Treaty, he used his influence to obtain the insertion of labour clauses, relating especially to the eight-hour day. As minister of justice in the "Liberal-Catholic-Socialist" cabinet formed after the war, Vandervelde effected great humanitarian and scientific reforms in the prison system. After the important successes achieved by the Labour Party at the general elections of 1925 he entered the "Socialist-Catholic Coalition" cabinet as minister for foreign affairs and played an important part in negotiating the Locarno Pact in 1925, which he signed on behalf of Belgium. He retained the portfolio of foreign affairs in M. Jaspar's ministry of "National Unity." He had come to be regarded abroad as well as in Belgium as essential in Belgian foreign policy, partly because of his success at Locarno and the high esteem in which he was held by his foreign colleagues at Geneva. But he was constantly subjected to criticism because of his genuine internationalism, and early in 1927 he had some difficulty in soothing his non-Socialist critics In internal politics he fought for a reduction of the term of military service to six months and thorough reorganization of the army system. This attitude of the Socialist members of the Jaspar cabinet was the immediate cause of its fall, it was reorganized by Jaspar without the participation of Vandervelde and the Socialists.

Considered by some to be the most powerful Socialist orator in the French language since the death of Jaurès, Vandervelde has played a very conspicuous rôle in all the international Socialist congresses since the beginning of the present century In 1924 Vandervelde was made professor of political economy at the University of Brussels

BIBLIOGRAPHY—Among his works are *Le socialisme en Belgique,* with J. Destrée (1898), *Le collectivisme et l'évolution industrielle* (1900, trans by R P. Farley 1907), *Essais sur la question agraire en Belgique* (1902), *La Belgique et le Congo* (1911), *La grève générale en Belgique, avril 1913* (1914), *Le socialisme contre l'état* (1918), *Réalisations socialistes* (1923), *Le parti ouvrier belge, 1885–1925* (1925)

VAN DER VLUGT, W. (1853–), Dutch professor of jurisprudence, was born on March 12, 1853, and educated at Haarlem and at Leyden university He was appointed professor of the philosophy and the encyclopaedia of jurisprudence at Leyden university and was named emeritus professor on his retirement in 1923 He sat for four years (1902–06) in the second chamber of the States General

His numerous publications include *Transvaal versus Great Britain* (1889); *La Question des Iles d'Aland* (1921), and a number of lectures, addresses and articles for various periodicals In 1925 was published part of an introductory volume to his lectures on the encyclopaedia of jurisprudence

VANDEVELDE or **VAN DE VELDE,** name of a family of Dutch artists active during the 17th century The most notable members were.—

ADRIAN VAN DE VELDE (1636–1672), landscape and animal painter, born at Amsterdam in Nov 1636 He was a son of Willem Van de Velde I (*q v.*) He was trained in the studio of Jan Wynants, where he made the acquaintance of Philip Wouwerman, who seems to have helped him with his studies of animals He was employed by his master to introduce figures into his landscapes, and he rendered a similar service to Hobbema, Ruysdael, Verboom and others; for he knew well how to subordinate the figures and make them take their place in landscape compositions His favourite subjects are scenes of open pasture land with sheep, cattle and goats, admirably drawn and with clear, silvery colouring He also painted a few excellent winter scenes with skaters, and executed a Passion series for the Spinhuiskerk at Amsterdam (now in the parsonage of the Augustinian church "De Ster"). In addition to his paintings, of which de Groot catalogues 387, he made about 30 etchings; they are distinguished by a pleasing tonality, and by delicacy and certainty of touch. He died at Amsterdam on Jan 21, 1672.

JAN VAN DE VELDE II. (1593–after 1641), an engraver who excelled in portraiture, genre and biblical scenes, and views of towns and landscapes There are 429 engravings by him extant. He was a brother of Willem Van de Velde I. (*q.v.*)

WILLEM VAN DE VELDE I. (1611–1693), a celebrated draughtsman of ships, born at Leyden He was employed by the Dutch Government to depict sea-fights, and for that purpose accompanied the Dutch fleet during the war with England He went to England in 1672 with his son, WILLEM VAN DE VELDE II (1633–1707), a native of Amsterdam, and pupil of his father and of the marine-painter, Simon de Vlieger Both artists were employed by Charles II, and afterwards by James I, at a salary of £100 each "for taking and making draughts of sea-fights," the son's part being to reproduce in colour the drawings of the father Willem the elder died at Greenwich in 1693 His epitaph in St. James's church records that he was "a painter of sea-fights to their Majesties" Willem the younger was made court painter in 1677 His first works represent views off the coast of Holland, with Dutch shipping He died in London on April 6, 1707.

VAN DE VELDE, HENRI (1863–), Belgian architect, was born at Antwerp in 1863 After studying in Brussels he went in 1892 to Paris where he interested himself in contemporary artistic movement At the beginning of the 20th century he spent some considerable time in Germany, where he founded the present Dessauer Bauhaus at Weimar He built in that country the Fakwang museum, Hagen (1901); the Haus Esche, Chemnitz (1903), the interior decoration and furniture of which he also designed; the Kunstgewerbliches Institut, Weimar (1906), the Ernst Abbe monument, Jena (1910), and the Werkbund theatre, Cologne (1914) During this period he interested himself very deeply in decorative art, and is now director of the Institute of Decorative Arts in Brussels, and professor at the University of Ghent. Although Van de Velde has been markedly receptive and encouraging to new ideas and tendencies, his own work is not only loosed from tradition but singularly personal and unaffected by contemporary doctrine His publications include *Die Renaissance im modernen Kunstgewerbe* (1901) and *Der Neue Stil im Frankreich* (1925)

See G A Platz, *Baukunst der neuesten Zeit* (1927).

VAN DYCK, SIR ANTHONY (1599–1641), Flemish painter, was born in Antwerp on March 22, 1599 Though the name of Van Dyck is frequently met with in the list of Antwerp painters, Anthony's pedigree cannot be traced beyond his grandparents, who were silk mercers of some standing He was the seventh of twelve children of Frans Van Dyck, an Antwerp merchant His mother, Maria Cupers, who died when he was eight years of age, attained a certain degree of excellence in art needlework The boy was little over ten when he was apprenticed to Hendrick Van Balen, the painter of many delicate little pictures and the master of Snyders From a document in the state paper office at Brussels, relating to a lawsuit between a picture dealer and an Antwerp churchman, which arose out of the sale, in 1660, of a series of Apostles' heads ascribed to Van Dyck, it appears that, as far back as 1615, Van Dyck had worked independently, with pupils of his own, and that his pictures were greatly valued by artists and amateurs Professor Woermann has identified several of the Apostles' heads here spoken of with some paintings in the gallery at Dresden Others probably belonging to a second series executed by pupils and retouched by the master are in the possession of Earl Spencer at Althorp

Early Works.—Before he was nineteen (February 1618) Van Dyck became a full member of the Antwerp gild of painters, and some idea of his ability at the time may be gained from the excellent portraits of an old lady and gentleman, formerly ascribed to Rubens, in the Dresden gallery But the same admiration cannot be accorded to the earliest religious composition known to have been painted by him—"Christ falling under the Cross," in St Paul's at Antwerp At first sight it seems also that with him, as with most other Flemish painters of the period, every conception, whether sacred or profane, needed to be cast in the mould of Rubens It would be too much, however, to assert that Van Dyck at this time stood under the guidance of that master; their association, indeed, does not seem to have begun until 1619, and Bellori (1672), who got his information from Sir Kenelm Digby, Van Dyck's bosom friend, tells us that he was first employed in making drawings (probably also chiaroscuros) for the use of the great master's engravers, and that

among works of the kind one of the first was the "Battle of the Amazons" (1619).

In 1620 Van Dyck was working with Rubens, for on March 20, in making arrangements with the Antwerp Jesuits for the decoration of their church, the master is allowed to avail himself of his pupil's assistance, and obtains for him the promise of a picture Van Dyck left for England in the autumn of 1620. There is evidence in the order books of the exchequer of Van Dyck's presence in London till the end of February 1621. What Van Dyck did in London is not known That he was at the time a portrait painter of the rarest merit may easily be seen from the portrait of "Van der Geest" in the National Gallery (London), and from his own likenesses of himself when still quite young and beardless, in the National Gallery, in the Pinakothek at Munich and, as Paris, in the Wallace Collection

Residence in Italy.—Van Dyck's next journey was to Italy He left Antwerp on Oct. 3, 1621, and arrived at Genoa on Nov 21. Though Van Dyck unquestionably first became acquainted with the masterpieces of the great Venetian colourists in Rubens's *atelier*, most of the pictures which were formerly ascribed to his earliest period probably date from the years of his Italian journey In fact, studies for some of them can be found in the Chatsworth sketch-book Among these early works are the "Martyrdom of St Peter" (Brussels), the "Crowning with Thorns" (Berlin), and the "Betrayal of Christ" (Madrid, a replica formerly Lord Methuen's is now in America) A sketch of the same subject is at Doughty House, Richmond), "St Martin dividing his Cloak" (Windsor Castle),—a magnificent production On a reduced scale, and with the omission of two or three figures, the "St Martin" at Saventhem church is a reproduction of the picture at Windsor Castle

With the exception of a short visit to Antwerp at the time of his father's death in 1622, Van Dyck spent the next five years in Italy There can be no doubt as to the great influence exerted by the works of Titian, Paul Veronese and other masters of the Venetian school in the development of his genius, still the individuality of the painter remains a striking feature of what may be termed his Italian works, especially portraits Their peculiar character seems to originate even more in the stateliness of his sitters than in any desire to follow individual predilection or prevailing fashion It is difficult to trace with certainty the course of the artist's travels in Italy He made a prolonged stay at Venice; at Rome, he resided with Cardinal Guido Bentivoglio, who had been papal nuncio in Flanders from 1607 to 1617 For this patron were painted several important works, the most renowned being the prelate's own portrait, now in the Pitti Palace at Florence Another work was a "Crucifixion" spoken of by Bellori—but which cannot be identified with certainty among the many replicas of the subject existing at Antwerp Genoa, Vienna and Munich He also painted religious subjects and portraits, such as the portrait of Duquesnoy, better known as Fiammingo, the famous sculptor, and those of Sir Robert Shirley and his wife, in Persian attire In the company of Lady Arundel he travelled to Turin, but he was eager to reach Genoa here he probably painted the portraits of Luke and Cornelis de Wael, now in the Pinacoteca Capitolina at Rome (a monochrome replica at Cassel) Genoa can still boast of a good number of his most attractive productions, portraits of the beautiful ladies and haughty cavaliers of the noble houses of Doria, Brignole Sale, Pallavicini, Balbi, Cattaneo, Spinola, Lommelini and Grimaldi It would scarcely be possible to speak too highly of such works as the portrait of the lady in white satin and the Durazzo children at the Durazzo Palace, the Balbi children from Panshanger now lent to the National Gallery, the Marchesa Balbi, formerly at Dorchester House, the equally beautiful portraits of the Lommelini and of the knight in black armour, buff jacket and boots in the Scottish National Gallery at Edinburgh, or the Marchesa Brignole Sale (Warwick Castle). Van Dyck's Genoese portraits are remarkable for their richness of tonality and what might be called royal splendour, perhaps never before attained in works of the kind. This we may suppose to have had its origin, not only in his recent study of Titian but also in decorative necessities—the size of the palatial galleries and the rich hues of the Genoese velvets, on which these portraits were to find their place, obliging the painter to find a most uncommon strength of contrast In Italy, moreover, he found those gorgeous backgrounds—flowing draperies, beautiful gardens, ornamental pillars, marble terraces and balustrades—which elsewhere must be regarded as fictions merely. Here, finally, he was called upon to paint some of his grandest equestrian portraits, and the often-recurring grey steed with flowing mane (an admirable study of which belongs to Lord Brownlow) was first employed for the portrait of Antonio Giulio Brignole (still at Genoa) As with Rubens, Titian seems to have been paramount in Van Dyck's regard We know he possessed copies of the master's best works, and several little sketches in the British Museum and in the Chatsworth sketch-book bear proof of his devout study of the great Venetian Some of Van Dyck's earlier paintings, religious and mythological—the "Tribute Money" (Palazzo Bianco), "Holy Family" (Turin), "Virgin and Saints" (Louvre), "Virgin" (Grosvenor House), are certainly Titianesque in the extreme

In 1624 Van Dyck sailed from Genoa to Palermo and there painted several persons of rank, including the viceroy, Emmanuel Philibert of Savoy While in Sicily he became acquainted with the painter Sofonisba Anguisciola (or Angussola), who was then ninety-six years of age and blind, and he was wont to say that he had received more valuable information from a blind woman than from many a seeing man There is a "Virgin and Child" by Van Dyck at S Caterina in Palermo, and a "Virgin and Child with Saints" in the same city Bellori tells us that plague compelled him to leave abruptly, taking with him an unfinished picture of St Rosalia completed in Genoa The composition was repeated in Antwerp for the Bachelor's Brotherhood, a picture now in Vienna Van Dyck most probably remained in Genoa till 1626, and here in all likelihood he painted the De Jodes, father and son the celebrated engravers, who are represented together in a masterly portrait in the Capitol at Rome

Traversing the Mont Cenis pass, Van Dyck stopped at Aix with Peiresc, the famous scholar and friend of Rubens, and probably proceeded straight to Antwerp His beautiful portrait of Langlois, the Paris print-seller, from which it was conjectured that he spent some time at Paris, was unquestionably painted in Genoa By March 3, 1628 he was back at Antwerp One of his sisters had died in a convent the year before, and he now made a will in favour of Susan and Isabella, two other sisters, also nuns That Van Dyck was in Antwerp on May 18, is proved by a letter from Lord Carlisle to Buckingham (Sainsbury, ciii).

The Antwerp Period.—Great as may have been the strength of Italian reminiscence, from the moment Van Dyck again trod Flemish soil the influence of Rubens became predominant Among the earliest works after his return to Antwerp is the "Crucifixion," given to the Dominican nuns, in accordance with the wish expressed by the painter's dying father, and now in the Antwerp museum. The figures are life-size, and at the foot of the cross, besides a weeping angel, are St. Catherine of Siena and St Dominic Neither in type nor in general effect does it suggest the master's immediately preceding works. As a new feature we observe a kind of elegance, not entirely free from mannerism, which is often conspicuous with Van Dyck even when the technical excellence commands our warmest admiration Inspiration was far more limited with Van Dyck than with Rubens His delicate nature led him to restrain his conceptions within the bounds of an academic evenness To Van Dyck's second—more justly speaking third—manner belong some of his best religious works. The "Crucifixion" in the cathedral at Mechlin is termed by Sir Joshua Reynolds one of the finest pictures in the world. Still finer are the two works painted for the Antwerp Jesuits and now at Vienna—"The Mystic Marriage of the Blessed Herman Joseph" and "St Rosalia Crowned by the Infant Saviour." To this period likewise belong the celebrated "Elevation of the Cross" at Courtrai and the "St. Augustine in Ecstacy," in the church of the Jesuits at Antwerp; the general effect of this last, according to Reynolds, is inferior to that of the beautiful engraving by De Jode, and also to the earl of Northbrook's mag-

nificent sketch. Van Dyck's Flemish portraits indicate, technically speaking, a further step towards perfection The darkness of the Genoese portraits has vanished; broad daylight now freely illuminates the model, and such works as the portraits of Francisco de Moncada (Louvre) and of the Count de Bergh (Prado) are perhaps as close to material excellence as any painting could be. The full-length likenesses of Philip Le Roy (1630) and his wife (1631) (Wallace Collection) and of Mary Louisa of Tassis (Prince Liechtenstein, Vienna) deserve to rank among the most beautiful portraits ever painted The "Snyders" at Castle Howard is regarded by Waagen as not inferior to the most celebrated Raphaels, Titians or Holbeins, and of almost equal excellence are the "Wife of Colin de Nole" in the Munich gallery, the "Lady and her Daughter" at the Louvre, and the "Lady in Black" at Cassel.

Rapidly rising to honour and wealth, Van Dyck shared with Rubens the official title of court painter, and he painted numerous portraits of the infanta in her monastic garb (Paris, Vienna, Turin, Parma etc) When Marie de Medici fled from France to Brussels (1631), she several times commissioned Van Dyck to paint her likeness, as well as those of Gaston of Orleans and his wife Margaret of Lorraine, and several of the personages of their court From Gerbier's letters we learn that Van Dyck at this time was contemplating a journey to England, and desired commissions from the infanta and the queen of France to take over their portraits as presents for the king and royal family He soon travelled to The Hague to paint the prince and princess of Orange and their son Early in 1632 Constantine Huygens, who was then living at The Hague, inscribes in his diary, "pingor a Van Dyckio " When, in March, Van Dyck sailed for England, he took these portraits with him

Settles in London.—Gerbier's letters show that the king had personally desired his presence in London As early as March 1629 Endymion Porter had been commissioned to order a picture from Van Dyck, "Rinaldo and Armida " The canvas, now belonging to the duke of Newcastle, is one of the master's finest creations Besides the title of painter in ordinary, and an annual pension of £200, he received a knighthood (July 5 1632) He rapidly achieved popularity, and, as Walpole says, his works are so frequent in England that to most Englishmen it is difficult to avoid thinking of him as their countryman

Few artists, whether in England or elsewhere, have more richly endowed their models with distinction of feature and elegance in bearing Charles I and Henrietta Maria, although pictured by several other painters, are known to posterity almost exclusively through Van Dyck, because of a particular power of expression and bearing which once seen, it is impossible to forget The artist was given a summer residence at Eltham Palace, and was frequently visited by the king at his studio at Blackfriars Portraits now followed each other with great rapidity His mode of living and his love of pleasure sufficiently explain his great need of money. During his first year in England he painted the king and queen a dozen times The first of these noble portraits is the admirable full-length of Charles I, with the queen and their two eldest children, at Windsor Castle The style he adopted in England is generally termed his third manner; we might better say his fourth, as he already had a very particular style before he set out on his Italian journey. De Piles gives us some account of Van Dyck's methods at this period of his career He began with a small sketch on grey paper with black and white chalks, or a monochrome in oils. This study was passed on to assistants in order to be copied on the required scale When the clothes were sufficiently advanced by the pupils from those sent by the model, as well as the background and accessories, the master was enabled in a few sittings of an hour each to complete the work Van Dyck excelled in painting the hands; he is said to have kept special models for this part of his work. It need hardly be said that a system of this kind, although employed by Rubens for his larger creations, was exceedingly ill adapted to portrait painting In Van Dyck's later productions we too often detect marks of haste, as if the brush were becoming a mere implement of trade

Visit to the Netherlands.—Nearly the whole of 1634 and 1635 were spent by Van Dyck in the Netherlands, whence his brother, an Antwerp priest, had been called over by the queen to act as her chaplain. The archduchess died Dec. 1, 1633, and Van Dyck wished to get his official title renewed by her successor, Ferdinand of Austria, brother of Philip IV On the arrival of the new governor Van Dyck was immediately called upon to paint his likeness (Madrid gallery). Another portrait of Ferdinand on horseback belongs to Mr Mainwaring, Oteley Park, Shropshire The most important of Van Dyck's works, at any rate as a portrait painter, belong to this period The picture representing in life-size the members of the Brussels corporation, which was destroyed by fire during the siege of 1695, is spoken of with intense admiration by several writers Bullart, for instance, is very enthusiastic about its fine colour and life-like qualities Among the religious paintings of undisputed excellence belonging to the same period are the "Adoration of the Shepherds" in the church at Termonde, and the "Deposition," where the body of Christ rests upon the lap of the Virgin, in the Antwerp museum Among the portraits are the admirable full-length of Scaglia, the king's frequent agent in the Netherlands (formerly at Dorchester House), the equestrian portrait of Albert of Arenberg (Holkham Hall), and a portrait of the same nobleman on foot, in the black velvet Spanish dress with golden chamberlain's key (Althorp), an admirable half-length of a lady in black (Vienna gallery), and above all the grandiose picture in which John of Nassau is represented at full-length, with his wife and children.

Returns to London.—After being chosen honorary president of the Antwerp gild of St Luke, Van Dyck returned to London before the end of 1635 In spite of the vast number of his later portraits, some of them deserve to be ranked among the most celebrated of his productions The group of three English royal children in the gallery at Turin (1635), the portraits of Charles I in the Louvre and in the National Gallery, London the picture of the Pembroke family at Wilton House, Sir George and Sir Francis Villiers at Windsor and in the National Gallery and the earls of Bristol and Bedford, at Althorp, all belong to the years following the master's return from the Netherlands

He married, about the end of 1639, Lady Mary Ruthven, daughter of Sir Patrick Ruthven and granddaughter of the earl of Gowrie There are several portraits of her by her husband, the most important being in the Munich gallery, in which she is represented in white satin, playing on the violoncello There is a capital engraving of her by Bolswert In another picture (J C Harford, London) a handsome lady said to be Mary Ruthven, is represented as "Herminia Putting on Clarinda's Armour" There can be no doubt as to the model having been Margaret Lemon, a celebrated beauty, whose portrait was engraved by W Hollar and J Morin and painted by Van Dyck at Hampton Court She was the most beautiful and celebrated, though far from being the only mistress of Van Dyck

When the news of Rubens's death reached London (June 1640) Van Dyck contemplated a return to his native country, and a letter from Ferdinand of Austria to Philip IV speaks of his intended journey to Antwerp on St Luke's Day (Oct 18) Rubens had left unfinished a series of paintings commanded by the king of Spain, and Van Dyck had been thought of to give them the finishing touch But he refused It was then agreed that he should paint an independent canvas destined to complete the series Whether Van Dyck found it possible to work during his short stay in the Netherlands is doubtful It has been suggested that Van Dyck's principal object in travelling to the continent was to be entrusted with the decoration of one of the galleries of the Louvre Unfortunately the great painter was thwarted in his aspirations His health was beginning to fail

The portraits of William II of Orange and the Princess Mary, now in the museum at Amsterdam, are the last Van Dyck painted in England. Of works dated 1639 the portrait of the Countess of Portland (Darmstadt) is a fine example, and to the same year belongs a full-length portrait of Arthur Goodwin at Chatsworth. Van Dyck sailed in September, and probably spent some time with his Antwerp friends Early in November he reached Paris but on Nov 16 he was compelled to resign his commissions

on account of the state of his health. Scarcely three weeks later (Dec. 9, 1641) he died at his residence at Blackfriars Van Dyck was buried in old St. Paul's, where a Latin inscription was placed on his tomb by Charles I

An elegy in Cowley's *Miscellanies* speaks, not only of the painter's talent, but of his amiable disposition We may perhaps point to the coincidence that a Mrs. Cowley is in Van Dyck's will (of Dec '1) named guardian of his child, Justiniana Anna, born only eight days before her father's death The painter had in the Netherlands an illegitimate daughter, Maria Theresia, who was entrusted to his sister, and to whom he bequeathed £4,000. Lady Van Dyck became the second wife of Sir Richard Pryse of Gogerddan in Cardiganshire. She was dead in 1645. Justiniana Van Dyck, who was married when scarcely twelve years old to Sir John Stepney of Prendergast, painted a "Crucifixion," with four angels receiving Christ's blood in chalices After the Restoration a pension of £200 for life was granted to Justiniana Van Dyck, who died before 1690

Properly speaking, Van Dyck cannot be said to have formed a school He was followed to London by some of his earlier collaborators, and there soon met a considerable number of others. Jan van Reyn, David Beek, Adrian Hanneman, Mathew Merian, John Bockhorst (Lang Jan), Remy van Leemput and Peter Thys were foremost among foreigners, Henry Stone and William Dobson among Englishmen To their assistance the master owed much; but they are also responsible for the vast number of constantly recurring copies which go by his name. It often requires a very discriminating eye to distinguish some of these copies from the original paintings. No school more strikingly reflects the influence of Van Dyck than the British school. Stone, Dobson, George Jameson, Robert Walker and Samuel Cooper were the most fortunate of his continuators, and such masters as Reynolds, Gainsborough, Lawrence and Raeburn owe much to their study of his works

Though Van Dyck's reputation greatly suffered through the numerous copies he allowed his pupils to take from his works, the case is otherwise with engraving. Vorsterman, Pontius, Peter de Jode, P Balliu and S Bolswert were seldom more fortunate than when under his guidance. De Jode's "St. Augustine," Bolswert's "Ecce Homo" and "Crucifixion," Vorsterman's "Deposition," and especially Pontius's "Herman Joseph" rank among the masterpieces of the art of engraving Van Dyck was himself an incomparable etcher. The art of portrait etching, scarcely in existence before his time, reached the highest point of excellence in his work. He etched some 18 plates for a collection of portraits generally called "the Iconography" Such prints as the portraits of Vorsterman, John de Wael, Snyders, Josse de Momper, Adam van Noort, and above all his own effigy, display a manner fresh and personal admirably suited to the medium Print collectors pay extravagant prices for a first proof taken from the plates engraved by Van Dyck himself Van Dyck also employed some of the best engravers of his time for this collection of illustrious heads Whether the whole series had been published before 1645 when it was issued by Hendrick is uncertain Martin van der Enden, whose name appears on some of the plates was probably only a printer, who issued the plates separately as the work proceeded Hendrick's edition contains 99 plates. He used as a frontispiece the portrait of Van Dyck, with the following inscription. *Icones principum, virorum doctorum, &c &c, numero centum ab Antonio Van Dyck pictore ad vivum expressae eiusq sumptibus aeri incisae*, 1645. Seventeen editions were published, the last in 1759, with 124 plates Many of the plates are the property of the French Government, and belong to the Chalcographie Nationale in Paris A relic of great importance is a sketch-book obviously used by the painter in Italy containing but few original compositions and chiefly studies of the Italian masters. This book, once in the possession of Sir Peter Lely, is now at Chatsworth.

VAN DYKE, HENRY (1852–), American writer, was born in Germantown (Pa.), Nov 10, 1852 He studied at the Brooklyn Polytechnic Institute, Princeton university (M A., 1876), the Princeton Theological School, and the university of Berlin In 1879 he entered the Presbyterian ministry, becoming pastor at Newport, Rhode Island; in 1883 he became pastor of the Brick Presbyterian Church, New York City. In this capacity his preaching gave him a national reputation

In 1900 he became professor of English literature at Princeton. During 1902–3 he served as moderator of the Presbyterian Church in the United States. In 1908–9 he was American lecturer at the Sorbonne In 1913 President Wilson appointed him minister to Holland and Luxembourg, but he resigned in 1917

Among his best works are his "outdoor essays," especially *Little Rivers* (1895) and *Fisherman's Luck* (1899). His short stories, notably *The Other Wise Man* (1896) and the collections *The Ruling Passion* (1901) and *The Blue Flower* (1902), were extremely popular. His other publications include *The Reality of Religion* (1884), *Days Off* (1907); *Out-of-Doors in the Holy Land* (1908), *Collected Poems* (1911); *Fighting for Peace* (1917), *The Valley of Vision* (1919); *Companionable Books* (1922), and (with Tertius Van Dyke) *Light My Candle* (1926).

VANE, SIR HENRY (1589–1654), English secretary of state, born at Hadlow, Kent, on Feb 18, 1589, was educated at Brasenose College, Oxford, entered Gray's Inn in 1606, and was knighted in 1611. He purchased various court offices, and sat in parliament for various constituencies from 1614 onwards Vane was sent on many foreign missions, and in 1630 became one of the king's chief advisers He was made a commissioner of the Admiralty in 1632 and for the colonies in 1636 He was one of the eight privy councillors appointed to manage affairs in Scotland on the outbreak of the troubles there, and on Feb 3, 1640, through the influence of the queen and of the marquis of Hamilton and in opposition to the wishes of Strafford, he was made secretary of state in the room of Sir John Coke.

In the Short Parliament, which assembled in April, it fell to Vane to demand supplies He proposed that the king should give up ship-money and receive in return twelve subsidies Parliament proved intractable and was dissolved on May 5 to prevent a vote against the continuance of the war with the Scots In the impeachment of Strafford, Vane asserted that Strafford had advised the king at a meeting of the privy council to employ the Irish army against England He was on bad terms with Strafford, who had opposed his appointment to office Vane was accused of collusion and treachery, and there is no doubt that he desired Strafford's removal, believing that his sacrifice would satisfy the demands of the parliament. Nevertheless, the charge that he deliberately compassed his destruction is not proved Suspicions of his fidelity, however, increased, and after accompanying the king to Scotland in August 1641, he was dismissed from all his appointments on Nov. 4, on Charles's return.

Vane immediately joined the parliament, he was placed on the committee for Irish affairs on Dec. 13, was made lord lieutenant of Durham on Feb 10, 1642, became a member of the committee of both kingdoms on Feb 7, 1644, and in this capacity attended the Scots army in 1645, while the parliament in the treaty of Uxbridge demanded for him from Charles a barony and the repayment of his losses. He adhered to the parliament after the king's death, and in the first parliament of the Protectorate he was returned for Kent, but the House had refused to appoint him a member of the council of state in February 1650 He died in 1654

VANE, SIR HENRY (1613–1662), English statesman and author, known as "the younger" to distinguish him from his father,

Sir Henry Vane (*q.v.*), was baptized on May 26, 1613, at Debden, Essex. After an education at Westminster, and at Magdalen Hall, Oxford, he was attached successively to the embassies at Vienna, Leiden and Geneva. He had already acquired strong Puritan views, and, in 1635, in order to obtain the free exercise of his religion, he emigrated to Massachusetts, where he was elected governor in 1636. After one year in office, he was defeated by Winthrop.

Vane returned to England in August 1637. He was made joint-treasurer of the navy with Sir W Russell in January 1639, was elected for Hull in the Short and Long parliaments, and was knighted on June 23, 1640 He at once became one of the leaders of the parliamentary party, and in 1643 he was the leading man among the commissioners sent to treat for a league with the Scots. Vane, who was bitterly opposed to the tyranny of the Presbyterian system, succeeded in getting the proposed bond between the parties termed the Solemn League and Covenant, and further in substituting the whole expression "*according to the word of God and* the example of the best Reformed churches" for the latter part alone He succeeded to the leadership of the party on Pym's death and was engaged in all the principal negotiations which followed His leadership ended when the Presbyterian party obtained the supremacy in parliament in 1646 During the subsequent struggle he was one of the six commissioners appointed to treat with the army by the parliament, and endeavoured to effect a compromise, but failed, being distrusted by both the Levellers and the Presbyterians His views of government may be studied in *The People's Case Stated*, written shortly before his death

In spite, however, of these free opinions, Vane still desired the maintenance of the monarchy and the constitution He supported the renewal of negotiations with the king and was appointed in 1648 one of the commissioners for the treaty of Newport. He showed a desire to come to terms on the foundation of toleration and a "moderate episcopacy," of which Cromwell greatly disapproved, and opposed the shaking off of the conferences He remained in retirement until after the king's death On Feb 14, 1649 he was placed on the council of state, though he refused to take the oath approving the king's execution Vane served on innumerable committees of importance, and was assiduous in his attendance. He furnished the supplies for Cromwell's expedition to Scotland, and was one of the commissioners to negotiate a union between the two countries He was a leading member of the committee dealing with foreign affairs, and in 1651 went on a secret mission to negotiate with Cardinal de Retz To Vane, as chief commissioner of the navy, belongs largely the credit of the victories obtained against Van Tromp.

In domestic politics Vane continued to urge his views of toleration and his opposition to a state church On Jan. 9, 1650 he brought forward as chairman the report of a committee for the reform of the franchise on the property basis, the disfranchisement of certain existing boroughs, and increased representation to the large towns, the sitting members, however, were to retain their seats But Cromwell desired an entirely new parliament and the supremacy of the army representation On April 20 Cromwell forcibly dissolved the Long Parliament while in the act of passing Vane's bill. On the latter's protesting, "This is not honest; yea, it is against morality and common honesty," Cromwell fell a-railing at him, crying out with a loud voice, "O Sir Henry Vane, Sir Henry Vane; the Lord deliver me from Sir Henry Vane!" (Ludlow, *Mem.* i 353) Hitherto they had lived on intimate terms of friendship, but this incident created a permanent breach In his seclusion at Raby he now wrote the *Retired Man's Meditations* (1655). In 1656 he proposed in *A Healing Question* (reprinted in the "Somers Tracts," vol vi, ed Scott) a new form of government, insisting as before upon a Puritan parliament supreme over the army The seditious movements of the Anabaptists were attributed to his influence, and on July 29, 1656 he was summoned before the council. Refusing to give security, he was a prisoner at Carisbrooke Castle from September to the end of the year. In the parliament of Richard Cromwell he was elected for Whitchurch, when he urged that the protector's power should be strictly limited.

He allied himself with the officers in setting aside the protectorate and in restoring the Long Parliament, and on Richard Cromwell's abdication he became a member of the committee of safety and of the council of state appointed in May, was commissioner for the navy and for the appointment of army officers, managed foreign affairs and superintended finance He adhered to Lambert, remained a member of the government after the latter had turned out the Long Parliament, and endeavoured to maintain it by reconciling the disputing generals and by negotiating with the navy, which first deserted the cause In consequence, at the restoration of the Long Parliament he was expelled from the House and ordered to retire to Raby.

At the Restoration, Vane was imprisoned in the Tower by the king's order After several conferences between the houses of parliament, it was agreed that he should be excepted from the indemnity bill, but that a petition should be sent to Charles asking that his life might be spared. The petition was granted. But the new parliament of 1661 demanded his trial on the capital charge, and Vane was taken back to the Tower in April 1662 from the Scilly Isles, where he had been imprisoned On June 2 he appeared before the king's bench to answer the charge of high treason, when he made a bold and skilful defence, asserting the sovereign power of parliament in justification of his conduct He was found guilty, and executed on June 14, 1662

VAN GOGH: *see* Gogh, Vincent van

VAN HORNE, SIR WILLIAM CORNELIUS (1843–1915), Canadian financier, was born in Will county, Illinois, U S A, Feb 3, 1843, of Dutch descent. He was educated in the common schools of the state, and in 1857 began work as office boy in a railway station. In 1881 he was appointed general manager of the Canadian Pacific railway. For the successful completion of this great road his strong will and mental grasp were largely responsible, and he controlled and extended its operations. In 1884 he became vice-president of the line, in 1888 president, and in 1899 chairman of the board of directors. After the Spanish-American War (1898) he became one of the chief promoters of railway and industrial enterprises in Cuba. He died at Montreal on Sept. 11, 1915

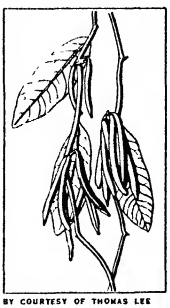
THE VANILLA VINE, AS IT IS CULTIVATED IN MEXICO

VANILLA, a flavouring agent largely used in the manufacture of chocolate, in confectionery and in perfumery. It consists of the fermented and dried pods of several species of orchids belonging to the genus *Vanilla.* The name of the genus comes from the Spanish *Vainilla,* a diminutive of *vaina,* a pod. The great bulk of the commercial article is the produce of *V planifolia,* a native of south-eastern Mexico, but now largely cultivated in several tropical countries, especially in Bourbon, the Seychelles, Tahiti and Java. The plant has a long fleshy stem and attaches itself by its aerial rootlets to trees; the roots also penetrate the soil The leaves are alternate, oval-lanceolate and fleshy; the light greenish flowers form axillary spikes The fruit is a pod from 6 to 10 in. long, when mature, about half an inch in diameter The wild plant yields a smaller and less aromatic fruit, distinguished in Mexico as *Baynilla cimarona,* the cultivated vanilla being known as *B. corriente.*

Mexican vanilla is principally consumed in the United States In Bourbon large areas are under cultivation, the crop is sent to Bordeaux, the chief centre of the trade in France. Its odour is

said to differ from the Mexican variety in having a suggestion of tonka bean

The best varieties of vanilla pods are of a very dark chocolate brown or nearly black colour, and are covered with a crystalline efflorescence technically known as *givre*, the presence of which is taken as a criterion of quality The peculiar fragrance of vanilla is due to vanillin, $C_8H_8O_3$, which forms this efflorescence. Chemically speaking, it is the aldehyde of methyl-protocatechuic acid It is not naturally present in the fleshy exterior of the pod, but is secreted by hair-like papillae lining its three internal angles, and ultimately becomes diffused through the viscid oily liquid surrounding the seeds Besides vanillin, the pods contain vanillic acid (which is odourless), about 11% of fixed oil, 2.3% of soft resin, sugar, gum and oxalate of lime



BY COURTESY OF THOMAS LEE

VANILLA (VANILLA PLANIFOLIA) BRANCH WITH FRUITS

Vanillin forms crystalline needles, melting at 81° C, and soluble in alcohol, ether and oils, hardly soluble in cold, but more so in boiling water Vanillin has been found in Siam benzoin and in raw sugar, and has been prepared artificially from coniferin, a glucoside found in the sapwood of fir-trees, from asafoetida, and from a constituent of oil of cloves named eugenol It is now prepared synthetically on a commercial scale in Germany

VANINI, LUCILIO, or, as he styled himself in his works, GIULIO CESARE (1585–1619), Italian free-thinker, was born at Taurisano, near Naples He studied at Rome, Naples, and at Padua, and was ordained priest Subsequently he led a roving life in France, Switzerland and the Low Countries

Vanini was obliged to flee from Lyons to England in 1614, but was imprisoned in London for some reason for forty-nine days Returning to Italy he made an attempt to teach in Genoa, but was driven once more to France, where he tried to clear himself of suspicion by publishing a book against atheists, *Amphitheatrum aeternae providentiae divino-magicum* (1615) Though the definitions of God are somewhat pantheistic, the book is sufficiently orthodox, but the arguments are largely ironical, and cannot be taken as expounding his real views Vanini expressly tells us so in his second (and only other published) work, *De admirandis naturae reginae deaeque mortalium arcanis* (Paris, 1616), which, originally certified by two doctors of the Sorbonne, was afterwards re-examined and condemned Vanini then left Paris, where he had been staying as chaplain to the maréchal de Bassompierre, and began to teach in Toulouse In Nov. 1618 he was arrested, and after a prolonged trial was condemned as an atheist He was burnt on Feb 9, 1619

VANLOO, CHARLES ANDREW (1705–1765), subject painter, a younger brother of John Baptist Vanloo (1684–1745), a well known portrait painter, was born at Nice on Feb 15, 1705. He received some instruction from his brother, and like him studied in Rome under Luti In 1734 he settled in Paris, and in 1735 became a member of the French Academy, and he was decorated with the order of St Michael and appointed principal painter to the king He died in Paris on July 15, 1765

VANNES, a town of western France, capital of the department of Morbihan, 84 m N W of Nantes on the railway to Brest. Pop (1926) 16,577. Vannes (*Dariorigum*), the capital of the Veneti (whence *Gwened*, the Breton name of the town), led the Armorican league against Julius Caesar, who in 56 B C overcame their fleet and opened up their country by six roads St. Paternus, the first bishop, was consecrated in 465 In the 5th century Vannes was ruled for a time by independent counts, but soon came under the yoke of the Franks Nomenoé the lieutenant of Louis I., the Pious, in Brittany, assumed the title of king in 843, and one of his brothers was the founder of a line of counts who resisted the Normans in the 9th and 10th centuries Vannes became part of the duchy of Brittany at the end of the 10th century The estates of Brittany met there for the first time in 1203. In the course of the War of Succession the town was besieged in 1342 Duke John IV built here the castle of L'Hermine and made it his habitual residence In 1487 the town was for a year in the hands of Charles VIII of France. In 1532 Brittany was definitively united to France

Vannes is situated 10 m from the open sea, at the confluence of two streams forming the Vannes river, which opens into the land-locked gulf of Morbihan about a mile below the town The old town, lying on a hill facing the south, is surrounded by fortifications of the 14th, 15th and 17th centuries, pierced by four gates and flanked by nine towers and five bastions, connected by battlements. In the Constable's tower Olivier de Clisson was confined in 1387 The modern suburbs, with the port and public buildings, surround the old town The archaeological museum includes one of the richest collections of prehistoric remains in Europe The cathedral of St Peter, burnt by the Normans in the 10th century, was rebuilt in the 13th, 15th and 18th centuries It has remains of a cloister The curious round Chapelle du Pardon to the left of the nave was built in 1537 in the Italian style Among the industries are tanning and cotton-weaving The port of Vannes, to the south of the town, is formed by the Vannes river and is accessible only to small vessels.

VAN RENSSELAER, STEPHEN (1764–1839), American political leader and soldier, "last of the patroons," was born at New York city, Nov. 1, 1764 He was fifth in descent from Killian Van Rensselaer, original patroon of Rensselaerwyk, New York He was a member of the New York assembly 1789–90, 1808–10, and in 1818; a member of the State senate 1791–95 and of the national House of Representatives 1822–29 He served as a major-general in the second war with Great Britain, commanding the First Division of the detached militia of the state of New York, and on the 13th of October 1812 was defeated at the battle of Queenston Heights As he was a Federalist he was severely criticised and censured for this defeat and resigned from the army At the close of the war the Erie Canal project was renewed, and from 1816 till his death he was a member of the board of canal commissioners, and for nearly fifteen years was its president In 1818 he was again elected to the Assembly, in 1819 he became a regent of the State university of which he was for a time chancellor From 1822 to 1829 he was a member of the National House of Representatives, and there voted for John Quincy Adams for the presidency He died at Albany (N Y), Jan 26, 1839

VANSITTART, HENRY (1732–1770 or 1771), Anglo-Indian governor, was born in London on June 3, 1732, and educated at Reading school and Winchester college He joined the society of the Franciscans, or the "Hell-fire club" at Medmenham In 1745 he entered the service of the East India company and sailed for Fort St David In 1760 he went to Bengal as president of the council and governor of Fort William, deposing the subadar of Bengal, Mir Jafar, he replaced him by his son-in-law, Mir Kasim In 1762 he made a treaty with Mir Kasim, checking the system of private trading by the company's servants. The repudiation by the council of this treaty led to war with the subadar, and Vansittart resigned and returned to England in 1764 In 1769 he was made a director of the company, and left England for India, but his ship was lost at sea in 1770 or 1771

VAN'T HOFF, JACOBUS HENRICUS (1852–1911), Dutch physical chemist, was born in Rotterdam on Aug. 30, 1852 He studied at the Polytechnic at Delft, at the University of Leyden, then under Kekulé at Bonn, Wurtz at Paris and, finally, with Mulder at Utrecht, where he obtained his doctorate. In 1876 he became lecturer in physics at the veterinary school, Utrecht, and in 1878 he was appointed professor of chemistry, mineralogy and geology in Amsterdam university. In 1896 he went to Berlin as professor to the Prussian academy of sciences but as this position involved no teaching duties he accepted an

honorary professorship in the university so that he might lecture if he wished. He was elected a foreign member of the Royal Society in 1897 and awarded its Davy medal in 1893; he received the Nobel prize in 1901 and died on March 1, 1911, at Steglitz.

Van't Hoff's first research was on cyanacetic and malonic acids but his earliest important contribution to science was made in 1874. Starting with the results of the work of Wislicenus (*q v*) on the lactic acids, van't Hoff showed that the four valencies of the carbon atom were probably directed in space towards the four corners of a regular tetrahedron; in this way optical activity, shown to be always associated with an "asymmetric carbon atom," could readily be explained An identical idea was put forward two months later (Nov 1874), quite independently, by J. A Le Bel, whose name is generally linked with that of van't Hoff in connection with the theory of asymmetric carbon. The concept was attacked by Kolbe (*q.v*), but its value was soon universally realized and it laid the foundation stone of the science of stereochemistry (*q.v*). In 1884 was published van't Hoff's second important work; it dealt with the application of thermo-dynamics to chemical reactions, and was probably his greatest contribution to physical chemistry He developed the principles of chemical kinetics, described a new method of determining the order of a reaction, and applied thermodynamics to chemical equilibria; in the course of this work he deduced the connection between the equilibrium constant of a reaction and the temperature, in the form of an equation known as the "van't Hoff isochore." He generalized this in the form of the "principle of mobile equilibrium," a special case of the principle developed by Le Chatelier at the same time (1884) In the course of the same study van't Hoff introduced the modern concept of chemical affinity as the maximum work obtainable as the result of a reaction and showed how it may be calculated from measurements of osmotic pressure, gas pressure and the e m f. of reversible galvanic cells. In 1886 he published the results of his study of dilute solutions and showed the analogy existing between them and gases, since both obey equations of the type pv = RT During the next nine years he developed this work in connection with the theory of electrolytic dissociation enunciated by Arrhenius (*q v*) in 1887 As part of this work he carried out a series of researches on the conditions of formation and decomposition of double salts, and on his translation to Berlin in 1896, he developed this into the important study of the formation of oceanic salt deposits with special reference to those at Stassfurt, Saxony With W Ostwald (*q v*) he started the important *Zeitschrift fur physikalische Chemie* in 1887 and the first volume contained the famous paper by Arrhenius on electrolytic dissociation. Van't Hoff's publications include *La Chimie dans l'Espace* (1875), German edition 1876, and English 1898; *Etudes de dynamique chimique* (1884), revised and extended by E Cohen as *Studien zur Chemischen Dynamik* (1896). *Vorlesungen uber Bildung und Spaltung Doppelsalzen* (1897); and *Zur Bildung der Ozeaniachen Salz ablagerangen* (i, 1905, ii, 1909)

See E Cohen, *Jacobus Henricus van't Hoff, Sein Leben und Werken* (Leipzig, 1912); also obituary notice in *Proc Roy Soc*, vol. 86

VAN WERT, a city of western Ohio, U S.A, the county seat of Van Wert county, on the Lincoln highway, 34 m S E of Fort Wayne (Indiana) It is served by the Cincinnati Northern, the Pennsylvania and electric railways Pop (1920) 8,100 (97% native white) It is in a rich grain-growing region, and has railroad shops and various other manufacturing industries. Van Wert was settled about 1840, incorporated as a town in 1848 and as a city in 1903

VAPEREAU, LOUIS GUSTAVE (1819–1906), French man of letters and lexicographer, was born at Orleans on April 4, 1819. After 1870 he was appointed prefect of Cantal (1870) and of Tarn et Garonne (1871–73) From 1877 to 1888 he was inspector-general of public instruction. He was the author of some excellent editions of the classics, and of works on political and social questions, but he is famous for his valuable *Dictionnaire universel des contemporains* (1858; 6th ed., 1893), brought up to date in 1895 by a supplementary volume. He also drew up a *Dictionnaire universel des littérateurs* (1876) He died in 1906

VAPHIO, an ancient site in Laconia, Greece, on the right bank of the Eurotas, some 5 m S of Sparta, famous for its "bee-hive" tomb, excavated in 1889 by Dr. Tsountas A walled approach, or δρόμος, about 97 ft long, leads to a corbel-vaulted chamber 33 ft. in diameter, in the floor of which the grave was cut The tomb, which probably belonged to Amyclae rather than to Pharis, as is commonly stated, is now almost entirely destroyed Its contents (in the National Museum in Athens) are typical of the "First Late Minoan" period (about 1500 B C) and include engraved gems and amethyst beads, articles in gold, silver, bronze, lead, amber and crystal; also an iron ring, unusual at this early date. By far the finest objects are two golden cups with scenes in relief, picturing the capture of bulls

See C Tsountas, Ἐφημερὶς Ἀρχαιολογική (1889), 136–172; J G. Frazer, *Pausanias's Description of Greece*, iii 135 f (with full bibliography), R C Bosanquet, *Journal of Hellenic Studies* (1904), xxiv. 317 ff, A Riegl, *Jahreshefte d osterr arch Institutes* (1906), ix. 1 ff

VAPORIZATION, a general term denoting the change of state of any substance from solid or liquid to vapour The converse change from vapour to liquid or solid is most often called condensation, though there are many other special terms employed in particular cases The general phenomena of change of state as affected by heat have been described in the article HEAT The most accurate methods of measuring the latent heat of vaporization or condensation are discussed in the article CALORIMETRY, and the application of the laws of thermodynamics to the subject is included in the article THERMODYNAMICS Important practical applications of the properties of vapours will be found in other articles, such as LIQUEFACTION OF GASES; DISTILLATION, STEAM, and STEAM-ENGINE, TURBINE The chief object of the present article is to discuss the *physical* explanation of the phenomena, and to show how the various properties of vapours can be represented by equations, so that the effects to be expected under any conditions can be calculated

Gases and Vapours.—In effect all gases may be regarded as vapours, since all may be liquefied and solidified under suitable conditions Conversely we should expect that all vapours would behave as gases under conditions sufficiently far removed from those at which the corresponding liquid can exist This is found to be the case for all stable vapours, which approximate more and more closely to the gas equation $aPV = RT$ as the temperature is raised or the pressure reduced In this equation V represents the volume occupied by unit mass at a temperature T on the absolute scale, and pressure P in any convenient units The constant a is the factor required for reducing PV to heat units, and the value of the constant R in heat-units per degree is $1{\cdot}985/m$, where m is the molecular weight corresponding to the chemical formula for the molecule of the vapour considered. At any temperature below the boiling-point of the liquid, if the volume of the vapour is reduced, the deviations from Boyle's law will seldom exceed 1 per cent But a sharp limit is set to the application of the gas equation by the *saturation-pressure* at which the vapour begins to condense The pressure then remains constant, as the volume is further reduced at constant temperature, until the whole of the vapour is condensed By experiments of this kind, Dalton established the law of saturation pressure, that for each vapour there is a unique relation between pressure and temperature defining the state in which alone the liquid and vapour can exist together in equilibrium

Empirical Formulae for Saturation Pressure

$\log p = A + BT$	Dalton, 1800
$\log p = C \log (A + BT)$	Young, 1820
$\log p = AT/(B + CT)$	Roche, 1830
$\log p = A + Bb^t + Cc^t$	Biot, 1844
$\log p = A + B \log t + C \log (T + c)$	Bertrand, 1887
$\log p = A - B/T - C(365 - t)^4/T$	Thiesen, 1903
$\log p = A - B/T - C \log t - DT + ET^2 + FT^3 + GT^4$	Goodenough, 1915

Biot's formula, though apparently the most ungainly and difficult to work, possesses some practical interest because it was adopted by Regnault (1847) for representing his observations on the saturation pressures of steam, which were made with a mercury manometer 70 ft high, and were much the most accurate

obtained for many years. In spite of the five empirical constants in Biot's formula, Regnault found it necessary to use different formulae above and below 100° C. At that time the laws of thermodynamics had not been elucidated sufficiently to permit their application to the problem, but some theoretical basis might have been expected in the case of the later formulae.

Theoretical Equation of Saturation Pressure.—The law according to which the saturation pressure of any vapour varied with the temperature was discovered by Carnot in 1824 by the direct application of his principle to the case of vaporization, and was first stated in the form —"The increase of saturation pressure per degree is equal to the latent heat per unit increase of volume in vaporization multiplied by a function of the temperature (Carnot's function) which is the same for all substances" The law could not be applied until the form of this function had been determined. Accordingly Carnot utilized the relation in the first instance for calculating values of his function from the very scanty and inaccurate data available for the latent heats of various substances. But this failed to give any conclusive result owing to the poverty of the data (*See* THERMODYNAMICS) Clapeyron (1834) first stated the equation in the analytical form in which it is generally known as Clapeyron's equation,

$$L\ F't = (V-v)\ (dp/dt)_s \qquad (1)$$

in which L is the latent heat of vaporization corresponding to the increase of volume $V-v$ from liquid to vapour, $F't$ is Carnot's function of the temperature and $(dp/dt)_s$ denotes the increase of the saturation pressure per degree Ultimately, as the result of Joule's experiments on the mechanical equivalent of heat, denoted by J, and of Regnault's experiments on the gas-scale of temperature, denoted by T, it gradually became obvious (*see* HEAT) that Carnot's function must be very nearly equal to J/T. The absolute scale of temperature T was accordingly defined on Kelvin's suggestion by the condition $T = J\ F't$, in which it is understood that the appropriate numerical value of J must be employed, depending on the units in terms of which heat and work are measured in the equation Putting a for $1/J$, Clapeyron's equation may be written in the form,

$$L/ap(V-v) = (T/p)\ (dp/dT)_s \qquad (2)$$

The expression on the left is the ratio of the latent heat L to the equivalent $ap(V-v)$ of the external work of vaporization in heat units. The expression on the right is the most convenient method of stating the rate of increase of saturation pressure with temperature, since it has the same numerical value, for a given substance under given conditions, in all systems of units. To find the expression for p in terms of T, we have merely to integrate equation (2) after substituting appropriate expressions for L and V in terms of p and T

Rankine (1851) was the first to show that the total heat of an ideal vapour reckoned from the state of liquid at 0° C should be $H = L_o + St$, where S is the specific heat of the vapour at constant pressure, and L_o the latent heat of vaporization at 0° C The total heat of the *liquid* reckoned from 0° C is simply $h = st$, where s is specific heat of the liquid, and is taken as constant Hence the latent heat L at any temperature t will be approximately,

$$L = H - h = L_o + (S-s)t \qquad (3)$$

If the vapour also satisfies the gas law, as is generally the case at low pressures, we may substitute $apV = RT$ in (2), and neglect v, which is generally less than a thousandth of V at atmospheric pressure Equation (2) then reduces to the simple form, $L/RT^2 = (dp/dt)/p$, which is easily integrated with the value of L from (3), and gives a theoretical equation for p,

$$\log_e p = A - B/T - C \log_e T \qquad (4)$$

where $B = L_o/R + (s-S)T_o/R$, $C = (s-S)/R$, and A is the constant of integration. This equation must necessarily give a good first approximation to the saturation pressures if the values of the constants L_o, s, and S are correct Thus in the case of steam, if we take $L_o = 594.3$, $s = 0.9967$ (the minimum specific heat of water) $S = 0.4772 = 13R/3$, equation (4) gives values at low pressures which are correct to 0·1° C at a temperature as high as 60° C. Beyond this point the approximation begins to fail, chiefly in the first instance because apV begins to deviate appreciably from the ideal value RT above assumed At 100° C the value of p given by (4) is already about 1·5% too small, corresponding to a defect of the same order of magnitude in the value of V This agreement verifies Clapeyron's equation (2), and the assumption $apV = RT$ at low pressures, as well as equation (3) for L, but it is necessary to obtain consistent expressions for the defect of both L and V from these ideal values before equation (4) can be extended to higher pressures. Rankine, who first gave a correct deduction of (4) (Trans R S.E. 1865), came to the conclusion that both L and V must show an increasing defect from their ideal values as the pressure increased, but he was unable to trace the required connection between them Equation (4) is generally attributed to Dupré (1869), who deduced it by assuming a linear formula for the latent heat, and used it as a purely empirical formula by calculating the coefficients from observations at high pressures Bertrand, in his treatise on Thermodynamics, followed the same course, which is necessarily unsatisfactory, because it does not comply with the theoretical conditions, or give the true relations of the constants B and C to L and S

Deviations of a Vapour from the Ideal State.—The manner in which a gas passes into a vapour and finally condenses, must be studied in the first instance by observing the gradual deviations from the gas law $aPV = RT$, as the pressure is increased The simplest way of doing this is to find the departure from Boyle's law at various constant temperatures, which gives the whole story if the range of temperatures is sufficiently extended Regnault (1847) was the first to make observations of this kind with sufficient accuracy in the case of CO_2 Rankine (1854) succeeded in representing these experimental results by a fairly simple equation in a convenient form,

$$P + A/V^2T = RT/aV \qquad (5)$$

The second term, in which A is an empirical constant, represents the deviations from the gas law, and tends to vanish when V or T is large. It is of the dimensions of a pressure, and may be interpreted as an internal pressure, varying as the square of the density, which is added to the external pressure P, and tends to reduce V below the ideal value According to Boyle's law, the product PV of the observed values of P and V at various pressures should be constant at each temperature at which observations are made, and should give a horizontal straight line when PV is plotted against P Equation (5) when plotted in this manner, gives a series of parabolas, each with its axis horizontal and its vertex at a height equal to half the initial value of PV This is easily seen by multiplying equation (5) by PV^2, which gives it in the form of a quadratic in (PV),

$$(PV)^2 - (PV)(RT/a) + AP/T = 0 \qquad (5)a$$

the two roots of which become equal when $P = RT/2aV$, and are imaginary at higher pressures The equation would evidently fail before this point was reached, but was found to be quite satisfactory for the restricted range of Regnault's experiments. It also represented his observations on the pressure-coefficient of CO_2 very closely, and Joule and Thomson found that it also satisfied their results for the cooling effect in expansion through a porous plug. They found however that (5) was very inconvenient in form for their purpose, because it gave P as a quadratic function of $1/V$, whereas they wanted V explicitly as a function of P They therefore transformed equation (5) by multiplying throughout by V/P, and making the approximation $PV = RT/a$ in the small term A/PVT, thus obtaining,

$$V = RT/aP - Aa/RT^2 \qquad (6)$$

The small term Aa/RT^2 is now of the dimensions of a volume, and may be interpreted as a first approximation to the reduction of volume A/PVT due to the internal pressure A/V^2T, as in equation (5). It also might be interpreted on the kinetic theory (which was expressly designed to explain the pressure of gases and vapours without assuming imaginary forces of attraction or repulsion between the molecules) as being due to a reduction in the

effective *number* of molecules per unit mass owing to the formation of multiple or complex molecules by coaggregation. This process is well known to occur in analogous chemical problems, where the proportions of different molecules existing in a gas mixture can be analysed and verified. On this view, the reduction of V below the ideal value RT/aP is due to a corresponding reduction in the number of *effective* molecules, and the formation of complex molecules is regarded as the first stage in the transition from the state of vapour to the state of liquid, in which nearly all the molecules are coaggregated. The reduction of volume Aa/RT^2 given by the Joule-Thomson equation (6) is a function of the temperature only, and should be a very good first approximation to the coaggregation at low pressures according to the kinetic theory. If the isothermals are plotted on the $PV-P$ diagram, they will all be straight lines, as is easily seen by multiplying (6) by P, so as to give the product PV. The slope of successive isothermals is proportional to $1/T^2$, and diminishes with rise of temperature. The diminution of slope with rise of temperature is to be expected on thermodynamic grounds, if the molecules combine with evolution of heat, which would afford the most natural explanation of the latent heat of condensation. The term A/PVT representing the reduction of volume according to Rankine's equation, though fitting exactly with the hypothesis of an internal pressure varying as the square of the density, might equally well represent the effect of coaggregation. We might expect that the complex molecules would begin to combine *with each other* as the proportion of such molecules in the mixture increased with increase of density, and that the slope of each isothermal would increase accordingly, giving the parabolic form (5)*a* in place of the rectilinear-isothermals given by (6). This is certainly true at high pressures near saturation, though the isothermals approximate more nearly to straight lines at temperatures above the critical point; but neither of these equations could be expected to apply to the liquid state, or even to the vapour in extreme cases, beyond the limits of the observations on which they were founded.

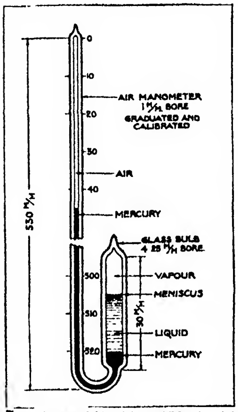

FIG 1.—BARON COGNIARD DE LA TOUR APPARATUS USED IN THE DISCOVERY OF THE CRITICAL POINT

The Continuity of State.—The theory of the continuity of state, which is now so familiar as an explanation of the relations between liquid and vapour, appears to have originated from the experiments of Andrews (*Phil Trans* 1869) on the properties of carbonic acid (CO_2) between the temperatures of 13° and 48° C, including the critical region. The vapour was confined in a capillary tube by a pellet of mercury, and the apparatus was arranged so that the volume could be varied by means of a screw plunger, while the tube was maintained at a steady temperature in a water bath. A similar capillary containing air subject to the same pressure was employed as a manometer (for details of apparatus *see* article LIQUEFACTION OF GASES). The isothermal curves obtained by plotting simultaneous values of P and V observed at the temperatures of 13·1°, 21·5°, 31·1°, 35·5° and 48·1° C, are shown in fig 1B. They showed the well known discontinuities, required by Dalton's law, at the commencement and conclusion of condensation, but the sharp corners were rounded off at these high pressures, and the pressure did not remain quite constant during condensation, but showed a rise of about 2 per cent attributed by Andrews to an impurity of about 2 parts of air in 1,000 of CO_2. The dotted line shown in the figure has been added to Andrews' original diagram to indicate the saturation lines for the liquid and vapour, meeting at the critical point 31·1°, with the critical isothermal as a common tangent. At any point within the dotted boundary, *e g*, at 21·5°, the fluid exists partly in the state of vapour and partly in that of liquid, in stable equilibrium with the vapour, as is usually observed during the condensation of a vapour by compression at constant temperature. But Andrews showed very conclusively that a vapour could be transformed into a liquid by a continuous process without any breach of homogeneity, or separation into the two states of liquid and vapour, provided that the change was effected along any path on the diagram which did not intersect the dotted boundary curve. Thus if the vapour were taken at a temperature of 48°, and at a pressure of 80 atmospheres, and were then cooled *at constant pressure* to a temperature of 13°, at which it was certainly liquid, the fluid remained homogeneous throughout the process, and showed no sign of separation into two states at any point. He concluded from these experiments that "The gaseous and liquid states are only widely separated forms of the same condition of matter, and may be made to pass into one another by a series of gradations so gentle that the passage shall nowhere present any interruption or breach of continuity."

James Thomson (*Proc R S* 1871) extended this view to the region included by the boundary curve. He maintained that the discontinuities ordinarily shown at the beginning and end of condensation, were apparent rather than real. He quoted Donny's experiments as showing that, in the absence of dissolved air, the liquid curve AB in fig 2 A, could be traced along the extension BM to pressures far below the saturation line BCD, without any formation of vapour. It was possible to imagine the vapour curve ED similarly extended in the direction DN to pressures above saturation. This had been suggested by Kelvin (*Phil Mag* 1870) on theoretical grounds, though it had not then been proved by experiment. The two curves thus extended might be joined into one continuous isothermal by the intermediate branch MCN. This branch would involve unstable conditions (V increasing with P) and could not be realized in practice, though it might be represented by some type of equation such as a cubic. If this could be done, it would have the great advantage of representing both liquid and vapour by a single equation of state, which would take account of all possible modes of transformation.

The Equation of van der Waals.—The continuous isothermal of James Thomson was first realized in the form of an equation by van der Waals in his famous essay *On the Continuity of the Liquid and Gaseous States* (Leyden, 1873), which put the whole theory in a more definite form. He assumed that the cohesion of the liquid, shown by Donny's experiments, could be attributed to an internal pressure, such as that invoked by Laplace to account for the surface tension. He considered that this internal pressure should depend on the attraction of contiguous parts of the fluid for each other, and should vary as the square of the density, or as $1/V^2$. It would then also explain the deviations of the vapour from the ideal state, as in Rankine's equation for CO_2. Thus both liquid and vapour would be represented by the same equation, which implied that the molecules were identical, and that the two states differed only in density. The only modification necessary in Rankine's equation was the inclusion of the co-volume b in the last term, to represent the irreducible volume of the molecules themselves at high pressures, as demonstrated by Natterer (1854). This also had the effect of transforming the equation into a cubic in V as required by the theory of the James Thomson isothermal. We thus obtain the equation,

$$P+A/V^2=RT/a(V-b) \qquad (7)$$

The factor T in Rankine's expression for the internal pressure was omitted by van der Waals on the ground that an internal pressure, representing a force of attraction between the molecules, should be independent of the temperature. But this does not make any material difference to the critical relations. It will be evident that, for given values of P and T, equation (7) gives a cubic in V, and may have three real roots within certain limits representing the points of intersection, B,C,D, in fig 1A, of the isothermal of T with the line of constant pressure P. The smallest of these roots, given by the point B, may be identified with the volume of the liquid, v, and the largest, given by the point D, with that of

the vapour, V, the middle root C corresponding to the unstable intermediate state imagined by James Thomson The isothermal curve shown in the figure 1A, corresponds roughly with that given by equation (7) at 21·5° C, or T=294·6 As the temperature is raised towards the critical point at 31·1° C, the line BCD becomes rapidly shorter, and the three roots finally coalesce at the critical point, where the isothermal has a point of inflection with a hori-

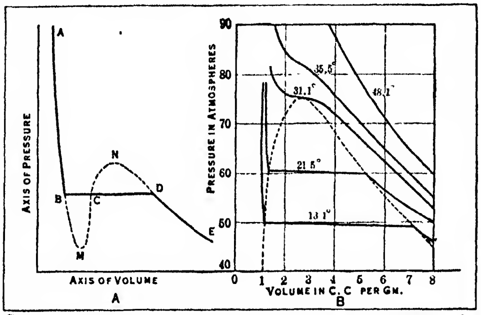

FIG 2—(A) JAMES THOMSON ISOTHERMAL (B) ISOTHERMALS OF CO_2 (ANDREWS)

zontal tangent as shown in Andrews' diagram, fig 1B The condition for three equal roots at this point gives the critical relations,

$$V=v=3b,\ P=A/27b^2,\ T=8A/27bR, \tag{8}$$

as given by van der Waals, omitting the reduction factor a These relations give the values of V, P and T, at the critical point in terms of the constants A, b and R, or *vice versa* It will be seen that the results depend mainly on the value assigned to b, which is very small, and could not be determined satisfactorily from Regnault's observations at comparatively low pressures The value of the constant A was taken from Regnault's observations, following Rankine's procedure, but that of b was selected to fit the critical temperature, T=304°, which was known with a fair degree of accuracy The calculated values of the critical pressure and volume did not agree very well with Andrews' observations, but these were somewhat uncertain The *qualitative* agreement was incredibly perfect in all essential respects with the James Thomson theory, and the equation of van der Waals was immediately accepted as the true and final solution of the problem

Maxwell's Theorem.—The continuous isothermals represented by equation (7) could easily be plotted on the PV diagram as shown in fig 2, but an exact *quantitative* comparison was difficult, because van der Waals' theory, as originally presented, gave no indication of the manner in which the line BCD, representing the saturation pressure, should be drawn in relation to the continuous isothermal This question was first solved by J C Maxwell (1875), who showed by a simple application of Carnot's principle, that the work of vaporization must be the same along either path, or that the line BCD at each temperature must cut off positive and negative loops of equal area from the continuous isothermal The work of vaporization along BCD is simply $p(V-v)$, that along the curve is the integral of $p\,dV$ from (7) between the same limits The integration is easy, and gives the condition,

$$p(V-v)=(RT/a)\log_e(V-b)/(v-b)+A/V-A/v \tag{9}$$

Fig 3 shows the saturation lines correctly drawn in accordance with Maxwell's rule in relation to the isothermal curves given by (7) for the temperatures 0°, 10°, 20° and 30° C Below 0° down to −50° C, the saturation pressures given by (7) are marked on the saturation line aC_w for the liquid. The dotted curve AC shows the saturation line for the liquid and the saturation pressures as actually observed. Comparing the two curves, we see at once that the values of v calculated from (9) are all nearly 100% too large, and that the actual increase of saturation pressure between 10° and 30° C is nearly double that given by (7). This was not noticed at the time, because the saturation pressures were difficult to calculate from (9), and the volumes of the liquid were considered to be of little importance. Equation (7) gives a very simple expression for the internal latent heat L_1 regarded as being equivalent to the work done against the internal pressure A/V^2 when the volume is increased from v to V at constant temperature We find immediately, $L_1=A/v-A/V$ in work units The work-equivalent of the latent heat L as ordinarily measured is obtained by adding to L_1 the external work $p(V-v)$. L could also be calculated directly from Clapeyron's first relation (*see* article on THERMODYNAMICS, equation 29) by integrating $T(dp/dt)_v$ from v to V, along the continuous isothermal given by (7). We thus obtain, in work units, a quite different expression, namely, $L=(RT/a)\log_e(V-b)/(v-b)$; but it is easy to see that the two expressions for L are equal and exactly consistent with Maxwell's condition (9). These expressions show that any error in v will entail a corresponding error in L as calculated from (7), as is found to be the case on comparison with actual measurements of L which have since become available.

Clausius' Equations for Carbonic Acid and Steam.—To deduce the equation of saturation pressure from (9) in the form of a relation between p and T, as in (4), it would be necessary to eliminate V and v with the aid of (7), which is satisfied by both This proved to be extremely difficult, as is often the case with transcendental equations Clausius (*Phil. Mag.* 1882) first succeeded in finding a practical solution in the form of a table of corresponding states, giving the values of p, V and v, as fractions of the critical pressure and volume, in terms of the temperature expressed as a fraction of the critical temperature The table in this form could be applied to any equation of the type (7) provided that A were a function of the temperature only If A were constant, as assumed by van der Waals, the saturation pressures given by the table could not be made to agree at all with observation But by choosing a suitable expression for A as a function of the temperature, the saturation pressures could always

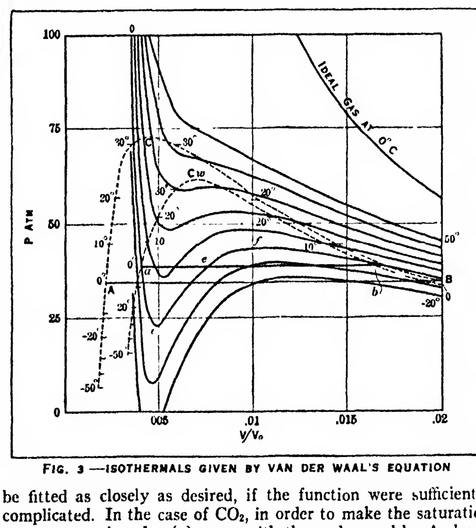

FIG. 3—ISOTHERMALS GIVEN BY VAN DER WAAL'S EQUATION

be fitted as closely as desired, if the function were sufficiently complicated. In the case of CO_2, in order to make the saturation pressures as given by (7) agree with those observed by Andrews over the very limited range of his experiments, it sufficed to replace Rankine's T in the expression for the internal pressure, making it A/V^2T as in (5) In order to make the equation represent the volumes of the liquid more closely, Clausius also found it necessary to replace V^2 in this term by $(V+b'')^2$, the empirical constant b'' being chosen to make the calculated value of v agree with observation at 20° C. The equation thus modified and

developed normally takes the form shown in (10),

$$P + A/T(V+b'')^2 = RT/a(V-b') \qquad (10)$$

which is still often quoted as applicable to CO_2, and gives fair agreement with observation from 0° to 30° C. But in spite of these additional complications, the equation would be of little use for practical purposes at low temperatures (where it is most

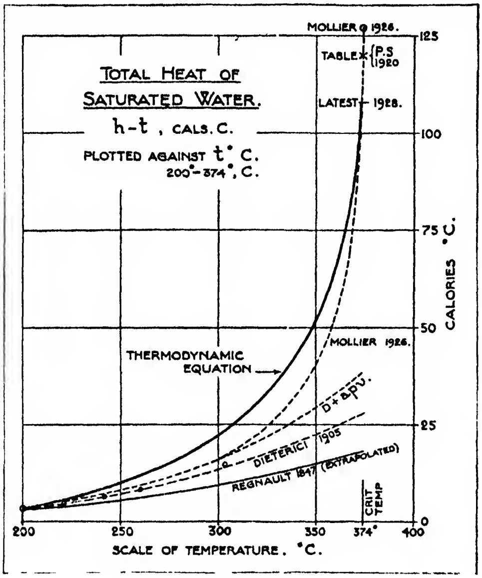

FIG 4

often required at the present day in the use of CO_2 for refrigerating plant), as it would make the saturation pressure about 50 per cent too small, and the volume of the liquid about 35 per cent too small at −50° C. Clausius could undoubtedly have made a much better approximation to the saturation pressures, if accurate observations of p had been available over a wider range, but the volumes of the liquid, and the values of the latent heat (which are most important for practical purposes) would still have been most unsatisfactory.

Owing to the restricted range of the observations available for CO_2, Clausius also applied his method to steam, for which Regnault's values of the saturation pressures were above suspicion, and extended over a much wider range. Having succeeded in representing the observed steam-pressures over the range 0° to 230° C by means of an equation similar to (10), but with a somewhat more complicated expression for A as a function of the temperature, Clausius was able to calculate the values of the critical temperature and pressure from the critical relations, which were very similar in form to (8). These gave the values, $t = 332°$ C, and $p = 134$ atmos., and should have afforded a good test of the theory, but no satisfactory observations were available for comparison. The old estimate, $t = 362°$ C, made by de La Tour, for a solution of soda, might not apply to pure water, and the temperature was somewhat doubtful. The values given by Clausius brought the properties of steam more nearly into correspondence with those of CO_2, and the theory of the continuity of state was by that time so firmly established that everyone assumed that all the other properties of the fluid must fall naturally into line if the saturation pressures were correct. The value of the constant b'' was adjusted, as in the case of CO_2, to make the calculated value of v correct at 20° C, but the value given by the equation was nearly 100% too large at 300° C. This was regarded as unimportant, because engineers at that time were in the habit of neglecting the volume of the liquid, but the discrepancy would necessarily make a corresponding error in the calculated values of the latent heat according to van der Waals' theory. Some ten years later Cailletet and Colardeau succeeded in measuring the saturation pressures of steam up to the critical point, which they estimated as 365° C, confirming the old value given by de La Tour. They found the critical pressure at this point to be nearly 200 atmospheres, which greatly exceeded the value given by Clausius. Meanwhile more and more complicated equations on the lines of van der Waals' theory, were still being evolved by mathematicians, who were strongly attracted by the conception of an internal pressure applying equally to the gaseous and liquid states, but were not greatly concerned with the practical question of agreement with actuality. The qualitative agreement with the properties of the vapour were sufficiently striking to arrest attention, while the discrepancies with regard to the properties of the liquid and the latent heat entirely escaped notice owing to the extraordinary difficulties involved in the experimental measurement.

Thermodynamic Equation for the Liquid.—The failure of so many ingenious attempts to construct an equation of the van der Waals' type capable of representing the properties of the liquid satisfactorily, might be taken as strong presumptive evidence that his fundamental assumption of identity of molecular structure was unsound. The proved facts with regard to the continuous transition from vapour to liquid, or *vice versa*, at high pressures might just as well be explained on the hypothesis that the fluid consisted of a mixture of molecules of different types, the composition of the mixture being capable of continuous variation according to the conditions of temperature and pressure. If two phases or mixtures of different molecular composition were capable of coexistence in thermodynamic equilibrium under any given conditions, the fluid would tend to separate into two parts according to general laws, which were first comprehensively stated by J. Willard Gibbs (1875) in his papers on the equilibrium of heterogeneous substances. That a simple substance like water might possibly contain molecules of different types, was first suggested by Rowland as an explanation of the remarkable variation of the specific heat of water near the freezing point, which he attributed to the presence of a small proportion of *ice* molecules. The measurement of the specific heat of water up to 100° C by the continuous electric method (*see* CALORIMETRY) suggested that the variation at higher temperatures could be explained by supposing that water contained its own volume v of saturated steam which would contribute the fraction $v/(V-v)$ of the latent heat of vaporization L to the total heat h of the water. This gave the very simple and convenient expression for h (*Phil. Trans.* 1902)

$$h = st + vL/(V-v) = st + avT(dp/dt) \qquad (11)$$

which appeared to be capable of taking account of the variation of specific heat of the liquid at higher temperatures, and at the same time fitted perfectly with Clapeyron's equation, (2), and with all the properties of the liquid in relation to the vapour. Thus if we add L to both sides of (11) we obtain,

$$H = st + VL/(V-v) = st + aVT(dp/dt) \qquad (12)$$

which gives the corresponding relation for the total heat H of the saturated vapour at the same temperature. Moreover it gives equally simple and exact expressions for the entropy of the liquid and vapour in equilibrium, namely,

$$\Phi = s\log_e(T/T_0) + vL/T(V-v) \qquad (13)$$

$$\Phi = s\log_e(T/T_0) + VL/T(V-v) \qquad (14)$$

From (11) and (12) we obtain a very useful relation between the volumes and total heats of the liquid and vapour at saturation,

$$v/V = (h-st)/(H-st) \qquad (15)$$

and from (11) and (13) we obtain a simple expression for the Gibbs' function, $G = T\phi_w - h$, which has the same value for water at saturation as for wet steam of any quality at the same temperature and pressure, namely,

$$G = T\phi_w - h = sT\log_e(T/T_0) - st \qquad (16)$$

One of the chief advantages of (11) is that it completely solves the problem of finding the theoretical equation of saturation pressure so far as the liquid is concerned. As indicated above, Rankine had to neglect v entirely and to assume that s was constant. Whereas in (11) s denotes the constant minimum specific heat of the liquid, and the second term takes complete account of the variation of h in terms of the volume v. This term is exactly eliminated by adding the expression for L from Clapeyron's equation, leaving (12) as the equation to be integrated, from which the troublesome terms representing the volume of the liquid, and the variation of its specific heat, have both automatically disappeared. We have only to find consistent expressions for H and V, and the equation must be the exact differential of the corresponding equation of saturation pressure. The equation for the liquid was verified indirectly by the fact that this method gave correct values of the saturation pressures of steam up to 200° C, when the defect of H from Rankine's ideal value was determined by the differential throttling method. The corresponding values of V, as given by the Joule Thomson equation (6), were verified up to the same limit by the subsequent observations of Knoblauch (1905).

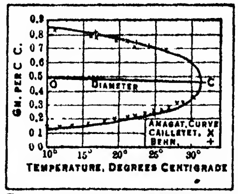

FIG 5.—AMAGAT'S DENSITY DIAGRAM FOR CO_2 NEAR THE CRITICAL POINT

Another method, which appears simpler at first sight, but requires equivalent integrations, is to find a consistent expression for the entropy Φ_s, from those for H and V, by integrating $(dH/T)-a(V/T)dP=dQ/T$. The value of $T\Phi_s-H$ for the vapour is then equated to the Gibbs' function (16) for the liquid. This necessarily gives the same result as integrating Clapeyron's equation in the form (12). It was also found that, if an equation of the van der Waals type, giving consistent values of H and V for the vapour, were combined with equation (11) for the liquid (instead of assuming *the same* equation for liquid and vapour), the combination would give much better results for L, and even for p itself, than Clausius' method. This afforded further presumptive evidence in favour of (11) as a suitable equation for the liquid.

Modified Joule-Thomson Equation.—The modification (6) of Rankine's equation which was adopted by Joule and Thomson to represent the deviations of gases from the ideal state, proved more convenient in practice than that of van der Waals, because it gave V directly in terms of P and T, instead of giving P as a cubic function of V, and also gave a much better account of the properties of CO_2 at moderate pressures. In applying the same equation to steam and other gases and vapours (*Proc R S.* June 1900, *Phil. Mag* Jan 1903) it was put in the more general form,

$$V-b=RT/aP-c \qquad (17)$$

in which b is the covolume as in van der Waals's equation, and c represents the reduction of volume due to coaggregation or pairing of molecules To a first approximation, c is a function of the temperature only, as in the original Joule-Thomson equation (6), but it may vary with temperature in different ways for molecules of different types Thus in the case of steam, in order to satisfy the adiabatic equation, $P/T^{13/3}=$ constant, cP/T must be constant along any adiabatic, in which case c must vary as $1/T^{10/3}$ The value of c was determined by the throttling method on this assumption, and found to be 26.3 c.c./gm. at 100° C. The equation in this simple form gave very convenient expressions for the total heat H, and the entropy Φ of the dry vapour. (*See* THERMODYNAMICS.) When taken in conjunction with equation (16) for the liquid, it appeared that the effect of coaggregation on the saturation pressures could be represented by simply adding the term $a(c-b)p/RT$ to Rankine's theoretical equation (4) for an ideal vapour, which was about 1·5% in error at 100° C without this addition, though agreeing closely with observation at low pressures The addition of the term required by (18) to represent the coaggregation, brought the values of p into good agreement with Regnault's observations up to 200° C Beyond this point the values of p given by the modified equation (4) began to deviate gradually from observation, until they were about 15% too small at 365° C according to the observations of Cailletet and Colardeau It was evident that the first approximation, represented by c, though very good at moderate pressures, or at high superheats, would necessarily fail at high pressures near saturation, because it took no account of the higher degrees of coaggregation due to the combination of the complex molecules with each other. This effect could most easily be represented by employing, in place of c for the coaggregation, a series of the form,

$$c(1+Z+Z^2+Z^3+\text{ etc. . . . })=c/(1-Z) \qquad (18)$$

representing a geometrical progression with first term c and common ratio Z, where $Z=kcP/T$, being proportional to the mass of the coaggregated molecules present in the vapour. It was found however that, in order to represent the values of p satisfactorily at pressures up to 200 lb., the second term Z in this series must be absent, and that the common ratio should be Z^2 instead of Z, giving the sum of the series in the form $c/(1-Z^2)$ This was confirmed by the observations on the values of V up to the critical point described in the preceding section Unfortunately the value of Z thus found would not necessarily give correct values of H, unless the adiabatic equation, which required an expression of this type for the coaggregation, remained true up to the critical point. No values of H were at that time available beyond 200° C, and the series suggested by the observations of V was quite inconsistent with the orthodox theory of the critical state, which could not be questioned without the most conclusive experimental evidence. The only practicable method of verifying the adiabatic at such high pressures would be to measure the values of H and h, in addition to those of V and v, which would be a very laborious

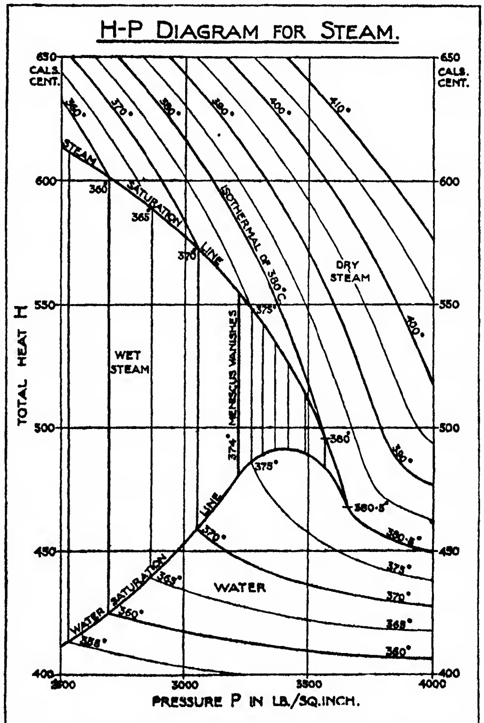

FIG. 6

and expensive undertaking

The probability of this solution was first suggested by measurements of the saturation volumes of water and steam in sealed tubes of quartz-glass, which showed that the meniscus vanished at 374° C, and that the densities did *not* become equal at this point, as commonly assumed, but were 0·438 gm./c.c. for the liquid and 0·264 gm./c.c. for the vapour Moreover, the difference of density could be traced nearly up to 380° C, with suitable illumination, under favourable conditions, and the coefficients of expansion remained finite These phenomena could not be reconciled with van der Waals's theory, but could be represented satisfactorily by the modified equation (17) with the series $c/(1-Z^2)$ in place of c. Many other stable liquids showed similar effects when carefully purified, but the equilibrium under these critical conditions might be completely upset by small traces of air or other impurities. In order to complete the proof, it was necessary to measure the total heats of both water and steam in the critical region. This had not previously been attempted, owing to grave experimental difficulties, but was successfully accomplished by the jacketed condenser method as described in the article CALORIMETRY.

H-P Diagram for Steam.—The application of the method described above proved to be less troublesome than in the case of water, because no air cushion was required to protect the gauge from vibration, since the steam itself acted as a perfect cushion, and the gauge readings were always steady. It was most important however to keep a continuous check on the purity of the water, and especially on the absence of air, which appeared to have a profound effect on the attainment of true equilibrium between the complex molecules at high pressures near the critical point The apparatus required for *eliminating air* was very simple and effective The water for supplying the pump was passed through two boilers in series, which were kept boiling with a free escape of steam Before reaching the first boiler the water was heated nearly to the boiling point by passing through a regenerator Most of the air was carried off with the steam from the first boiler, the remainder, to a very small fraction, was eliminated by the second The air-free water then returned through the regenerator, and was further cooled to atmospheric temperature before being delivered to the pump With ordinary distilled water, which may contain from a tenth to a twentieth of its volume of air at atmospheric pressure (about 1 part in 10,000 by weight) an almost continuous stream of bubbles could be observed issuing with the condensate through the glass inspection tube attached to the outlet of the condenser. It was impossible under these conditions to obtain consistent values of H owing to accidental fluctuations in the air content of the water. With the air-free apparatus in action, not a single bubble could be seen in the course of an hour's run, and the observations near saturation became incredibly more consistent. The elimination of air appeared to be just as important as in the case of the observations on the saturation volumes in the quartz tubes by the static method It was also important to keep the fluid in the superheater at a steady temperature for a sufficient time to permit the attainment of true equilibrium before passing into the high-pressure pocket where its initial temperature and pressure were measured It was then throttled to atmospheric pressure before entering the condenser, where its *total heat* was measured by observing the rise of temperature of a steady stream of cooling water, and deducing the increase of total heat as explained in the article CALORIMETRY.

The results thus obtained on the basis of the above are exhibited in the annexed figure 3, in which the observed values of the total heats are plotted against the pressure, and the temperatures are indicated by isothermal lines. The observations of H and h confirmed those of the saturation volumes by showing that the *saturation lines* for water and steam could be traced beyond 374° C and appeared to meet in a sharp cusp tangential to the isothermal of 380·5° C, which made an abrupt bend at this point, and became parallel to the lower isothermals of water, showing that all the active molecules of steam were condensed. Taking $V-b$ from the modified equation (17), the observed values of H for dry steam were found to agree with the fundamental relation,

$$H-B=(13/3)aP(V-b)+a\theta P, \qquad (19)$$

as required by the equation for the adiabatic (*See* THERMODYNAMICS.) The observations of h for the liquid verified equation (11), which explains the peculiar form of the water saturation line, since it requires that the active molecules of steam in the liquid must be condensed with increase of pressure at the same rate per unit volume as in the vapour

A further verification of the system of equations (11), (17), and (19), was afforded by calculating the values of the saturation pressure from the theoretical equation given by (11) and (17) as above explained. These agreed with the pressures previously observed by Holborn and Baumann (1910) to within 0·3° C on the average over the whole range from 0° to 374° C. But the equation went further and continued to give values of p agreeing with observation up to 380·5° C, where it came to a stop, and refused to give any solution at higher temperatures, thus verifying the limit observed by direct experiment. (*Proc. Roy. Soc.* Sept 1928.)

The theory of the continuity of state, though very fascinating, was most artificial, and was founded on a somewhat inadequate experimental basis It has now served its turn, and may have to give place to an experimental study of the molecular structure of liquids as affording a more natural explanation of the phenomena of change of state (H L C.)

VAR, a department of France, formed in 1790 of a part of Lower Provence, but in 1860 reduced by the transfer of the district of Grasse to the newly formed department of the Alpes Maritimes, which is the reason why the Var does not now flow in the department to which it gives its name. It is bounded north by the department of the Basses Alpes (the Verdon river forming the boundary), east by that of the Alpes Maritimes (the Siagne stream forming the limit), south by the Mediterranean, and west by the department of the Bouches du Rhône. Pop. (1926) 347,932. Area 2,333 sq. miles.

The east of the department is built up of the Estérel and the Massif des Maures, a block of Archaean and Palaeozoic rocks, the two parts named being separated by the Argens river; this massif reaches a height of 2,500 feet The rest of the department is mostly made up of the east-to-west lines of the Alpes de Provence which include the chain of Sainte Beaume (3,786 ft) in the west, but rise to 5,620 ft. at the Signal des Chens in the north-east The valley lines for the most part run east and west between the hills, but the Gapeau river makes its way to the coast southwards between the outliers of Sainte Beaume and the Massif des Maures, and other streams have north-to-south sections cutting through lines of hills. The coast shows evidences everywhere of a recent sinking movement and has numerous islands, notably the Iles d'Hyères, Porquerolles, Île de Riou, etc. The harbour of Toulon is a famous case of a sunken valley. The climate is mild on the coast, St Raphael and Hyères being much frequented winter resorts. The department now forms the bishopric of Fréjus (4th century) which is in the ecclesiastical province of Aix en Provence.

The chief industries are spinning and weaving of silk, manufacture of soap, paper, cork, pottery and tanning. Tobacco is grown and there is much fishing for tunny and anchovy Trade is in wood and coal Cut flowers are largely exported from Hyères The department forms the bishopric of Fréjus (4th century), under Aix en Provence. It is in the académie (educational division) of Aix, where is its court of appeal, and is in the region of the XIII army corp There are two arrondissements (Draguignan and Toulon), 30 cantons and 149 communes. The principal towns are Toulon, La Seyne, Hyères, Draguignan, its political capital, Brignoles and Fréjus.

VARALLO SESIA, a town of Piedmont, Italy, in the province of Novara, from which it is 34 m. N N W. by rail, situated in the valley of the Sesia, 1,480 ft. above sea-level. Pop. (1921) 4,036 (town); 4,386 (commune). The churches of S Gaudenzio, S. Maria delle Grazie and S. Maria di Loreto, all contain works by Gaudenzio Ferrari (1471–1546), who was born in the neighbouring Val Duggia, while the Sacro Monte, a place of pilgrimage rising above the town (1,995 ft.), is approached by a path leading past 45 chapels.

VARAŽDIN, a town of Croatia, Yugoslavia Pop (1921) 13,645 Varaždin is the seat of a district court, and possesses an old castle, a cathedral, several churches, monasteries and schools, and a popular university. There are woollen mills, and trade in timber, wine, pigs, fruit, tobacco, spirits, stoneware and silk. Coal is mined in the Varaždin Mts. The celebrated sulphur baths of Constantins-Bad or Toplitz, known to the Romans as Thermae Constantianae, are about 10 m. S

VARDANES, the name of two Parthian kings.

VARDANES I succeeded Artabanus II, probably his father, in A D 40 (Joseph *Ant* xx 3, 4), but had continually to fight against his rival Gotarzes (*q.v*) The coins show that he was in full possession of the throne from 42 to 45 In 43 he forced Seleucia on the Tigris to submit to the Parthians again after a rebellion of seven years (Tac *Ann* xi 9) Ctesiphon, the residence of the kings on the left bank of the Tigris, opposite to Seleucia, naturally profited by this war, and Vardanes is therefore called founder of Ctesiphon by Ammianus Marc xxiii 6, 23 He also prepared for a war against Rome, with the aim of reconquering Armenia (*cf* Joseph. *Ant* xx 3, 4), but did not dare to face the Roman legions (Tac *Ann* xi 10) In a new war with Gotarzes he gained a great success against the eastern nomads In the summer of 45 he was assassinated while hunting, and Gotarzes became king again

VARDANES II rebelled against his father Vologaeses I in A D 54 (Tac. *Ann* xiii 7) We know nothing more about him and it is not certain whether the coins of a young beardless king, which are generally attributed to him, really belong to him (Wroth, *Catalogue of the Coins of Parthia*, p L ff)

VARENIUS, BERNHARDUS [BERNHARD VAREN] (1622–1650), German geographer, was born at Hitzacker on the Elbe, in the Luneburg district of Hanover Varenius studied medicine at Konigsberg and Leyden universities intending to practise at Amsterdam But the recent discoveries of Tasman, Schouten and other Dutch navigators, and his friendship for Blaeu and other geographers, attracted Varenius to geography He died in 1650

In 1649 he published, through L Elzevir of Amsterdam, his *Descriptio Regni Japoniae* which included a Latin translation of part of Jodocus Schouten's account of Siam (*Appendix de religione Siamensium, ex Descriptione Belgica Iodoci Schoutenii*), and chapters on the religions of various peoples In 1650 appeared, also through Elzevir, his best-known work, *Geographia Generalis,* in which he endeavoured to lay down the general principles of the subject on a wide scientific basis The work is divided into—(1) absolute geography, (2) relative geography and (3) comparative geography The first investigates mathematical facts relating to the earth as a whole, its figure, dimensions, motions, their measurement, etc The second part considers the earth as affected by the sun and stars, climates, seasons, the difference of apparent time at different places, variations in the length of the day, etc The third part treats briefly of the actual divisions of the surface of the earth, their relative positions, globe and map-construction, longitude, navigation, etc

Varenius, with the materials at his command, dealt with the subject in a truly philosophic spirit, and his work long held its position as the best treatise in existence on scientific and comparative geography The work went through many editions Sir Isaac Newton introduced several important improvements into the Cambridge edition of 1672; in 1715 Dr Jurin issued another Cambridge edition with a valuable appendix; in 1733 the whole work was translated into English by Dugdale; and in 1736 Dugdale's second edition was revised by Shaw. In 1716 an Italian edition appeared at Naples; in 1750 a Dutch translation followed; and in 1755 a French version, from Shaw's edition, came out at Paris

See Breusing, "Lebensnachrichten von Bernhard Varenius" (*Geogr. Mittheil*, 1880); H. Blink's paper on Varenius in *Tijdschr. van het Nederl Aandrijksk Genotschap* (1887), ser ii. pt 3; and F Ratzel's article "Bernhard Varenius," in *Allgemeine Deutsche Biographie,* vol. xxxix (Leipzig, 1895).

VARESE, a town and provincial capital of Lombardy, Italy, 18 m by rail W. of Como, and 37 m N.W. of Milan, 1,253 ft. above sea-level Pop (1921) 16,201 (town); 23,864 (commune). It is a favourite summer and autumn resort of the Milanese The church of S Victor has an ancient baptistery (dating from the 9th century but rebuilt in the 13th). The fine campanile of the church is 246 ft. high. There is an archaeological museum with prehistoric antiquities from the lake-dwellings on an island in the Lake of Varese. To the north-west is the pilgrimage church of the Madonna del Monte (2,885 ft.). Varese is the seat of active silk-spinning, tanning and paper-making.

VARIA (mod. Vicovaro), an ancient village of Latium, Italy, in the valley of the Anio, on its right bank, and on the Via Valeria, 8 m. N E. of Tibur (Tivoli) It was probably an independent town and not within the territory of Tibur, and Horace speaks of it as Sabine Some remains of its walls, in rectangular blocks of travertine, still exist, and there is a chapel of S Giacomo with beautiful carvings by Domenico Capodistria (d 1464 here) and Giovanni Dalmata One mile to the east is a picturesque gorge of the Anio, in which may be seen remains of the ancient aqueducts which supplied Rome, consisting partly of rock-cut channels and partly of ruined bridges above it is the monastery of S Cosimato Close to this point begins the valley of the Digentia (mod Licenza) in which Horace's Sabine farm was situated On the hill at the east of the entrance is the village of Cantalupo, which has now assumed the name of Mandela, being identified thus (correctly) with Horace's *"rugosus frigore pagus."*

About 3 m up the valley, close to the road on the west (right) bank of the stream, remains of what is undoubtedly the house which he occupied have been excavated

VARIATION. All kinds of living organisms vary It is the business of the biologist to find out the range of such variation in wild and domesticated animals and plants, to decide what share of variation is due to hereditary and what to environmental causes, and to see whether heritable variations, which are the raw material of evolution, can be artificially produced in the laboratory. (*See* also SELECTION, EVOLUTION; HEREDITY.) (X)

VARIATION IN NATURE

The variation of animals and plants in nature is, so far as known, subject to the fundamental laws revealed by experiment and pedigree-breedings (*see* HEREDITY). Only by such experiments and culture is it possible to decide authoritatively how a given variation is produced and whether it is heritable or not Nevertheless it is desirable to know—(a) the actual kinds of variation that occur in nature, (b) which of these we may assume to be heritable and (c) the effect which isolation (topographical, habitudinal, etc) and interbreeding may have on the distribution of variant characters in nature. Variation in the habits of animals, the food they eat, their breeding-seasons and all their complex inter-relationships is moreover of cardinal importance in evolutionary studies and can only be effectively observed among animals in nature.

The kinds of structural variation that occur in nature will be best illustrated by means of the following classification which, although it is not exhaustive, will show the circumstances in which such variation typically occurs

1 Variation regularly occurring in the presence of a given environmental condition or factor.

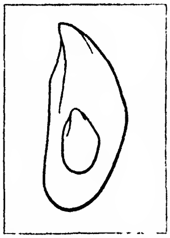
(a) Gross variation in form and size associated with the excess or deficiency of some tissue-forming substance.

The periwinkle, clam and mussel when living in water of reduced salinity (*e.g*, in the Baltic Sea) are found to be smaller than in normal sea-water. Low night-temperature and inferior soil render various hawkweeds (*Hieracium*) living at high altitudes more stunted than those living at lower altitudes.

(b) Special modifications.

The tail-lamellae of the brine shrimp (*Artemia salina*) are reduced in water of high salinity The shape of the common cockle (*Cardium edule*) is more elongate in water of salinity above

that of normal sea-water Terrestrial animals living in damp situations or in humid atmosphere are often darker than representatives of the same species which live in drier conditions This is recorded among slugs (Leydig), birds (Swarth) and mammals (Sumner) The greater part of the variation exemplified by (a) and (b) is in all probability non-heritable. Experiment has however shown that in a few cases variation induced by external causes may be inherited either permanently (Lepidoptera, *Harrison and Garrett*) or temporarily (Amphibia, *Kammerer;* Crustacea, *Agar*). Similarly the colour-differences recorded by Sumner (*see* above) have been shown to be hereditary.



FROM GRIMPE AND WAGLER DIE TIERWELT DER NORD UND OSTSEE (AKADEMISCHE VERLAGSGESELLSCHAFT, LEIPZIG)

FIG 1 —SPECIMEN OF NORTH SEA AND BALTIC MUSSELS THE SMALL FORM BEING CHARACTERISTIC OF THE BALTIC SEA

A series of allied varieties or races which replace each other in succession, either in time or place, will sometimes exhibit progressive modification. Such variation may be simply correlated with a change in geographical position, the causes of structural change being obscure

2. Variation resulting from adaptation to diverse conditions

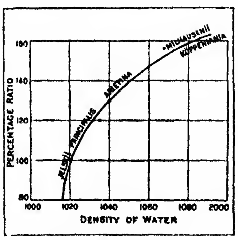
In the arrow head (*Sagittaria*) the same plant may have some leaves adapted for aerial and others for aquatic conditions Protective "mimicry" affords some striking examples of this type of variation among animals (*see* MIMICRY)

3. Variation known to be heritable but not referable to known external causes

Many variations in colour, form and pattern that are known by experiment to be hereditarily stable have been recognized in nature Such variations may be distributed at random through a large natural population, or the latter may be divided into topographically isolated races or colonies, each of which has a more or less distinct appearance These divergences may likewise be associated with other modes of isolation, *e g*, with mutual sterility, difference in breeding-period, etc. Other examples of this kind of variation are to be found in the "colour-phases" of mammals (*e g*, foxes) and birds. Stresemann's important work on the occurrence and heredity of such colour-phases in the latter should be consulted (Bibliography) It is also known in flowers

4. Variation due to accident, interference with growth-processes, etc.

It is not always easy to differentiate between this type of variation and that described in (1) For example the shells of the water snail *Planorbis* seem to assume the uncoiled ("scalariform") form in water of unusually high temperature This may be described as an accidental malformation, but it is actually produced by a particular state of the medium in which these snails live Scalariformity is more obviously "accidental" when produced in the Gastropod *Trochus* by parasitic infection Plant lice sometimes produce green colour in flowers and the attacks of a rust fungus (*Aecidium*) produce shorter and broader leaves in *Euphorbia cyparissias*



FROM THOMPSON, "GROWTH & FORM" (UNIVERSITY OF BUDAPEST)

FIG 2 —VARIATION IN BRINE SHRIMPS (ARTEMIA), SHOWING INCREASE IN RATIO AS WATER BECOMES MORE SALINE

5. Seasonal Variation

This is a familiar phenomenon among vertebrate animals, and is also known among invertebrates (Insects, Cephalopods). The change of coat-colour in the mountain hare from "smoky-brown" in summer to white or "blue" in winter is a notable example. In the rufous horseshoe bat of India (*Rhinolophus rouxii*) the fur after the spring and autumn moults is mouse-brown on the upper surfaces. This changes in course of time into brighter colours, probably owing to oxidation of the pigment.

6 Variation due to sexual dimorphism and growth-changes

Strictly speaking this should not come under the rubric of variation as described here; but it is important to notice that some of the differences in size, colour and shape among animals of the same species may be due to these causes

The data presented above relate only to the structure of animals and plants Although the distinction between structural characters and those of physiological constitution and habits is arbitrary, it is convenient to retain the distinction in a survey of this kind Our knowledge concerning modes of variation other than that of structure is less complete Each species is probably as variable in its physiological constitution as it is in its structure. This has been shown by exact tests, and also may be inferred from such facts as the infection of hosts belonging to different families and genera by individuals of the same species of parasite, the occupation by members of the same species of habitats radically different in physical and bionomic factors, varying susceptibility to disease and so on The variability of habits may be illustrated by Darwin's observations on the behaviour of the great titmouse, certain individuals of which species sometimes behave as birds of prey

A number of highly important considerations are omitted from this discussion The problem of intermediacy, the degree of variability in different species of the same genus, the relation between natural variation and classificatory units, observations on the effect of Natural Selection and on the first appearance, increase or decrease of variant individuals are dealt with in the undermentioned works

EXPERIMENTAL VARIATION

The Types of Variation.—Not everything differentiating an offspring from its parents can be handed down to later generations (*see* above) Only the alterations occurring in the hereditary determiners, or *genes* (*q v*), can furnish actually new materials for the permanent fabric of a race, and these changes in the genes, called *gene-mutations*, are remarkably rare However, after the mutations have occurred, the changed or mutant genes enter into varying combinations with each other and with the old genes, in successive generations, and so the actual degree of variation becomes increased Individuals having assortments of characteristics different from their parents are thus formed, by *recombination*, in somewhat the same way as, by drawing some cards out of each of two given hands, we might obtain new hands, having one or another new assortment of cards Besides the above two kinds of variation, which involve the genes, there are also many important variations not due to the genes, but to the environment. These variations may be grouped together under the term *modifications*. For detailed consideration we may best treat these three classes of variations in an order the reverse of the above.

Modifications Caused by Environment.—The common question, "Which is more important, heredity or environment?" permits of no answer, except that both are equally and absolutely essential. We are related to our heredity and environment more nearly as an arithmetical product of the two than as a sum, and, with either annulled, the product must be zero. The genes provide the egg, not with the guarantees of developing certain characters, but only with the possibilities of reacting in certain ways so as to produce given adult structures and peculiarities, provided food and other conditions are appropriate Change the environment (it cannot really be abolished completely) and these genes may exercise their possibilities of reacting in very different ways, to produce a different type of development, or disintegration

It is, however, more pertinent to put our question in the form, "Which set of factors are ordinarily responsible for a larger part

of the *variation* which actually occurs, *differences* in heredity or *differences* in environment?" If, now, we take variation in the larger sense, to include differences between all living things, it is obvious that, all in all, differences in environment are an insignificant cause of the existing variation as compared with hereditary differences, and this is usually true even of two individuals chosen from closely related yet different species. On the other hand, within a given population of one species, the variation due to environment is sometimes comparable to, or even much greater than, that dependent on the genes. Which sort of variation predominates, and to what extent will depend on many circumstances, and to answer our question will therefore require separate study, and often elaborate experimentation and measurement, in the case of each population considered and even in the case of different characteristics in the same population. The unravelling of any intimate combination of hereditary and environmental effects will usually demand either that we hold the effective features of the environment constant (often an impossible operation), or else that we secure a set of individuals identical in their genes (as a result of inbreeding, twinning or asexual reproduction); under such circumstances the residual variation, due to the influence that was not held constant, may then be ascertained.

It is especially desirable to discover not only the extent of variation due to environmental differences, but the principles governing the production of this variation This quest, however, leads to a study of all the intricacies of embryonic development, physiology and mechanistic biology in general. Although the details of the chemistry and physics comprised in these phenomena are for the most part scarcely guessed, we at least know, from our observations on the grosser visible occurrences, that the processes whereby most adult organs and characteristics are formed are highly involved, interdependent in a complicated way and composed of many successive reactions. Make one change, and effect follows effect until the final result bears no resemblance to the initial one. So, for example, a quantitative change in some primary process may appear in the adult as a qualitative change, and vice versa It should also be observed that there are often regulatory mechanisms which automatically compensate for effects produced, as in regeneration of a lost limb or in the accelerated growth of a child following temporary stunting.

Genetics has adduced cogent evidence that, despite the strong influence of the environment in modifying the body as a whole, and even the protoplasm of its cells, the genes within the germ-cells of that body retain their original structure without specific alterations caused by the modification of the body, so that when the modified-individual reproduces it transmits to its offspring genes unaffected by its own "acquired characters." The offspring, then, will not tend to repeat the parental modifications, unless the same peculiar environment is itself repeated Our sins and our successes are not reborn in our children, though the latter may inherit our original tendency and capacity for these Modifications, therefore, unlike mutations, cannot be a cause of biological evolution or degeneration Now, if modifications acquired before the conception of children are not visited upon the latter, it certainly holds true that any modifications acquired by the mother after the embryos are partly developed, but prior to their birth, would not be transmitted to them Mothers may rest assured that there is no more ground either *a priori* or in observation, for supposing that a fright received during pregnancy (or before) will give their child a fearsome disposition than that it will give him spots.

Variation Due to Segregation and Recombination of Genes.—Whenever an individual breeds, having received a different hereditary contribution from its two parents, its offspring will tend to vary from one another. Thus, if we had received a gene for brown eyes from our mother, and one for blue eyes from our father, then, although we ourselves would have brownish eyes (brown being said to be "dominant" and blue "recessive"), nevertheless we would transmit our gene for brown only to half of our reproductive cells, and the gene for blue, unalloyed by brown, to the remainder. This process of separation is called segregation (*see* HEREDITY). If our parents had given us different genes for hair-form also, we would produce reproductive cells having all the possible assortments of the two pairs of genes, namely, some having "brown curly," others "blue straight," still others "brown straight" and the rest "blue curly." This phenomenon is recombination. Since such variation can be produced in our children only in respect to genes which already differed from one another in our parents, it is evident that the primary cause of this variation lies in the events whereby these genes came to differ in the first place, that is, in the gene-mutations such as originally changed a gene for brown eyes into the gene for blue These mutations, that make possible the recombinations of to-day, may have happened in the remote past

The explanation of segregation and recombination is to be found in the behaviour of the chromosomes, those tiny separate filamentous bodies, visible under the microscope, which contain the invisible genes "linked" together within them, like beads in so many separate chains. Several or many chromosomes, each probably containing hundreds of different genes of distinctive natures and effects, are contained in each of the two uniting reproductive cells derived from the two parents. While the majority of the genes from one parent are always like those from the other, since the parents are in general similar organisms, yet in the case of most matings there are some gene-differences, and these give an opportunity for the operation of the segregation and recombination processes above mentioned, after the individual formed by the union of the two cells in question develops and reproduces reproductive cells for a still later generation

It will be seen that the more gene-differences exist the more different combinations can then be formed The numerical relations resulting from recombination are calculable according to definite laws, provided the effects of the genes concerned, and their positions in the chromosomes, have been determined by prior experimentation The character-effects of untried combinations cannot, however, be predicted with certainty, as unexpected developmental results, including even new traits, are occasionally produced by recombination. As some new combinations may be more advantageous for the race than the original combinations, the function of recombination, of segregation, and in fact of sexual reproduction itself, becomes explained in terms of their value in evolution.

The development of most characters depends on the combined action of numerous genes. A difference in any one of these genes may affect either the quality, or the degree of development of the character in question. Now, when a number of mutations, in different genes all concerned with the same character (*e g.*, stature), have some time previously occurred in a population, random crossing and recombination will result in the transmission, to different offspring, of many different assortments of the mutated and non-mutated genes Thus the population may tend to exhibit many different grades of expression of the character. These grades will often differ only by small steps, which become blurred into an apparently continuous gradient through the effect of environic modifications Such quantitative variation, as well as all other variation of recombinational origin, is of course especially evident when individuals are bred which resulted from the crossing of widely different stocks, in which many differing gene-mutations had become established since these stocks diverged from their common ancestor.

Many abnormal types of recombination occasionally occur, owing to such disturbances of chromosome-behaviour as the loss or reduplication of a chromosome or section of a chromosome, or the reduplication of one or more entire sets of chromosomes. When such an occurrence alters the proportions existing between the different kinds of genes (by changing the numbers of some and not of others) there generally results a combination of various (usually detrimental) abnormalities at once. At other times, a chromosome may become broken in two, or two chromosomes unite to form one, or a piece broken off one chromosome and united to another. The genes thereby become rearranged, but the characteristics of the individual probably remain little affected, since they depend rather on the kind and numbers of

different genes present than on their arrangement. X-rays, cold and other influences are known to induce such disturbances of chromosome-behaviour.

Mutations in the Genes.—It has been found in fruit-flies (*Drosophila*) that any given gene, existing in a fly at the present day, has probably remained constant in its composition for several thousand years. This stability is not passive, for, as every organism grows and reproduces through a process of repeated cell-growth and cell-division, each gene must repeatedly reproduce itself, and in so doing it must each time construct a daughter-gene that possesses exactly its own peculiar structure Occasionally, however, something goes wrong, and either the mother-gene becomes altered in its composition or else the daughter-gene is not formed exactly in the image of the old gene. As a result of this mutation there arises a new type of gene, having a different effect upon the organism, and this mutant gene is then capable of reduplicating its own new type—a process which it usually performs with as constant accuracy as that which the old gene had exhibited. It is this peculiarity of the gene—its retention of the power of self-reduplication despite the occurrence of alternations (mutations) in its composition—which makes *heritable* variations possible, and hence organic evolution

There is evidence that, when one gene in a cell mutates, the thousands of others, even including the similar or identical gene derived from the other parent, remain unaffected and constant The mutation, then, may be regarded as an "accident" of submicroscopic dimensions, dependent on the occurrence of certain "chance" configurations of atoms, electrons and energy-quanta within or near to the gene in question It is not strange, in view of this, that it has not yet been proved possible, by particular external conditions, to dictate the occurrence of specified types of gene-mutations in preference to others.

Though the kind of mutation which shall occur has not been brought under control, experiments with a number of different organisms have shown that heavy treatment with X-rays will make the mutational accidents in general occur far more frequently than otherwise, so that gene-mutations of varied kinds may be produced at a rate in some cases over a hundred times higher than that at which they previously were found to occur. This raises the conjecture, as yet untested, that possibly the γ-rays (related to X-rays) which originate in minerals of the earth's crust have played an essential rôle in the causation of the varied "natural" mutations through which evolution has come about However, there is evidence that temperature, genetic composition, and perhaps other factors, also affect the general frequency of gene-mutations No particular stage in the life-cycle is known to be especially favourable for the occurrence of gene-mutations; certainly they may happen either in embryos or in adults, and in somatic as well as in germinal tissue, though of course only mutations in germ-cells can be inherited.

Though most gene-mutations seem, in the sense above explained, to be accidents, some genes appear to be less stable than others, and a few are definitely known to be exceedingly mutable ("ever-sporting"). In the latter cases, which may represent changes of a different sort from most gene-mutations, the stability of the mutable gene may be much affected by specific conditions. These effective conditions differ in different cases. Some are determined by the nature of the tissue and developmental stage in question, others by the external environment, and still others by the genetic composition.

A given gene has the capability of mutating in various ways, so as to form a number of different kinds of genes ("multiple allelomorphs"). Usually the effects of these differing changes in a given gene resemble each other strongly, and often, though not always, the discernible differences between them lie chiefly in the *degree* of change produced. There are also numerous cases on record of mutations that seem quite identical in kind with other mutations which occurred independently in homologous genes of other individuals belonging to the same or a related species. Not infrequently, too, different kinds of genes (non-homologous) will, on mutating, produce similar or indistinguishable final effects on the characteristics of the organism. In this connection it is found that certain character-changes can be produced by mutations in a greater number of different genes, and hence tend to occur more commonly, than others.

The most frequently produced effect, so far as known, is the lethal effect; that is, mutant genes are usually so deleterious in their action that they tend to kill the organism. When they are not positively lethal they are usually retrograde in direction, and hinder rather than help the organism to fulfil the functions of its existence. Such results are to be expected of accidental changes occurring in any complicated organization A race, therefore, will tend gradually to undergo degeneration in any respect in which selection (natural or artificial) does not persistently weed out the degenerative mutations that continue to occur It can be only the rare mutations that are helpful which furnish material for evolution These latter, however, when they show, will tend to multiply

As a matter of fact, most gene-mutations never show. For most (though not all) mutant genes are recessive to the type from which they arose, and in their cases an obviously mutant individual cannot appear unless—usually many generations subsequently to the original gene-mutation—two reproductive cells, each bearing the identical mutant gene, meet in fertilization.

Both conspicuous and inconspicuous, minor and major, fundamental and superficial, character-changes are produced by gene-mutation, and either one character or several at once may be altered by a single gene-change. The more far-reaching the change, the more apt it is to be deleterious rather than advantageous Hence geneticists are returning to a view essentially similar to Charles Darwin's (though now much more highly elaborated), namely, that the origin of one species from another usually involves the accumulation of numerous selected small steps of heritable variation

VARIATIONAL PSYCHOLOGY: *see* DIFFERENTIAL PSYCHOLOGY.

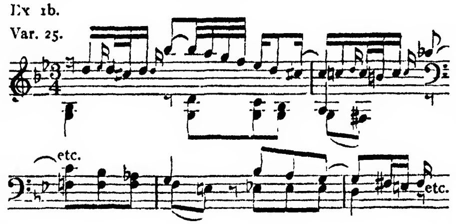
VARIATIONS, in music, the term given to groups of progressively developed versions of a complete self-contained theme, retaining the form of that theme though not necessarily its melody This is the classical sense of the term, but there are modern developments of the variation form to which this definition is at once too broad and too precise to apply The aesthetic principle of variations appeared at very early stages of music. During the 16th century an artistically mature variation-form automatically rose in the polyphonic treatment of Gregorian hymns verse by verse Accordingly, the hymns and Magnificats of Palestrina might be described as contrapuntal sets of variations on ecclesiastical tunes, like rich and free examples on the simple plan shown later by Haydn's variations on his Austrian national anthem in the "Emperor" quartet (op. 76, No 3). Already in the 16th century instrumental music was climbing up the trellis of a primitive variation-form A favourite plan (*see* the *Fitzwilliam Virginal Book, passim*) was to put together several popular or original tunes, with an ornamental variation sandwiched between. Sometimes sets of variations on a single tune were produced, with excellent effect, as in Byrd's variations on "The Carman's Whistle" Such variations were naturally grouped in order of increasing brilliance, and they often include passages that would catch the greatest pianoforte players.

In the 17th century a highly artistic form of variation solved with great simplicity the problem of expanding instrumental pieces to a length admitting of growth to a big climax This was the ground-bass, a single phrase placed in the bass and repeating itself *ad infinitum*. It originated in the dance forms of the *passacaglia*

and the *chaconne*. Both were in slow triple time, the chaconne having a strong accent on the second beat, while the passacaglia, by some chance, developed the liberty to transfer its theme to other parts than the bass. The genius of Purcell was cruelly hampered by the non-existence of large musical forms in his time, and he seized upon the ground-bass with avidity. By the time of Bach and Handel lighter sets of variations, consisting essentially of embroidery on a melody, had come into vogue. Bach's *Aria variata alla maniera Italiana* tells us where this fashion began; and in France the *air et doubles* was taken over from early English virginal music. Doubles are variations each of which divides the rhythm into quicker notes than the one before. The most familiar example is that known as "The Harmonious Blacksmith" in Handel's E major suite. Sometimes the air itself was stated in a tangle of ornamentation, while the doubles simplified the melody and varied the accompaniment. But Bach had meanwhile applied the principle of the ground-bass to variations on a complete symmetrical movement in binary form. His Air and 30 Variations, commonly known as the "Goldberg" variations, is (with the exception of Beethoven's 33 *Veränderungen* on a waltz by Diabelli) the most gigantic set of variations in the world. A melodically interesting ground-bass could not be maintained on so large a scale; but the 32 bars of Bach's theme are so many clear harmonic steps which can be represented by many analogous progressions, without loss of identity. (Ex. 1a) There is no question of retaining or varying the melody of the aria, which is a tissue of ornaments that will bear neither development nor simplification.

Ex. 1a Harmonic theme. (BACH "*Goldberg*" *Variations*)

Ex. 1b.
Var. 25.



The rise of the sonata style again brought the melodic embroidery variation into prominence, for in sonata forms we identify themes entirely by their melodies. Now, with not more than three or four exceptions, the best sets of variations by Mozart and Haydn are movements in their sonata works; and their independent sets are either early or perfunctory exercises and encore-pieces. Two common mistakes of professional and amateur criticism are, first, the judging of Haydn's and Mozart's variations by these parerga, and secondly, the much graver error of despising the embroidery variation on principle. It is either vulgar or sublime. And it is handled lovingly by precisely the greatest masters of deep harmonic and rhythmic variation, Beethoven and Brahms. Haydn is fond of a special form first known in Philipp Emanuel Bach. It consists of alternating variations on two themes, alternately major and minor; the first a rich and complete binary melody, and the other a shorter binary melody, often beginning with the same figure as the first. The first theme usually returns as if it were going to be unvaried, but its first repeat is an ornamental variation. The form is rarely worked out far enough to include more than one variation of the second theme; and sometimes (as in the famous "Gypsy" trio) there are new episodes instead of variations of the second theme, so that the form becomes a sectional rondo. The only strict example of Haydn's type of alternating variations in later music is the first allegretto of Beethoven's pianoforte trio in E flat (op. 70, No. 2), but a magnificent application of it, without change of mode, though with a wide range of key, is shown in the slow movement of his C minor symphony.

Beethoven, in his last works, invented another variation-form on two themes, of which the second is in a different key and time. The examples of this are the slow movement of the 9th symphony and the Lydian figured chorale in the A minor quartet. In the slow movement of Brahms's F major string quintet (op. 88), the alternation of the two keys gives rise, in the last line of the movement, to one of the most astonishing dramatic strokes in all music. Beethoven uses embroidery variations as means of obtaining extraordinary repose in slow movements. The extreme case of this is the slow movement of the sonata op. 57 (commonly called "Appassionata"), which is described in the article on SONATA FORMS. In this, and in many other instances, his method is that of the *air et doubles,* which grows to a natural climax which can subside into the rhythm of the plain theme. Until his latest works, such sets of variations are never finished. Their dramatic intent is that of a repose which is too unearthly to last; and at the first sign of dramatic motion or change of key the sublime vision "fades into the light of common day," a light which Beethoven is far too great an idealist to despise. *See* the andante of the B flat trio (op. 97); and the slow movement of the violin concerto, which contains two episodic themes in the same key. In his later works Beethoven found means, by striking out into foreign keys, of organizing a coda which finally spins down in fragmentary new variations, or even returns to the plain theme. Thus he was able to end his sonatas, opp. 109 and 111, with solemn slow movements.

Beethoven also found other applications of the variation forms. Thus the finale of the Eroica symphony has not only the theme but many other ideas in common with the brilliant set of variations and fugue for pianoforte on a theme from *Prometheus* (op. 35); and the fantasia for pianoforte, chorus and orchestra, and the choral finale of the 9th symphony, are sets of melodic variations with freely-developed connecting links and episodes. In the case of the 9th symphony, a second thematic idea eventually combines with the figures of the first theme in double fugue.

But Beethoven's highest art in variation-form is independent of the sonata. From his earliest display of pianoforte playing, the wonderful 24 variations on a theme by Righini, to his supreme variation-work, the 33 on Diabelli's waltz, he uses and transcends every older means of variation and adds his own discoveries. Before Beethoven the basis of variations might be a ground bass, a melody or a harmonic scheme. Beethoven discovered that rhythm and form can, with a suitable theme, be a solid basis for variations. The aria of Bach's Goldberg variations is in its phrasing as uniform as a chess-board; and if its harmonies had not a one-to-one correspondence with each variation the form would be lost. But there are themes, such as Haydn's Chorale St. Antoni, which Brahms varied, where the phrasing is interesting in itself. A similar example is the following theme by Paganini which inspired Brahms to compose two complete sets on it.

The climax in the history of variations dates from the moment when Beethoven was just about to begin his 9th symphony, and received from A. Diabelli a waltz which that publisher was sending round to all the musicians in Austria, so that each might contribute a variation to be published for the benefit of the sufferers in the late Napoleonic wars. Diabelli's theme was absurdly prosaic, but it happened to be, perhaps, the sturdiest piece of musical anatomy that Beethoven (or any composer since) ever saw; and it moved Beethoven to defer his work on the 9th symphony! The shape of Diabelli's waltz may be illustrated by a diagram which represents its first 16 bars; the upright strokes (not the spaces) being the bars, and the brackets and dots (together with the names underneath) indicating the rhythmic groups. The sec-

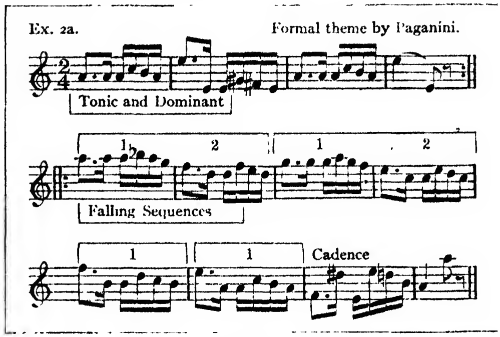
ond part also consists of 16 bars, moving harmonically back from the dominant to the tonic, and rhythmically the same as the first part. This plan is astonishingly elastic The alternation of tonic and dominant in the first eight bars may be represented by another familiar form in which three bars of tonic and a fourth of dominant are answered by three bars of dominant and a fourth of tonic, as in variation 14 (which must be reckoned in half-bars). Again, when the theme answers the tonic by the dominant it raises the first melodic figure by one step, and this may be translated by the answer on the supertonic harmony In the course of 50 minutes a few of these 33 variations become vague as to more than the beginnings and cadences of the theme; and there are three simple variations on which one would like to ask Beethoven whether he had not inadvertently omitted a bar; but the momentum of the theme is never lost, and after a group of three slow and rather free variations this momentum breaks into an entirely free fugue (variation 32) on a salient feature of what must by courtesy be called Diabelli's melody A free fugue is a favourite solution of the problem of the coda in a set of variations. The momentum produced by the revolution of true variations in the orbit of the theme gives the key to the whole problem A fugue solves it by flying off at a tangent Very sublime is the way in which Beethoven, after letting his fugue run its torrential course, returns to the orbit of his theme in an ethereal little minuet with a short coda of its own which, 16 bars before the end, shows signs of beginning to revolve again

Again, let us regard the period of the theme not as an orbit but as diurnal rotation We can then describe the codas of Brahms's Paganini-variations as produced by accelerating the spin till it breaks away for a while and then resumes for a few final catastrophic whirls; exactly like a dying top (though this, of course, does not accelerate its spin). Without acceleration Beethoven ended his wonderful C minor variations (most perfect of passacaglias) in this way. Brahms found in Haydn's Chorale St Antoni the opportunity for another method He took the first five bars as a ground-bass, within which narrow orbit the finale moves until its climax broadens out into the rest of the glorious theme, and so rounds off the whole work.

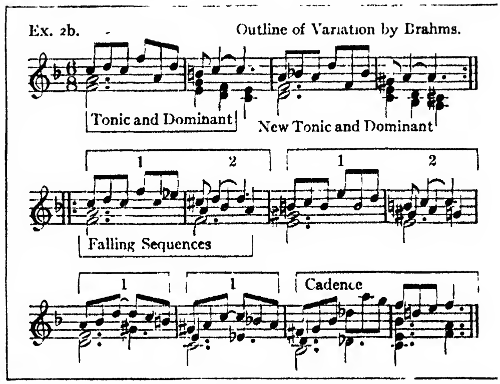
Bach poised the contrasts and climaxes of the Goldberg variations so accurately that the ending of the whole by a simple *da capo* of the theme is astonishingly effective It is as if a charming old ancestress of a living line of great folk were to step from the frame of her Holbein portrait and bow to her assembled posterity

To speak of the progress in variation-form since Beethoven is like speaking of the progress in reinforced concrete since the Parthenon. The classical variation-form is limited only by the composer's imagination and technique; and the removal of its foundations does not enlarge it at all There is no reason to condemn other kinds of variation; and many great and beautiful works in non-classical variation-form exist, from Schumann's *Études Symphoniques* to Elgar's "Enigma" variations and Dohnany's Variations on a Nursery Song. But no "free" variation that breaks down the phrasing of its theme and follows its own discursive ways will ever achieve anything externally so unlike the theme as a strict harmonic and rhythmic variation on classical lines. (*See* Ex. 2b) Nor will a series of such variations acquire anything like the classical momentum. On the contrary, in clumsy hands the free variation becomes apologetic in the way in which it offers raw chunks of the original melody as evidence that it has not forgotten its duty, like Lewis Carroll's poetic *Tema con Variazioni*, the preface to which is an unconscious epitome of modern misunderstandings of the form.

Variation writers may be scientifically classified into those who know their theme and those who do not. There is no reasonable doubt that many very clever composers, from Mendelssohn on-



Ex. 2a. Formal theme by Paganini.



Ex. 2b. Outline of Variation by Brahms.

wards, have completely misunderstood the nature of the deepe classical variations, and have thought that anything so unlike the original tune must be quite independent of it. Mendelssohn's *Variations sérieuses* have a beautiful theme with a structure tha might have given rise to splendid features, but Mendelssohn simply ignores this structure and replaces it by weaker things in almost every variation. Schumann shows more insight He ha no great grip of his theme, but he tries to distinguish by titles those variations which are true from those which are episodic; thus in the *Études Symphoniques* the etudes are numbered separately from the variations, the andante of the F major quartet i called *quasi variozioni;* and the strictest set he ever wrote (on a theme by Clara Wieck) is called Impromptus

Brahms stands alone in his grip of his theme Reger is no neare the classical form in his variations than in his other works The present state of the form seems to indicate that if the compose does not aim at strict variations his most vital results will be on the line of melodic development, as in the above-mentioned works of Elgar and Dohnányi, the Symphonic Variations o Dvořák, and those variations of Reger which are closest to thi type. (D. F. T.)

VARIATIONS, CALCULUS OF: *see* CALCULUS OF VARIATIONS.

VARICOSE VEINS, a condition of the veins which mostly occurs in those parts of the blood-stream which are farthest from the heart, occupy a dependent position and are relatively unsupported by surrounding tissues. Thus they are found, superficially in the legs and thighs; in the lowest part of the bowel (piles; *see* HAEMORRHOIDS), and in the spermatic cord (varicocele). Any condition which hinders the return of blood from the veins is ap to cause their permanent dilatation; thus is explained the occurrence of varicose veins in the leg from the wearing of a tigh garter, and of piles as the result of the pressure of an ovaria

tumour or of a pregnant uterus, or of disease of the liver.

Sometimes the trouble is begun by a direct injury to the vein, which, by setting up inflammation, weakens the coats of the vein, which then yield under the pressure of the blood-stream. In the case of varicocele, the dilatation of the veins is probably of developmental origin, many other causes are given, but not one of them appears satisfactory Examination of a varicose vein shows that it is increased in length as well as in capacity, and that the valves are atrophied and functionless In some parts of its course the vein has its coats much thickened, but at those places where there is most dilatation the walls are very thin Veins thus affected give rise to pains and achings, and they are, moreover, liable to attacks of inflammation which end in clotting of the blood (*thrombosis*, *q v*). This is a dangerous condition, as a sudden or violent movement is apt to cause the detachment of a piece of the clot, which, carried up to the brain or the lung, may cause sudden death Less serious results of varicose veins are swelling of the parts below (*oedema*), ulceration and abscess.

As regards treatment, the wearing of a well-fitting elastic stocking will prove beneficial in the case of a moderate dilatation of the veins of the leg; the individual must avoid long standing and fatigue. It is well also to have the foot of the bed raised three or four inches, so that during the night the veins may be kept as empty as possible If the case is more serious, the thinned veins threatening to give way, it will be advisable, provided the dilatations are fairly well localized, and the general condition of the patient permits, to excise the diseased parts, tying the cut ends of the veins, and closing the surface wounds with fine sutures. Should a varicose vein be plugged with clot, it will be advisable to tie it high up where the coats are healthy, and to remove the lower part by dissection. This will render the person safe from the very serious risk of a piece of the clot being carried to the heart, and will also permanently rid him of his trouble It may be said generally that any operative treatment for varicose veins in the lower extremity is best associated with the application of a ligature upon the large surface vein just before it enters the common femoral vein below the fold of the groin This operation removes the risk of the downward pressure of blood in the veins whose dilatation has rendered the valves useless Recently, a method of internal coagulation by means of injections (*e.g*, salicylic acid) into the vein has been adopted with success

In the case of a varicose vein being opened by accident or disease, it is quite possible for the individual to bleed to death. The first-aid treatment for the serious haemorrhage should consist in laying the patient on the floor, raising the limb upon the seat of a chair, and fixing a pad over the open vessel by a handkerchief or bandage.

Varicose veins of the spermatic cord (*varicocele*) of the left side are met with in adolescents. The dilatation is, in all probability, of developmental origin, making its appearance at puberty. It is, as a rule of no serious moment, and, unless present in an extreme degree, had best be treated merely by a suspension bandage. If, however, it is causing real physical distress, it may be treated by excision of an inch or two of the bunch of dilated veins. The presence of varicocele is apt to cause inconvenience or even discomfort to men living in India or the tropics, but the Englishman who intends spending his life in temperate climes will do well to ignore a varicocele. It will become less and less noticeable as time goes on. (E. O.)

VARIETY THEATRE: *see* MUSIC HALL.

VARIOLITE, in petrology a basaltic or doleritic rock with prominent spherulitic (variolitic) texture, the spherulites or varioles consisting usually of radial aggregates of feldspar. These varioles, especially on weathered surfaces, appear as pale coloured spots, giving the rock a pock-marked appearance The name is from Lat. *variola*, smallpox, in allusion to this characteristic feature The variolitic texture of the basic rocks is closely akin to the spherulitic texture of the acid lavas, as seen in rhyolites, etc.

Variolites frequently form the tachylytic selvages of dolerite dykes (*see* TACHYLYTE), and also appear in the form of pillow lavas (*see* SPILITE). The varioles are usually rounded in outline and are often about ½ in. in diameter, but may much exceed this size. With few exceptions they are built up of divergent fibres of feldspar embedded in dark brown glass. As variolites are frequently much decomposed, the glassy matrix is represented by secondary alteration products or has been devitrified. (C. E. T.)

VARLEY, JOHN (1778–1842), English water-colour painter, was born at Hackney, London, on Aug. 17, 1778. His father discouraged his leanings towards art, and placed him under a silversmith. But after his father's death the lad found work with an architectural draughtsman, who employed him to sketch the principal buildings in the towns they visited. His spare hours were employed in sketching from nature, and in the evenings he was permitted, like Turner and Girtin, to study in the house of Dr. Munro. In 1798 he exhibited his first work, a "View of Peterborough Cathedral," in the Royal Academy. In 1804 he became a foundation member of the Royal Society of Painters in Water-Colours, and contributed over forty works to its first exhibition. He died in London on Nov. 17, 1842.

VARNA, a fortress, seaport, departmental capital and episcopal city of Bulgaria; on the bay of Varna, an inlet of the Black sea, in 40° 12′ N. and 27° 56′ E. Pop (1926) 60,787. Varna is built on the hilly north shore of the bay, overlooking the estuary of the river Devna It is the eastern terminus of the railway to Rustchuk and Sofia. The "Varna quadrilateral," so important in Bulgarian military history, consists of the fortresses of Varna, Shumla, Rustchuk and Silistra (*q.v.*) Varna ranks with Burgas as one of the two principal seaports of Bulgaria Its deep and capacious bay is sheltered from northerly and north-easterly winds, and the harbour works are modern. The principal exports are cattle and dairy produce, grain, lamb and goat skins, and cloth (*shayak*); the imports include coal, iron and machinery, textiles, petroleum and chemicals In 1921 the port was entered by 906 vessels of 684,931 tons, comprising 55% of Bulgaria's Black Sea trade It is the headquarters of the Bulgarian Steamship Co, which trades with Turkey, Greece and Russia Its trade has been affected by the cession of the Dobruja to Rumania, but it is a growing sea-side resort.

Varna was the ancient Milesian colony of *Odessos*, founded 585 B.C Close by was fought in 1444 the battle in which Murad II. slew Wladislaus III. of Poland and Hungary, and routed his forces under Hunyadi János. Varna was occupied in 1828 by the Russians, in 1854 by the allies, who here organized the invasion of the Crimea, and in 1877 by the Egyptian troops summoned to the defence of Turkey against the Russians. By the treaty of Berlin (1878) it was ceded to Bulgaria. It has long been the seat of a Greek metropolitan and since 1870 of a Bulgarian bishop.

VARNHAGEN VON ENSE, KARL AUGUST (1785–1858), German biographer, was born at Düsseldorf on Feb. 21, 1785. He studied at Berlin, Halle and Tübingen. He began his literary career in 1804 as joint-editor with Adelbert von Chamisso (*q v.*) of a *Musenalmanach.* In 1809 he joined the Austrian army, and was wounded at the battle of Wagram. Soon afterwards he accompanied his superior officer, Prince Bentheim, to Paris, where he carried on his studies. In 1812 he entered the Prussian civil service at Berlin, but in the following year resumed his military career, this time as a captain in the Russian army. He accompanied Tettenborn, as adjutant to Hamburg and Paris, and his experiences were recorded in his *Geschichte der Hamburger Ereignisse* (London, 1813), and his *Geschichte der Kriegszüge des Generals von Tettenborn* (1815). At Paris he entered the diplomatic service of Prussia, and in 1814 acted under Hardenberg at the congress of Vienna. He also accompanied Hardenberg to Paris in 1815. He was resident minister for some time at Karlsruhe, but was recalled in 1819, after which, with the title of "Geheimer Legationsrat," he lived chiefly at Berlin. He had no fixed official appointment, but was often employed in important political business. In 1814 he married Rahel Levin (1771–1833) sister of the poet, Ludwig Robert (1778–1832). By birth she was a Jewess; but before her marriage she made profession of Christianity. She was a woman of remarkable intellectual

qualities, and exercised a powerful influence on many men of high ability. After her death her husband published a selection from her papers, and afterwards much of her correspondence was printed. Varnhagen von Ense died suddenly in Berlin on Oct 10, 1858.

He made some reputation as an imaginative and critical writer, but he is famous chiefly as a biographer. He possessed a remarkable power of grouping facts so as to bring out their essential significance, and his style is distinguished for its strength, grace and purity Among his principal works are *Goethe in den Zeugnissen der Mitlebenden* (1824); *Biographische Denkmale* (5 vols., 1824–30; 3rd ed., 1872); and biographies of General von Seydlitz (1834), Sophia Charlotte, queen of Prussia (1837), Field-Marshal Schwerin (1841), Field-Marshal Keith (1844), and General Bulow von Dennewitz (1853) His *Denkwürdigkeiten und vermischte Schriften* appeared in 9 vols. in 1843–59, the two last volumes appearing after his death His niece, Ludmilla Assing, between 1860 and 1867, edited several volumes of his correspondence with eminent men, and his *Tagebucher* (14 vols, 1861–70). *Blätter aus der preussischen Geschichte* appeared in 5 vols. (1868–69); his correspondence with Rahel in 6 vols (1874–75); and with Carlyle (1892) His selected writings appeared in 19 vols. in 1871–76. There is also an extensive literature dealing with Rahel Varnhagen von Ense; *see* especially her husband's *Rahel, ein Buch des Andenkens* (3 vols., 1834), *Aus Rahels Herzensleben* (1877); E Schmidt-Weissenfels, *Rahel und ihre Zeit* (1857); *Briefwechsel zwischen Karoline von Humboldt, Rahel und Varnhagen von Ense* (1896); O. Berdrow, *Rahel Varnhagen* (1900).

VARNISH. A homogeneous liquid, which when thinly applied, dries, on exposure to air, to a hard film giving decorative effect and protective action to the surface to which it is applied.

The use of varnish dates back to great antiquity; the ancient Egyptians were acquainted with the softer resins, such as sandarac, mastic, etc, which they melted up in oil to form a varnish which was applied warm with the finger or a knife On the mummy cases in the British Museum the varnish still retains its lustre and its surface is uncracked and undamaged But it is not until the middle of the 18th century that any description can be traced of linseed oil varnish thinned with oil of turpentine, and incorporating litharge as a drier.

Varnishes may be classified broadly into two varieties, (1) oil varnishes and (2) spirit varnishes (including cellulose varnishes) Oil varnishes are composed of hard gum resins, a drying oil—usually linseed oil—and a volatile solvent such as turpentine; on application the volatile solvent first evaporates leaving a soft oil-resin film which subsequently dries by absorption of oxygen from the air. Spirit varnishes are solutions of soft resins dissolved in a volatile solvent and on evaporation leave hard dry resinous films.

Manufacture of Oil Varnish.—The chief components of an oil varnish are hard fossil gums, oils and a volatile thinner—usually turpentine The gums are the fossilized exudations of ancient trees; in the course of centuries the original soft gums and resins have become hard, brittle and lustrous They are found in many different parts of the world as follows.—kauri gum from New Zealand, animi from Zanzibar, Angola and Congo, copals from West Africa and Pontianac and Manila gums from the Dutch Indies

The first process in the manufacture of an oil varnish is the selection and grading of the gums according to colour, hardness, etc, only the palest gums being used for the highest grade varnishes. These gums are put through a crusher so as to reduce them to a uniform size. The crushed gums are placed in a copper or aluminium varnish pot, provided with a hood or cover which is connected to a flue to take away the fumes given off during the "running" or melting process. The cover has a hole in the centre to allow the introduction of a copper or aluminium stirrer. The charge of gum—which varies from 50 lb. to 120 lb.—is put into the pot which is then placed over a hot coke or gas fire and gradually heated up to a temperature of about 300° C. When the gums are all melted and in a thin liquid condition, linseed oil—previously heated up to 300° C—is gradually added and the mixture thoroughly stirred; the heating is continued until complete amalgamation has taken place; this is indicated when a portion on being taken out and put on a piece of glass appears bright and transparent. The driers which consist of lead and manganese salts are next introduced and the mixture boiled until they are thoroughly incorporated. The pot is then removed from the fire to the thinning shop and when it has cooled down sufficiently, turpentine or white spirit is gradually added, the mixture being continually stirred so as to reduce the mass to a suitable consistency The varnish is then strained to remove any dirt and pumped into storage tanks where it is left to mature.

A large number of varieties of oil varnishes are made, each having its own special use The most important varieties are, coach-builders' varnishes, including finishing and hard drying body varnish, elastic carriage varnish and flatting or rubbing varnish, decorators' varnishes, such as copal oak varnish for inside and outside work, church oak varnish and French oil varnish A special type of varnish known as japan goldsize is made for gilders' use and as a binder for coach colours; it dries in two hours or less Other types of varnish made for specialized uses include, egg-shell flat varnish which dries with a mat surface, stoving or baking varnishes for tin printing work, and insulating varnishes for electrical purposes Oil varnishes are sometimes classified as long and short oil varnishes based upon the relative amounts of gum and oil used; that is on the number of gallons of oil per 100 lb of gum The general formulae for oil varnishes may be summarized as follows.—

	Gum	Oil	Thinner
	Lb.	Gals	Gals
Best finishing body varnish	50	14	15
Elastic carriage varnish	50	12	13
Hard carriage varnish	50	10	12
Flatting or rubbing varnish	50	5	10
Front door varnish	50	13	15
Best elastic oak varnish	50	11	12
Hard copal oak varnish	50	9	13
Japan goldsize	50	4	12

Spirit Varnishes.—These are simple solutions of soft recent resins—such as shellac, sandarac, dammar, mastic, etc, in a volatile solvent or mixtures of solvents such as methylated spirit, turpentine or acetone. When a spirit varnish is applied the volatile solvent rapidly evaporates leaving a thin coating of resin covering the object The manufacture of a spirit varnish is a comparatively simple matter, the process consists in placing the resin and solvent in a barrel or churn which is rotated at a slow speed for a period of about 12 to 48 hours until the resin is completely dissolved. The varnish is then strained to remove any dirt or other insoluble matter, into suitable containers where it is left to stand for a few days, and it is then ready for use The most important spirit varnish is French polish (*q v.*). White polish which is used for polishing very light woods such as satinwood is made by dissolving bleached shellac in methylated spirit—usually 2 lb of shellac to 1 gallon of methylated spirit White and brown hard spirit varnish which is largely used as a quick-drying varnish for woodwork, basket work, chairs and other articles of furniture is made by dissolving 4 to 5 lb of soluble manila gum in one gallon of methylated spirit. By the addition of various aniline dyestuffs to these varnishes, a large range of coloured varnish stains may be obtained which are used on woodwork to imitate mahogany, oak, walnut, etc

The chief spirit varnish in which turpentine is the volatile solvent is crystal paper varnish, made by dissolving 7 to 8 lb. of white dammar gum in one gallon of turpentine. This varnish is water-white in colour and is used for varnishing wallpapers and delicate interior work Other spirit varnishes include mastic varnish used for varnishing oil paintings and sandarac used as bookbinders and negative varnish.

Cellulose Varnish.—This consists of a base, usually cellulose nitrate, dissolved in suitable solvents. A large number of solvents may be used for dissolving cellulose nitrate, but those most commonly employed are acetone, amyl acetate, butyl alcohol and ethyl lactate. As these cellulose nitrate solvents are very expensive it is usual to substitute as far as possible cheaper diluents such as benzol, alcohol and light petroleum ether; these diluents while not in themselves solvents for nitro-cellulose nevertheless when mixed with the other solvents yield a good solution When cellulose varnish is applied to a surface the solvents evaporate leaving

the cellulose nitrate behind as a thin film These nitro-cellulose films are very brittle and do not adhere well to the surface and it is therefore necessary to add to the varnish a proportion of softening agent, or "plasticizer" in order to prevent shrinking and to toughen them, an addition of certain gums such as kauri, resin, ester gum, dammar, etc., is also made to promote adhesion of the film

The process of manufacture of cellulose varnish or lacquer is comparatively simple and consists in adding the cellulose-nitrate to the mixed solvents and stirring until complete solution has taken place, the gums and plasticizers being incorporated during the mixing process. The finished varnish is then strained off into suitable airtight containers and is ready for use.

Cellulose varnishes are perfectly clear and transparent, dry quickly leaving tough, hard films, which wear well and are remarkably resistant to alcohol, petrol and the effects of heat. They are largely used as wood finishes on tables, pianos and furniture generally; they have the advantage over French polish in that they can be more quickly applied and the resultant finish is not damaged when in contact with hot articles such as tea-pots, hot plates, etc These varnishes may be coloured with aniline dyestuffs giving coloured lacquers which are used for the colouring and protection of metal and other surfaces.

By the addition of strong staining pigments to the transparent cellulose varnishes the so-called opaque cellulose enamels are obtained which are largely used in the painting of motor-cars, etc. The pigments are ground in the varnish to a very fine state of division, but the amount which can be safely used without injuring the film is very limited The finish obtained from these cellulose enamels has neither the full gloss nor the opacity given by oil enamels, and if a high gloss finish is required it is necessary to use a final oil or wax polishing process The rapid rate of drying, hardness of finish and speedy rate of application by the spray process has resulted in their being extensively used

Natural Varnishes.—A reference should be made in conclusion to the natural varnishes which are the liquid saps of the varnish tree (Tsi-chou) indigenous to China and Japan These natural varnishes are obtained by tapping the trees and are thick, milky emulsions which have the peculiar property of drying only in a moist atmosphere The coatings given by them are exceedingly hard and durable and are unaffected by water They are largely used by the Chinese and Japanese for executing the beautiful lacquer work for which they are famous (*See* also BLACK VARNISH, and WOOD FINISHES, PAINTS, VARNISHES)

See J G. Bearn, *The Chemistry of Paints, Pigments and Varnishes*, bibl. (1925); Max Bottler and A. H Sabin, *German and American Varnish Making* (1912); Ch Coffignier, *Varnishes, Their Chemistry and Manufacture* (1923), J. G. McIntosh, *The Manufacture of Varnishes* (1922). (J. G. Bl)

VARNISHES, CHEMISTRY OF. The drying oil most commonly used is linseed oil, obtained from the seeds of *linum usitatissimum* containing 35–40% of oil, cultivated in temperate zones, especially in Russia, Hungary, France, the United States, Canada and North India This oil consists of mixed glycerides (*q v.*) of linolenic, linolic, and oleic acids, with small quantities of palmitic and stearic. The glycerides are derived from open-chain acids containing 18 carbon atoms which absorb oxygen in proportion to their unsaturation to give a gel (linoxyn) consisting of the oxidised glyceride in a colloidal form Another drying oil now in demand is China-wood oil (*tung* oil) extracted from the fruit of *Aleurites fordii* or *Acordate* (China and Japan) containing the glyceride of another 18 carbon-atom open-chain acid (elaeostearic acid) isomeric with linolic or linolenic acids. The annual production of this oil is 100,000 tons, compared with 700,000 tons of linseed oil

In the drying of linseed or tung oil, oxygen is at first slowly absorbed with a considerable induction period, and subsequently more rapidly, and then progressively diminishing as the process approaches completion. At the ordinary temperature 20–30 days are required for linseed oil with an induction period of 1–3 days. At 100° C, 67 hours are required, with an induction period of less than ½ hour The linseed oil acids behave similarly, but the oxidised films are of inferior durability. If small percentages (0·1–0·3%) of lead, manganese or cobalt as linoleates or resinates be present, the period of oxidation is much reduced A peroxide is formed in both absence and presence of the catalyst, and this undergoes change to a polymerised modification in which the glyceryl group remains intact but molecular rearrangement with loss of the peroxide and condensation have occurred The metals and peroxides function as oxygen carriers, and comparison with similar systems would indicate polymerisation of a monoxide type of glyceride or condensation according to the following scheme:

$$\mathrm{X{\cdot}CH{\cdot}CH{\cdot}Y} + \mathrm{O_2} \rightarrow \underset{\mathrm{O-O}}{\mathrm{X{\cdot}CH{\cdot}CH{\cdot}Y}} \begin{array}{l} \nearrow \ \underset{\mathrm{O}}{\mathrm{X{\cdot}CH{\cdot}CH{\cdot}Y}} \text{ (polymerised)} \\ \searrow \ \mathrm{X{\cdot}CHOH{\cdot}CO{\cdot}Y} \text{ (condensed)} \end{array}$$

Treatment of Drying Oils.—The treatment of drying oils for use in paints and varnishes comprises. (1) preliminary refining of the crude oil to remove mucilage and part of the colouring matter, and (2) a further treatment which may either thicken the oil, or partially oxidise it or incorporate in it metallic driers (lead, cobalt or manganese) so that when applied as a film the oil will oxidise and harden rapidly. The refining may be effected by neutralisation of the oil with sufficient alkali in the form of carbonate or caustic, whereby the soap formed carries down with it the mucilage (foots) and a fair amount of the chlorophyll colouring matter, but the use of sulphuric acid to the amount of 2% is cheaper, whereby the mucilage is coagulated in small flakes, and the oil purified by washing with water.

The thickening of drying oils may be brought about by heat (260° C) out of contact with the air, whereby association or polymerisation of the unsaturated components of the glycerides ensues Such heat-thickened oils are known as "litho" or "stand" oils If tung oil be heated similarly, thickening is very rapid, and unless controlled a spongy insoluble gel is produced with great evolution of heat and charring Stand oils are still unsaturated and dry to elastic and durable gels in the presence of metallic driers, yielding a more durable film than linseed oil Sometimes air is passed into the drying oil containing small quantities of cobalt or manganese drier between 60° and 120° C, whereby partial oxidation takes place together with thickening, but these "blown" oils are inferior to stand oils in the durability of their films.

Boiled linseed oil is frequently preferred to raw linseed oil It is obtained by heating the oil to about 90° C, adding driers in the form of lead, cobalt or manganese linoleates or resinates (0·1% Pb or 0·03% Mn or Co), and raising the temperature to 120° C. Agitation with air is continued for 2–3 hours, and the oil allowed to cool It should dry in the form of paint in 10–14 hours Extra-pale, pale boiled, and double boiled are varieties according to colour and viscosity.

Paint and Varnish Thinners.—The thinners used comprise (1) turpentine from varieties of pinus (*P. palustris*, U S.; *P. maritima*, France, *P sylvestris*, Russia). The extraction is by tapping the trees for oleo-resin (gum turpentine) or by steam distillation of the wood in the form of chips (wood turpentine). From the oleo-resin, containing 70% rosin (colophony) and 20% turpentine, the spirit is obtained by steam distillation. All forms of turpentine contain one or more terpene hydrocarbons. American and French turpentine contain pinenes, $C_{10}H_{16}$ (b p. 155–175° C), and thicken and partially oxidize on exposure, but turpentine is not to be considered as a siccative. It is the most reliable solvent or thinner for paints and varnishes. White spirit (b.p. up to 210° C) and kerosene are used to thin paints and varnishes either alone or blended with turpentine. It must be pointed out that the resins or resins and oils will give fluids with petroleum, but addition of excess of the thinner will precipitate the resin-oil as a gel. Benzene and coal-tar naphtha are sometimes used as thinners. The flash point (closed test) of a thinner must not fall below 73° F, so that it may avoid classification among the highly inflammable liquids of the Petroleum Acts (1871–81). The thinners for oil varnishes and paints play no part in the chemical changes during drying, but they may modify the

physical properties of the linoxyn film.

Constituents of Varnishes.—The simplest form of varnish are the spirit varnishes which are a solution of a resin in a volatile solvént; as a class they are generally brittle. Oil varnishes are free from this defect, since the drying oils which they contain bind and soften the resin. The resins employed include copals (Kauri, Manila, Congo), rosin (colophony), and, more recently, synthetic resins (*q v.*). For black varnishes, the solid components are asphaltum, or other forms of pitch (petroleum and stearin), together with carbon black Under the German term *Firniss* is included a drying oil with metallic driers without a resin, and the film is merely an elastic gel of oxidised linseed oil (linoxyn). Litho varnishes are essentially of the same character In the manufacture of a resin oil varnish, the copal resins must be heated to 290°–300° C with a loss of 10–25% in weight before they can be taken up by drying oils. The temperature to which the resins must be heated before they become soluble in oil is higher in the case of the hard fossil resins The drying oils used in oil varnishes are linseed oil with or without tung oil. The resin oil mixture is thinned down with turpentine or white spirit Driers in the form of lead and manganese compounds (*cf.* drying oils) are incorporated in the oil before or after the addition of the thinners. The mixture is left to clarify and to mature. The proportions of resin, oil and thinners vary with the requirements; for coach-work the proportions are 1 2, and for hard coatings 1·1 4 A varnish for exterior work is generally richer in oil than an inside varnish. Recently, soluble forms of cellulose nitrate and acetate in appropriate solvents have been largely used with pigments and plasticisers in the form of enamels for protective coatings of good elasticity and durability The most durable form of varnish known is Japan lacquer, obtained from *rhus vernicifera* (Tsi-chou, varnish tree) It gives a black film on stoving in a moist atmosphere with the formation of an oxidation product of urushiol, the reduction product of which has been synthesised by Japanese chemists (*See* also OILS, FATS AND WAXES)

VARRO, MARCUS TERENTIUS (116–27 B C), Roman antiquarian and man of letters, was born at Reate He studied at Rome under L. Aelius Stilo, the first Roman grammarian, and at Athens under Antiochus of Ascalon In politics he espoused the side of Pompey. He disapproved, apparently, of the first triumvirate (that of Pompey, Caesar and Crassus, 60 B C), which he ridiculed in a book called *The Three-headed* (Τρικάρανος *cf.* Appian *Civil War*, ii 9. καί τις αὐτῶν τήνδε τὴν συμφροσύνην συγγραφεὺς, Οὐάρρων ἐνὶ βιβλίῳ περιλαβὼν ἐπέγραψε Τρικάρανον). Under Pompey he saw considerable military service and was engaged in several operations during the Civil War. Before the battle of Pharsalia he went to Epirus, and along with Cicero and Cato, he awaited at Dyrrachium the issue of the conflict. His personal relations with Caesar were friendly, and when, after the defeat of Pompey, Caesar secured the restoration of some of Varro's property, which had been seized by Mark Antony, Varro showed his gratitude by dedicating to him the second part of his *Antiquitates.* He also assisted Caesar in collecting Greek and Latin literature for the great public library which he contemplated. On the formation of the second triumvirate (that of Octavianus, Antony and Lepidus 43 B.C.), Varro was proscribed, but through the good offices of Q Fufius Calenus he was able to come to terms with the triumvirs and the remaining years of his long life were spent in study and writing.

Volume of Writings.—Varro was not only the most learned of Romans, but also the most voluminous of Roman writers (*homo* πολυγραφώτατος Cic., *Ad.Att.*, xiii.18). Aulius Gellius, iii., 10 17 quotes Varro as saying that "he had now entered on the 12th hebdomad of years (*i.e.*, was between 78 and 84), and up to that day had written 70 hebdomads (*i.e.*, 490) of books, of which some considerable number had not appeared, his libraries having been plundered when he was proscribed." Jerome's catalogue of his works is preserved in a mutilated form in Rufinus, pref to translation of the homilies of Origen. From this and other evidence Ritschl puts the number of his separate literary works at 74 and the number of "books"—counting, for example, the 150 *Menippean Satires* as 150 "books"—at about 620.

Conspectus of Writings.—His work, which survives only in fragments, with the exception of the *De Lingua Latina,* of which six books are extant, and the *Rerum Rusticarum libri tres* which is extant almost entirely, may be considered under various heads.

1 *Saturae Menippeae* in 150 books These were medleys in prose and verse in the style of Menippus, a Cynic philosopher of the first half of the 3rd century B C. (Aul Gell, ii. 18 6) The titles, often Greek, of the individual Satires are of the most varied kind—sometimes personal names of gods or men, sometimes proverbs, Greek or Latin, *e g*, *Nescis quid vesper serus vehat* (You know not what evening may bring forth), Δὶς παῖδες οἱ γέροντες (Old men are in their second childhood), Γνῶθι σεαυτόν (Know thyself). And the range of subject is no less wide and varied—eating and drinking (*Est modus matulae,* περὶ μέθης, περὶ ἐδεσμάτων, ὑδροκύων), literature (*Parmeno*), philosophy (περίπλους, περὶ αἱρέσεων, *armorum iudicium*), politics (the Τρικάρανος mentioned above), praise of the good old times (*Sexagesis,* Γεροντο-διδάσκαλος, Bimarcus)—in a word, Varro might have said with Juvenal (i. 85). *quidquid agunt homines, votum timor ira voluptas gaudia discursus nostri farrago libelli est* So far as can be judged from the fragments the Menippean Satires had no great merit either of style or content, but the frequency with which they are quoted in later writers suggests that they were the most generally popular of Varro's writings.

2 *Logistoricon libri LXXVI*, treatises on philosophical, historical and other subjects, generally with a double title, *e g.*, *Catus aut de liberis educandis* (Aul Gell, iv 19, *cf* xx 11), *Orestes vel de insania* (Aul Gell., xiii 4); *Pius aut de pace* (Aul. Gell., xvii 18); *Sisenna vel de historia* (Aul Gell, xvi 9).

3 *Imagines* in 15 books This consisted of 700 biographies of famous Greeks and Romans, each biography being accompanied by a portrait of the subject and an explanatory metrical *elogium.* Thus was probably the first Latin illustrated book, but Cratenas, the medical attendant of Mithridates VI (120–63 B C) had shown the way by an illustrated book (Ῥιζοτομικόν) on plants. The number of biographies, 700, is explained by Varro's curious affection for the number 7 (*hebdomas*) *cf.* Aul Gell, iii. 10 1 "M Varro in the first of the books entitled *Hebdomades* or *De Imaginibus* says that the virtues and powers of the number 7, which the Greeks call ἑβδομάς are many and various". *cf* iii 11 3, *M. Varro in primo de Imaginibus, uter* (Homer or Hesiod) *prior sit natus, parum constare dicit*, ibid 6 M Varro in the first book, *de Imaginibus*, placed beside the portrait of Homer this epigram. *Capella Homeri candida haec tumulum indicat Quod hac Ietae mortuo faciunt sacra* (This shining she-goat indicates the tomb of Homer, because it is with a she-goat that the Ietae sacrifice to the dead)

4 On literature and the history of literature he wrote a series of treatises, *e g*, *De poematis, De compositione saturarum, De Poetis* (Aul Gell, i 24.3; xvii. 21, 43 and 45). *De originibus scaenicis, De comoediis Plautinis* (Aul. Gell, iii 3 9 seq), *Quaestionum Plautinarum libri V* In this connection it is to be noted that Varro established the canon of the genuine plays of Plautus, the 21 so-called *Fabulae Varronianae, i.e*, the 21 plays now extant (the *Vidularia* only partially).

5 *Antiquitatum rerum humanarum et divinarum libri XLI* Of this work the first 25 books dealt with *res humanae,* the second part in 16 books, dedicated to Caesar, dealt with the gods For the first part, *cf.* Aul Gell., i 16, i 25, iii 2, v 4, xi 1, xiii 12, xiii 13, xiii.17, xvii 3; for the second part *cf.* Aul Gell, i 18, iii.16, x 15, xv 30, xviii.12. Other works in this sphere written by Varro were *De gente populi Romani libri IV, De vita populi Romani, De familiis Troianis, Tribuum liber, Rerum urbanarum libri III, Aetia* (so called after the Αἴτια of Callimachus).

6. Historical works. *De Pompeio libri III*, *Annalium libri III*, *De sua vita, Legationum libri III.*

7. Encyclopaedic works. *Disciplinarum libri IX* (*cf* Aul Gell.,

i.20, x.1, xviii 15), dealing with the liberal arts, grammar, rhetoric, music, medicine, etc., *De forma philosophiae libri III.*

8. Legal work. *De iure civili libri XV.*

9. Geographical works: *De ora maritima, De aestuariis, Ephemeris navalis.*

10. Grammatical works: *De lingua Latina libri XXV.*, of which books 2–4 were dedicated to P Septimius, the rest to Cicero; *cf.* Aul. Gell., ii 25, vi.11, x 21, xvi 8. Bks. 5–10 are extant in a somewhat mutilated condition. The work was divided into three parts, the first dealing with the etymology of Latin words, the second with inflexion, the third with syntax Other works in this sphere by Varro were *De sermone Latino ad Marcellum libri V.* (*cf* Aul. Gell., xii 6, xii 10, xvi 12, xviii 12); *De similitudine verborum; De utilitate sermonis; περὶ χαρακτήρων; De antiquitate litterarum; De origine linguae Latinae.*

11 *Epistolicae Quaestiones* (Aul. Gell., vi 10, xiv.7, xiv.8) dealing with a variety of subjects

12. *Rerum rusticarum libri III.*, written when Varro was in his 80th year. (*Cf.* the opening words, "If I had leisure, Fundania, I would have written for you more conveniently what I will now set forth as best I can, considering that I must make haste, since, as the saying goes, if man is a bubble, still more so is an old man. My 80th year warns me that I must collect my baggage before I depart from life ") This work (for which *cf.* Aul Gell, ii. 20) is extant practically entire.

Estimate of Contemporaries.—It is a very remarkable fact that Livy nowhere in his extant work alludes to Varro, or gives any evidence of acquaintance with his writings But the reputation which he enjoyed, both in his own day and in later times, is abundantly testified: Cic., *Acad post.*, i.3. "You have revealed to us the age of our fatherland, its chronology, the laws of its religion and priesthoods, the plan of our home and foreign administration, the position of our territories and districts, the titles and descriptions of all things Divine and human, with the duties and principles attaching to them, and you have shed a vast amount of light on our poets and on Latin literature in general and on the Latin vocabulary, while you have yourself composed picturesque and choice poems in almost every metre, and in many passages have touched upon philosophy, so far as to arouse interest, but not sufficiently for full treatment "

VARTHEMA (Barthema, Vertomannus, etc), **LUDOVICO DI,** of Bologna (*fl* 1502–1510), Italian traveller and writer, left Europe near the end of 1502; early in 1503 he reached Alexandria and ascended the Nile to Cairo From Egypt he sailed to Beirut and thence travelled to Tripoli, Aleppo and Damascus, where he managed to get himself enrolled, under the name of Yunas (Jonah), in the Mameluke garrison—doubtless after adopting Islam From Damascus he made the pilgrimage to Mecca and Medina as one of the Mameluke escort of the Hajj caravan (April–June 1503); he describes the sacred cities of Islam and the chief pilgrim sites and ceremonies with remarkable accuracy, almost all his details being confirmed by later writers With the view of reaching India, he embarked at Jidda and sailed down the Red sea and through the Straits of Bab-el-Mandeb to Aden, where he was arrested and imprisoned as a Christian spy. He gained his liberty—after imprisonment both at Aden and Radaa —through the partiality of one of the sultanas of Yemen, made an extensive tour in south-west Arabia (visiting Sana, etc), and took ship at Aden for the Persian Gulf and India. On the way he touched at Zaila and Berbera in Somaliland; he then (early in 1504?) ran across to the Indian port of Diu in Gujarat, afterwards famous as a Portuguese fortress. From Diu he sailed up the Gulf of Cambay to Gogo, and thence turning back towards the Persian Gulf made Julfar (just within the entrance of the gulf), Muscat and Ormuz. From Ormuz he seems to have journeyed across Persia to Herat, returning thence south-west to Shiraz, where he entered into partnership with a Persian merchant, who accompanied him during nearly all his travels in South Asia.

After an unsuccessful attempt to reach Samarkand, the two returned to Shiraz, came down to Ormuz, and took ship for India. From the mouth of the Indus Varthema coasted down the whole west coast of India, touching at Cambay and Chaul; at Goa, whence he made an excursion inland to Bijapur; at Cannanore, from which he again struck into the interior to visit Vijayanagar on the Tungabudra; and Calicut (1505?), where he stopped to describe the society, customs and institutions of Malabar, as well as the topography and trade of the city. Passing on by the "backwater of Cochin," and calling at Kulam (Quilon), he rounded Cape Comorin, and passed over to Ceylon (1506?) Though his stay here was brief (at Colombo?), he learnt a good deal about the island, from which he sailed to Pulicat, slightly north of Madras, then subject to Vijayanagar Thence he crossed over to Tenasserim in the Malay peninsula, to Banghella, perhaps near Chittagong, at the head of the Bay of Bengal, and to Pegu, in the company of his Persian friend and of two Chinese Christians (Nestorians?) whom he met at Banghella. After some successful trading with the king of Pegu, Varthema and his party sailed on to Malacca, crossed over to Pider (Pedir) in Sumatra, and thence proceeded to Bandan (Banda).

From the Moluccas he returned westward, touched at Borneo, and there chartered a vessel for Java, the "largest of islands," as his Christian companions reckoned it He notes the use of compass and chart by the native captain on the transit from Borneo to Java, and preserves a curious, more than half-mythical, reference to supposed Far Southern lands. From Java he crossed over to Malacca, where he and his Persian ally parted from the Chinese Christians; from Malacca he returned to the Coromandel coast

Varthema was now anxious to resume Christianity and return to Europe; after some time he succeeded in deserting to the Portuguese garrison at Cannanore (early in 1506?). He fought for the Portuguese in various engagements, and was knighted by the viceroy Francisco d'Almeida, the navigator Tristan da Cunha being his "sponsor." For a year and a half he acted as Portuguese factor at Cochin, and in 1507 (?) he finally left India for Europe by the Cape route. Sailing from Cannanore, Varthema apparently struck Africa about Malindi, and (probably) coasting by Mombasa and Kilwa arrived at Mozambique, where he notices the Portuguese fortress then building, and describes the negroes of the mainland He finally arrived safely in Lisbon.

Varthema's work (*Itinerario de Ludouico de Varthema Bolognese* . .) was first published in Italian at Rome in 1510 (*ad instãtia de Lodouico de Henricis da Corneto Vicẽtino*) Other Italian editions appeared at Rome, 1517, at Venice, 1518, 1535, 1563, etc The first English translation was of 1576–77 (in Richard Eden's *History of Travayle*); an extract from Varthema was inserted in Samuel Purchas's *Pilgrimage* (1625–26), and in 1863 appeared the Hakluyt Society edition by J W Jones and G. P. Badger (*Travels of Ludovico di Varthema*). (C. R B)

VARUNA, in Vedic Hindu mythology the associate of Mitra, whose individuality faded while Varuna's gained ground by a process still obscure. In contrast to Indra, the war-god, who was supreme, Varuna has no myths related of him But in post-Vedic myth Varuna sinks to the position of a departmental god—of the waters—being replaced by Prajāpati as the supreme.

VASA or **NIKOLAISTAD,** a seaport of Finland in 63° 6′ N, 21° 36′ E., on the east coast of the Gulf of Bothnia. Pop (1925) 24,347 It is the chief town of a department of the same name. Vessels enter from the sea at Rönnskär, 26 m. distant, and the channel is safe for vessels drawing 22 feet. The exports are timber, tar, etc., and the imports coal and salt, and there is a ship-repairing yard The town was founded in 1606, and after its destruction by fire in 1852 was rebuilt nearer the shore.

VASARI, GIORGIO (1511–1571), Italian painter and architect, whose main distinction, however, rests on his valuable history of Italian art, was born at Arezzo on July 30, 1511. At a very early age he became a pupil of Guglielmo da Marcilla, a very skilful painter of stained glass. At the age of thirteen he went to Florence, where he studied under Michelangelo, Andrea

del Sarto and Baccio Bandinelli aided by the patronage of the Medici princes. In 1531 he visited Rome in the suite of Cardinal Ippolito de Medici and studied the works of Raphael and others of his school. The paintings of Vasari were much admired. Vasari's principal works are at Florence, Rome, Naples, Arezzo, Bologna, Bosco (near Alexandria), Lucca, Monte Sansovino, Pisa, Perugia, Pistoja. Many of his pictures still exist, the most important being the wall and ceiling paintings in the great hall of the Palazzo Vecchio in Florence, and his frescoes on the cupola of the cathedral He died at Florence on June 27, 1574, and was buried in the chapel of S. Giorgio in the Pieve of Arezzo

Personally Vasari was a man of upright character, always ready to appreciate the works of others: in spite of the very different taste of his time, he expresses a warm admiration of the works of Giotto, which is very remarkable. As an art historian of his country he must always occupy the highest rank. His great work *Delle Vite de' più eccellenti pittori, scultori, ed architettori,* was first published in 1550, and afterwards partly rewritten and enlarged in 1568 It was dedicated to Cosimo de' Medici, and was printed at Florence by the Giunti; it is a small quarto illustrated with many woodcut portraits This *editio princeps* of the complete work is usually bound in three volumes, and also contains a very valuable treatise on the technical methods employed in all branches of the arts, entitled *Le Tre Arti del disegno, cioè architettura, pittura, e scoltura.* His biographies are written in a very pleasant style, interspersed with amusing stories. With a few exceptions Vasari's judgment is acute and unbiased. The work in any case remains a classic, however it may be supplemented by the more critical research of modern days.

Vasari gives his own biography at the end of his *Vite,* and adds further details about himself and his family in his lives of Lazzaro Vasari and Francesco Salviati The first edition of his *Vite* was issued by the Torrentino Press (1550). The best edition is that published at Florence by Milanesi (1878–1882), which embodies the valuable notes in the earlier edition by Le Monnier (1846). The *Lives* has been translated into French, German and English.

See Sir D Colnaghi, *Dict of Florentine Artists* (1928), on his literary works *see* W Kallab, *Vasaristudien* (Vienna, 1908); and J Schlosser, *Die Kunstliteratur* (Vienna, 1924), which also contains an account of his life.

VASCO DA GAMA: *see* GAMA, VASCO DA.

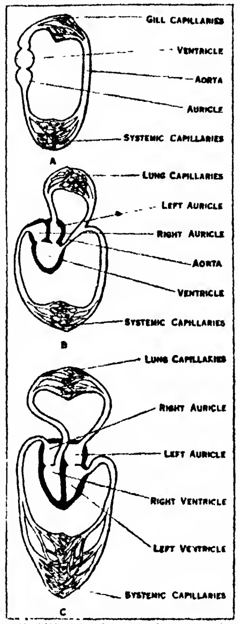
VASCULAR SYSTEM. The unicellular organism receives all the supplies necessary for its growth and maintenance directly from its environment, either by diffusion of substances held in solution, or by direct intake of foodstuffs, which undergo chemical disintegration in vacuoles containing liquid into which the necessary enzymes are secreted In the multicellular organism, such direct intake of foodstuffs by diffusion by every individual cell is impossible, for only the outer layer of cells is in contact with the environment, and this layer is usually protected by some form of membrane which is impermeable to water and food substances.

The vascular system has been developed to convey nutrient materials, etc. to the various parts of the organism, and the blood serves as intermediary between the environment and the organs of the body. This function can be fulfilled only if the blood is in continuous circulation, carrying nutrient materials and oxygen to the tissues, and conveying the waste products of metabolism from the tissues to the places where they are excreted. The heart is the organ which provides the necessary energy for this circulation, and the blood vessels are the channels which convey the blood to and from the tissues.

In the case of most invertebrate animals, the blood or analogous fluid is not all enclosed in blood vessels, and the various tissues lie freely in the fluid; which is kept in constant motion. In the higher animals, however, the blood is entirely enclosed in a system of tubes, and the nutrient substances, etc., are brought into contact with the cells only after their diffusion through the thin walls of the finest blood vessels. By the force of the cardiac contraction, the blood is driven through the tissues by way of thick-walled tubes, the arteries, and back to the heart by a system of thinner-walled vessels, the veins. In the tissues, the blood passes through a fine meshwork of capillaries, the walls of which consist of a single layer of delicate cells, which allow a free interchange of material to take place between the blood within and the tissue fluids outside the vessel.

THE HEART

In fishes (fig 1, A) the heart consists of one auricle and one ventricle The blood is received from the great veins into the auricle. By the contraction of the auricle the blood is forced into the ventricle and this, when it contracts, sends the blood on to the bulbus arteriosus The blood passes through the branchial arteries into the gills, where it takes up oxygen, and then flows on into the aorta, by which it is distributed to the organs of the body. From the capillaries of these organs the blood is collected by the veins and is carried once more back to the auricle The fish heart is thus entirely on the venous side of the vascular system.



FROM STARLING, "ELEMENTS OF HUMAN PHYSIOLOGY" (J & A CHURCHILL)

FIG 1—DIAGRAM OF CIRCULATORY SYSTEM IN A, FISH, B AMPHIBIAN (FROG), C MAMMAL, ILLUSTRATING DEVELOPMENT OF VASCULAR SYSTEM AND SEPARATION OF SYSTEMIC CIRCULATION FROM PULMONARY CIRCULATION

In amphibia, such as the frog, the heart consists of two auricles and one ventricle (fig 1, B) The right auricle receives venous blood from the body and forces it by its contraction into the ventricle From the ventricle the blood passes into the aorta, whence it is carried partly by the pulmonary artery to the lungs, partly by other arteries to the different organs of the body The blood, which has passed through the lungs and been arterialised, flows through the pulmonary veins to the left auricle, whence it passes into the ventricle and mixes with the venous blood which is arriving from the right auricle. The pulmonary circulation is thus merely a branch of the general or systemic circulation. The bulbus aortae in the frog is divided into two parts by means of a spiral valve, by which a partial separation of the blood coming from the right and left auricles is effected, and the venous blood from the right auricle is directed especially into the pulmonary artery.

Course of the Circulation in Mammals.—In mammals and birds, the heart has become entirely divided into two halves, right and left, which have no direct communication with one another (fig. 1, C). The right auricle receives the venous blood from all parts of the body From the right auricle, the blood passes to the right ventricle, and from here it is forced into the lungs along the pulmonary artery. In the lungs it takes up oxygen and becomes arterial, and is returned by the pulmonary veins to the left auricle and to the ventricle The left ventricle forces the blood into the aorta, whence by the branching arteries it is carried to all parts of the body.

There are thus two circulations—the one *pulmonary,* from the right side of the heart to the pulmonary artery and the capillaries of the lungs and to the left heart by the pulmonary veins; the other *systemic,* from the left side of the heart, by the aorta, to the arteries and capillaries of the body tissues and organs, from which by the veins to the right side of the heart. A schematic representation of the circulatory system is given in fig. 2 The muscular walls of the right ventricle are much thinner than those of the left ventricle. This is so because the energy required of the left ventricle must exceed that of the right ventricle, as resistance in the systemic circuit exceeds that in the pulmonary circuit

The heart becomes filled with venous blood during its relaxation or *diastole,* and forces the blood into the arteries during its contraction or *systole.* The large arteries are of less capacity than the corresponding veins, and their walls are essentially extensile and elastic. The small arteries and *arterioles* are essentially muscular tubes and can vary considerably in diameter. The arterioles open into the capillaries, and these are so numerous

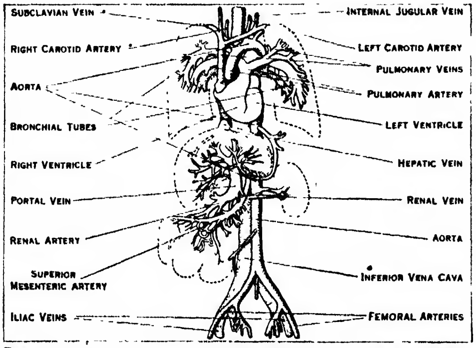


FIG. 2.—GENERAL COURSE OF CIRCULATION AND SOME OF THE PRINCIPAL VESSELS

that each organ may be regarded as a sponge full of blood The skeletal muscles and the muscular walls of the viscera at each contraction express the blood within them and materially influence the circulation. The whole muscular system must therefore be regarded as an accessory pump to the vascular system The veins are of larger calibre than the corresponding arteries, and have tough and inextensile walls The veins are not, as a rule, distended with blood to their full potential capacity. The latter is so great that the whole blood of the body can collect within the veins.

The heart and lungs are placed within the thoracic cavity, the floor of which is formed by the muscular diaphragm; the heart is itself enclosed in a tough inextensile bag, *the pericardium,* the function of which is to check over-dilatation of the heart Below the heart, the pericardium is fixed to the central tendinous part of the diaphragm; above, it is suspended by the mediastinum On account of this fixed position of the pericardium, the heart is prevented from oscillating.

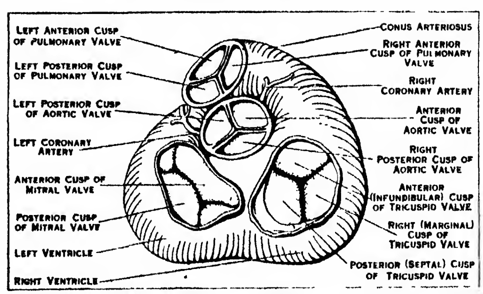
The Valves of the Heart.—As regards the valves of the heart (fig. 3), the tricuspid guards the right auriculo-ventricular opening, and consists of three flaps of fibrous tissue covered, like all the internal surfaces of the heart, with the smooth shining membrane, *the endocardium.* The flaps are continuous at their base, forming an annular membrane surrounding the opening. The bicuspid or mitral valve consists of two cusps, and guards the left auriculo-ventricular opening The under surface and free edge of each cusp of these valves are attached by chordae tendinae to two papillary muscles, these are pillars of muscle which rise up from the inner surface of the ventricles.

The papillary muscles and chordae tendinae pull down the diaphragm formed by the closed valves (the floor of the auricles), thus expanding the auricles and enabling the valvular as well as the muscular parts of the wall of the ventricles to approach together and force out the blood. The ventricles are never completely emptied, for some blood remains in contact with the auriculo-ventricular valves up to the end of systole and ensures their closure. The aortic and pulmonary valves consist of three semilunar, pocket-shaped cusps. A fibrous nodule is placed centrally in the free edge of each cusp, whence numerous tendinous fibres radiate to the attached borders of the cusp. Opposite the cusps are bulgings of the aortic walls—the sinuses of Valsalva. From the anterior one arises the right coronary artery, and from the left posterior the left coronary artery; these vessels supply the substance of the heart with blood.

Foetal Circulation.—The foetus has no independent respiration or digestion and therefore depends entirely on the oxygen and nutritive substances which diffuse through the placenta from the mother's blood. The arterial blood flowing from the placenta along the umbilical vein is partly conveyed to the vena cava ascendens by means of the ductus venosus and partly flows through two trunks which unite with the portal vein returning the blood from the intestine into the liver, thence to be carried back to the vena cava by the hepatic veins. The arterial blood flowing from the placenta becomes mixed in the vena cava with the venous blood which has returned from the trunk and the lower extremities. In the right auricle it would also become freely mixed with the venous blood returning from the head and upper extremities were it not for a special arrangement which impedes but does not entirely prevent this mixture.

On account of the presence of special valves (Eustachian valves), the upward arterial stream is directed into the left side of the heart through the foramen ovale—an opening in the intra-auricular septum—whilst the venous current from the superior vena cava is directed into the right ventricle. When the ventricles contract, the arterial blood contained in the left ventricle is expelled into the ascending aorta and thence to the head and upper extremities, while the venous blood of the right ventricle is expelled into the pulmonary artery and then through the ductus arteriosus (which branches off from the pulmonary artery before it passes into the lungs) into the descending aorta This separation of the two streams is not perfect, but it is responsible for the fact that the upper parts of the foetus receive blood which contains more oxygen than that received by the lower parts This is possibly the reason why the head and the arms of the foetus are always considerably more developed than the pelvis and legs A portion of the blood flowing through the descending aorta enters the two umbilical arteries and is conveyed to the placenta, where it is re-oxygenated.

At birth, the course of circulation undergoes changes As soon as the lungs become distended by the first respiration, a portion of blood is diverted from the pulmonary artery into the lungs As the pulmonary circulation increases, the ductus arteriosus becomes gradually obliterated, and finally disappears. The foramen ovale between the auricles also becomes closed The circulation, which was carried out in the foetus upon the plan of that of the higher reptiles, becomes that of the warm-blooded animal, and the venous blood becomes separated from the arterial blood After birth, the



FROM YOUNG AND ROBINSON IN CUNNINGHAM, "TEXTBOOK OF ANATOMY" (OXFORD MEDICAL PUBLICATIONS)

FIG 3.—THE BASES OF THE VENTRICLES OF THE HEART, SHOWING AURICULO-VENTRICULAR, AORTIC AND PULMONARY ORIFICES AND VALVES

umbilical arteries and vein shrink and close up and form the ligaments of the bladder, and the ligamentumteres of the liver. The ductus venosus disappears.

Physiological Properties of the Heart.—The cardiac muscle must be regarded as endowed with four fundamental properties, viz., *Rhythmicity,* the function of originating its impulse; *Conductivity,* the function of transmitting the impulse; *Irritability,* the function of responding to stimuli; and *Contractility,* the function of developing tension which may be utilized for performing the work of circulating the blood.

Rhythmicity.—The cause of the heart beat has naturally been one of the most continued subjects of inquiry. H. Allen in 1757 was the first to show that the activity of the heart is not dependent on its connections with the nervous system. The heart is controlled and influenced by the nervous system, but this control is not essential for life. The excised heart of a frog continues to beat rhythmically for days, provided that it is supplied with oxygen and prevented from drying. In the case of the warm-blooded animal, the heart is similarly capable of continuing its rhythmic contractions for some time after excision.

(1) *The Amphibian and Reptilian Heart*—The frog's heart consists of a sinus venosus which receives the venous blood from the body, two auricles, the ventricle and the bulbus arteriosus, which divides into the two aortae. The frog's heart in the body, or after excision from the body, beats regularly, the contractions starting in the sinus, then travelling to the auricles, ventricles and bulbus.

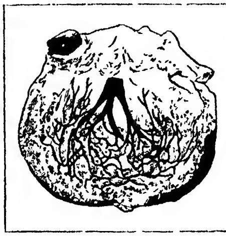
At one time the rhythmic contraction of the heart was attributed to the action of groups of nerve cells in the sinus that were discovered by Robert Remak in 1848. Some experimental support for this theory, which is known as the "neurogenic" theory of the heart beat was given by Stannius, who demonstrated that the auricle and ventricle of the frog's heart cease to beat for some time if the sinus is tied off with a ligature, while the sinus goes on beating regularly. Further experiments have shown however that the beat of the heart cannot be ascribed to the rhythmic activity of these ganglion cells, for every strip of the heart muscle is capable of rhythmic action, whether it contains nerve cells or not. In the developing chick, the heart contracts by the 24–28th hour of incubation, while the nerves do not grow into the heart before the 6th day. The inherent power of rhythmic contraction belongs to the cardiac muscle itself (the "myogenic" theory of the heart beat).

Furthermore, it belongs to every part of the heart, but there is a descending scale of this automatic power, from the sinus where it is highest to the lower parts of the ventricle where it is very slight (Gaskell). The normal sequence of contraction of the four parts is determined by the natural rhythm of these parts, but in the whole heart it is impossible for the ventricle to contract at its own rhythm because before it is ready to beat again, after a preceding contraction, it receives an impulse from the auricle. In the same way, the auricle never beats at its own rhythm; it is always subordinated to the faster rate of impulses coming from the sinus. If, however, the ventricle is electrically stimulated at a rate slightly faster than the beat of the sinus, the normal sequence of contractions becomes reversed, the ventricle now contracting first and the sinus last. All recent experiments tend to confirm the myogenic theory of the heart beat.

(2) *The Mammalian Heart.*—Although the mammalian heart has no sinus venosus, its contractions are as regular, and as independent of the nervous system as those of the lower vertebrates. Both in the heart *in situ* and in the excised heart the two auricles contract together, and after a short interval there follows the contraction of the two ventricles.

In the mammalian heart, within the region where the superior vena cava opens into the right auricle, there lies a club-shaped formation known as the *sino-auricular* or the *S-A node;* functionally it is identical with the sinus of the amphibian and reptilian heart. The node is composed of slender fusiform cells with little striation. It can be considered as definitely proven that, in the normal heart, the sinus serves as the centre in which the stimulus for the cardiac contraction originates. The *S-A* node is, however, by no means the only place in which the impulses for the heart can originate. The seat of these rhythmically recurring impulses may shift to some other portion of the heart since, as in the frog's heart, the function of rhythmicity is potentially present in every part of the heart, and the *S-A* node governs the rate of the whole heart only in virtue of its faster rate of discharge of these impulses. On this account the *S-A* node has often been described as the "pace-maker" of the heart. Other centres in which the impulses sometimes originate, and which in certain cases may gain mastery over the whole heart, are known as *ectopic* centres.

It has been shown that a very distinctive system of muscle fibres lies enclosed within its own sheath beneath the endocardium. This system is known as *the conductive system* of the heart. It begins as a few strands of fibres in the region of the coronary sinus; these strands converge in a thickening which is known as the *auriculo-ventricular* or the *A-V node;* it is composed of the same type of cells as the *S-A* node. The two nodes are not connected with each other, but are divided by the ordinary contractile elements of the auricle. From the *A-V* node, a thin bundle of tissue passes through the auriculo-ventricular septum towards the ventricle. This bundle was first described by His, and is known as *the A-V bundle*. On penetrating the intra-ventricular septum, the bundle divides into two branches, which pass to the right and left ventricle respectively. The two branches in turn divide and subdivide, forming an extensive arborization on the inner surface of the ventricles (fig. 4).



FROM STARLING, "ELEMENTS OF HUMAN PHYSIOLOGY" (J & A CHURCHILL)

FIG 4—THE CONDUCTING SYSTEM OF THE HEART

Left ventricle, laid open to show Interventricular system, on which the course of the Auriculo-ventricular Bundle and its ramifications are shown in black (after Tawara)

Various parts of the conductive system may become centres of ectopic rhythms. If the *S-A* node is destroyed or injured, or if the irritability of the *A-V* node is increased, the latter assumes the rôle of initiating the heart beat. Many nervous and other influences may modify the relative irritability of the two nodes, and a shift of the pace-maker from one to the other may occur temporarily even under normal conditions. Destruction of the His bundle is equivalent to a complete functional separation of the ventricles from the auricles. The ventricles develop a rhythm of their own, *the idio-ventricular rhythm*. Both ventricles however continue to contract together, the centre for their activity being localized in the higher part of the bundle. It is probable that still lower centres may assume a rhythmicity, but it is doubtful whether these can ever dominate the rhythm of the whole heart. Their significance consists rather in the fact that they serve to disturb some other dominant rhythm.

Thus we see that every part of the heart may serve as a centre of origin of an impulse. The natural rate of the discharges of these centres is in the following descending order: the *S-A* node, the *A-V* node, the bundle, its branches and muscle. If several centres are active simultaneously, the rate of the heart as a whole will be dominated by that centre which discharges most frequently.

The "Normal" Heart Rate.—The normal heart rate presents considerable variations in different individuals and in different species of animals. For man it may be estimated at 68 to 76 beats per minute, and for woman 74 to 80, but the normal rate for some individuals may be much lower (50) or much higher (90). Small animals as a rule have a higher heart rate than large animals, *e.g.*, elephant 25–28, horse and ox 36–50, sheep 60–80, dog 100–120, rabbit 150–180, mouse 700; small birds like the canary have the extremely high rate of 1,000 beats per minute. Usually in man, under normal conditions, the heart rate declines with age. While at birth it is about 140, it is 100–110 at the age of 5; in childhood it is about 90, and in the adult about 70. In old age it accelerates slightly and becomes about 80.

Conductivity.—The impulses which originate in the *S-A* node spread along the ordinary muscular tissue to every part of the auricles. The rate of conduction in the auricle ranges from 600–1,200 mm. per second. In its fan-like spread, the excitation wave reaches the *A-V* node. There is no indication of a preferential path of conduction between the two nodes, so that the impulse travels at the same rate over the auricle and reaches the *A-V* node about 0·03 second after the origin of the impulse. In the *A-V* node, the rate of conduction is considerably slower, the impulse passing the node at about 150–200 mm. per second. Once it has passed the node, the impulse travels rapidly down the

bundle and its ramifications at the rate of about 5,000 mm per second

The slow conduction in the *A-V* node and the rapid conduction in the bundle tissue ensure two important features of cardiac activity On account of the former, auricular contraction is given time to end before the onset of the ventricular contraction, and on account of the latter the impulse arrives at every part of the ventricle at approximately the same time Thus the whole ventricular muscle contracts approximately at the same time, which is a condition necessary for the development of a high pressure in the ventricular cavities.

Irritability.—When a skeletal muscle is stimulated by an increasing strength of electrical stimulus, it responds by an increasing strength of contraction, until a certain maximum is reached. A heart under the same conditions gives a contraction which is maximal for a given condition of the heart in response to the first effective stimulus; further increase in the strength of the stimulus does not lead to an increase in the strength of the response. This difference between the skeletal and the cardiac muscle is not due to fundamentally different properties, but depends on the fact that in cardiac muscle the muscle fibrils are in free inter-communication with each other, and in this way a stimulus which originates in one part spreads over the whole of the organ, in the skeletal muscle, however, the contractile fibrils are collected into muscle fibres which are separated by the homogeneous coat of the sarcolemma. Since the threshold value of a stimulus which will evoke contraction is different for the different muscle cells, it is only to be expected that a greater number of these cells will contract in the skeletal muscle when the stimulus is strengthened, the result being a stronger total effect of contraction of the muscle In the heart, when a stimulus evokes a contraction of a few fibres, this contraction will spread over the whole heart, so that with increase in the stimulus there is no further strengthening of the contraction. This behaviour of the heart is known as the *All or None Law.* It is most evident in the cardiac muscle, but is not peculiar to it.

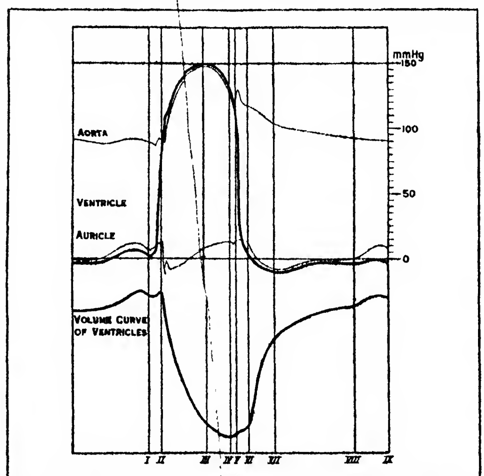
The Refractory Period.—The irritability of the heart undergoes rhythmical variations which are determined by the heart beat itself. Like all excitable tissues, the heart exhibits the phenomenon of the *refractory period,* which is a period of loss of irritability following each impulse which evokes a contractile response In the heart this period is extremely prolonged It lasts as long as the contraction of the heart. If a second stimulus is applied to the heart during the contraction which is evoked as a response to the first stimulus, it is found that it has no effect. In the skeletal muscle, on account of the fact that the refractory period is shorter than the time occupied by the contraction, a second stimulus evokes a second contraction, or a summation of the two contractions. The period of complete loss of irritability is followed by gradual recovery, after which there is a phase of super-normal irritability before it returns to the normal.

The length of the refractory period depends in the first place on the strength of the contraction of the heart. Thus drugs and physiological conditions which strengthen the heart beat also increase its refractory period. Of greater significance, however, is the relation of the refractory period to the rate of the heart beat. Lewis found that the duration of the refractory period of mammalian auricular muscle contracting 100, 130 and 250 times per minute was 0·2, 0·15 and 0·01 sec. respectively.

It is obvious that as a result of the shortening of the refractory period the heart is able to respond to more rapid rates of excitation than would otherwise be possible. As soon, however, as stimuli occur at intervals which are shorter than the refractory period alternate stimuli will fail to evoke any response, the heart beating at a *half-rhythm* or 2:1 response. The change from a 1:1 to a 2:1 response does not occur abruptly. Between these rates there exists a phase in which large and small beats alternate; with further acceleration of the stimulation, some beats are dropped, and with a still further acceleration a regular 2:1 rate sets in. This stage of irregular response is due to the fact that apparently all the parts of the cardiac muscle have not the same minimal refractory period and consequently at some definite rate of excitation parts of the heart will contract in response to every stimulus, while other parts will respond by a 2:1 rate.

Contractility.—The strength of contraction of the heart is independent of the strength of the stimulus It is, however, highly dependent on the condition of the cardiac muscle. Any interference with the nutrition of the heart, inadequacy of the oxygen supply, or accumulation of the products of metabolism such as carbonic acid or lactic acid, will lead to a weakening of the contractile response, and even to a complete loss of contractility.

There is also a physiological factor of primary importance which modifies the strength of contraction Briefly it can be stated that, other conditions being equal, the greater the filling of the heart during diastole, the stronger is the following systole This dependence of strength of contraction is so marked and is of such importance for the whole circulation that Starling named it the "Law of the Heart." It must be remembered, however, that it is not a feature peculiar to the cardiac muscle alone; it belongs to all contractile tissues, whether heart, skeletal muscle or plain muscle, but in the heart it is of a greater immediate vital importance. The practical significance is obvious; it enables the heart to eject the amount of blood which it receives during diastole whether small or large, and thus enables the heart to adapt its beat to considerable variations of the blood flow without changing its rate. A dog's heart weighing 50 grams, can put out 100 or 3,000 cc. of blood per minute without changes of the heart rate.



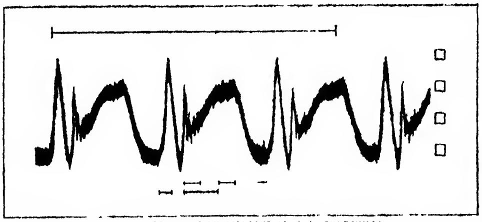
FROM STARLING, "ELEMENTS OF HUMAN PHYSIOLOGY" (J & A CHURCHILL)

FIG. 5.—PRESSURE CURVES FROM AORTA, VENTRICLE AND LEFT AURICLE, TOGETHER WITH VOLUME CURVE OF THE TWO VENTRICLES DURING ONE COMPLETE CARDIAC CYCLE (MODIFIED FROM WIGGERS)

This remarkable adaptation is due to the fact that the larger the output, the more the heart will be filled during each period of relaxation (diastole), and hence its contraction (systole) will be stronger, so that the heart will empty itself of the extra amount of blood. When a heart is in good condition, it performs a given amount of work with a smaller diastolic volume than when the contractility of the heart becomes impaired. The same work may be performed in both cases, but in the second case in order to do the work the heart has to dilate, because at the previous diastolic volume its contractions would be too weak. The dilation of the heart at constant work is thus the first sign of impairment of its functions.

Sequence of Events in the Cardiac Cycle.—The time relation between the different events occurring during a cardiac cycle can be most satisfactorily determined by measuring pressure changes in the different cavities of the heart and in the aorta. The apparatus almost universally used for this purpose is known

as the optical manometer. It consists of a small glass or metal tube which can be introduced directly into one of the cavities of the heart. The tube is filled with fluid, and the outside opening is sealed with a thin rubber membrane, which carries an excentrally placed small and light splinter of a mirror. A beam of light reflected from the mirror is made to play on a moving photographic plate or film, and thus the minute movements of the membrane,



FROM STARLING, "ELEMENTS OF HUMAN PHYSIOLOGY" (J & A CHURCHILL)

FIG. 6—CURVES OF PRESSURES IN LEFT AURICLE OF CAT (AFTER STRAUB)

which are of course proportional to the pressure changes, are greatly magnified without the danger of increasing the inertia of the apparatus.

The pressure changes in the heart (fig. 5) have been described by Starling as follows.—

"The cardiac cycle begins with the contraction of the auricles, which may or may not give rise to a slight rise of pressure in the ventricles. As the auricular contraction dies away, the ventricular contraction begins at I. This causes a very rapid rise of pressure. Almost immediately after the beginning of the rise, the auriculo-ventricular valves close The pressure then rises rapidly in the ventricular cavity During this period, the contraction of the ventricular muscle is isometric It is raising the pressure within the ventricles without causing any change in its contents, or in the length of the muscle fibres Directly the pressure exceeds that in the aorta, the aortic valves open at the point marked II, and the aortic pressure thereafter rises with the ventricular pressure. During the whole duration of the ventricular contraction, the aortic pressure remains somewhat below the ventricular pressure, showing that the blood is flowing continuously from the ventricle into the aorta. The ejection of blood is at first rapid, so that the pressure in the ventricles continues to rise As the heart gets smaller, the amount of blood ejected into the aorta becomes less than that flowing out in the unit of time through the peripheral branches, so that the pressure begins to fall in the aorta and ventricle, even though the outflow of blood is still going on.

"The ejection period may therefore be divided into two phases, that of maximum ejection and that of reduced ejection. The ventricular muscle suddenly relaxes at the point marked IV, causing a sudden fall of pressure in the ventricle and a slight fall in the aorta. The latter is, however, arrested almost at once by the closure of the aortic valves, marked by the sharp depression, the *dicrotic notch,* in the aortic tracing The pressure in the ventricle continues to fall until at the point VI. it drops below that in the auricle and the auriculo-ventricular valves open, allowing the inflow of blood from the pulmonary veins and auricles Between V. and VI. the relaxation is isometric, since all the valves guarding the orifices of the ventricles are closed

"The pressure in the ventricles then continues to fall more slowly until it reaches the line of zero pressure, and remains at or near this line during the greater part of diastole. With a big inflow there may be a slight rise towards the end of diastole, which may be accentuated by the auricular contraction If the chest is opened the pressure in the ventricle never sinks below zero during any part of diastole. In the closed chest the pressure in the heart cavities during diastole will be negative, on account of the negative pressure within the thorax."

The duration of the separate phases of the heart beat depends naturally on the rate of the beat. In all cases, of change of heart rate, the period of diastole is affected relatively much more than the period of systole. Owing to the absence of valves between the auricles and the large veins, changes of pressure within the auricle will be transmitted along the veins

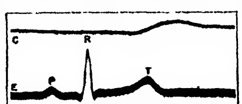
In every case the auricular pressure tracing exhibits the following features (fig. 6): (1) The first positive wave, which occurs during auricular systole. (2) The second positive wave, which is due to the sharp closure of the auriculo-ventricular valves. (3) The third positive wave, which is due to the filling of the auricles while the auriculo-ventricular valves are closed. (4) A negative wave, which is due to the rapid emptying of the auricle after the opening of the auriculo-ventricular valves. The chief function of the auricle is not to propel blood into the ventricle by its contraction, but to serve together with the big veins as a reservoir for the blood which flows in from the body but which cannot enter the ventricle while the latter is in a state of contraction

The Apex Beat.—The pulsation which is felt over the region of the heart is known as the "apex beat," and was formerly thought to be due to the twisting forward of the apex at each systole. Its origin is, however, different. During diastole, the ventricles form a flabby flattened cone, lying against the chest wall and slightly depressed by the latter. In systole, the ventricles become hard and rigid, and assume the form of a rounded cone This sudden change in shape and hardening of the ventricular wall pushes out that part of the chest wall which is in immediate proximity to the ventricle, giving rise to the "apex beat."

The Sounds of the Heart.—When the ear is applied to the chest above the cardiac region, two sounds may be heard, the first, which is heard most intensely over the apex, is a duller and longer sound than the second, which is heard best over the base of the heart The first and second sounds resemble the syllables *lubb dup–lubb dup.* The first sound is of twofold origin. It arises from the sudden closure of the auriculo-ventricular valves, and from the contraction of the thick muscular wall of the ventricles. The second sound is due to the sharp closure of the auricular and pulmonary valves.

When fluid escapes through a narrow orifice, vibrations are set up in the fluid giving rise to various sounds. Under normal conditions, when the valves of the heart are closed completely, sounds produced in this way are either absent or negligible, in abnormal conditions, *e.g.,* after disease affecting the orifices of the heart or the valves, these vibrations may become loud enough to be easily heard These murmurs or *bruits* as they are called are of great importance, for they enable the physician to judge the condition of the valves, and to determine which valve is affected.

The Electrocardiogram.—The contractions of the different cavities of the heart are accompanied by electrical changes which can be recorded if any two parts of the heart are connected to a sensitive galvanometer. The apparatus which is generally used for this purpose is the string galvanometer, in which a very delicate thread of silvered quartz or of platinum is stretched between the poles of a strong magnet. If we lead off, not from the heart itself, but from tissues which are in contact with the heart, we shall still obtain the electrical changes at each heart beat. An electrocardiogram so obtained is reproduced in fig. 7.



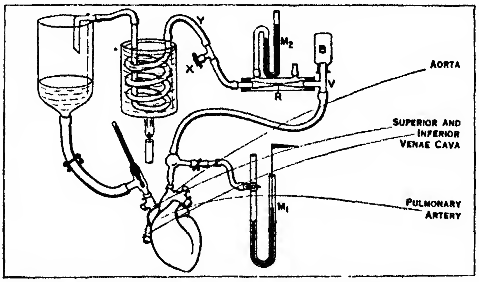
FROM STARLING, "ELEMENTS OF HUMAN PHYSIOLOGY" (J & A. CHURCHILL)

FIG 7—ELECTROCARDIOGRAM OF MAN, OBTAINED BY LEADING OFF FROM THE TWO HANDS TO A STRING GALVANOMETER, C THE CAROTID PULSE TRACING

The deflection P is due to the auricular contraction and QRS marks the beginning of the ventricular contraction Thus the P-R interval represents the period between the auricular and ventricular contractions. The total duration of the excitatory state of the ventricle is measured by the distance between Q and T. A case of *A-V* block, as for instance in Adams-Stokes' disease, is shown at once on the electrocardiogram by the dissociation of the normal relations between the auricular and ventricular deflections. A delay in conduction of the excitatory wave is accompanied by a prolongation of the P-R interval, while a beat originating from the *A-V* node instead of the *S-A* node is immediately shown by a

shortening or even disappearance of the P-R interval The exact origin of the T wave is not known The electrocardiogram has become an important aid in the study and diagnosis of abnormal heart activities.

The Isolated Mammalian Heart.—The nutrition of the mammalian heart is carried out by means of the coronary arteries, which leave the aorta at the place of its origin. A mammalian



FROM STARLING, "ELEMENTS OF HUMAN PHYSIOLOGY" (J & A. CHURCHILL)

FIG. 8.—ARRANGEMENT FOR WORKING ON THE ISOLATED MAMMALIAN HEART, WITH THE DIFFERENT PARTS NOT DRAWN TO SCALE, AND THE LUNGS NOT SHOWN

heart, which has been removed after the death of the animal, can easily be revived if the coronary arteries are perfused under pressure with blood or a salt solution which resembles the saline medium of the blood in composition This procedure was first introduced by Ludwig for the frog's heart, and by Langendorff for the mammalian heart Sydney Ringer first determined the exact amount and type of salts necessary for the most successful survival of the frog's heart, and Locke modified Ringer's solution for the mammalian heart With the use of such a solution, a mammalian heart can be restored to activity as long as 7 days after death. The beat of the isolated heart of a child can be restored 20 hours after death from pneumonia The excised heart of a cat can be kept beating for 4 days. The heart of a monkey was restored after freezing the dead body of the animal

Conditions Essential for the Heart Beat.—For perfusion experiments, a cannula is tied in the aorta pointing to the heart The pressure of the column of fluid closes the aortic valves and the only way of escape is through the coronary arteries, after having passed through the heart muscle, the fluid flows out of the coronary veins In this manner it is possible to study the influences directly affecting the heart beat and the coronary blood vessels

The first and most essential condition for reviving a heart is an abundant supply of oxygen; the second is the maintenance of the perfusion fluid at a reaction similar to that of blood, *i e.,* slightly on the alkaline side of neutrality (sodium bicarbonate is usually added for this purpose)

A third important factor is the maintenance of the temperature within physiological limits An increase in temperature causes an increase in heart rate but at about 44° C to 45° C the beat ceases entirely At temperatures ranging from 13°–19° C the beat ceases, but on rewarming the co-ordinated contractions are re-established, In all these cases the effect of temperature is primarily on the S-A node, and warming or cooling the node duplicates the effect of warming or cooling the perfusion fluid, except that at some stage the lower rhythm centre of the heart will begin to be dominant, whereas in the cooling of the whole heart the rhythm of all the centres becomes depressed

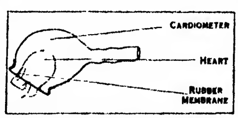
The main purpose of the sodium chloride in the fluid is to keep the osmotic pressure of the fluid the same as that of blood Calcium and potassium have however a direct influence on the contractility of the heart. After a short perfusion with a fluid that lacks calcium and potassium, the heart soon stops beating altogether Addition of calcium salts will immediately evoke contractions, which will grow in force, but the heart will soon fail to relax completely and will gradually stop in systole. On addition of potassium salts, the heart resumes a normal beat. Excess of calcium salts leads to a systolic standstill, and excess of potassium salts leads to a diastolic standstill. The normal activity can proceed only if salts of both calcium and potassium are present in the proper proportions.

The Heart-lung Preparation.—A great advance in the study of the heart was made when Starling succeeded in investigating the heart under conditions like those of the perfused heart, but with the great advantage that the heart performed work and pumped blood in exactly the same way as in the whole animal. The arrangement of the method is shown in fig 8

Artificial respiration being maintained, the chest is opened under an anaesthetic. Cannulae are placed in the brachiocephalic artery and the superior vena cava All other blood vessels going to and from the heart are tied off The blood emerging from the heart is made to flow against an artificial variable resistance (R), through a glass spiral immersed in warm water, into a reservoir From the reservoir the blood flows through the superior vena cava into the heart The aortic blood pressure can be varied in this preparation by changing the artificial resistance against which the heart is made to work.

The output of the heart can be measured at any time by opening the tube X, clamping tube Y, and allowing the blood to flow into a graduated cylinder The volume changes of the heart at each beat can be measured by the so-called cardiometric method A glass cardiometer of the shape shown in fig 9 is fitted over the beating heart The opened pericardium is tied around the lip of the cardiometer, which is then connected with a tambour with a slack rubber membrane The movements of this membrane are recorded by a lever on the smoked surface of a revolving drum The difference between the diastolic and the systolic volume thus recorded is obviously equal to the amount of blood put out by the two ventricles during a single heart beat

This preparation enabled Starling and his co-workers to study the main features of the physiological activity of the heart It was found that the heart itself cannot modify the blood flow and that, within wide variations of the heart rate and of the arterial resistance against which the heart beats, the output remains constant provided the inflow is not changed This means that the heart will adapt the strength of its beat within very wide limits, and will perform the work required if it is within the functional capacity of the organ If the inflow into the heart is say 1,000 cc a minute, this output will be maintained if the heart rate is 100 or 200 beats per minute, or if it has to beat against a pressure of 60 or 160 mm of mercury Increase in the heart rate does not modify the output, but it increases the maximum amount of blood which the heart is able to expel, since at the faster heart rates the inflow of blood can be increased without causing over-distension of the ventricles Another important observation made by Starling was that, in the heart-lung preparation, the heart rate is independent of the pressure against which the heart works and of the output The heart rate is here determined by the temperature of the *S-A* node, *i.e.,* by the temperature of the circulating blood It is clear that the extent of this effect will vary from heart to heart, depending on the natural rhythmicity of the node



FROM STARLING, "ELEMENTS OF HUMAN PHYSIOLOGY" (J & A CHURCHILL)

FIG 9—HENDERSON'S GLASS CARDIOMETER

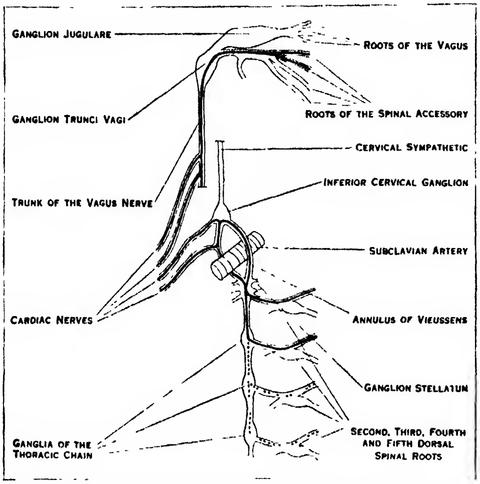
The Work of the Heart.—The energy of the contraction of the heart is expended (*a*) in forcing a certain amount of blood against a certain resistance presented by the arterial pressure, and (*b*) in imparting a certain velocity to the blood. The work done by each ventricle can be calculated from the formula.

$$W = Mr + \frac{Mv^2}{2g}$$

Where W is the work done, M is the mass of blood expelled at each beat, r is the mean arterial pressure, v is the velocity at the root of the aorta, and g the factor of acceleration. The work of the right ventricle is approximately $\frac{1}{4}$ of that of the left. The work of both ventricles in the human heart at rest is about 100 gram-

meters per beat, which is equivalent to about 10,000 kilogram-meters in 24 hours. During very strenuous muscular exercise when the output is considerably increased, the work of the heart per beat is about 400 gram.-meters, or 80,000 kilogram-meters in 24 hours. This rate of work could probably be maintained for not more than a few minutes

The energy required for the cardiac contraction is derived from the oxidation of the deposits of glycogen (possibly also of fats) within the heart itself It was found by Lovatt Evans that. on increasing the arterial pressure from 80–140 m.m of mercury, the oxygen consumption of a heart was increased from 228 to 404 cc. per hour; and on increasing the output from 9·3 to 92 litres per hour, it increased from 155–649 cc. per hour. The maximum efficiency of the heart is of the same order as that found for skeletal muscle, namely 20–28%



FROM STARLING, "ELEMENTS OF HUMAN PHYSIOLOGY" (J & A. CHURCHILL)

FIG 10 —DIAGRAM OF CARDIAC INHIBITORY AND ACCELERATOR FIBRES IN THE DOG (FROM FOSTER)

The Nervous Regulation of the Heart Beat.—In the vertebrates, the heart is supplied with two sets of nerve fibres; those which pass from the central nervous system in the vagus nerve, and those which pass in the sympathetic nerves (fig 10) The cardiac fibres of the vagus terminate around nerve cells situated in the heart itself (preganglionic fibres), the ganglionic cells serve as relays from which new fibres (postganglionic fibres) emerge and run directly to the cardiac muscle and to the *S-A* node The sympathetic fibres leave the spinal cord by the anterior roots mainly of the second and third dorsal nerves, run in the white *remi communicantes* to the Stellate ganglia where they end; from the Stellate ganglia, postganglionic fibres begin, which go to the various parts of the cardiac muscle.

The Vagus Nerve.—In 1845 the brothers Weber made the important discovery that stimulation of the vagus nerve retards or even arrests the heart beat. The cardio-inhibitory nerves have since then been found in all classes of vertebrates and in many invertebrates. During a stimulation of the vagi, the heart beat is considerably retarded or stops altogether, and as the result of this the arterial blood pressure falls. Blood accumulates on the venous side of the heart and is not forced out in sufficient amount to maintain the blood pressure. If the stimulation of the vagus is prolonged, the heart often begins to beat again with a slow rhythm; this beat is seen to be confined to the ventricles only, the auricles still remaining at a standstill. We speak of such a beat as an "escape." The ventricle is really beating at its own idio-ventricular rhythm in response to impulses originating within itself.

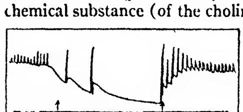
A detailed study of the effect of vagus stimulation on the heart has shown that it affects all the four fundamental properties of the heart muscle (fig. 11). By inhibiting the S-A node, it depresses the rhythmicity; by affecting the conductive system, it retards the propagation of the impulse in the auricular muscle and in the A-V bundle; by affecting the muscle proper, it diminishes its contractility and each beat becomes weaker, in consequence of which the refractory period of the heart is shortened; and finally it diminishes the irritability of the heart. Whether the vagus has a direct action on the mammalian ventricle is still doubtful

If both vagi are cut, the heart immediately begins to beat faster, showing that under normal conditions a continuous stream of impulses passes down the cardio-inhibitory nerves, which do not allow the heart to beat at its full independent rate.

For obvious reasons, section of the vagi cannot be performed in man, but we have at our disposal a drug which paralyses the peripheral nerve endings of the postganglionic vagal fibres, namely atropine, an alkaloid obtained from belladonna

The question as to what controls the normal tone of the vagi has been the subject of many researches, and at present we know of several factors that are concerned Amongst them we must mention first the blood pressure. Marey was the first to show that, other conditions being equal, the vagus tone increases with increase in the blood pressure. This effect is probably not due to the direct stimulation of the vagus centre in the medulla, but to stimulation by high blood pressure of special sensory endings in the aorta, in the ventricles, and in some of the blood vessels going to the brain The sensory impulses reflexly retard the heart by stimulation of the vagus centre Changes in the composition of the blood and various drugs may also affect the vagus centre. Asphyxia, and the action of morphine may be mentioned as such centrally acting stimuli; they retard the heart, but only if the vagi are intact. Reflexes from various sensory nerves may stimulate or inhibit the vagus centre, for instance, inflation of the lungs diminishes vagus tone (the Hering Breuer reflex); increase in the output of the heart has the same effect (Bainbridge reflex). Stimulation of the respiratory passages, as in the case of inhalation of an irritant volatile substance, retards the heart, and high intracranial pressure has the same effect. There are also stimuli which may excite the peripheral nerve endings of the vagi in the heart itself, *i.e*, substances which will act even after section of the vagi, but not after injection of atropine—for instance bile salts, which enter the general circulation in the case of jaundice

The intimate mechanism by means of which the vagus produces its effect on the heart has been a field of intense experimentation and theorisation It has been suggested that the vagus impulses produce "interference' waves with the impulses originating in the S-A node; that the vagus is a nerve which abolishes the katabolism or disintegration processes associated with activity, and leads to anabolism or reconstruction processes; that on account of similarity in the effect of stimulation of the vagus with that of potassium salts, the vagus possibly liberates free potassium from a colloidal combination or from an adsorbed state from the proteins. According to Loewi, the vagus acts by producing some chemical substance (of the choline type) which is the active factor His experiments support the theory most brilliantly. If a perfused frog's heart is stopped by stimulation of the vagus, and if the perfusion fluid is collected from the heart and transferred to a beating frog's heart, the second heart will show all the effects of vagus stimulation. The chemical substance responsible has been extracted and dried, but has not yet been obtained in a sufficiently pure form to establish its chemical nature.

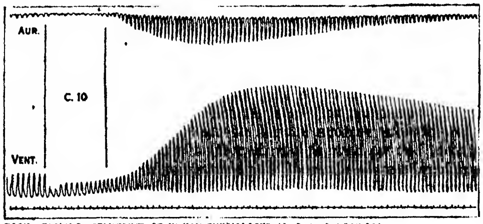


FROM STARLING "ELEMENTS OF HUMAN PHYSIOLOGY" (J & A CHURCHILL)

FIG 11 —BLOOD PRESSURE TRACING FROM CAROTID OF A DOG SHOWING EFFECT OF EXCITATION OF VAGUS (BETWEEN THE ARROWS)

The Sympathetic Nerve.—Stimulation of the sympathetic cardiac nerve produces effects which are the reverse of the vagus stimulation. It increases the rate by raising the rhythmicity of the heart, augments the contractions, increases the rate of conduc-

tion of the impulse, and raises the irritability of the heart. On account of the increased strength of contraction, the refractory period becomes somewhat more prolonged than that normally associated with the given heart rate. The sympathetic nerves are much less easily tired than the vagus fibres and have a longer after-effect. In most animals the inhibitory and the accelerator fibres, which were discovered by Cyon, become mixed in the cardiac nerves, so that if these are stimulated a double effect is produced on the heart. During the period of stimulation the vagus effect predominates, but after the end of stimulation the sympathetic effect becomes apparent, and the heart accelerates and the beat increases in strength (fig. 12).

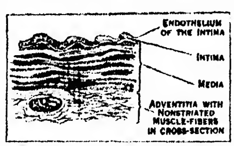


FROM STARLING, "ELEMENTS OF HUMAN PHYSIOLOGY" (J. & A. CHURCHILL)

FIG. 12.—TRACING TO SHOW EFFECT OF STIMULATION OF THE VAGO-SYMPATHETIC NERVE ON THE FROG'S HEART (AFTER GASKELL)

Stimulation of either set of fibres before they are mixed together produces effects typical of one or the other only. In the dog, whose normal heart rate is about 100 beats per minute, stimulation of the accelerator nerves may increase it to 260 beats, and at the same time the strength of each contraction will be increased. The latter effect is most marked in hearts which have begun to fail and which are therefore dilated.

The question whether, under normal conditions, the accelerator fibres are in a state of tone like that of the inhibitory fibres of the vagus is not definitely settled. It is customary to assume the existence of such a tone, but to consider it as less pronounced than that of the vagus. In most experiments, extirpation of the Stellate ganglia leads to a retardation of the heart. Many observers have shown that the tonic conditions of the two centres stand in a reciprocal relation to one another. Whenever the tone of the inhibitory fibres is increased, that of the accelerator fibres is diminished; thus the final effect on the heart will be an algebraical summation of the two influences. The tone of the accelerator centre is greatly increased in asphyxia, in cerebral anaemia, in the case of various sensory stimuli (especially painful stimuli), and probably in the case of muscular exercise. In the first two states, which are pathological, the tone of both nerves is increased simultaneously. Thus, in the absence of the sympathetic nerves, asphyxia produces retardation of the heart by stimulating the vagus, and in the absence of the vagus it produces an acceleration. In the presence of both nerves, it first retards the heart and may even arrest it until the vagi become paralysed, after which the heart greatly accelerates above the normal, because of the co-existent stimulation of the sympathetic centre.

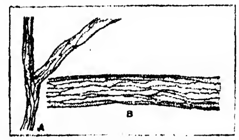


FROM BOHM, DAVIDOFF & HUBER, "TEXTBOOK OF HISTOLOGY" (SAUNDERS & CO.)

FIG. 13.—TRANSVERSE SECTION THROUGH ONE OF THE SMALLER OF THE MEDIUM SIZED HUMAN ARTERIES

The Suprarenal Gland.—It has already been mentioned that the influence of the vagus can be modified by stimuli affecting the centre, or by substances which stimulate or paralyse the peripheral nerve endings of the vagus within the heart itself. In the case of the sympathetic innervation, the organism normally produces a chemical substance which stimulates all the sympathetic nerve endings.

The production of this substance is the function of the suprarenal (or adrenal) gland, and the substance has not only been obtained in a chemically pure state, but has also been synthesised. It is known as *adrenaline* or suprarenin. Adrenaline is active in very small amounts, concentrations of one in one hundred millions producing a strongly exciting effect. Under normal conditions, however, the quantities entering the blood are probably too small to have any physiological effect. The liberation of adrenaline is under the influence of the splanchnic nerves, section of which diminishes the secretion, while stimulation greatly increases it. Certain drugs, asphyxia, various emotions such as fear or anger lead to an excessive production of adrenaline. Directly the adrenaline reaches the heart, even when its connections with the nervous system are all severed, the contractions become considerably faster and extremely energetic, and the heart becomes able to cope with a greater strain (either in the shape of arterial resistance or increased venous inflow) than it could do without the stimulus of adrenaline.



FROM BOHM, DAVIDOFF & HUBER, "TEXTBOOK OF PHYSIOLOGY" (SAUNDERS & CO.)

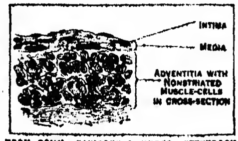
FIG. 14.—CAPILLARY BLOOD VESSELS

To summarize, we may state that the heart beat is a property of the heart itself, and as such it is independent of the nervous system. The latter may however be said to keep the activity of the heart under constant supervision, moderating its action by means of the vagus, and increasing it by means of the sympathetic nerves, thus adapting it to the general requirements of the body. Under conditions of great physical strain, the organism is able to make use of its store of adrenaline, which assists the nervous regulation of the heart beat. Thus, even after complete denervation of the heart, a certain amount of adaptation of its activity is still possible.

THE BLOOD VESSELS

Structure of the Blood Vessels.—The haemodynamic conditions in the various parts of the vascular system are very different, and it is not surprising to find that the structure of the various blood vessels is accordingly different. A cross-section of a blood vessel shows several coats. The inner consists of flattened endothelial cells and is common to all vessels. The second coat, the *tunica media,* varies greatly in thickness; it contains most of the contractile elements of the arterial wall (smooth muscle fibres) and a variable amount of elastic fibres. The latter have in general a circular arrangement; they are fused at their outer and inner surfaces to form elastic membranes (*lamina interna and externa*). Outside the media, lies the third coat, the *adventitia,* which consists in the arteries almost entirely of connective tissue, and in the veins principally of contractile elements. Between the internal elastic membrane and the endothelial layer is a fibrous structure which, together with the endothelial layer, forms the *tunica intima.*

The Arteries.—In the great arterial trunks such as the aorta, the pulmonary, the carotid and iliac arteries, the tunica media is divided by elastic fibres and membranes into a large number of concentric layers containing (especially in the aorta) only a few muscle fibres. The adventitia of the large arteries is also composed of fibro-elastic tissue, but its structure is looser and the fibrous tissue is more abundant. The medium-sized arteries differ in structure from the larger ones in that the elastic elements of the intima and media are replaced to a considerable extent by non-striated muscular fibres (fig. 13). To this type belong the majority of the arterial vessels.



FROM BOHM, DAVIDOFF & HUBER, "TEXTBOOK OF HISTOLOGY" (SAUNDERS & CO.)

FIG. 15.—TRANSVERSE SECTION THROUGH A SMALL HUMAN VEIN

The Capillaries.—These (fig. 14) consist solely of a single layer of endothelial cells, which present little resistance to the passage of substances dissolved in the blood, such as oxygen, carbon dioxide, sugar and salts. According to some observers, the cells forming the capillary wall are contractile; according to others, the actual contractile elements are special Stellate cells which encircle the capillaries. But whatever the mechanism, the

contractility of the capillaries is unquestionable, and must play a considerable part in regulating the blood flow through an organ. The average length of capillaries is between 0·4 and 0·7 m.m.; in most organs they freely anastomose with each other, forming a more or less loose network.

The Veins.—The smallest veins result from the fusion of a variable number of capillaries. They assume a connective tissue coat, the adventitia (fig. 15), and with increase in size muscle-fibres appear in the form of a badly defined media. Some of the larger veins, such as the brachial and subcutaneous veins, have a better developed muscular layer, while in others (the jugular, the subclavian, the veins of the dura and pia mater) the media is entirely lacking. Generally speaking, the muscular and elastic elements are much less prominent in the veins than in the arteries, and they contain a preponderance of inelastic connective tissue fibres. In many veins the adventitia shows an inner longitudinal muscular layer. All subcutaneous veins and some internal veins are supplied with valves which restrict any possible back flow. The valves of the veins are reduplications of the intima, and the greater part of the valvular structure consists of fibrous connective tissue and elastic fibres.

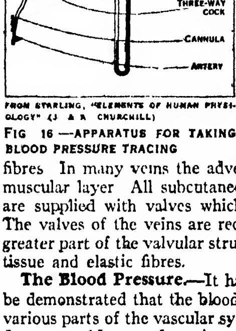
FIG. 16.—APPARATUS FOR TAKING BLOOD PRESSURE TRACING

The Blood Pressure.—It has long been known and can easily be demonstrated that the blood is under different pressures in the various parts of the vascular system. When an artery is cut, blood flows out with great force in a series of jerks which are synchronous with the heart beat. When a large vein is cut, the blood also flows out rapidly, but the stream has very little force.

The first measurement of arterial pressure was made by the Rev. Dr. Stephen Hales. ("Statical Essays, containing Haemastaticks" 1733.)

Since Hales' work, the chief improvements in the method have been the application of the mercury manometer by Poiseuille, the invention of the recording manometer and the kymograph by Ludwig (figure 16), and the introduction of the more accurate membrane manometer by Hürthle and Frank.



FROM HOWELL, "TEXTBOOK OF PHYSIOLOGY" (SAUNDERS '00)

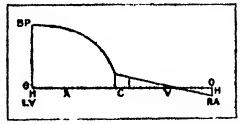
FIG. 17.—A RECORD OF ARTERIAL BLOOD PRESSURE TAKEN WITH A MERCURY MANOMETER FROM THE CAROTID ARTERY OF THE RABBIT, RECORDED IN SECONDS

The manometer of Ludwig consists of a U-tube which is half-filled with mercury. On the surface of the mercury of one limb is a float from which a stiff light rod projects, bearing on its upper end a writing point which is made to write on the smoked surface of a revolving drum. The other limb of the manometer is connected by means of a glass or metal cannula to the artery. The tube between the artery and the manometer is filled with a solution of some anticoagulant salt (sodium citrate, magnesium sulphate).

The mercury manometer allows a direct reading of pressure, but on account of its inertia it does not accurately record rapid changes in the pressure. The membrane manometer, which is merely a tube filled with fluid and sealed at one end with a stretched rubber membrane, records rapid changes in pressure more accurately, but each membrane requires special calibration if absolute values are desired. The venous pressure is recorded by a similar method, but with a water manometer or a manometer with a lightly stretched membrane.

The highest pressure, which occurs while the blood is passing from the heart into the aorta, is called the *systolic arterial pressure,* and the pressure at the end of diastole is the *diastolic pressure;* the range between these two extremes is known as the *pulse pressure.* In the dog, with a mean arterial pressure of about 120 mm. of mercury, the systolic pressure may be as high as 160 mm., and the diastolic pressure as low as 65 mm., here the pulse pressure would be 95 mm. of mercury. By taking the pressure at different parts of the vascular system, we obtain a result which is diagrammatically represented in figure 18.

Close to the heart, the mean arterial pressure is about 100–120 mm. It falls only slowly in the large arteries, but between the smaller arteries and the capillaries there is a very extensive fall of pressure, so that the capillary pressure is only about 10 to 30 mm. of mercury; from the capillaries to the veins the blood pressure falls steadily, until in the large veins near the heart it may be negative.



FROM STARLING, "ELEMENTS OF HUMAN PHYSIOLOGY" (J. & A. CHURCHILL)

FIG. 18.—BLOOD PRESSURES IN VARIOUS PARTS OF VASCULAR SYSTEM

A. In the arteries, C. capillaries, and V. in the veins

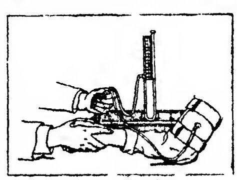
The arterial blood pressure in man is determined by means of the Riva Rocci sphygmomanometer (figure 19), which consists of a rubber bag that can be strapped round the upper arm. The bag is connected with a manometer, and the pressure in the bag is raised by pumping air into it. The pressure at which all pulsations disappear in an artery below the place of compression represents the systolic pressure. The diastolic pressure can also be determined by the same apparatus.

To determine the venous pressure in man, an apparatus is used which is constructed on the same principle as the sphygmomanometer. The skin is greased, and an annular rubber bag is placed over a vein and cemented over with a glass plate (figure 20). On blowing air into the bag, the pressure can be determined at which the vein collapses. The blood pressure in the capillaries is usually determined by the von Kries method (figure 21). A small glass plate is placed over the skin, attached to this plate is a small scale pan on which weights are placed until the pressure is just sufficient to blanch the underlying skin.

The mean blood pressure in the circulatory system of a young adult man in the horizontal position was found to be as follows:

Large arteries	90 mm. mercury (65–110)
Medium arteries	85 mm.
Capillaries	10–30 mm.
Small veins	9 mm.
Large veins	0–8 mm.

From this we see that the largest drop in pressure occurs between the small arteries and the small veins. This shows that the main resistance of the vascular system is situated in the arterioles. The arterioles are always in a semi-contracted state (tone), partly determined by impulses coming from the central nervous system, and partly by the properties of the plain muscles of which they are composed. Since the total vascular bed of the capillaries is very much larger than that of the arterioles, the main drop in the pressure must occur just past the arterioles. The mean arterial pressure depends on two factors: (a) the total resistance to the outflow of blood from the arterial system, *i.e.,* the state of constriction of the arterioles; (b) the output of the heart in a given time, which depends on the inflow of blood.

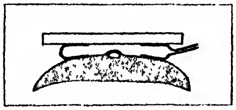


FROM STARLING, "PRINCIPLES OF HUMAN PHYSIOLOGY" (HAWKSLEY BROS.)

FIG. 19.—MEASUREMENT OF BLOOD PRESSURE IN MAN WITH THE RIVA ROCCI SPHYGMOMANOMETER

The Arterial Pulse.—Owing to the elasticity of the arteries, every systolic rise of the blood pressure produces an expansion of their walls, which can be felt by placing a finger on any superficial artery. It is obvious that the nearer the artery is to the

heart, the more pronounced will be the pulse The rate of transmission of this pressure wave will depend on the elasticity of the arteries If they were rigid, no pulse could be recorded. The more elastic the arteries, the slower will be the transmission of pressure along them. Under normal conditions, the pulse wave in man is transmitted at the rate of about 7 meters per second, but if the arteries are initially stretched by high pressure their walls will tend to approximate to rigidity, and therefore the propagation of the pulse wave will be faster It is important not to confuse the velocity of the pulse wave, which is simply a transmission of pressure along the tubes, with the velocity of the blood flow The latter is of the order of about 0·5 meters per second in the aorta, and considerably less in the smaller blood vessels



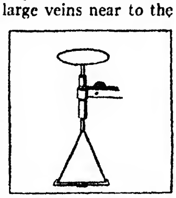
FROM STARLING, "ELEMENTS OF HUMAN PHYSIOLOGY" (J & A CHURCHILL)

FIG 20 —APPARATUS FOR DETERMINATION OF VENOUS PRESSURE

The elasticity of the arterial system determines another important feature of the blood flow; it is the cause of the continuity of the blood flow (except for slight increases during systole and decreases during diastole), in spite of an intermittent ejection of blood by the heart into the aorta A sufficient amount of blood is accommodated in the arterial system to maintain a flow into the capillaries during the whole period of diastole In the capillaries the pulse disappears, and the blood flow is continuous Arterial pulse tracings recorded by means of sphygmographs (a system of levers which can be placed on a pulsating artery, the pulsation of which is thus registered on a moving plate with blackened surface) show various secondary undulations, either in the ascending part of the wave (anacrotic pulse), or in the descending (catacrotic pulse). These are partly due to extra vibrations set up in the arterial wall by the inrushing blood, and partly to pressure waves reflected from the periphery.

The Velocity of the Blood Flow.—This depends on the relation between the bore of the blood vessel and the amount of blood passing through it in a unit of time The total area of the cross sections of the arterial system gradually increases from the aorta to the periphery. The increase in area is especially great when the arteries break up into capillaries, the area of which is probably over a thousand times larger than that of the cross section of the aorta. The velocity of the blood flow will obviously be proportionately reduced the further we go towards the periphery, so that while in the aorta the mean velocity under resting conditions may be about 500 mm per second, in capillaries it is barely 0·5 mm per second. As the capillaries join to form veins, the area of the vascular bed diminishes and the velocity of the blood flow increases; however, it never reaches the velocity which is observed in the aorta since the cross section of the large veins near to the heart is about double that of the aorta.

Intensity of the Circulation.—The amount of blood received by the heart from the veins and passed to the arteries in a unit of time, cannot be measured directly. However, a knowledge of the cardiac output is of considerable importance because it controls the amount of oxygen carried to the tissues and the rate of the removal of various products of metabolism from the tissues. The great value of the study of the cardiac output of man and animals has only been realised comparatively recently, and there still remains much to be done; nevertheless methods of sufficient precision have been worked out, and the main factors governing the cardiac output are gradually being disclosed.



FROM STARLING, "ELEMENTS OF HUMAN PHYSIOLOGY" (J & A CHURCHILL)

FIG 21 —APPARATUS OF VON KRIES FOR MEASURING CAPILLARY BLOOD PRESSURE

Zuntz calculated the output by comparing the difference in the oxygen content of the arterial and venous blood with the amount of oxygen consumed in a given time For instance in a horse weighing 360 kilo., 2,735 cc. of oxygen were consumed per minute; the arterial blood contained 10·33% more oxygen than the venous. Since every 100 cc. of blood that passed through the lungs had taken up 10·33 cc of oxygen, 2,733 cc. of oxygen had been taken up in the course of one minute by $\frac{100 \times 2733}{10 \cdot 33} = 26{,}457$ cc of blood. Krogh modified this method by making the animal or man breathe a gas which was harmless and easy to detect, viz. nitrous oxide He knew how much of the gas could be absorbed by 1cc. of blood, and was therefore able to calculate the cardiac output by determining the amount of gas taken in during one minute. Recently other methods have been introduced which are claimed to be more exact. In one of them, ethyl iodide is the gas absorbed, and in another the principle of Zuntz is modified and the output is calculated by comparing the carbon dioxide content of the arterial and venous blood with the amount of carbon dioxide given off in a unit of time.

Cardiac Output in Man.—In man, under conditions of rest, the cardiac output varies in different individuals between about 3½ and 6 litres of blood per minute, that is between 60 and about 110 cc for each heart beat. The cardiac output, *i.e.*, the inflow of blood into the heart, as in the heart-lung preparation, is within wide limits independent of the heart rate It primarily depends on (a) how freely the blood passes from the arterial system through the tissues into the venous system, *i e*, on the peripheral resistance; and (b) the power of the heart to pump the inflowing blood into the arteries, and (c) the capacity of the vascular system relative to the amount of blood When the arterioles dilate, the blood passes quickly through the organs and, since the capacity of the vascular bed will be changed but little, the blood will reach the heart during the next few beats in a larger amount The heart will therefore force more blood into the arterial system, and thus within limits prevent a fall of arterial blood pressure, which would have taken place if the arterioles dilated without causing an increase in the blood flow

If we turn now to the second way in which the output may be increased, namely the strengthening of the heart beat, it is clear that, if the pumping action of the heart becomes inadequate, blood will stagnate on the venous side, and the output will diminish If the heart beat is improved by nervous or pharmacological agencies, there will be better emptying of the venous side, and a consequent increase in the circulation rate.

The third factor governing the output is the capacity of the vascular bed relative to the amount of blood This factor can be appreciated by considering the tremendous capacity of the capillary system Krogh has shown that $\frac{1}{20}$ to $\frac{1}{10}$ of a muscle is made up of capillaries, and in the heart there is at least one capillary to every muscle fibre. If all these capillaries lost their tone, the animal would literally bleed into them, the arterial and venous system would become empty, and the output of the heart would fall to vanishing point.

The amount of blood in the circulation and the capacity of the vascular bed should not be considered as rigidly fixed for any individual. The vascular system is in a perpetual state of variation on account of the continuous changes of the vasomotor tone It is obvious that unless vasoconstriction is compensated for by a simultaneous vasodilation elsewhere it will lead to a change in the resistance as well as a change of capacity. Arterial vasoconstriction will chiefly affect the resistance, while even small changes in the tone of the enormous capillary bed will mainly affect capacity. Thus on account of these changes of capacity more or less blood may be in active circulation, and more or less blood may be left behind to fill the vascular bed.

Spleen, Lungs and Other Factors.—There are however two organs which play a predominant rôle as reservoirs of blood, namely the spleen and the lungs, the difference being that the spleen seems to change its capacity mainly as the result of active contraction and relaxation, while the lungs play a purely passive rôle and act only because of the very great elasticity of their blood vessels. With every increase in the pulmonary blood pressure or with a certain decrease in the intrathoracic pressure, the pulmonary blood vessels contain more blood, and therefore less blood is available for the systemic circulation. On the other hand, the capacity of the spleen is to a much greater extent independent

somewhat peculiar, since this organ is enclosed in a rigid bony covering. The limbs, glands and viscera can expand considerably when the blood pressure rises, but the expansion of the brain is confined. By the expression of venous blood from the veins and sinuses, the brain can receive a larger supply of arterial blood at each pulse. Increase in arterial pressure increases the velocity of flow through the brain, the whole cerebral vascular system behaving like a system of rigid tubes when the limits of expansion have been reached. The pressure of the brain against the skull wall is circulatory in origin; in the infant's fontanelle the brain can be felt to pulse with each heart-beat and to expand with expiration. The arterial supply to the brain by the two carotid and two vertebral arteries is so abundant, and so assured by the anastomosis of these vessels in the circle of Willis, that at least two of the arteries can be tied without grave effect Sudden compression of both carotids may render a man unconscious, but will not destroy life, for the centres of respiration, etc., are supplied by the vertebral arteries. The vertebral arteries in their passage to the brain are protected from compression by the cervical vertebrae.

Whether the muscular coat of the cerebral arteries is supplied with vasomotor nerves is uncertain

The Coronary Circulation.—Extremely peculiar conditions exist in the coronary circulation, *i e*, the blood supply to the heart muscle itself The coronary arteries originate at the root of the aorta They turn back into the substance of the cardiac muscle and break up into a rich meshwork of capillaries which convey the blood into the coronary veins, the majority of which collect the blood into the coronary sinus, while some open on the inner surface of the chambers of the heart (Thebesian veins) During systole the heart muscle develops a pressure which must be higher than that in the aorta, as otherwise no ejection of blood from the ventricle into the aorta would be possible The coronary arteries, which are at any time distended by the pressure prevailing in the aorta, are thus compressed, and during systole the inflow of blood into those of the left ventricle is stopped. The right ventricle by its weak contraction only affects the coronary circulation to a slight extent. While restraining the inflow of blood into the coronary arteries, the contraction of the heart greatly facilitates the outflow from the veins by mechanically expressing their contents. It is interesting to note that adrenaline, which greatly increases the strength of the cardiac beat, also produces a great dilation of the coronary blood vessels, so that a larger amount of blood is provided to meet the increased expenditure of energy. The coronary blood vessels are richly provided with vasodilator and vasoconstrictor nerves; the sympathetic supplies the vasodilator, and the vagus the vasoconstrictor fibres

Since the coronary blood flow is so readily affected by the heart beat, great difficulties are encountered in the study of the regulation of the coronary circulation. A knowledge of all the influences affecting it is, however, extremely important because the activity of the heart, and therefore the fate of the organism, ultimately depends on the blood supply to the cardiac muscle. It is known that even temporary occlusion of the coronary blood vessels is fatal. The disease known as *Angina pectoris,* which usually leads to death, is most probably due to such occlusion as the result of arteriosclerosis or thrombosis of the arteries; it is highly probable that in some cases it may also be due to disorders of the nerves which regulate the tone of the coronary blood vessels. In most cases of weakening of the heart, the coronary flow increases. Lack of oxygen produces an enormous augmentation of the coronary circulation, thus ensuring the survival of the heart so long as there is a trace of oxygen left in the blood.

The Influence of Posture on the Circulation.—The circulation remains efficient not only in the horizontal but also in the erect position. Yet in a man standing six feet high the hydrostatic pressure of a column of blood reaching from the vertex to the soles of the feet is equal to 14 cm of mercury. The blood, owing to its weight continually presses downwards, and under the influence of gravity would sink if the veins and capillaries of the lower parts were sufficiently extensile to contain it. During the evolution of man, there have been developed special mechanisms by which the determination of the blood to the lower parts is prevented, and the assumption of the erect posture rendered possible. The abdominal viscera are slung upwards to the spine, while below they are supported by the pelvic basin and the wall of the abdomen, the muscles of which are arranged so as to act as a natural waistband In tame hutch rabbits, with large patulous abdomens, death may follow in from 15 to 20 minutes if the animals are suspended and immobilized in the erect posture, for the circulation through the brain ceases, and the heart soon becomes emptied of blood. If, however, the capacious veins of the abdomen be confined by an abdominal bandage, no such result occurs Man is naturally provided with an efficient abdominal belt, although this is often rendered toneless by neglect of exercise or gross and indolent living The splanchnic arterioles are maintained in tonic contraction by the vasomotor centre, and thus the flow of blood to the abdominal viscera is confined within due limits

The veins of the limbs are broken into short segments by valves, and these support the weight of the blood in the erect posture Every contraction of the skeletal muscles compresses the veins of the body and limbs, for these are confined beneath the taut and elastic skin Guided by the valves of the veins, the blood is by such means driven upwards into the venae cavae.

Circulation During Muscular Exercise.—An attempt to understand the changes in the circulation during muscular exercise can only be made if every part of the complex regulation of the cardio-vascular system is kept in mind.

In muscular exercise, every available mechanism concerned in the regulation of the blood flow is brought into operation, everything being centred on the achievement of two objects, (a) to carry the all important oxygen to the muscles, and (b) to remove the excess of waste products as quickly as possible. In violent exercise the common effort of all the cardio-vascular mechanisms involved is often inadequate, but fortunately the muscles and other organs do not require an immediate supply of sufficient oxygen to fulfill their needs; fortunately also the muscles can withstand a certain degree of accumulation of waste products without much alteration of the intensity of the activity. In other words the muscles can to some extent run into debt as regards the oxygen supply. But the excess oxygen requirements must at some time be made good, or the activity will have to stop. The complete adaptation of the vascular and respiratory systems, when the oxygen supply and the removal of waste products entirely meets the demand, is achieved comparatively slowly. The first period of severe muscular activity proceeds under somewhat less favourable conditions than hold after complete adjustment has been attained. This is probably the explanation of the phenomenon of "second wind." The organism is better adapted to exercise, the more rapidly this state of adjustment is reached.

Since the arterial blood is normally about 95% saturated with oxygen, not much extra oxygen can be obtained by increasing the saturation of the haemoglobin. As already explained, the muscle obtains the required oxygen in two ways: (*a*) by increased utilization of the oxygen of the blood, *i e*, by a greater desaturation of the haemoglobin, and (*b*) by an increase in the blood flow. The first factor alone would be inadequate even if the muscles were able to remove all the oxygen from the blood A simple example will serve to illustrate this If we take the total blood flow as 4 5 litres per minute, even if we make the impossible assumption that the whole of the blood goes through the muscles, it will mean that the muscles will only be supplied with about 800 cc. of oxygen per minute. Now the normal oxygen requirements at complete rest are about 300 cc per minute, and during severe exercise they may rise to 3,000 cc. per minute or more Moreover, the desaturation of haemoglobin is never carried to completion, and even during severe muscular exercise the venous blood still contains some oxygen. Thus the increased oxygen demand can be met to only a limited extent by increasing the coefficient of the oxygen utilization.

The second factor, namely the increase in the output of the heart, is far more important. Amongst all the factors involved in this increase in the blood flow, we will first consider the heart This organ plays only a subordinate rôle The output of the

heart depends on the inflow and, under normal conditions, changes in the activity of the heart have little or no effect on blood flow. The main factor in the augmentation of the inflow concerns the peripheral blood vessels. Considerable changes in the heart beat must, however, take place in order to make it possible for the heart to cope with the larger inflow. The first effect of the larger inflow will be to increase the filling of the heart and therefore the output on account of the stronger beat. This is a purely automatic reaction of the cardiac muscle, and is independent of the central nervous system. The adaptation of a denervated heart stops at this point. The limit to this adaptation of the heart muscle is set by the pericardium. The adaptation of the innervated heart does not, however, stop here. The increase in the strength of contraction in this case is out of proportion to the inflow, so that the heart becomes able to give progressively stronger beats It is not only more filled in diastole but it also empties better during systole This additional strengthening of contraction depends on the diminution of the influence of the vagus nerve, and on the excitation of the augmentor fibres of the sympathetic nerve.

But usually in addition to this increase in strength of the beat there is a quickening of the heart rate. This is also based in the first instance on a diminution of the vagus tone, and probably in most cases on an augmentation of the sympathetic tone Further increase of the inflow is therefore met by a corresponding quickening of the heart beat The acceleration of the heart in muscular exercise is a purely reflex phenomenon, based (especially at the beginning of the exercise) partly on impulses descending to the cardiac medullary centres from the cortex of the hemispheres, which are probably conditioned reflexes In part the acceleration is due to concurrent changes in the respiratory activity and to reflexes originating within the vascular system of the animal itself We have seen that each inspiratory phase is accompanied by a diminution of the vagus tone and hence by an acceleration of the heart Thus if there is a greater number of respirations per minute, the periods of acceleration become more frequent and finally fuse, so that the periods of retardation typical of the expiratory state have no time to develop.

Amongst the reflexes which affect the cardiac rhythm and which originate within the organs of the body itself, the reflexes from the heart should be considered first. It has been shown by several observers that an increased inflow into the heart brings about a reflex acceleration of the heart beat. Changes in the activity of the heart should not be regarded as the cause of increased intensity of circulation, but as an adaptation which enables the increase to be performed.

The chief causes of increased total blood flow during muscular exercise can be grouped under the following headings:

1. The increase in the aspiration by the thorax;
2. The pumping action of the contracting muscles,
3. The increase in the amount of circulating blood,
4. The diminution of the total vascular resistance

To these should be added the factors which are not likely to affect the total blood flow, but which alter the distribution of the blood between the various organs. These are:

1. The constriction of the splanchnic area;
2. The dilation of the blood vessels of the muscles.

These factors have all been discussed in the preceding pages and need only be mentioned shortly. The increased and more frequent expansion of the chest, which follows the deepening and acceleration of respiration, accentuates the negative pressure in the thorax, and tends to diminish the pressure in the large veins. These are therefore more quickly and more completely filled with blood from the periphery The working muscles expel, by each contraction, blood from their capillaries to the veins, and thus actively help the propulsion of blood into the heart. The spleen contracts and empties its blood into the vascular system, and an extra amount of blood thus becomes available. The dilation of the blood vessels in the muscles is so intense that the general resistance diminishes and the blood passes from the aorta into the venous system at a considerably faster rate All these factors are helped by the contraction of the splanchnic vascular area, which diverts the blood to the muscles. The blood vessels in the muscle dilate, and the capillaries open so that the capillary bed in the muscles may increase 40 to 100 times during maximal activity This dilation is chiefly if not exclusively due to the local production of vasodilator substances It is not at present known how far the vasomotor innervation participates in this dilation

Thus we see that during muscular exercise the organism meets the demand for an increased oxygen supply to the muscle by an intricate series of correlated mechanisms. The necessary adjustments involve the respiratory system and the whole cardio-vascular system, and probably afford one of the finest examples of co-ordination that has yet been discovered in the realm of physiology.
